Dynamic Tracing of MariaDB Server on Linux

Problems and Solutions

Valerii Kravchuk, Principal Support Engineer, MariaDB
valerii.kravchuk@mariadb.com
Who am I and What Do I Do?

Valerii (aka Valeriy) Kravchuk:

- MySQL Support Engineer in MySQL AB, Sun and Oracle, 2005-2012
- Principal Support Engineer in Percona, 2012-2016
- Principal Support Engineer in MariaDB Corporation since March 2016
- [http://mysqlentomologist.blogspot.com](http://mysqlentomologist.blogspot.com) - my blog about MariaDB and MySQL (including some [HowTos](http://mysqlentomologist.blogspot.com), not only bugs marketing)
- [https://www.facebook.com/valerii.kravchuk](https://www.facebook.com/valerii.kravchuk) - my Facebook page
- [http://bugs.mysql.com](http://bugs.mysql.com) - my personal playground
- [@mysqlbugs](https://twitter.com/mysqlbugs) #bugoftheday
- **MySQL Community Contributor of the Year 2019**
- I speak about MySQL and MariaDB in public. Some slides from previous talks are [here](https://example.com) and [there](https://example.com)…
- “I solve problems”, “I drink and I know things”
Disclaimers

- Since September, 2012 I act as an Independent Consultant providing services to different companies
- All views, ideas, conclusions, statements and approaches in my presentations and blog posts are mine and may not be shared by any of my previous, current and future employees, customers and partners
- All examples are either based on public information or are truly fictional and has nothing to do with any real persons or companies. Any similarities are pure coincidence :)
- The information presented is true to the best of my knowledge
Sources of tracing and profiling info for MariaDB

- Trace files from `-debug` binaries
- Extended slow query log
- `show [global] status;`
- `show engine innodb status\G`
- `show engine innodb mutex;`
- InnoDB-related tables in the INFORMATION_SCHEMA
- `userstat` - per user, client, table or index
- `show profiles;`
- PERFORMANCE_SCHEMA (MariaDB 10.5 added memory instrumentation and some more)
- Profilers (even simple like `pt-pmp` or real like `perf`)
- OS-level tracing and profiling tools
- `tcpdump` analysis
What is this session about?

● It’s about tracing and profiling MariaDB server (or any other processes, or even kernel), and some tools for dynamic tracing and profiling in production on recent Linux versions:
  ○ Few words about ftrace that is “always there”
  ○ Some details about perf and adding dynamic probes
  ○ Mostly about eBPF, bcc tools and bpftrace
● I plan to present and discuss some (mostly resolvable) dynamic tracing problems one may hit with MariaDB server
● Why not about Performance Schema?
● Performance impact of tracing and profiling
Why not about Performance Schema?

- Discussed elsewhere a lot
- It may be NOT enabled when server was started (the case for MariaDB by default) or built (performance impact?)
- Too much memory used (see MDEV-20216)
- Specific instruments may not be enabled at startup and then it’s too late (see Bug #68097) - not dynamic enough!
- Sizing instruments properly may be problematic
- Part of the code or 3rd party plugins may not be instrumented at all or in enough details (see Bug #83912)
- It does not give you a system-wide profiling, just for selected parts of MariaDB (and more of MySQL) server
- MariaDB Developers do not consider it that useful and prefer to get stack traces… (see pt-pmp)
- Not easy to use (large and complex queries), sys helps...
So, what do I suggest?

