There are no performance degradation's when accessing existing tables on the server. Accessing the S3 table the first time will copy the .frm file from S3 to the local disk, speeding up future accesses to the table.

Caching

- Accessing a table on S3 can take some time , especially if you are using big packets (`s3_block_size`). However the second access to the same data should be fast as it's then cached in the S3 page cache.

Things to Try to Increase Performance

If you have performance problems with the S3 engine, here are some things you can try:

- Decreasing `s3_block_size`. This can be done both globally and per table.
- Use `COMPRESSION_ALGORITHM=zlib` when creating the table. This will decrease the amount of data transferred from S3 to the local cache.
- Increasing the size of the s3 page cache: `s3_pagecache_buffer_size`

Try also to execute the query twice to check if the problem is that the data was not properly cached. When data is cached locally the performance should be excellent.

Future Development Ideas

- Store aws keys and region in the mysql.servers table (as [Spider](#) and [FederatedX](#)). This will allow one to have different tables on different S3 servers.
- Store s3 bucket, access_key and secret key in a cache to better be able to better to reuse connections. This would save some memory and make some S3 accesses a bit faster as we could reuse old connections.

Troubleshooting S3 on SELinux

If you get errors such as:

```
ERROR 3 (HY000): Got error from put_object(bubu/produkt/frm): 5 Couldn't connect to server
```

one reason could be that your system doesn't allow MariaDB to connect to ports other than 3306. To procedure to enable other ports is the following:

Search for the ports allowed for MariaDB:

```
$ sudo semanage port -l | grep mysqld_port_t
mysqld_port_t          tcp      1186, 3306, 63132-63164
```

Say you want to allow MariaDB to connect to port 32768:

```
$ sudo semanage port -a -t mysqld_port_t -p tcp 32768
```

You can verify that the new port, 32768, is now allowed for MariaDB:

```
$ sudo semanage port -l | grep mysqld_port_t
mysqld_port_t          tcp      32768,1186, 3306, 63132-63164
```

5.3.16.2 Testing the Connections to S3

MariaDB starting with [10.5](#)

The [S3 storage engine](#) has been available since [MariaDB 10.5.4](#).

Contents

1. [S3 Connection Variables](#)
 1. [Using aria_s3_copy to Test the Connection](#)
 2. [Using mariadb-test-run to Test the Connection and the S3 Storage Engine](#)
2. [Create a trace of the S3 connection to see what goes wrong](#)
3. [What to do when you have got things to work](#)

If you can't get the S3 storage engine to work, here are some steps to help verify where the problem could be.

S3 Connection Variables

In most cases the problem is to correctly set the S3 connection variables.

Key [S3 variables](#) are:

- [s3_access_key](#): The AWS access key to access your data
- [s3_secret_key](#): The AWS secret key to access your data
- [s3_bucket](#): The AWS bucket where your data should be stored. All MariaDB table data is stored in this bucket.
- [s3_region](#): The AWS region where your data should be stored.
- [s3_host_name](#): Hostname for the S3 service.
- [s3_provider](#): Enable S3 provider specific compatibility tweaks. "Default", "Amazon", or "Huawei".
- [s3_protocol_version](#): Protocol used to communicate with S3. One of "Amazon" or "Original"

There are several ways to ensure you get them right:

Using aria_s3_copy to Test the Connection

[aria_s3_copy](#) is a tool that allows you to copy [aria](#) tables to and from S3. It's useful for testing the connection as it allows you to specify all s3 options on the command line.

Execute the following sql commands to create a trivial sql table:

```
use test;
create table s3_test (a int) engine=aria row_format=page transactional=0;
insert into s3_test values (1), (2);
flush tables s3_test;
```

Now you can use the [aria_s3_copy](#) tool to copy this to S3 from your shell/the command line:

```
shell> cd mariadb-data-directory/test
shell> aria_s3_copy --op=to --verbose --force --**other*options* s3_test.frm

Copying frm file s3_test.frm
Copying aria table: test.s3_test to s3
Creating aria table information test/s3_test/aria
Copying index information test/s3_test/index
Copying data information test/s3_test/data
```

As you can see from the above, [aria_s3_copy](#) is using the current directory as the database name.

You can also set the [aria_s3_copy](#) options in your my.cnf file to avoid some typing.

Using mariadb-test-run to Test the Connection and the S3 Storage Engine

One can use the [MariaDB test system](#) to run all default S3 test against your S3 storage.

To do that you have to locate the `mysql-test` directory in your system and `cd` to it.

The config file for the S3 test system can be found at `suite/s3/my.cnf`. To enable testing you have to edit this file and add the s3 connection options to the end of the file. It should look something like this after editing:

```
!include include/default_mysqld.cnf
!include include/default_client.cnf

[mysqld.1]
s3=ON
#s3-host-name=s3.amazonaws.com
#s3-protocol-version=Amazon
s3-bucket=MariaDB
s3-access-key=
s3-secret-key=
s3-region=
```

You must give values for `s3-access-key`, `s3-secret-key` and `s3-region` that reflects your S3 provider. The `s3-bucket` name is defined by your administrator.

If you are not using Amazon Web Services as your S3 provider you must also specify `s3-hostname` and possibly change `s3-protocol-version` to "Original".

Now you can test the configuration:

```
shell> cd **mysql-test** directory
shell> ./mysql-test-run --suite=s3
...
s3.no_s3                [ pass ]      5
s3.alter                [ pass ] 11073
s3.arguments           [ pass ] 2667
s3.basic               [ pass ] 2757
s3.discovery           [ pass ] 7851
s3.select              [ pass ] 1325
s3.unsupported         [ pass ] 363
```

Note that there may be more tests in your output as we are constantly adding more tests to S3 when needed.

Create a trace of the S3 connection to see what goes wrong

One can use the `s3_debug` variable to get a trace of the S3 engines interaction with the S3 storage. The trace is sent to the error log.

Here follows one example on can use to get a trace if `ALTER TABLE .. ENGINE=S3` fails:

```
use test;
create table s3_test (a int) engine=aria row_format=page transactional=0;
insert into s3_test values (1), (2);
set @@global.s3_debug=1;
ALTER TABLE s3_test ENGINE=S3;
set @@global.s3_debug=0;
```

If you have problems decipher the trace, you can always create a ticket on [MariaDB Jira](#) and explain the problem you have, including any errors. Don't forget to include the trace!

What to do when you have got things to work

When you got the connection to work, you should add the options to your global `my.cnf` file. Now you can start testing S3 from your [mariadb command client](#) by converting some existing table to S3 with `ALTER TABLE ... ENGINE=S3`.

5.3.16.3 S3 Storage Engine Internals

MariaDB starting with [10.5](#)

The [S3 storage engine](#) has been available since [MariaDB 10.5.4](#).

Contents

1. [ALTER TABLE](#)
2. [Partitioning Tables](#)
3. [Big Reads](#)
4. [Compression](#)
5. [Structure Stored on S3](#)
6. [Using the awsctl Python Tool to Examine Data](#)
 1. [Installing awsctl on Linux](#)
 2. [Using the awsctl Tool](#)

The [S3 storage engine](#) is based on the [Aria](#) code. Internally the S3 storage inherits from the Aria code, with hooks that change reads, so that instead of reading data from the local disk it reads things from S3.

The S3 engine uses it's own page cache, modified to be able to handle reading blocks from S3 (of size `s3_block_size`). Internally the S3 page cache uses pages of [aria-block-size](#) for splitting the blocks read from S3.

ALTER TABLE

[ALTER TABLE](#) will first create a local table in the normal Aria on disk format and then move both index and data to S3 in buckets of `S3_BLOCK_SIZE`. The `.frm` file is also copied to S3 for discovery to support discovery for other MariaDB servers. One can also use [ALTER TABLE](#) to change the structure of an S3 table.

Partitioning Tables

Starting from [MariaDB 10.5.3](#), S3 tables can also be used with [Partitioning tables](#). All [ALTER PARTITION](#) operations are supported except:

- [REBUILD PARTITION](#)
- [TRUNCATE PARTITION](#)
- [REORGANIZE PARTITION](#)

Big Reads

One of the properties of many S3 implementations is that they favor large reads. It's said that 4M gives the best performance, which is why the default value for `S3_BLOCK_SIZE` is 4M.

Compression

If [compression](#) (`COMPRESSION_ALGORITHM=zlib`) is used, then all index blocks and data blocks are compressed. The `.frm` file and Aria definition header (first page/pages in the index file) are not compressed as these are used by discovery/open.

If [compression](#) is used, then the local block size is `S3_BLOCK_SIZE`, but the block stored in S3 will be the size of the compressed block.

Typical compression we have seen is in the range of 80% saved space.

Structure Stored on S3

The table will be copied in S3 into the following locations:

```
frm file (for discovery):
s3_bucket/database/table/frm

First index block (contains description of the Aria file):
s3_bucket/database/table/aria

Rest of the index file:
s3_bucket/database/table/index/block_number

Data file:
s3_bucket/database/table/data/block_number
```

`block_number` is a 6-digit decimal number, prefixed with 0 (Can be larger than 6 numbers, the prefix is just for nice output)

Using the `awsctl` Python Tool to Examine Data

Installing `awsctl` on Linux

```
# install python-pip (on an OpenSuse distribution)
# use the appropriate command for your distribution
zypper install python-pip
pip install --upgrade pip

# the following installs awscli tools in ~/.local/bin
pip install --upgrade --user awscli
export PATH=~/.local/bin:$PATH

# configure your aws credentials
aws configure
```

Using the `awsctl` Tool

One can use the `aws python` tool to see how things are stored on S3:

```
shell> aws s3 ls --recursive s3://mariadb-bucket/
2019-05-10 17:46:48      8192 foo/test1/aria
2019-05-10 17:46:49  3227648 foo/test1/data/000001
2019-05-10 17:46:48      942 foo/test1/frm
2019-05-10 17:46:48  1015808 foo/test1/index/000001
```

To delete an obsolete table `foo.test1` one can do:

```
shell> ~/.local/bin/aws s3 rm --recursive s3://mariadb-bucket/foo/test1
delete: s3://mariadb-bucket/foo/test1/aria
delete: s3://mariadb-bucket/foo/test1/data/000001
delete: s3://mariadb-bucket/foo/test1/frm
delete: s3://mariadb-bucket/foo/test1/index/000001
```

5.3.16.4 `aria_s3_copy`

MariaDB starting with [10.5](#)
The [S3 storage engine](#) has been available since [MariaDB 10.5.4](#).

`aria_s3_copy` is a tool for copying an [Aria](#) table to and from [S3](#).

The Aria table must be non transactional and have `ROW_FORMAT=PAGE`.

For `aria_s3_copy` to work reliably, the table should not be changed by the MariaDB server during the copy, and one should have first performed [FLUSH TABLES](#) to ensure that the table is properly closed.

Example of properly created Aria table:

```
create table test1 (a int) transactional=0 row_format=PAGE engine=aria;
```

Note that `ALTER TABLE table_name ENGINE=S3` will work for any kind of table. This internally converts the table to an Aria table and then moves it to S3 storage.