- Use modern Linux tracing tools!
- Yes, all that kernel and user probes and tracepoints, **ftrace**, and **perf**, and eBPF (via bcc tools and **bpftrace**), depending on Linux kernel version
- **Julia Evans** explains and illustrates them all [here](http://www.percona.com)
- **Brendan D. Gregg** explains them all with a lot of details and examples:
Tracing events sources

- So, *tracing* is basically *doing something* whenever specific *events* occur.
- Event data can come from the kernel or from userspace (apps and libraries). Some of them are automatically available without further upstream developer effort, others require manual annotations:

<table>
<thead>
<tr>
<th></th>
<th>Automatic</th>
<th>Manual annotations</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Kernel</strong></td>
<td>kprobes</td>
<td>Kernel tracepoints</td>
</tr>
<tr>
<td><strong>Userspace</strong></td>
<td>uprobes</td>
<td>USDT</td>
</tr>
</tbody>
</table>

- *Kprobe* - the mechanism that allows tracing any function call inside the kernel.
- *Kernel tracepoint* - tracing custom events that the kernel developers have defined (with TRACE_EVENT macros).
- *Uprobe* - for tracing user space function calls.
- *USDT* (e.g. DTrace probes) stands for *Userland Statically Defined Tracing*.
On frontends to events sources

- *Frontends* are tools that allow users to easily make use of the event sources
- Frontends basically operate like this:
  a. The kernel exposes a mechanism – typically some */proc* or */sys* file that you can write to – to register an intent to trace an event and what should happen when an event occurs
  b. Once registered, the kernel looks up the location in memory of the kernel/userspace function/tracepoint/USDT-probe, and modifies its code so that *something else* happens. Yes, the code is modified on the fly!
  c. The result of that "something else" can be collected later through some mechanism (like reading from files).
- Usually you don't want to do all these by hand (with *echo*, *cat* and text processing tools via *ftrace*)! Frontends do all that for you
- *perf* is a frontend
- *bcc* and related tools are frontends
- *bpftrace* is a frontend
Few words about ftrace: do not bother much...

- **ftrace** - “a kind of janky interface which is a pain to use directly”. Basically there’s a filesystem at `/sys/kernel/debug/tracing/` that lets you get various tracing data out of the kernel. It supports kprobes, uprobes, kernel tracepoints and UDST can be hacked.

- The way you fundamentally interact with ftrace is:
  - Write to files in `/sys/kernel/debug/tracing/`
  - Read output from files in `/sys/kernel/debug/tracing/`

```
[openxs@fc29 ~]$ sudo mount -t tracefs nodev /sys/kernel/tracing
[openxs@fc29 ~]$ sudo ls /sys/kernel/tracing/
available_events  kprobe_profile  stack_trace
available_filter_functions  max_graph_depth  stack_trace_filter
...
[openxs@fc29 ~]$ sudo cat /sys/kernel/tracing/uprobe_events
p:probe_mysqld/dc /home/openxs/dbs/maria10.3/bin/mysqld:0x00000000005c7c93
```

- Usually is used via some tool (like **trace-cmd**), not directly
Few words about ftrace: if you want to... go for it!

- **ftrace** - let's try to add uprobe for `dispatch_command()` that prints SQL
- Tricky steps are to get probe address (it may be more complex):
  ```bash
  openxs@ao756:~$ objdump -T /home/openxs/dbs/maria10.5/bin/mariadbd | grep dispatch_command
  00000000070a170 g DF .text 0000000000289b Base
  _Z16dispatch_command19enum_server_commandP3THDPcjbb
  ```
- ...and to work with function arguments (do you know how they are passed?)
  ```bash
  root@ao756:~# echo 'p:dc /home/openxs/dbs/maria10.5/bin/mariadbd:0x000000000070a170
query=+0(0dx):string' > /sys/kernel/debug/tracing/uprobe_events
  root@ao756:~# echo 1 > /sys/kernel/debug/tracing/events/uprobes/dc/enable
  root@ao756:~# echo 1 > /sys/kernel/debug/tracing/tracing_on
  root@ao756:~# cat /sys/kernel/debug/tracing/trace_pipe
  mariadbd-22196 [000] d... 260006.251430: dc: (0x5592713fa170) query="select 1+3"
  mariadbd-22196 [001] d... 260008.899395: dc: (0x5592713fa170) query="select version(), connection_id()"
  ```
- You can try to do this even with 2.6.27+ kernels, CentOS 6, (but better 4.x+)
- More details in my [blog post](#)
- Or just check/use **uprobe** from Brendan Gregg's **ftrace**-based perf-tools

Dynamic tracing with ftrace: problems and demo

- You need **sudo** or even **root** access
- How to get the probe address? Consider complex cases of C++ class methods, like in [this post](#) with **perf**
- How to work with function arguments? What if they are complex classes or structures like **THD**?
- Return probes: this is easy: `r` instead of `p` and you can access **$retval**
- Don’t forget to remove the probe when done:
  
  ```bash
  root@ao756:~# echo '-:dc' > /sys/kernel/debug/tracing/uprobe_events
  ```
- In some cases it may help to add probe with **perf** and then check the details in `/sys/kernel/tracing/uprobe_events`
- Let’s try and see that machine code of traced function is really changed
- A lot of extra reading [here](#)
- I plan to write more blog posts on **ftrace** when I find out something...
A lot about perf

- If you are interested in details presented **nicely**...
- Or **even more details**...
- But basically with Linux 2.6.31+ (since 2009) install **perf** package and try it:

```
# perf
usage: perf [--version] [--help] [OPTIONS] COMMAND [ARGS]
The most commonly used perf commands are:

... record    Run a command and record its profile into perf.data
report      Read perf.data (created by perf record) and display the
profile
sched       Tool to trace/measure scheduler properties (latencies)
script      Read perf.data (created by perf record) and display
trace output
stat        Run a command and gather performance counter statistics
...

top         System profiling tool.
probe       Define new dynamic tracepoints
trace       strace inspired tool
```

See 'perf help COMMAND' for more information on a specific command.
Adding uprobe to MariaDB 10.5 with perf

- The idea is still to add dynamic probe to capture SQL queries
- This was done on Ubuntu 16.04 with recent MariaDB 10.5.6
- First I had to find out with `gdb` where is the query (demo)
- Then it’s just as easy as follows (demo continued):

```bash
openxs@ao756:~$ sudo perf probe -x /home/openxs/dbs/maria10.5/bin/mariadb 'dispatch_command packet:string'
openxs@ao756:~$ sudo perf record -e probe_mariadb:dispatch_command -aR
^C[ perf record: Woken up 1 times to write data ]
[ perf record: Captured and wrote 0.948 MB perf.data (2 samples) ]
openxs@ao756:~$ sudo perf script >/tmp/queries.txt
openxs@ao756:~$ sudo cat /sys/kernel/tracing/uprobe_events
p:probe_mariadb/dispatch_command
/home/openxs/dbs/maria10.5/bin/mariadb:0x000000000070a170
packet_string=+0(%dx):string
openxs@ao756:~$ sudo perf probe --del dispatch_command
```
Adding uprobes to MariaDB 10.5 with perf

- We have queries captured with probe added on previous slide:

  ```
  openxs@ao756:~$ cat /tmp/queries.txt
  mariadbd 11063 [001] 2492.149290: probe_mariadb:dispatch_command:
  (556a2921d170) packet_string="select 1"
  mariadbd 11063 [000] 2496.934324: probe_mariadb:dispatch_command:
  (556a2921d170) packet_string="select version()"
  ```

- We can control output format, but basically we see binary, PID, CPU where uprobes were executed on, timestamp (milliseconds since start of record), probe and variables with format we specified.

- **perf** is easier to use than **ftrace** directly, but we can use it to see the way to add probes with **ftrace** too.