Main Arguments

Option	Description
-?, --help	Display this help and exit.
-k, --s3-access-key=name	AWS access key ID
-r, --s3-region=name	AWS region
-K, --s3-secret-key=name	AWS secret access key ID
-b, --s3-bucket=name	AWS prefix for tables
-h, --s3-host-name=name	Host name to S3 provider
-c, --compress	Use compression
-o, --op=name	Operation to execute. One of 'from_s3', 'to_s3' or 'delete_from_s3'
-d, --database=name	Database for copied table (second prefix). If not given, the directory of the table file is used
-B, --s3-block-size=#	Block size for data/index blocks in s3
-L, --s3-protocol-version=name	Protocol used to communication with S3. One of "Amazon" or "Original".
-f, --force	Force copy even if target exists
-v, --verbose	Write more information
-V, --version	Print version and exit.
#, --debug[=name]	Output debug log. Often this is 'd:t:o,filename'.
--s3-debug	Output debug log from marias3 to stdout

Typical Configuration in a my.cnf File

```
[aria_s3_copy]
s3-bucket=mariadb
s3-access-key=xxxx
s3-secret-key=xxx
s3-region=eu-north-1
#s3-host-name=s3.amazonaws.com
#s3-protocol-version=Amazon
verbose=1
op=to
```

Example Usage

The following code will copy an existing Aria table named `test1` to S3. If the `--database` option is not given, then the directory name where the table files exist will be used as the database.

```
shell> aria_s3_copy --force --op=to --database=foo --compress --verbose --s3_block_size=4M test1
Delete of aria table: foo.test1
Delete of index information foo/test1/index
Delete of data information foo/test1/data
Delete of base information and frm
Copying frm file test1.frm
Copying aria table: foo.test1 to s3
Creating aria table information foo/test1/aria
Copying index information foo/test1/index
.
Copying data information foo/test1/data
.
```

When using `--verbose`, `aria_s3_copy` will write a dot for each #/79 part of the file copied.

5.3.16.5 S3 Storage Engine Status Variables

MariaDB starting with [10.5](#)

The [S3 storage engine](#) has been available since [MariaDB 10.5.4](#).

Contents

1. [S3_pagecache_blocks_not_flushed](#)
2. [S3_pagecache_blocks_unused](#)
3. [S3_pagecache_blocks_used](#)
4. [S3_pagecache_reads](#)

This page documents status variables related to the [S3 storage engine](#). See [Server Status Variables](#) for a complete list of status variables that can be viewed with `SHOW STATUS`.

See also the [Full list of MariaDB options, system and status variables](#).

 19. [s3_use_http](#)

This page documents system variables related to the [S3 storage engine](#).

See [Server System Variables](#) for a complete list of system variables and instructions on setting system variables.

Also see the [Full list of MariaDB options, system and status variables](#)

Variables

`s3_access_key`

- **Description:** The AWS access key to access your data. See [mariadb startup options for S3](#).
- **Commandline:** `--s3-access-key=val`
- **Scope:** Global
- **Dynamic:** No
- **Data Type:** String
- **Default Value:** (Empty)
- **Introduced:** [MariaDB 10.5.4](#)

`s3_block_size`

- **Description:** The default block size for a table, if not specified in [CREATE TABLE](#). Set to 4M as default. See [mysqld startup options for S3](#).
- **Commandline:** `--s3-block-size=#`
- **Scope:** Global
- **Dynamic:** Yes
- **Data Type:** Numeric
- **Default Value:** 4194304
- **Range:** 4194304 to 16777216
- **Introduced:** [MariaDB 10.5.4](#)

`s3_bucket`

- **Description:** The AWS bucket where your data should be stored. All MariaDB table data is stored in this bucket. See [mysqld startup options for S3](#).
- **Commandline:** `--s3-bucket=val`
- **Scope:** Global
- **Dynamic:** No
- **Data Type:** String
- **Default Value:** `MariaDB`
- **Introduced:** [MariaDB 10.5.4](#)

s3_debug

- **Description:** Generates a trace file from libmarias3 on stderr (mysqld.err) for debugging the S3 protocol.
 - **Commandline:** `--s3-debug=[0|1]`
 - **Scope:** Global
 - **Dynamic:**
 - Yes (`>=` [MariaDB 10.6.17](#), [MariaDB 10.11.7](#), [MariaDB 11.0.5](#), [MariaDB 11.1.4](#), [MariaDB 11.2.3](#), [MariaDB 11.3.2](#), [MariaDB 11.4.1](#))
 - No (`<=` [MariaDB 10.6.16](#), [MariaDB 10.11.6](#), [MariaDB 11.0.4](#), [MariaDB 11.1.3](#), [MariaDB 11.2.2](#), [MariaDB 11.3.1](#))
 - **Data Type:** Boolean
 - **Valid Values:** 0 or 1
 - **Default Value:** 0
 - **Introduced:** [MariaDB 10.5.4](#)
-

s3_host_name

- **Description:** Hostname for the S3 service. "s3.amazonaws.com", Amazon S3 service, by default
 - **Commandline:** `--s3-host-name=val`
 - **Scope:** Global
 - **Dynamic:** No
 - **Data Type:** String
 - **Default Value:** `s3.amazonaws.com`
 - **Introduced:** [MariaDB 10.5.4](#)
-

s3_no_content_type

- **Description:** If true (false is default), disables the Content-Type header, required for some providers.
 - **Commandline:** `--s3-no-content-type=[0|1]`
 - **Scope:** Global
 - **Dynamic:** No
 - **Data Type:** Boolean
 - **Default Value:** 0
 - **Introduced:** [MariaDB 11.6.2](#)
-

s3_pagecache_age_threshold

- **Description:** This characterizes the number of hits a hot block has to be untouched until it is considered aged enough to be downgraded to a warm block. This specifies the percentage ratio of that number of hits to the total number of blocks in the page cache.
 - **Commandline:** `--s3-pagecache-age-threshold=val`
 - **Scope:** Global
 - **Dynamic:** Yes
 - **Data Type:** Numeric
 - **Default Value:** 300
 - **Range:** 100 to 18446744073709551615
 - **Introduced:** [MariaDB 10.5.4](#)
-

s3_pagecache_buffer_size

- **Description:** The size of the buffer used for index blocks for S3 tables. Increase this to get better index handling (for all reads and multiple writes) to as much as you can afford. Size can be adjusted in blocks of 8192.
 - **Commandline:** `--s3-pagecache-buffer-size=val`
 - **Scope:** Global
 - **Dynamic:** No
 - **Data Type:** Numeric
 - **Default Value:** 134217728 (128M)
 - **Range:** 33554432 to 18446744073709551615
 - **Introduced:** [MariaDB 10.5.4](#)
-

s3_pagecache_division_limit

- **Description:** The minimum percentage of warm blocks in key cache.
 - **Commandline:** `--s3-pagecache-division-limit=val`
 - **Scope:** Global
 - **Dynamic:** Yes
 - **Data Type:** Numeric
 - **Default Value:** 100
 - **Range:** 1 to 100
 - **Introduced:** [MariaDB 10.5.4](#)
-

s3_pagecache_file_hash_size

- **Description:** Number of hash buckets for open files. Default 512. If you have a lot of S3 files open you should increase this for faster flush of changes. A good value is probably 1/10 of number of possible open S3 files.
 - **Commandline:** `--s3-pagecache-file-hash-size=#`
 - **Scope:** Global
 - **Dynamic:** No
 - **Data Type:** Numeric
 - **Default Value:** 512
 - **Range:** 32 to 16384
 - **Introduced:** [MariaDB 10.5.4](#)
-

s3_port

- **Description:** The TCP port number on the S3 host to connect to. A values of 0 means determine automatically.
 - **Commandline:** `--s3-port=#`
 - **Scope:** Global
 - **Dynamic:** No
 - **Data Type:** Numeric
 - **Default Value:** 0
 - **Range:** 0 to 65535
 - **Introduced:** [MariaDB 10.5.7](#)
-

s3_protocol_version

- **Description:** Protocol used to communication with S3. "Auto" is the default. If you get errors like "8 Access Denied" when you are connecting to another service provider, then try to change this option. The reason for this variable is that Amazon has changed some parts of the S3 protocol since they originally introduced it but other service providers are still using the original protocol. Can also be set numerically.
 - Auto (0):
 - Original or (1): Same as "Auto". Deprecated from [MariaDB 10.6.17](#), [MariaDB 10.11.7](#), [MariaDB 11.0.5](#), [MariaDB 11.1.4](#), [MariaDB 11.2.3](#), [MariaDB 11.3.2](#), [MariaDB 11.4.1](#).
 - Amazon (2) Same as "Auto". Deprecated from [MariaDB 10.6.17](#), [MariaDB 10.11.7](#), [MariaDB 11.0.5](#), [MariaDB 11.1.4](#), [MariaDB 11.2.3](#), [MariaDB 11.3.2](#), [MariaDB 11.4.1](#).
 - Legacy (3): v1 protocol. From [MariaDB 10.6.17](#), [MariaDB 10.11.7](#), [MariaDB 11.0.5](#), [MariaDB 11.1.4](#), [MariaDB 11.2.3](#), [MariaDB 11.3.2](#), [MariaDB 11.4.1](#)
 - Path (4): From [MariaDB 10.6.17](#), [MariaDB 10.11.7](#), [MariaDB 11.0.5](#), [MariaDB 11.1.4](#), [MariaDB 11.2.3](#), [MariaDB 11.3.2](#), [MariaDB 11.4.1](#)
 - Domain (5): From [MariaDB 10.6.17](#), [MariaDB 10.11.7](#), [MariaDB 11.0.5](#), [MariaDB 11.1.4](#), [MariaDB 11.2.3](#), [MariaDB 11.3.2](#), [MariaDB 11.4.1](#)
 - **Commandline:** `--s3-protocol-version=val`
 - **Scope:** Global
 - **Dynamic:** Yes
 - **Data Type:** Enum
 - **Valid Values:**
 - Auto (0), Original (1), Amazon (2), Legacy (3), Path (4), Domain (5) (\geq [MariaDB 10.6.17](#), [MariaDB 10.11.7](#), [MariaDB 11.0.5](#), [MariaDB 11.1.4](#), [MariaDB 11.2.3](#), [MariaDB 11.3.2](#), [MariaDB 11.4.1](#))
 - Auto, Original, Amazon (\leq [MariaDB 10.6.16](#), [MariaDB 10.11.6](#), [MariaDB 11.0.4](#), [MariaDB 11.1.3](#), [MariaDB 11.2.2](#), [MariaDB 11.3.1](#))
 - **Default Value:** Auto
 - **Introduced:** [MariaDB 10.5.4](#)
-

s3_provider

- **Description:** Enable S3 provider specific compatibility tweaks. "Default", "Amazon", or "Huawei".
 - **Default :**
 - **Amazon :** Effectively sets `s3_protocol_version` to 5 (Domain), overriding any other setting it may have.
 - **Huawei :** Effectively sets `s3_no_content_type` to 1, overriding any other setting it may have.
 - **Commandline:** `--s3-provider=val`
 - **Scope:** Global
 - **Dynamic:** Yes
 - **Data Type:** enum
 - **Valid Values:** `Default` , `Amazon` , `Huawei`
 - **Default Value:** `Default`
 - **Introduced:** [MariaDB 10.6.20](#), [MariaDB 10.11.10](#), [MariaDB 11.2.6](#) [↗](#), [MariaDB 11.4.4](#), [MariaDB 11.6.2](#) [↗](#)
-

s3_region

- **Description:** The AWS region where your data should be stored. See [mysql startup options for S3](#).
 - **Commandline:** `--s3-region=val`
 - **Scope:** Global
 - **Dynamic:** No
 - **Data Type:** String
 - **Default Value:** (Empty)
 - **Introduced:** [MariaDB 10.5.4](#)
-

s3_replicate_alter_as_create_select

- **Description:** When converting S3 table to local table, log all rows in binary log. This allows the slave to replicate `CREATE TABLE .. SELECT FROM s3_table` even if the slave doesn't have access to the original `s3_table`.
 - **Commandline:** `--s3-replicate-alter-as-create-select=[0|1]`
 - **Scope:** Global
 - **Dynamic:** No
 - **Data Type:** Boolean
 - **Default Value:** 1

5.3.17 Sequence Storage Engine

Contents

1. [Installing](#)
2. [Usage and Examples](#)
3. [Table Name Conflicts](#)

This article is about the Sequence storage engine. For details about sequence objects, see [Sequences](#).

A **Sequence** engine allows the creation of ascending or descending sequences of numbers (positive integers) with a given starting value, ending value and increment.

It creates completely virtual, ephemeral tables automatically when you need them. There is no way to create a Sequence table explicitly. Nor are they ever written to disk or create `.frm` files. They are read-only, [transactional](#), and [support XA](#).

Installing

The Sequence engine is installed by default, and [SHOW ENGINES](#) will list the Sequence storage engine as supported:

```
SHOW ENGINES\G
...
***** 5. row *****
      Engine: MyISAM
      Support: YES
      Comment: MyISAM storage engine
Transactions: NO
              XA: NO
Savepoints: NO
***** 6. row *****
      Engine: SEQUENCE
      Support: YES
      Comment: Generated tables filled with sequential values
Transactions: YES
              XA: YES
Savepoints: YES
***** 7. row *****
      Engine: MRG_MyISAM
      Support: YES
      Comment: Collection of identical MyISAM tables
Transactions: NO
              XA: NO
Savepoints: NO
...
```

Usage and Examples

To use a Sequence table, you simply select from it, as in

```
SELECT * FROM seq_1_to_5;
+-----+
| seq |
+-----+
| 1 |
| 2 |
| 3 |
| 4 |
| 5 |
+-----+
```

To use a sequence in a statement, you select from the table named by a pattern `seq_ FROM _to_ TO` or `seq_ FROM _to_ TO _step_ STEP`.

In the case of an odd step, the sequence will commence with the `FROM`, and end at the final result before `TO`.

```
SELECT * FROM seq_1_to_15_step_3;
+-----+
| seq |
+-----+
| 1 |
| 4 |
| 7 |
| 10 |
| 13 |
+-----+
```

A sequence can go backwards too. In this case the final value will always be the `TO` value, so that a descending sequence has the same values as an ascending sequence:

```
SELECT * FROM seq_5_to_1_step_2;
+-----+
| seq |
+-----+
| 5 |
| 3 |
| 1 |
+-----+
```

```
SELECT * FROM seq_15_to_1_step_3;
+-----+
| seq |
+-----+
| 13 |
| 10 |
| 7 |
| 4 |
| 1 |
+-----+
```

```
SELECT * FROM seq_15_to_2_step_3;
+-----+
| seq |
+-----+
| 14 |
| 11 |
| 8 |
| 5 |
| 2 |
+-----+
```

This engine is particularly useful with joins and subqueries. For example, this query finds all prime numbers below 50:

```

SELECT seq FROM seq_2_to_50 s1 WHERE 0 NOT IN
      (SELECT s1.seq % s2.seq FROM seq_2_to_50 s2 WHERE s2.seq <= sqrt(s1.seq));
+-----+
| seq |
+-----+
|  2 |
|  3 |
|  5 |
|  7 |
| 11 |
| 13 |
| 17 |
| 19 |
| 23 |
| 29 |
| 31 |
| 37 |
| 41 |
| 43 |
| 47 |
+-----+

```

And almost (without 2, the only even prime number) the same result with joins:

```

SELECT s1.seq FROM seq_2_to_50 s1 JOIN seq_2_to_50 s2
      WHERE s1.seq > s2.seq AND s1.seq % s2.seq <> 0
      GROUP BY s1.seq HAVING s1.seq - COUNT(*) = 2;
+-----+
| seq |
+-----+
|  3 |
|  5 |
|  7 |
| 11 |
| 13 |
| 17 |
| 19 |
| 23 |
| 29 |
| 31 |
| 37 |
| 41 |
| 43 |
| 47 |
+-----+

```

Sequence tables can also be useful in date calculations. For example, to find the day of the week that a particular date has fallen on over a 40 year period (perhaps for birthday planning ahead!):

```

SELECT DAYNAME('1980-12-05' + INTERVAL (seq) YEAR) day,
      '1980-12-05' + INTERVAL (seq) YEAR date FROM seq_0_to_40;
+-----+-----+
| day      | date      |
+-----+-----+
| Friday   | 1980-12-05 |
| Saturday | 1981-12-05 |
| Sunday   | 1982-12-05 |
| ...     |
| Friday   | 2014-12-05 |
| Saturday | 2015-12-05 |
| Monday   | 2016-12-05 |
| Tuesday  | 2017-12-05 |
| Wednesday | 2018-12-05 |
| Thursday | 2019-12-05 |
| Saturday | 2020-12-05 |
+-----+-----+

```

Although Sequence tables can only directly make use of positive integers, they can indirectly be used to return negative results by making use of the [CAST](#) statement. For example:

```

SELECT CAST(seq AS INT) - 5 x FROM seq_5_to_1;
+-----+
| x |
+-----+
| 0 |
| -1 |
| -2 |
| -3 |
| -4 |
+-----+

```

`CAST` is required to avoid a `BIGINT UNSIGNED value is out of range error`.

Sequence tables, while virtual, are still tables, so they must be in a database. This means that a default database must be selected (for example, via the `USE` command) to be able to query a Sequence table. The `information_schema` database cannot be used as the default for a Sequence table.

Table Name Conflicts

If the `SEQUENCE` storage engine is installed, it is not possible to create a table with a name which follows the `SEQUENCE` pattern:

```

CREATE TABLE seq_1_to_100 (col INT) ENGINE = InnoDB;
ERROR 1050 (42S01): Table 'seq_1_to_100' already exists

```

However, a `SEQUENCE` table can be converted to another engine and the new table can be referred in any statement:

```

ALTER TABLE seq_1_to_100 ENGINE = BLACKHOLE;

SELECT * FROM seq_1_to_100;
Empty set (0.00 sec)

```

While a `SEQUENCE` table cannot be dropped, it is possible to drop the converted table. The `SEQUENCE` table with the same name will still exist:

```

DROP TABLE seq_1_to_100;

SELECT COUNT(*) FROM seq_1_to_100;
+-----+
| COUNT(*) |
+-----+
|      100 |
+-----+
1 row in set (0.00 sec)

```

A temporary table with a `SEQUENCE`-like name can always be created and used:

```

CREATE TEMPORARY TABLE seq_1_to_100 (col INT) ENGINE = InnoDB;

SELECT * FROM seq_1_to_100;
Empty set (0.00 sec)

```

5.3.18 SphinxSE

SphinxSE is a storage engine that talks to `searchd` (Sphinx daemon) to enable text searching.

5.3.18.1 About SphinxSE

Contents

1. [Versions of SphinxSE in MariaDB](#)
2. [Enabling SphinxSE in MariaDB](#)
3. [Using SphinxSE](#)
 1. [Basic Usage](#)
 2. [Search Options](#)
 3. [SHOW ENGINE SPHINX STATUS](#)
 4. [JOINs with SphinxSE](#)
4. [Building snippets \(excerpts\) via MariaDB](#)
5. [More Information](#)

The Sphinx storage engine (SphinxSE) is a storage engine that talks to searchd (the Sphinx daemon) to enable text searching. Sphinx and SphinxSE is used as a faster and more customizable alternative to MariaDB's [built-in full-text search](#).

Sphinx does not depend on MariaDB, and can run independently, but SphinxSE provides a convenient interface to the underlying Sphinx daemon.

Versions of SphinxSE in MariaDB

SphinxSE Version	Introduced	Maturity
SphinxSE 2.2.6	MariaDB 10.0.15	Stable
SphinxSE 2.1.9	MariaDB 10.0.14	Stable
SphinxSE 2.0.4	MariaDB 5.5	
SphinxSE 0.99	MariaDB 5.2 and MariaDB 5.3	

Enabling SphinxSE in MariaDB

The Sphinx storage engine is included in the source, binaries, and packages of MariaDB. SphinxSE is built as a dynamically loadable .so plugin. To use it, you need to perform a one-time install:

```
INSTALL SONAME 'ha_sphinx';
```

MariaDB until 10.0

In Debian/Ubuntu packages SphinxSE is statically compiled into the MariaDB server, there is no need to use the

`INSTALL SONAME` statement.

Once installed, SphinxSE will show up in the list of installed storage engines:

```
SHOW ENGINES;
+-----+-----+-----+-----+-----+-----+
| Engine      | Support | Comment                                     | Transactions | XA      | Savepoints |
+-----+-----+-----+-----+-----+-----+
...
| SPHINX      | YES     | Sphinx storage engine 0.9.9               | NO           | NO      | NO         |
|
...
+-----+-----+-----+-----+-----+-----+
-----+
```

This is a one-time step and will not need to be performed again.

Note: SphinxSE is just the storage engine part of Sphinx. You will have to [install Sphinx](#) itself in order to make use of SphinxSE in MariaDB.

Despite the name, SphinxSE does not actually store any data itself. It is actually a built-in client which allows MariaDB to talk to Sphinx, run search queries, and obtain search results. All indexing and searching happen outside MariaDB.

Some SphinxSE applications include:

- easier porting of MariaDB/MySQL FTS applications to Sphinx
- allowing Sphinx use with programming languages for which native APIs are not available yet
- optimizations when additional Sphinx result set processing on the MariaDB side is required (eg. JOINS with original document tables, additional MariaDB-side filtering, and etc...)

Using SphinxSE

Basic Usage

To search via SphinxSE, you would need to create a special `ENGINE=SPHINX` "search table", and then `SELECT` from it with full text query put into the `WHERE` clause for query column.

Here is an example create statement and search query:

```
CREATE TABLE t1
(
  id          BIGINT UNSIGNED NOT NULL,
  weight     INTEGER NOT NULL,
  query      VARCHAR(3072) NOT NULL,
  group_id   INTEGER,
  INDEX(query)
) ENGINE=SPHINX CONNECTION="sphinx://127.0.0.1:9312/test1";

SELECT * FROM t1 WHERE query='test it;mode=any';
```

The first three columns of the search table must have a type of `BIGINT` for the 1st column (document id), `INTEGER` or `BIGINT` for the 2nd column (match weight), and `VARCHAR` or `TEXT` for the 3rd column (your query), respectively. This mapping is fixed; you cannot omit any of these three required columns, or move them around, or change types. Also, the query column must be indexed; all the others must be kept unindexed. Column names are ignored so you can use arbitrary ones.