- We do not need to find addresses, understand the way parameters are passed, and usually can access structure fields etc, but studying the source code of the specific version and **gdb** checks are still essential.
Adding uprobe to MariaDB with perf: problems

- The idea of the time was still to add dynamic probe to capture SQL queries
- This was done on Fedora 29 with recent MariaDB 10.3.x and something went wrong (event though it worked with `trace` bcc tool). I was NOT able to add uprobe to print `com_data->com_query.query` in a probe on `dispatch_command`
- So I tried with another function, `do_command()`, and its local variable, `packet::`

```
[openxs@fc29 ~]$ sudo perf probe -x /home/openxs/dbs/maria10.3/bin/mysqld 'do_command packet'
Sorry, we don't support this variable location yet.
Error: Failed to add events.
```
- I could print `THD *thd` parameter, but got no luck with structure members...
Adding uprobe to MariaDB with perf: problems

- **--vars** option shows what we can access:

  ```
  [openxs@fc29 ~]$ sudo perf probe -x
  /home/openxs/dbs/maria10.3/bin/mysqld --vars do_command
  
  Available variables at do_command
  
  @<do_command+0>
  
  THD* thd
  ```

- But **--vars** did not allow to directly access local variables, moreover, at function entry their values may be of no interest
- Sol needed need a way to create probe for a specific line of code, where some local variable already had the value set
- **--line** option shows what lines we can “probe”
Adding uprobe to MariaDB with perf: --line

- **--line** option shows what lines we can “probe”. You add probe for function entry and then:

```
[openxs@fc29 ~]$ sudo perf probe -x /home/openxs/dbs/maria10.3/bin/mysqld --line do_command
<do_command@/mnt/home/openxs/git/server/sql/sql_parse.cc:0>
  0  bool do_command(THD *thd)
  1  {
  2    bool return_value;
  3    char *packet= 0;
...
 10    enum enum_server_command command;
 11    DBUG_ENTER("do_command");
...
 154   packet[packet_length]= '\0';  // * safety */

 157   command= fetch_command(thd, packet);
...```
Adding uprobes to the line inside function with perf

- So I tried to attach probe to line 157 (relative to `do_command` start) and print local variable as it is there::

  [openxs@fc29 ~]$ sudo perf probe -x /home/openxs/dbs/maria10.3/bin/mysqld 'do_command:157 packet:string'

  Added new events:

    probe_mysqld:do_command (on do_command:157 in /home/openxs/dbs/maria10.3/bin/mysqld with packet:string)

  ...

  [openxs@fc29 ~]$ sudo perf record -e 'probe_mysqld:do_command*' -aR
    ^C[ perf record: Woken up 1 times to write data ]

    [ perf record: Captured and wrote 1.254 MB perf.data (14 samples) ]

    [openxs@fc29 ~]$ sudo perf script > /tmp/trace.out
It works!

- Let me check the **script** (raw data) output from **perf**:

  ```
  [openxs@fc29 ~]$ cat /tmp/trace.out
  mysql 15268 [002] 24115.673783:   probe_mysqld:do_command:
  (556c4297eb11) packet_string="select 2"
  mysql 15268 [002] 24118.361743:   probe_mysqld:do_command:
  (556c4297eb11) packet_string="select 1"
  mysql 15245 [001] 24125.281206:   probe_mysqld:do_command:
  (556c4297eb11) packet_string="SET time_zone='+00:00'"
  mysql 15245 [001] 24125.281431:   probe_mysqld:do_command:
  (556c4297eb11) packet_string="SHOW STATUS LIKE 'Uptime'"
  mysql 15245 [001] 24125.282427:   probe_mysqld:do_command:
  (556c4297eb11) packet_string=""
  mysql 15268 [002] 24127.401669:   probe_mysqld:do_command:
  (556c4297eb11) packet_string="select user, host from mysql.user"
  ...
  - Now, when you’ll get every other row of code instrumented in P_S?
  - Use **perf** and dynamic probes in the meantime...
Dynamic tracing with perf: practical examples

- Dynamic tracing of disk I/O with **perf**:
  - What to trace: file I/O, block device I/O, fsync calls, *something else*?
    - `sudo perf record -e block:block_rq_insert -a -g -- sleep 30`
  - More details (by Brendan Gregg) [here](#)

- Dynamic tracing of memory allocations with **perf**:
  - What if we want to trace all calls to `malloc` and record size and pointer?
    - Depends on allocator library used, but more or less:
      - `sudo perf probe -x /lib/x86_64-linux-gnu/libc.so.6 'malloc size=%di:s64'`
    - There are problems. More details in [this blog post](#)