Additional columns must be either `INTEGER`, `TIMESTAMP`, `BIGINT`, `VARCHAR`, or `FLOAT`. They will be bound to the attributes provided in the Sphinx result set by name, so their names must match the attribute names specified in `sphinx.conf`. If there's no such attribute name in the Sphinx search results, the additional columns will have `NULL` values.

Special "virtual" attribute names can also be bound to SphinxSE columns. `_sph_` needs to be used instead of `@` for that. For instance, to obtain the values of '@groupby', '@count', or '@distinct' virtual attributes, use '`_sph_groupby`', '`_sph_count`' or '`_sph_distinct`' column names, respectively.

The `CONNECTION` string parameter is used to specify the default `searchd` host, port, and indexes for queries issued using this table. If no connection string is specified in `CREATE`

`TABLE`, index name `*` (ie. search all indexes) and `'127.0.0.1:9312'` are assumed. The connection string syntax is as

follows:

```
CONNECTION="sphinx://HOST:PORT/INDEXNAME"
```

You can change the default connection string later like so:

```
ALTER TABLE t1 CONNECTION="sphinx://NEWHOST:NEWPORT/NEWINDEXNAME";
```

You can also override all these parameters per-query.

Note: To use Linux sockets you can modify the searchd section of the Sphinx configuration file, setting the listen parameter to a socket file. Instruct SphinxSE about the socket using `CONNECTION="unix:unix/domain/socket[:index]"`.

Search Options

As seen in the example above, both query text and search options should be put into the ' WHERE ' clause of the search query column (i.e. the 3rd column); the options are separated by semicolons (' ; ') and separate names from values using an equals sign (' = '). Any number of options can be specified. Available options are:

- query - query text;
- mode - matching mode. Must be one of "all", "any", "phrase", "boolean", or "extended". Default is "all";
- sort - match sorting mode. Must be one of "relevance", "attr_desc", "attr_asc", "time_segments", or "extended". In all modes besides "relevance" attribute name (or sorting clause for "extended") is also required after a colon:

```
... WHERE query='test;sort=attr_asc:group_id';  
... WHERE query='test;sort=extended:@weight desc, group_id asc';
```

- offset - offset into result set, default is 0;
- limit - amount of matches to retrieve from result set, default is 20;
- index - names of the indexes to search:

```
... WHERE query='test;index=test1;';  
... WHERE query='test;index=test1,test2,test3;';
```

- minid, maxid - min and max document ID to match;
- weights - comma-separated list of weights to be assigned to Sphinx full-text fields:

```
... WHERE query='test;weights=1,2,3;';
```

- filter, !filter - comma-separated attribute name and a set of values to match:

```
# only include groups 1, 5 and 19  
... WHERE query='test;filter=group_id,1,5,19;';  
  
# exclude groups 3 and 11  
... WHERE query='test;!filter=group_id,3,11;';
```

- range, !range - comma-separated attribute name, min and max value to match:

```
# include groups from 3 to 7, inclusive  
... WHERE query='test;range=group_id,3,7;';  
  
# exclude groups from 5 to 25  
... WHERE query='test;!range=group_id,5,25;';
```

- maxmatches - per-query max matches value:

```
... WHERE query='test;maxmatches=2000;';
```

- groupby - group-by function and attribute:

```
... WHERE query='test;groupby=day:published_ts;';  
... WHERE query='test;groupby=attr:group_id;';
```

- `groupsort` - group-by sorting clause:

```
... WHERE query='test;groupsort=@count desc;';
```

- `indexweights` - comma-separated list of index names and weights to use when searching through several indexes:

```
... WHERE query='test;indexweights=idx_exact,2,idx_stemmed,1;';
```

- `comment` - a string to mark this query in query log (mapping to `$comment` parameter in `Query()` API call):

```
... WHERE query='test;comment=marker001;';
```

- `select` - a string with expressions to compute (mapping to `SetSelect()` API call):

```
... WHERE query='test;select=2*a+3*b as myexpr;';
```

Note: It is much more efficient to allow Sphinx to perform sorting, filtering, and slicing of the result set than to raise `max matches count` and use `'WHERE'`, `'ORDER BY'`, and `'LIMIT'` clauses on the MariaDB side. This is for two reasons:

1. Sphinx does a number of optimizations and performs better than MariaDB/MySQL on these tasks.
2. Less data would need to be packed by `searchd`, and transferred and unpacked by SphinxSE.

SHOW ENGINE SPHINX STATUS

Starting with version 0.9.9-rc1, additional query info besides the result set can be retrieved with the `'SHOW ENGINE SPHINX STATUS'` statement:

```
SHOW ENGINE SPHINX STATUS;
+-----+-----+-----+
| Type  | Name  | Status                                     |
+-----+-----+-----+
| SPHINX | stats | total: 25, total found: 25, time: 126, words: 2 |
| SPHINX | words | sphinx:591:1256 soft:11076:15945          |
+-----+-----+-----+
```

This information can also be accessed through status variables. Note that this method does not require super-user privileges.

```
SHOW STATUS LIKE 'sphinx_%';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| sphinx_total  | 25    |
| sphinx_total_found | 25    |
| sphinx_time   | 126   |
| sphinx_word_count | 2     |
| sphinx_words  | sphinx:591:1256 soft:11076:15945 |
+-----+-----+
```

JOINS with SphinxSE

You can perform `JOIN`s on a SphinxSE search table and tables using other engines. Here's an example with "documents" from `example.sql`:

```

SELECT content, date_added FROM test.documents docs
  JOIN t1 ON (docs.id=t1.id)
  WHERE query="one document;mode=any";
+-----+-----+
| content                                | docdate                |
+-----+-----+
| this is my test document number two | 2006-06-17 14:04:28 |
| this is my test document number one | 2006-06-17 14:04:28 |
+-----+-----+

SHOW ENGINE SPHINX STATUS;
+-----+-----+-----+
| Type | Name | Status |
+-----+-----+-----+
| SPHINX | stats | total: 2, total found: 2, time: 0, words: 2 |
| SPHINX | words | one:1:2 document:2:2 |
+-----+-----+-----+

```

Building snippets (excerpts) via MariaDB

Starting with version 0.9.9-rc2, SphinxSE also includes a UDF function that lets you create snippets through MariaDB. The functionality is fully similar to the [BuildExcerpts](#) API call but is accessible through MariaDB+SphinxSE.

MariaDB until 5.5

The binary that provides the UDF is named sphinx.so and is automatically built and installed to the proper location along with SphinxSE itself. Register the UDF using the following statement:

```
CREATE FUNCTION sphinx_snippets RETURNS STRING SONAME 'sphinx.so';
```

MariaDB until 10.0

The UDF is packed together with the storage engine, in the same binary named ha_sphinx.so. Register the UDF using the following statement:

```
CREATE FUNCTION sphinx_snippets RETURNS STRING SONAME 'ha_sphinx.so';
```

The function name must be 'sphinx_snippets', you can not use an arbitrary name. Function arguments are as follows:

```
Prototype: function sphinx_snippets ( document, index, words, [options] );
```

Document and words arguments can be either strings or table columns. Options must be specified like this: `<code>'value' AS option_name</code>`. For a list of supported options, refer to the [BuildExcerpts\(\)](#) API call. The only UDF-specific additional option is named 'sphinx' and lets you specify searchd location (host and port).

Usage examples:

```

SELECT sphinx_snippets('hello world doc', 'main', 'world',
  'sphinx://192.168.1.1/' AS sphinx, true AS exact_phrase,
  '[b]' AS before_match, '[/b]' AS after_match)
FROM documents;

SELECT title, sphinx_snippets(text, 'index', 'mysql php') AS text
FROM sphinx, documents
WHERE query='mysql php' AND sphinx.id=documents.id;

```

More Information

More information on Sphinx and SphinxSE is available on the [Sphinx website](#).

5.3.18.2 Installing Sphinx

In order to use the [Sphinx Storage Engine](#), it is necessary to install the Sphinx daemon.

Many Linux distributions have Sphinx in their repositories. These can be used to install Sphinx instead of following the

instructions below, but these are usually quite old versions and don't all include API's for easy integration. Ubuntu users can use the updated repository at <https://launchpad.net/~builds/+archive/sphinxsearch-rel21> (see instructions below). Alternatively, download from <http://sphinxsearch.com/downloads/release/>

Debian and Ubuntu

Ubuntu users can make use of the repository, as follows:

```
sudo add-apt-repository ppa:builds/sphinxsearch-rel21
sudo apt-get update
sudo apt-get install sphinxsearch
```

Alternatively, install as follows:

- The Sphinx package and daemon are named `sphinxsearch`.
- `sudo apt-get install unixodbc libpq5 mariadb-client`
- `sudo dpkg -i sphinxsearch*.deb`
- [Configure Sphinx](#) as required
- You may need to check `/etc/default/sphinxsearch` to see that `START=yes`
- Start with `sudo service sphinxsearch start` (and stop with `sudo service sphinxsearch stop`)

Red Hat and CentOS

- The package name is `sphinx` and the daemon `searchd`.
- `sudo yum install postgresql-libs unixODBC`
- `sudo rpm -Uvh sphinx*.rpm`
- [Configure Sphinx](#) as required
- `service searchd start`

Windows

- Unzip and extract the downloaded zip file
- Move the extracted directory to `C:\Sphinx`
- [Configure Sphinx](#) as required
- Install as a service:
 - `C:\Sphinx\bin> C:\Sphinx\bin\searchd --install --config C:\Sphinx\sphinx.conf.in --servicename SphinxSearch`

Once Sphinx has been installed, it will need to be [configured](#).

Full instructions, including details on compiling Sphinx yourself, are available at <http://sphinxsearch.com/docs/current.html>

5.3.18.3 Configuring Sphinx

Before you can get Sphinx working with the Sphinx Storage Engine on MariaDB, you need to configure it.

- The default configuration file is called `sphinx.conf`, usually located in `/etc/sphinxsearch` (Debian/Ubuntu), `/etc/sphinx/sphinx.conf`. (Red Hat/CentOS) or `C:\Sphinx\sphinx.conf` (Windows).

If it doesn't already exist, you can use the sample configuration file, `sphinx.conf.dist`. There is also sample data supplied that we can use for testing. Load the sample data (which creates two tables, `documents` and `tags` in the `test` database), for example:

```
mysql -u test < /usr/local/sphinx/etc/example.sql (Red Hat, CentOS)
mysql -u test < /usr/share/doc/sphinxsearch/example-conf/example.sql (Debian/Ubuntu)
```

The sample configuration file documents the available options. You will need to make at least a few changes. A MariaDB user with permission to access the database must be created. For example:

```
CREATE USER 'sphinx'@localhost
  IDENTIFIED BY 'sphinx_password';
GRANT SELECT on test.* to 'sphinx'@localhost;
```

Add these details to the `mysql` section of the config file:

```
sql_host = localhost
sql_user = sphinx
sql_pass = sphinx_password
sql_db   = test
sql_port = 3306
```

On Windows, the `path` and `pid` lines will need to be changed to reflect a valid path, usually as follows:

```
path = C:\Sphinx\docsidx
...
pid_file = C:\Sphinx\sphinx.pid
```

The query in the configuration files is the query that will be used for building the index. In the sample data, this is:

```
sql_query = \
  SELECT id, group_id, UNIX_TIMESTAMP(date_added) AS date_added, title, content \
  FROM documents
```

5.3.18.4 Installing and Testing SphinxSE with MariaDB

To use [SphinxSE](#) with MariaDB you need to first [download and install Sphinx](#).