- Dynamic tracing of C++ class members:
  - What if we want to trace `return` value of `ha_heap::records_in_range`?
  - More details in [this blog post](#)
  - Mangled names and, shit happens, **virtual member functions**.
perf - basic usage as a profiler

- Check my post, “perf Basics for MySQL Profiling”, for details and references, but basic minimal steps are:
  - Make sure perf-related packages are installed (perf with RPMs) for your kernel: `sudo apt-get install linux-tools-generic`
  - Make sure debug symbols are installed and software is built with `-fno-omit-frame-pointer`
  - Start data collection for some time using perf record:
    `sudo perf record -a [-g] [-F99] [-p `pidof mysqld`] sleep 30`
    Run your problematic load against MySQL server
  - Samples are collected in `pwd`/perf.data by default
  - Process samples and display the profile using perf report:
    `sudo perf report [-n] [-g] --stdio`

- Alternatively, run in foreground and interrupt any time with Ctrl-C:
  
  
  [root@centos ~]# perf record -ag
  ^C

- Or run in background and send -SIGINT when done:
  
  
  [root@centos ~]# perf record -ag &
  [1] 2353
  [root@centos ~]# kill -sigint 2353

- Let’s see how it works alive… (demo). We’ll see perf top, perf record -g etc
Perf - Call Graphs (hanging at “statistics” case)

- This real life case got me converted from P_S to profiling with `perf` in 2016...
- See my blog post for details and outputs (`perf record -a -g -F99 sleep 60`):

```
|--71.70%-- srv_conc_enter_innodb(trx_t*)
|   |   ha_innобase::index_read(...) 
|   |   handler::index_read_idx_map(...) 
|   |   handler::ha_index_read_idx_map(...) 
|   |   join_read_const(st_join_table*) 
|   |   join_read_const_table(THD*, ...) 
|   |   make_join_statistics(JOIN*, ...) 
|   |   JOIN::optimize_inner() 
|   |   JOIN::optimize() 
|   |   mysql_select(THD*, ...) 
...
```

- We can see that time to do `SELECT` is mostly spent waiting to enter InnoDB queue while reading data via index (dive) to get statistics for the optimizer (see Bug #83912 for what P_S shown me back then)
- We can see where the time is spent by kernel and other processes (`-a`)
perf - Call Graphs (recent slow purge 10.4 case)

Use `-g` option of `perf record` to get call graphs/backtraces with `perf`, then:

```
openxs@ao756:~/dbs/maria10.4$ sudo perf report --stdio
... 40.15%  0.16% mysql   mysql   [.] row_purge_record_func
 | --39.99%--row_purge_record_func
 |   | --39.36%--row_purge_reset_trx_id
 |   |   | --35.72%--row_search_on_row_ref
 |   |   |   | --35.60%--btr_pcur_open_low
 |   |   |   |   | --35.51%--btr_cur_search_to_nth_level_func
 |   |   |   |   |   |   | --16.88%--btr_search_info_update_slow
 |   |   |   |   |   |   |   | --16.74%--btr_search_build_page_hash_index
 |   |   |   |   |   |   |   |   | --15.58%--ha_insert_for_fold_func
```

...
perf - more problems and challenges

- Large size of **perf.data** at high sampling rates:
  
  ```
  -rw------- 1 openxs openxs 33553324  CONTRIBUTED 15 00:25 perf.data_io
  ```
  The above is for block I/O only, not I/O bound case:
  ```
  sudo perf record -e block:block_rq_insert -a -g -- sleep 60
  ```

- Overhead of writing by **perf record** to the file (what if you profile I/O and are already I/O bound?)