Complete Sphinx documentation is available on the [Sphinx website](#).

Tips for Installing Sphinx

libexpat

One library we know you will need on Linux before you can install Sphinx is `libexpat`. If it is not installed, you will get the warning `checking for libexpat... not found`. On Suse the package is called `libexpat-devel`, on Ubuntu the package is called `libexpat1-dev`.

MariaDB detection

If you run into problems with MariaDB not being detected, use the following options:

```
--with-mysql           compile with MySQL support (default is enabled)
--with-mysql-includes  path to MySQL header files
--with-mysql-libs      path to MySQL libraries
```

The above will tell the `configure` script where your MySQL/MariaDB installation is.

Testing Sphinx

After installing Sphinx, you can check that things are working in MariaDB by doing the following:

```
cd installation-dir/mysql-test
./mysql-test-run --suite=sphinx
```

If the above test doesn't pass, check the logs in the `'var'` directory. If there is a problem with the sphinx installation, the reason can probably be found in the log file at: `var/log/sphinx.sphinx/searchd/sphinx.log`.

3.3.7.25 Sphinx Status Variables

5.3.19 Spider

The Spider storage engine is a federated database solution that supports partitioning and [xa transactions](#), and allows tables

of different MariaDB instances to be handled as if they were on the same instance.

Versions of Spider in MariaDB

From [MariaDB 10.9.2](#), the Spider version number matches the server version.

Spider Version	Introduced	Maturity
Spider 3.3.15	MariaDB 10.5.7 , MariaDB 10.4.6	Stable
Spider 3.3.15	MariaDB 10.5.4	Gamma

About

The Spider storage engine is a [storage engine](#) with built-in sharding features. It supports partitioning and [xa transactions](#), and allows tables of different MariaDB instances to be handled as if they were on the same instance. It refers to one possible implementation of ISO/IEC 9075-9:2008 SQL/MED.

When a table is created with the Spider storage engine, the table links to the table on a remote server. The remote table can be of any storage engine. The table link is concretely achieved by the establishment of the connection from a local MariaDB server to a remote MariaDB server. The link is shared for all tables that are part of a the same transaction.

Spider Versions in MariaDB

Spider Version	Introduced	Maturity
Spider 3.3.15	MariaDB 10.5.7 , MariaDB 10.4.6	Stable
Spider 3.3.15	MariaDB 10.5.4	Gamma
Spider 3.3.14	MariaDB 10.4.3 , MariaDB 10.3.13	Stable
Spider 3.3.13	MariaDB 10.3.7	Stable
Spider 3.3.13	MariaDB 10.3.3	Gamma

Spider 3.2	MariaDB 10.0.11	Gamma
Spider 3.0	MariaDB 10.0.4	Beta

Some Server Variables to Set When Using Spider

MariaDB starting with [10.3.4](#)

If you are using Spider with [replication](#), you can expand the list of transaction errors to be retried by setting [slave_transaction_retry_errors](#) to the following to avoid network problems:

- 1158: Got an error reading communication packets
- 1159: Got timeout reading communication packets
- 1160: Got an error writing communication packets
- 1161: Got timeout writing communication packets
- 1429: Unable to connect to foreign data source
- 2013: Lost connection to MySQL server during query
- 12701: Remote MySQL server has gone away

Do this as follows in your my.cnf file:

```
slave_transaction_retry_errors="1158,1159,1160,1161,1429,2013,12701"
```

From [MariaDB 10.4.5](#), the above is included the default.

Usage

Basic Usage

To create a table in the Spider storage engine format, the COMMENT and/or CONNECTION clauses of the [CREATE TABLE](#) statement are used to pass connection information about the remote server.

For example, the following table exists on a remote server (in this example, the remote node was created with the [MySQL Sandbox](#) tool, an easy way to test with multiple installations):

```
node1 >CREATE TABLE s (
  id INT NOT NULL AUTO_INCREMENT,
  code VARCHAR(10),
  PRIMARY KEY(id));
```

On the local server, a Spider table can be created as follows:

```
CREATE TABLE s (
  id INT NOT NULL AUTO_INCREMENT,
  code VARCHAR(10),
  PRIMARY KEY(id)
)
ENGINE=SPIDER
COMMENT='host "127.0.0.1", user "msandbox", password "msandbox", port "8607";'
```

Records can now be inserted on the local server, and they will be stored on the remote server:

```
INSERT INTO s(code) VALUES ('a');

node1 > SELECT * FROM s;
+----+-----+
| id | code |
+----+-----+
| 1  | a    |
+----+-----+
```

MariaDB starting with [10.8.1](#)

Alternative to specifying the data node information in the COMMENT, certain information (server, database, table) can also be specified using Table Options, like so:

```
CREATE SERVER srv FOREIGN DATA WRAPPER mysql OPTIONS (
  HOST '127.0.0.1',
  USER 'msandbox',
  PASSWORD 'msandbox',
  PORT 8607);

CREATE TABLE s(
  id INT NOT NULL AUTO_INCREMENT,
  code VARCHAR(10),
  PRIMARY KEY(id)
)
ENGINE=SPIDER REMOTE_SERVER="srv" REMOTE_DATABASE="db" REMOTE_TABLE="s";
```

Further Examples

Preparing 10M record table using the [sysbench](#) utility

```
/usr/local/skysql/sysbench/bin/sysbench --test=oltp --db-driver=mysql --mysql-table-
engine=innodb --mysql-user=skysql --mysql-password=skyvodka --mysql-host=192.168.0.202 --mysql-
port=5054 --oltp-table-size=10000000 --mysql-db=test prepare
```

Make a first read only benchmark to check the initial single node performance.

```
/usr/local/skysql/sysbench/bin/sysbench --test=oltp --db-driver=mysql --mysql-table-
engine=innodb --mysql-user=skysql --mysql-password=skyvodka --mysql-host=192.168.0.202 --mysql-
port=5054 --mysql-db=test --oltp-table-size=10000000 --num-threads=4 --max-requests=100000 --
oltp-read-only=on run
```

sysbench 0.4.12: multi-threaded system evaluation benchmark

Running the test with following options:

Number of threads: 4

Doing OLTP test.

Running mixed OLTP test

Doing read-only test

Using Special distribution (12 iterations, 1 pct of values are returned in 75 pct cases)

Using "BEGIN" for starting transactions

Using auto_inc on the id column

Maximum number of requests for OLTP test is limited to 100000

Threads started!

Done.

OLTP test statistics:

queries performed:

read:	1400196
write:	0
other:	200028
total:	1600224
transactions:	100014 (1095.83 per sec.)
deadlocks:	0 (0.00 per sec.)
read/write requests:	1400196 (15341.58 per sec.)
other operations:	200028 (2191.65 per sec.)

Test execution summary:

total time:	91.2681s
total number of events:	100014
total time taken by event execution:	364.3693
per-request statistics:	
min:	1.85ms
avg:	3.64ms
max:	30.70ms
approx. 95 percentile:	4.66ms

Threads fairness:

events (avg/stddev):	25003.5000/84.78
execution time (avg/stddev):	91.0923/0.00

Define an easy way to access the nodes from the MariaDB or MySQL client.

```
alias backend1='/usr/local/skysql/mysql-client/bin/mysql --user=skysql --password=skyvodka --
host=192.168.0.202 --port=5054'
alias backend2='/usr/local/skysql/mysql-client/bin/mysql --user=skysql --password=skyvodka --
host=192.168.0.203 --port=5054'
alias spider1='/usr/local/skysql/mysql-client/bin/mysql --user=skysql --password=skyvodka --
host=192.168.0.201 --port=5054'
```

Create the empty tables to hold the data and repeat for all available backend nodes.

```

backend1 << EOF
CREATE DATABASE backend;
CREATE TABLE backend.sbtest (
  id int(10) unsigned NOT NULL AUTO_INCREMENT,
  k int(10) unsigned NOT NULL DEFAULT '0',
  c char(120) NOT NULL DEFAULT '',
  pad char(60) NOT NULL DEFAULT '',
  PRIMARY KEY (id),
  KEY k (k)
) ENGINE=InnoDB;
EOF

```

```

backend2 << EOF
CREATE DATABASE backend;
CREATE TABLE backend.sbtest (
  id int(10) unsigned NOT NULL AUTO_INCREMENT,
  k int(10) unsigned NOT NULL DEFAULT '0',
  c char(120) NOT NULL DEFAULT '',
  pad char(60) NOT NULL DEFAULT '',
  PRIMARY KEY (id),
  KEY k (k)
) ENGINE=InnoDB;
EOF

```

Federation Setup

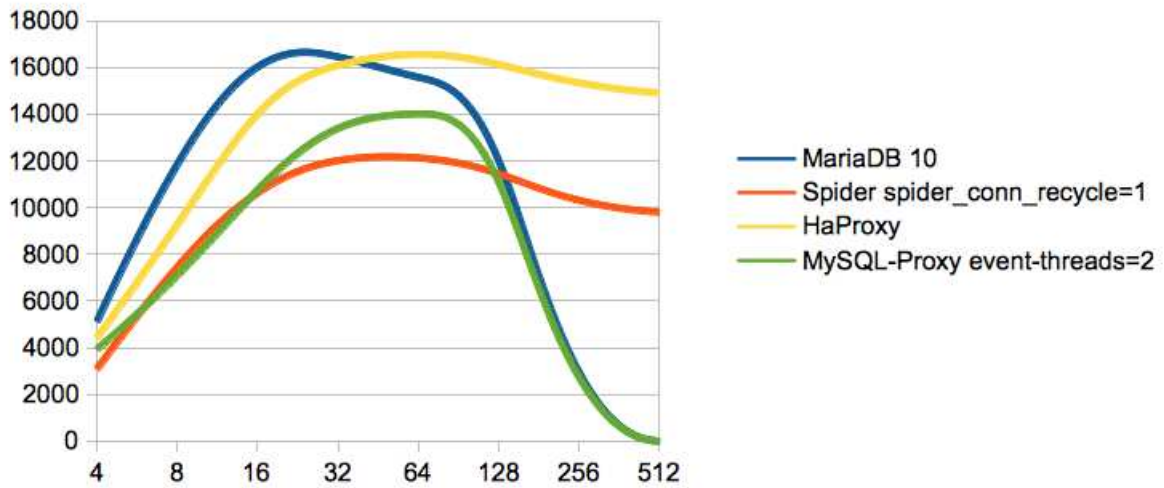

```

spider1 << EOF
CREATE SERVER backend
  FOREIGN DATA WRAPPER mysql
OPTIONS(
  HOST '192.168.0.202',
  DATABASE 'test',
  USER 'skysql',
  PASSWORD 'skyvodka',
  PORT 5054
);

CREATE TABLE test.sbtest
(
  id int(10) unsigned NOT NULL AUTO_INCREMENT,
  k int(10) unsigned NOT NULL DEFAULT '0',
  c char(120) NOT NULL DEFAULT '',
  pad char(60) NOT NULL DEFAULT '',
  PRIMARY KEY (id),
  KEY k (k)
) ENGINE=spider COMMENT='wrapper "mysql",srv "backend"';
SELECT * FROM test.sbtest LIMIT 10;
EOF

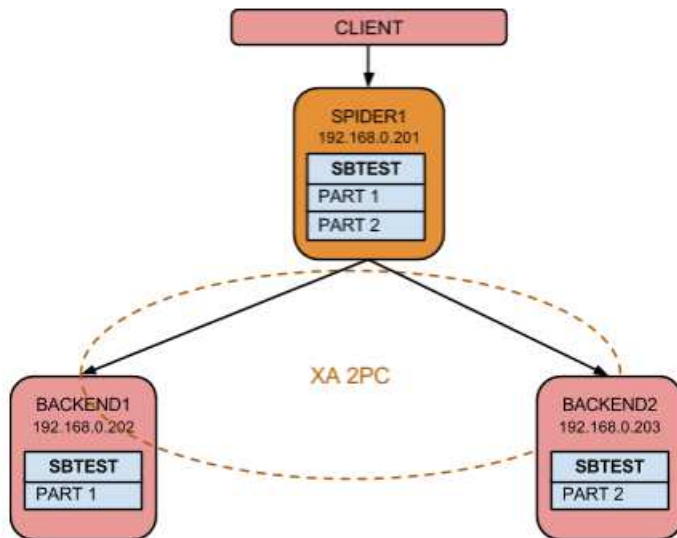