- The answer is... eBPF and safe summarizing in the probe (in kernel context)

- For complex software like MariaDB **perf** produces too large data sets to study efficiently

- The answer is filtering (with **grep**) and ... visualisation as **Heat Maps** or (for **-g**) **Flame Graphs**
A lot about eBPF: extended Berkeley Packet Filter

- **eBPF** is a tiny language for a VM that can be executed inside Linux Kernel. *eBPF* instructions can be JIT-compiled into a native code. *eBPF* was originally conceived to power tools like *tcpdump* and implement programmable network packed dispatch and tracing. Since Linux 4.1, *eBPF* programs can be attached to *kprobes* and later - *uprobes*, enabling efficient programmable tracing.

- **Brendan Gregg** explained it [here](#):
A lot about eBPF

- **Julia Evans** explained it [here](#):
  1. You write an “eBPF program” (often in C, Python or use a tool that generates that program for you) for LLVM. It’s the “probe”.
  2. You ask the kernel to attach that probe to a kprobe/uprobe/tracepoint/dtrace probe
  3. Your program writes out data to an eBPF map / ftrace / perf buffer
  4. You have your precious preprocessed data exported to userspace!

- **eBPF** is a part of any modern Linux (4.9+):
  1. 4.1 - kprobes
  2. 4.3 - uprobes (so they can be used on Ubuntu 16.04+)
  3. 4.6 - stack traces, **count** and **hist builtins** (use PER CPU maps for accuracy and efficiency)
  4. 4.7 - tracepoints
  5. 4.9 - timers/profiling

- You don’t have to install any kernel modules
- You can define your own programs to do any fancy aggregation you want, so it’s really powerful
- You’d usually use it with some existing **bcc** frontend. Check some [here](#).
- Recently a very convenient **bpftrace** frontend was added
Examples of bcc tools in action: tplist

- This tool displays kernel tracepoints or *USDT probes* and their formats
- It was applied it to MariaDB 10.3.x on Fedora 29 (*Fedora package!*):

  ```
  [openxs@fc29 mysql-server]$ sudo /usr/share/bcc/tools/tplist -l /usr/libexec/mysqld | more
  b'/usr/libexec/mysqld' b'mysql':b'connection__done'
b'/usr/libexec/mysqld' b'mysql':b'net__write__start'
b'/usr/libexec/mysqld' b'mysql':b'net__write__done'
b'/usr/libexec/mysqld' b'mysql':b'net__read__start'
b'/usr/libexec/mysqld' b'mysql':b'net__read__done'
b'/usr/libexec/mysqld' b'mysql':b'query__exec__start'
b'/usr/libexec/mysqld' b'mysql':b'query__exec__done'
...  
  ```

  - We get these USDT as they were added to the code when DTrace static probes were added. See also *readelf -n*.
  - MariaDB does NOT care about DTrace any more, but probes are there (*--DENABLE_DTRACE=1*). Not in MySQL 8.0.1+ it seems
Examples of bcc tools in action: mysqld_qslower

- Depends on `query__start` and `query__done` UDST probes!
- USAGE: mysqld_qslower PID [min_ms]
- By defaults logs queries slower than 1 millisecond. Set to 0 to have all queries logged. Does not seem to work with prepared statements!
- It was applied to MariaDB 10.3.18 (distro package) on Fedora 29:
  ```bash
  [openxs@fc29 tmp]$ sudo /usr/share/bcc/tools/mysqld_qslower `pidof mysqld`
  Tracing MySQL server queries for PID 4642 slower than 1 ms...
  TIME(s)    PID    MS QUERY
  ... 0.698114   5955   3546.324 INSERT INTO sbtest3(k, c, pad) VALUES(501130,
  '64733237507-56788752464-03679578678-53343296505-31167207241-10603050901-641486789
  4.251413   5955161.330 INSERT INTO sbtest3(k, c, pad) VALUES(503408,
  '77033721128-77169379656-02480595704-40686156292-96586631730-51870735982-037677765
  ```
- Now run sysbench and measure the impact of this logging vs other options :)
Examples of bcc tools in action: uprobe with trace

- [https://github.com/iovisor/bcc/blob/master/tools/trace.py](https://github.com/iovisor/bcc/blob/master/tools/trace.py)
- Trace a function and print a trace message based on its parameters, with an optional filter.
- It was applied to MariaDB 10.3.x on Fedora 29 to get queries without any UDST used (by adding `uprobe`). As usual I attached to function `dispatch_command` and printed its 3rd parameter:
  ```
  nm -na /home/openxs/dbs/maria10.3/bin/mysqld | grep dispatch_command
  ...
  00000000005c5180 T _Z16dispatch_command19enum_server_commandP3THDPcjbb
  sudo /usr/share/bcc/tools/trace
  'p:/home/openxs/dbs/maria10.3/bin/mysqld:_Z16dispatch_command19enum_server_commandP3THDPcjbb "%s" arg3'
  PID  TID  COMM      FUNC  
  26140 26225  mysqld  
  _Z16dispatch_command19enum_server_commandP3THDPcjbb b'select 2'
  ```
- It seems you have to use mangled name and access to structures may not work easily. See [this my blog post](this my blog post) for some more details.
What about bpftrace?

- [https://github.com/iovisor/bpftrace](https://github.com/iovisor/bpftrace)
- **bpftrace** (frontend with **programming language**) allows to do what I did with trace utility above, but **easier and more flexible**
- You need recent enough kernel (not available on Ubuntu 16.04), 5.x.y ideally
Study at least one-liner bpftrace examples

- [https://github.com/iovisor/bpftrace/blob/master/docs/tutorial_one_liners.md](https://github.com/iovisor/bpftrace/blob/master/docs/tutorial_one_liners.md)
- Command line options
  - `-l` | `-e 'program'` | `-p PID` | `-c CMD` | `--unsafe` | `-d` | `-dd` | `-v`
- Listing probes that match a template:
  ```
  bpftrace -l 'tracepoint:syscalls:sys_enter_*'
  ```
- Tracing file opens may look as follows:
  ```
  # bpftrace -e 'tracepoint:syscalls:sys_enter_openat\
  { printf("%s %s\n", comm, str(args->filename)); }'
  ```
- Syntax is basic:
  ```
  probe[,probe,...] [/filter/] { action }
  ```
- For me the language resembles awk and I like it
- More from Brendan Gregg (as of August 2019) on it is [here](https://github.com/iovisor/bpftrace/blob/master/docs/tutorial_one_liners.md)
- “Bpftrace is wonderful! Bpftrace is the future!”
Getting stack traces with bpftrace

- See `ustack()` etc in the Reference Guide
- This is how we can use `bpftrace` as a poor man’s profiler:
  ```bash
  sudo bpftrace -e 'profile:hz:99 /comm == "mysqld"/
  {printf("# %s\n", ustack(perf));}' > /tmp/ustack.txt
  ```
- We get output like this by default (`perf` argument adds address etc):
  ```
  ... 
  mysql_stmt_execute(THD*, char*, unsigned int)+37
  dispatch_command(enum_server_command, THD*, char*,
  unsigned int, bool, bool)+5123
  do_command(THD*)+368
  tp_callback(TP_connection*)+314
  worker_main(void*)+160
  start_thread+234
  ```
- See my recent blog post for more details on what you may want to do next :)

33
Performance impact of pt-pmp vs perf vs bpftrace

- Consider **sysbench** (I/O bound) test on Q8300 @ 2.50GHz Fedora 29 box:
  
  ```bash
  sysbench /usr/local/share/sysbench/ oltp_point_select.lua
  --mysql-host=127.0.0.1 --mysql-user=root --mysql-port=3306 --threads=12
  --tables=4 --table-size=1000000 --time=60 --report-interval=5 run
  ```

- I’ve executed it without tracing and with the following (compatible?) data collections working for same 60 seconds:
  1. `sudo pt-pmp --interval=1 --iterations=60 --pid=`pidof mysqld``
  2. `sudo perf record -F 99 -a -g -- sleep 60`
     