```

Qps/threads

Without connection pool or MariaDB thread pool, HaProxy and Spider have been protecting the tcp socket overflow without specific TCP tuning. In reality with a well tuned TCP stack or thread pool the curve should not decrease so abruptly to 0. Refer to the [MariaDB Thread Pool](#) to explore this feature.

Sharding Setup

Create the spider table on the Spider Node

```

#spider1 << EOF
CREATE SERVER backend1
  FOREIGN DATA WRAPPER mysql
OPTIONS(
  HOST '192.168.0.202',
  DATABASE 'backend',
  USER 'skysql',
  PASSWORD 'skyvodka',
  PORT 5054
);
CREATE SERVER backend2
  FOREIGN DATA WRAPPER mysql
OPTIONS(
  HOST '192.168.0.203',
  DATABASE 'backend',
  USER 'skysql',
  PASSWORD 'skyvodka',
  PORT 5054
);
CREATE DATABASE IF NOT EXISTS backend;
CREATE TABLE backend.sbtest
(
  id int(10) unsigned NOT NULL AUTO_INCREMENT,
  k int(10) unsigned NOT NULL DEFAULT '0',
  c char(120) NOT NULL DEFAULT '',
  pad char(60) NOT NULL DEFAULT '',
  PRIMARY KEY (id),
  KEY k (k)
) ENGINE=spider COMMENT='wrapper "mysql", table "sbtest"'
PARTITION BY KEY (id)
(
  PARTITION pt1 COMMENT = 'srv "backend1"',
  PARTITION pt2 COMMENT = 'srv "backend2"'
) ;
EOF

```

Copy the data from the original sysbench table to the spider table

```

#/usr/local/skysql/mariadb/bin/mysqldump --user=skysql --password=skyvodka --
host=192.168.0.202 --port=5054 --no-create-info test sbtest | spider1 backend

#backend2 -e"select count(*) from backend.sbtest;"
+-----+
| count(*) |
+-----+
| 3793316 |
+-----+
#backend1 -e"select count(*) from backend.sbtest;"
+-----+
| count(*) |
+-----+
| 6206684 |
+-----+

```

We observe a common issue with partitioning is a non uniform distribution of data between the backends. based on the partition key hashing algorithm.

Rerun the Benchmark with less queries

```

#/usr/local/skysql/sysbench/bin/sysbench --test=oltp --db-driver=mysql --mysql-table-
engine=innodb --mysql-user=skysql --mysql-password=skyvodka --mysql-host=192.168.0.201 --mysql-
port=5054 --mysql-db=backend --mysql-engine-trx=yes --oltp-table-size=10000000 --num-threads=4
--max-requests=100 --oltp-read-only=on run

```

```

OLTP test statistics:
  queries performed:
    read:                1414
    write:               0
    other:               202
    total:               1616
  transactions:         101   (22.95 per sec.)
  deadlocks:            0     (0.00 per sec.)
  read/write requests:  1414  (321.30 per sec.)
  other operations:     202   (45.90 per sec.)

Test execution summary:
  total time:           4.4009s
  total number of events: 101
  total time taken by event execution: 17.2960
  per-request statistics:
    min:                114.48ms
    avg:                171.25ms
    max:                200.98ms
    approx. 95 percentile: 195.12ms

Threads fairness:
  events (avg/stddev):  25.2500/0.43
  execution time (avg/stddev): 4.3240/0.04

```

The response time decreases to 0.04. This is expected because the query latency is increased from multiple network round trips and condition push down is not implemented yet. Sysbench doing a lot of range queries. Just consider for now that this range query can be a badly optimized query.

We need to increase the concurrency to get better throughput.

Background Setup

We have no background search available in MariaDB. It won't be available before [MariaDB 10.2](#), but the next table definition mainly enables improving the performance of a single complex query plan with background search that can be found via the upstream spiral binaries MariaDB branch.

We have 4 cores per backend and 2 backends .

On `backend1`

```
#backend1 << EOF
CREATE DATABASE bsbackend1;
CREATE DATABASE bsbackend2;
CREATE DATABASE bsbackend3;
CREATE DATABASE bsbackend4;
CREATE TABLE bsbackend1.sbtest (
  id int(10) unsigned NOT NULL AUTO_INCREMENT,
  k int(10) unsigned NOT NULL DEFAULT '0',
  c char(120) NOT NULL DEFAULT '',
  pad char(60) NOT NULL DEFAULT '',
  PRIMARY KEY (id),
  KEY k (k)
) ENGINE=InnoDB;
CREATE TABLE bsbackend2.sbtest (
  id int(10) unsigned NOT NULL AUTO_INCREMENT,
  k int(10) unsigned NOT NULL DEFAULT '0',
  c char(120) NOT NULL DEFAULT '',
  pad char(60) NOT NULL DEFAULT '',
  PRIMARY KEY (id),
  KEY k (k)
) ENGINE=InnoDB;
CREATE TABLE bsbackend3.sbtest (
  id int(10) unsigned NOT NULL AUTO_INCREMENT,
  k int(10) unsigned NOT NULL DEFAULT '0',
  c char(120) NOT NULL DEFAULT '',
  pad char(60) NOT NULL DEFAULT '',
  PRIMARY KEY (id),
  KEY k (k)
) ENGINE=InnoDB;
CREATE TABLE bsbackend4.sbtest (
  id int(10) unsigned NOT NULL AUTO_INCREMENT,
  k int(10) unsigned NOT NULL DEFAULT '0',
  c char(120) NOT NULL DEFAULT '',
  pad char(60) NOT NULL DEFAULT '',
  PRIMARY KEY (id),
  KEY k (k)
) ENGINE=InnoDB;
EOF
```

On backend2

```

#backend2 << EOF
CREATE DATABASE bsbackend5;
CREATE DATABASE bsbackend6;
CREATE DATABASE bsbackend7;
CREATE DATABASE bsbackend8;
CREATE TABLE bsbackend5.sbtest (
  id int(10) unsigned NOT NULL AUTO_INCREMENT,
  k int(10) unsigned NOT NULL DEFAULT '0',
  c char(120) NOT NULL DEFAULT '',
  pad char(60) NOT NULL DEFAULT '',
  PRIMARY KEY (id),
  KEY k (k)
) ENGINE=InnoDB;
CREATE TABLE bsbackend6.sbtest (
  id int(10) unsigned NOT NULL AUTO_INCREMENT,
  k int(10) unsigned NOT NULL DEFAULT '0',
  c char(120) NOT NULL DEFAULT '',
  pad char(60) NOT NULL DEFAULT '',
  PRIMARY KEY (id),
  KEY k (k)
) ENGINE=InnoDB;
CREATE TABLE bsbackend7.sbtest (
  id int(10) unsigned NOT NULL AUTO_INCREMENT,
  k int(10) unsigned NOT NULL DEFAULT '0',
  c char(120) NOT NULL DEFAULT '',
  pad char(60) NOT NULL DEFAULT '',
  PRIMARY KEY (id),
  KEY k (k)
) ENGINE=InnoDB;
CREATE TABLE bsbackend8.sbtest (
  id int(10) unsigned NOT NULL AUTO_INCREMENT,
  k int(10) unsigned NOT NULL DEFAULT '0',
  c char(120) NOT NULL DEFAULT '',
  pad char(60) NOT NULL DEFAULT '',
  PRIMARY KEY (id),
  KEY k (k)
) ENGINE=InnoDB;
EOF

```

On Spider Node

```

#spider2 << EOF
CREATE SERVER bsbackend1 FOREIGN DATA WRAPPER mysql OPTIONS( HOST '192.168.0.202', DATABASE
'bsbackend1',USER 'skysql', PASSWORD 'skyvodka',PORT 5054);
CREATE SERVER bsbackend2 FOREIGN DATA WRAPPER mysql OPTIONS( HOST '192.168.0.202', DATABASE
'bsbackend2',USER 'skysql', PASSWORD 'skyvodka',PORT 5054);
CREATE SERVER bsbackend3 FOREIGN DATA WRAPPER mysql OPTIONS( HOST '192.168.0.202', DATABASE
'bsbackend3',USER 'skysql', PASSWORD 'skyvodka',PORT 5054);
CREATE SERVER bsbackend4 FOREIGN DATA WRAPPER mysql OPTIONS( HOST '192.168.0.202', DATABASE
'bsbackend4',USER 'skysql', PASSWORD 'skyvodka',PORT 5054);
CREATE SERVER bsbackend5 FOREIGN DATA WRAPPER mysql OPTIONS( HOST '192.168.0.203', DATABASE
'bsbackend5',USER 'skysql', PASSWORD 'skyvodka',PORT 5054);
CREATE SERVER bsbackend6 FOREIGN DATA WRAPPER mysql OPTIONS( HOST '192.168.0.203', DATABASE
'bsbackend6',USER 'skysql', PASSWORD 'skyvodka',PORT 5054);
CREATE SERVER bsbackend7 FOREIGN DATA WRAPPER mysql OPTIONS( HOST '192.168.0.203', DATABASE
'bsbackend7',USER 'skysql', PASSWORD 'skyvodka',PORT 5054);
CREATE SERVER bsbackend8 FOREIGN DATA WRAPPER mysql OPTIONS( HOST '192.168.0.203', DATABASE
'bsbackend8',USER 'skysql', PASSWORD 'skyvodka',PORT 5054);

CREATE DATABASE IF NOT EXISTS bsbackend;
CREATE TABLE bsbackend.sbtest
(
  id int(10) unsigned NOT NULL AUTO_INCREMENT,
  k int(10) unsigned NOT NULL DEFAULT '0',
  c char(120) NOT NULL DEFAULT '',
  pad char(60) NOT NULL DEFAULT '',
  PRIMARY KEY (id),
  KEY k (k)
) ENGINE=spider COMMENT='wrapper "mysql", table "sbtest"'
PARTITION BY KEY (id)
(
  PARTITION pt1 COMMENT = 'srv "bsbackend1"',
  PARTITION pt2 COMMENT = 'srv "bsbackend2"',
  PARTITION pt3 COMMENT = 'srv "bsbackend3"',
  PARTITION pt4 COMMENT = 'srv "bsbackend4"',
  PARTITION pt5 COMMENT = 'srv "bsbackend5"',
  PARTITION pt6 COMMENT = 'srv "bsbackend6"',
  PARTITION pt7 COMMENT = 'srv "bsbackend7"',
  PARTITION pt8 COMMENT = 'srv "bsbackend8"'
) ;
EOF
INSERT INTO bsbackend.sbtest SELECT * FROM backend.sbtest;

```

Now test the following query :

```
select count(*) from sbtest;
+-----+
| count(*) |
+-----+
| 10000001 |
+-----+
1 row in set (8,38 sec)
```

```
set spider_casual_read=1;
set spider_bgs_mode=2;
```

```
select count(*) from sbtest;
+-----+
| count(*) |
+-----+
| 10000001 |
+-----+
1 row in set (4,25 sec)
```

```
mysql> select sum(k) from sbtest;
+-----+
| sum(k) |
+-----+
|      0 |
+-----+
1 row in set (5,67 sec)
```

```
mysql> set spider_casual_read=0;
mysql> select sum(k) from sbtest;
+-----+
| sum(k) |
+-----+
|      0 |
+-----+
1 row in set (12,56 sec)
```

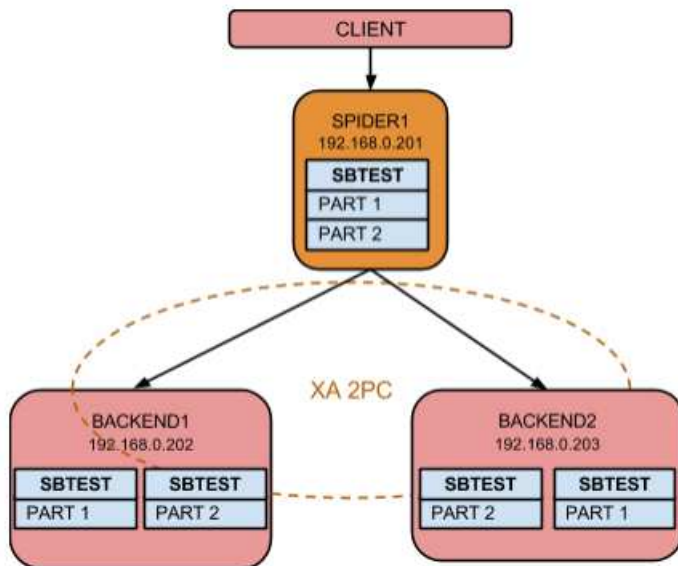

select count(*) from sbtest

High Availability Setup

MariaDB starting with [10.7.5](#)

Spider's high availability feature has been deprecated ([MDEV-28479](#)), and will be deleted. Please use other high availability solutions like [replication](#) or [galera-cluster](#).

```

#backend1 -e "CREATE DATABASE backend_rpl"
#backend2 -e "CREATE DATABASE backend_rpl"

#/usr/local/skysql/mariadb/bin/mysqldump --user=skysql --password=skyvodka --
host=192.168.0.202 --port=5054 backend sbtest | backend1 backend_rpl
#/usr/local/skysql/mariadb/bin/mysqldump --user=skysql --password=skyvodka --
host=192.168.0.203 --port=5054 backend sbtest | backend2 backend_rpl

#spider1 << EOF
DROP TABLE backend.sbtest;
CREATE SERVER backend1_rpl
  FOREIGN DATA WRAPPER mysql
OPTIONS(
  HOST '192.168.0.202',
  DATABASE 'backend_rpl',
  USER 'skysql',
  PASSWORD 'skyvodka',
  PORT 5054
);
CREATE SERVER backend2_rpl
  FOREIGN DATA WRAPPER mysql
OPTIONS(
  HOST '192.168.0.203',
  DATABASE 'backend_rpl',
  USER 'skysql',
  PASSWORD 'skyvodka',
  PORT 5054
);
CREATE TABLE backend.sbtest
(
  id int(10) unsigned NOT NULL AUTO_INCREMENT,
  k int(10) unsigned NOT NULL DEFAULT '0',
  c char(120) NOT NULL DEFAULT '',
  pad char(60) NOT NULL DEFAULT '',
  PRIMARY KEY (id),
  KEY k (k)
) ENGINE=spider COMMENT='wrapper "mysql", table "sbtest"'
PARTITION BY KEY (id)
(
  PARTITION pt1 COMMENT = 'srv "backend1 backend2_rpl"',
  PARTITION pt2 COMMENT = 'srv "backend2 backend1_rpl"'
);
INSERT INTO backend.sbtest select 10000001, 0, '', 'replicas test';
EOF
#backend1 -e "SELECT * FROM backend.sbtest WHERE id=10000001";
+-----+-----+-----+
| id      | k | c | pad          |
+-----+-----+-----+
| 10000001 | 0 |  | replicas test |
+-----+-----+-----+
# backend2 -e "SELECT * FROM backend.sbtest where id=10000001";
# backend2 -e "SELECT * FROM backend_rpl.sbtest where id=10000001";
+-----+-----+-----+
| id      | k | c | pad          |
+-----+-----+-----+
| 10000001 | 0 |  | replicas test |
+-----+-----+-----+

```

What is happening if we stop one backend?

```

#spider1 -e "SELECT * FROM backend.sbtest where id=10000001";
ERROR 1429 (HY000) at line 1: Unable to connect to foreign data source: backend1

```

Let's fix this with spider monitoring. Note that msi is the list of spider nodes @@server_id variable participating in the quorum.

```
#spider1 << EOF
DROP TABLE backend.sbtest;
CREATE TABLE backend.sbtest
(
  id int(10) unsigned NOT NULL AUTO_INCREMENT,
  k int(10) unsigned NOT NULL DEFAULT '0',
  c char(120) NOT NULL DEFAULT '',
  pad char(60) NOT NULL DEFAULT '',
  PRIMARY KEY (id),
  KEY k (k)
) ENGINE=spider COMMENT='wrapper "mysql", table "sbtest"'
PARTITION BY KEY (id)
(
  PARTITION pt1 COMMENT = 'srv "backend1 backend2_rpl", mbk "2", mkd "2", msi "5054",
link_status "0 0"',
  PARTITION pt2 COMMENT = 'srv "backend2 backend1_rpl", mbk "2", mkd "2", msi "5054",
link_status "0 0" '
) ;

CREATE SERVER mon
  FOREIGN DATA WRAPPER mysql
OPTIONS(
  HOST '192.168.0.201',
  DATABASE 'backend',
  USER 'skysql',
  PASSWORD 'skyvodka',
  PORT 5054
);
INSERT INTO `mysql`.`spider_link_mon_servers` VALUES
('%','%','%',5054,'mon',NULL,NULL,NULL,NULL,NULL,NULL,NULL,NULL,NULL,NULL,0,NULL,NULL);
SELECT spider_flush_table_mon_cache();
EOF
```

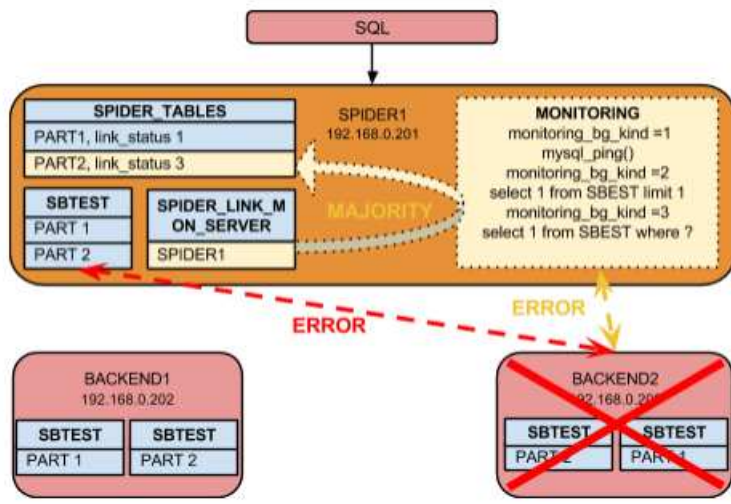

Monitoring should be setup between Spider nodes participating in the cluster. We only have one `Spider Node` and `spider_link_mon_servers` represent the inter-connection of all Spider nodes in our setup.

This simple setup does not bring HA in case the `Spider Node` is not available. In a production setup the number of `Spider Nodes` in the `spider_link_mon_servers` table should be at least 3 to get a majority consensus.

```
#spider1 -e "SELECT * FROM backend.sbtest WHERE id=10000001"
+-----+-----+-----+
| id      | k | c | pad          |
+-----+-----+-----+
| 10000001 | 0 |  | replicas test |
+-----+-----+-----+
```

Checking the state of the nodes:

```
#spider1 -e "SELECT db_name, table_name,server FROM mysql.spider_tables WHERE link_status=3"
+-----+-----+-----+
| db_name | table_name | server |
+-----+-----+-----+
| backend | sbtest#P#pt1 | backend1 |
+-----+-----+-----+
```

No change has been made to cluster, so let's create a divergence:

```
# spider1 -e "INSERT INTO backend.sbtest select 10000003, 0, '' , 'replicas test';"
# backend1 -e "SELECT * FROM backend.sbtest WHERE id=10000003"
# backend2 -e "SELECT * FROM backend_rpl.sbtest WHERE id=10000003"
+-----+-----+-----+
| id      | k | c | pad      |
+-----+-----+-----+
| 10000003 | 0 |  | replicas test |
+-----+-----+-----+
```

Reintroducing the failed backend1 in the cluster:

```
#spider1 << EOF
ALTER TABLE backend.sbtest
ENGINE=spider COMMENT='wrapper "mysql", table "sbtest"'
PARTITION BY KEY (id)
(
PARTITION pt1 COMMENT = 'srv "backend1 backend2_rpl" mbk "2", mkd "2", msi "5054", link_status
"2 0"',
PARTITION pt2 COMMENT = 'srv "backend2 backend1_rpl" mbk "2", mkd "2", msi "5054", link_status
"0 2" '
);
select spider_copy_tables('backend.sbtest#P#pt1','0','1');
select spider_copy_tables('backend.sbtest#P#pt2','1','0');
ALTER TABLE backend.sbtest
ENGINE=spider COMMENT='wrapper "mysql", table "sbtest"'
PARTITION BY KEY (id)
(
PARTITION pt1 COMMENT = 'srv "backend1 backend2_rpl" mbk "2", mkd "2", msi "5054", link_status
"1 0"',
PARTITION pt2 COMMENT = 'srv "backend2 backend1_rpl" mbk "2", mkd "2", msi "5054", link_status
"0 1" '
);
EOF
```

5.3.19.2 Spider Installation

The Spider storage engine supports partitioning and XA transactions, and allows tables of different MariaDB instances to be handled as if they were on the same instance.

To use Spider, you need two or more instances of MariaDB, typically running on separate hosts. The Spider node is the MariaDB server that receives queries from your application. It then processes these queries, connecting to one or more data nodes. The data nodes are the MariaDB servers that actually store the table data.