     [ perf record: Woken up 17 times to write data ]
     [ perf record: Captured and wrote **5.464 MB** perf.data (23260 samples) ]
  3. `sudo bpftrace -e 'profile:hz:99 { @[ustack] = count(); }' >
     /tmp/bpftrace-stack.txt`

  
  ```bash
  [openxs@fc29 tmp]$ ls -l /tmp/bpftrace-stack.txt
  -rw-rw-r--. 1 openxs openxs 2980460 Jan 29 12:24 /tmp/bpftrace-stack.txt
  ```

- **Average QPS**: 27272 | 15279 (**56%**) | 26780 (**98.2%**) | 27237 (**99.87%**)
Flame Graphs

- [http://www.brendangregg.com/flamegraphs.html](http://www.brendangregg.com/flamegraphs.html)
- Flame graphs are a visualization (as .svg file to be checked in browser) of profiled software, allowing the most frequent code-paths to be identified quickly and accurately.
- The x-axis shows the stack profile population, sorted alphabetically (it is not the passage of time), and the y-axis shows stack depth. Each rectangle represents a stack frame. The wider a frame is, the more often it was present in the stacks. Check some examples (on screen :)
- **CPU Flame Graphs** ← profiling by sampling at a fixed rate. Check this post.
- **Memory Flame Graphs** ← tracing malloc(), free(), brk(), mmap(), page_fault
- **Off-CPU Flame Graphs** ← tracing file I/O, block I/O or scheduler
- More (Hot-Cold, Differential, [pt-pmp-based](https://github.com/brendangregg/FlameGraph) etc),
- [https://github.com/brendangregg/FlameGraph](https://github.com/brendangregg/FlameGraph) + perf + ... or bcc tools like [offcputime.py](https://github.com/brendangregg/FlameGraph)
Flame Graphs - simple example for off-CPU

- Created based on these steps (while `oltp_update_index.lua` was running):

  ```
  [openxs@fc29 FlameGraph]$ sudo /usr/share/bcc/tools/offcputime -df 60 > /tmp/out.stacks
  WARNING: 459 stack traces lost and could not be displayed.
  [openxs@fc29 FlameGraph]$ ./flamegraph.pl --color=io --title="Off-CPU Time Flame Graph" --countname=us < /tmp/out.stacks > ~/Documents/out.svg
  ```
Problems of dynamic tracing: summary

- **root/sudo** access is required
- Debugging the program that is traced ...
- Limit memory and CPU usage while in kernel context
- How to add dynamic probe to some line inside the function (doable in **perf**)?
- C++ (mangled names, class members, **virtual member functions**) and access to complex structures (**bpftrace** needs headers)
- eBPF tools rely on recent Linux kernels (4.9+). Use **perf** for older versions!
- **-fno-omit-frame-pointer** must be used everywhere to see reasonable stack traces
- **-debuginfo** packages, symbolic information for binaries?
- More tools to install (and maybe build from source), but **ftrace** is there...
- Lack of knowledge and practical experience with anything but **gdb** and **perf**
- I had not (yet) used eBPF tools for real life Support issues at customer side (**gdb** and **perf** are standard tools for many customers already).
Am I crazy trying these and suggesting to DBAs?

- Quite possible, maybe I just have too much free time :)
- Or maybe I do not know how to use Performance Schema properly :)
- But I am not alone… Markos Albe also speaks about perf and eBPF/bcc tools, Daniel Black writes and speaks about perf....
- perf probes are used for tracing Oracle RDBMS! There is enough instrumentation there for almost everything, but still...
- Dynamic tracers are proven tools for instrumenting OS calls (probes for measuring I/O latency at microsecond precision, for example)
- Dynamic tracing of RDBMS userspace is a topic of growing interest, with a lot of RAM and workloads that are often CPU-bound these days.
- For open source RDBMS like MariaDB there is no good reason NOT to try to use dynamic probes (at least while UDST or Performance Schema instrumentations are not on every other line of the code :)
- eBPF (with bcc tools and bpftrace) makes it easier (to some extent) and safer to do this in production
Thank you!