In order for this to work, you need to configure the data nodes to accept queries from the Spider node and you need to configure the Spider node to use the data nodes as remote storage.

You don't need to install any additional packages to use it, but it does require some configuration.

Contents

1. [Configuring Data Nodes](#)
2. [Install Spider on Spider Node](#)
 1. [Step 1: Install Spider Package \(Debian/Ubuntu\)](#)
 2. [Step 2a: Load the Spider Plugin \(MariaDB 10.4 and Later\)](#)
 3. [Step 2b: Load the Spider Plugin \(MariaDB 10.3 and Before\)](#)
 4. [Step 3: Verify Loading of the Spider Plugin](#)
3. [Configuring Spider Nodes](#)
 1. [Configure the Server](#)
 2. [Create the Table](#)

Configuring Data Nodes

Spider deployments use data nodes to store the actual table data. In order for a MariaDB server to operate as a data node for Spider, you need to create a table or tables on which to store the data and configure the server to accept client connections from the Spider node.

For instance, first create the table:

```
CREATE TABLE test.spider_example (  
  id INT PRIMARY KEY AUTO_INCREMENT,  
  name VARCHAR(50)  
) ENGINE=InnoDB;
```

Next, create a user for the Spider node and set a password for that user. For the sake of the example, assume the Spider node is at the IP address 192.168.1.1:

```
CREATE USER spider@192.168.1.1;  
  
SET PASSWORD FOR spider@192.168.1.1 = PASSWORD('passwd');
```

Then grant the `spider` user privileges on the example table.

```
GRANT ALL ON test.spider_example TO spider@192.168.1.1;
```

The data node is now ready for use. You can test it by attempting to connect the MariaDB client to the data from the Spider node. For instance, assuming the data node is at the IP address 192.168.1.5, SSH into the Spider node then try to establish a client connection.

```
$ mysql -u spider -p -h 192.168.1.5 test -e "SHOW TABLES;"  
  
+-----+  
| Tables_in_test |  
+-----+  
| spider_example |  
+-----+
```

Install Spider on Spider Node

The Spider storage engine must be installed on the Spider node. The Spider node is the MariaDB server that receives queries for the table, (in this case `test.spider_example`). It then uses the Spider storage engine to connect to the tables on the data nodes to retrieve data and return the result-set.

To install the Spider storage engine, complete the installation process shown below.

Step 1: Install Spider Package (Debian/Ubuntu)

On Debian and Ubuntu, the Spider storage engine is installed via a separate `mariadb-plugin-spider` package. To install the package via APT, execute the following command:

```
$ sudo apt install mariadb-plugin-spider
```

On other Linux distributions, the Spider storage engine is installed with MariaDB Server.

Step 2a: Load the Spider Plugin (MariaDB 10.4 and Later)

With [MariaDB 10.4](#) and later, the Spider storage engine can be loaded as a normal plugin, and Spider automatically creates its dependencies. There are two primary ways to load the plugin.

The plugin can be loaded dynamically without a server restart by executing `INSTALL SONAME` or `INSTALL PLUGIN`:

```
INSTALL SONAME "ha_spider";
```

Alternatively, the plugin can be loaded by adding `plugin_load_add=ha_spider` to a configuration file:

```
<<quote>>  
[mariadb]  
...  
plugin_load_add = "ha_spider"  
<</quote>>
```

If the plugin is loaded in a configuration file, then the server will load the plugin after the server has been restarted.

Loading the plugin also creates a series of new tables in the `mysql` database, including:

table name	added version
spider_xa	MariaDB 10.0.4
spider_xa_member	MariaDB 10.0.4
spider_xa_failed_log	MariaDB 10.0.5
spider_tables	MariaDB 10.0.4
spider_link_mon_servers	MariaDB 10.0.4
spider_link_failed_log	MariaDB 10.0.4
spider_table_position_for_recovery	MariaDB 10.3.3
spider_table_sts	MariaDB 10.3.3
spider_table_crd	MariaDB 10.3.3

Step 2b: Load the Spider Plugin (MariaDB 10.3 and Before)

With [MariaDB 10.3](#) and before, the Spider storage engine can be loaded by executing the included `install_spider.sql` script:

```
$ mysql --user root --password < /usr/share/mysql/install_spider.sql
```

Running this configuration script also creates a series of new tables in the `mysql` database, including:

table name	added version
spider_xa	MariaDB 10.0.4
spider_xa_member	MariaDB 10.0.4
spider_xa_failed_log	MariaDB 10.0.5
spider_tables	MariaDB 10.0.4
spider_link_mon_servers	MariaDB 10.0.4
spider_link_failed_log	MariaDB 10.0.4
spider_table_position_for_recovery	MariaDB 10.3.3
spider_table_sts	MariaDB 10.3.3
spider_table_crd	MariaDB 10.3.3

Step 3: Verify Loading of the Spider Plugin

You can verify that the Spider plugin has been loaded by querying the `information_schema.ENGINES` table:

```
SELECT ENGINE, SUPPORT
FROM information_schema.ENGINES
WHERE ENGINE = 'SPIDER';
```

```
+-----+-----+
| ENGINE          | SUPPORT |
+-----+-----+
| SPIDER          | YES    |
+-----+-----+
```

If the Spider plugin is not loaded, then the query will not return any results.

Configuring Spider Nodes

With the data node or data nodes configured, you can set up the Spider node to use them. The Spider node is the MariaDB server that receives queries for the table, (in this case `test.spider_example`). It then uses the Spider storage engine to connect to the tables on the data nodes to retrieve data and return the result-set.

Configure the Server

In order to connect the Spider node to the data nodes, you may issue a `CREATE SERVER` statement for each data node. You can then use the server definition in creating the Spider table.

```
CREATE SERVER dataNode1 FOREIGN DATA WRAPPER mysql
OPTIONS (
  HOST '192.168.1.5',
  DATABASE 'test',
  USER 'spider',
  PASSWORD 'passwd',
  PORT 3306);
```

In the event that you need to modify or replace this server after setting up the Spider table, remember to issue a `FLUSH` statement to update the server definition.

```
FLUSH TABLES;
```

Alternatively, you could also choose not to create a server, but specify the connection info in the spider table creation.

Create the Table

With the data nodes set up and the Spider node configured for use, you can create the Spider table. The Spider table must have the same column definitions as the tables on the data nodes. Spider can be configured through table parameters passed to the `COMMENT` or `CONNECTION` option.

```
CREATE TABLE test.spider_example (
  id INT PRIMARY KEY AUTO_INCREMENT,
  name VARCHAR(50)
) ENGINE=Spider
COMMENT='wrapper "mysql", srv "dataNode1", table "spider_example";
```

This configures Spider to use the server `dataNode1`, (defined above), as a remote table. Any data you write to this table is actually stored on the MariaDB server at 192.168.1.5.

Alternatively, starting from [MariaDB 10.8.1](#), one could specify spider table parameters using table options:

```
CREATE TABLE test.spider_example (
  id INT PRIMARY KEY AUTO_INCREMENT,
  name VARCHAR(50)
) ENGINE=Spider
REMOTE_SERVER=dataNode1 REMOTE_TABLE=spider_example;
```

5.3.19.3 Spider Storage Engine Core Concepts

Contents

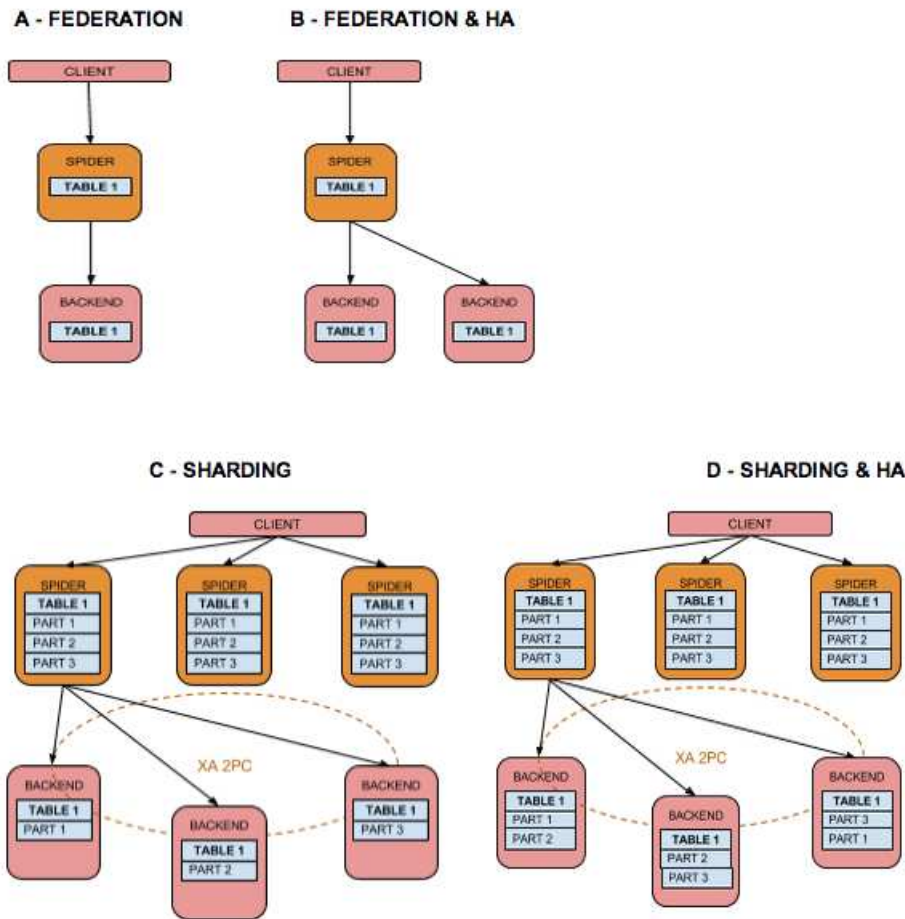

- 1. Spider Common Usage
- 2. Spider Storage Engine Federation
- 3. Spider Threading Model
- 4. Spider Memory Model

A typical Spider deployment has a shared-nothing clustered architecture. The system works with any inexpensive hardware, and with a minimum of specific requirements for hardware or software. It consists of a set of computers, with one or more MariaDB processes known as nodes.

The nodes that store the data will be designed as `Backend Nodes`, and can be any MariaDB, MySQL, Oracle server instances using any storage engine available inside the backend.

The `Spider Proxy Nodes` are instances running at least MariaDB 10. `Spider Proxy Nodes` are used to declare per table attachment to the backend nodes. In addition `Spider Proxy Nodes` can be setup to enable the tables to be split and mirrored to multiple `Backend Nodes`.

Spider Common Usage

In the default high availability setup `#Spider Nodes#` produce SQL errors when a backend server is not responding. Per table monitoring can be setup to enable availability in case of unresponsive backends `monotoring_bg_kind=1` or `monotoring_bg_kind=2`. The Monitoring Spider Nodes will be inter-connected with usage of the system table `mysql.link_mon_servers` to manage network partitioning. Better known as split brain, an even number of `Spider Monitor Nodes` should be setup to allow a consensus based on the majority. Rather a single separated shared `Monitoring Node` instance or a minimum set of 3 `Spider Nodes`. More information can be found [here](#).

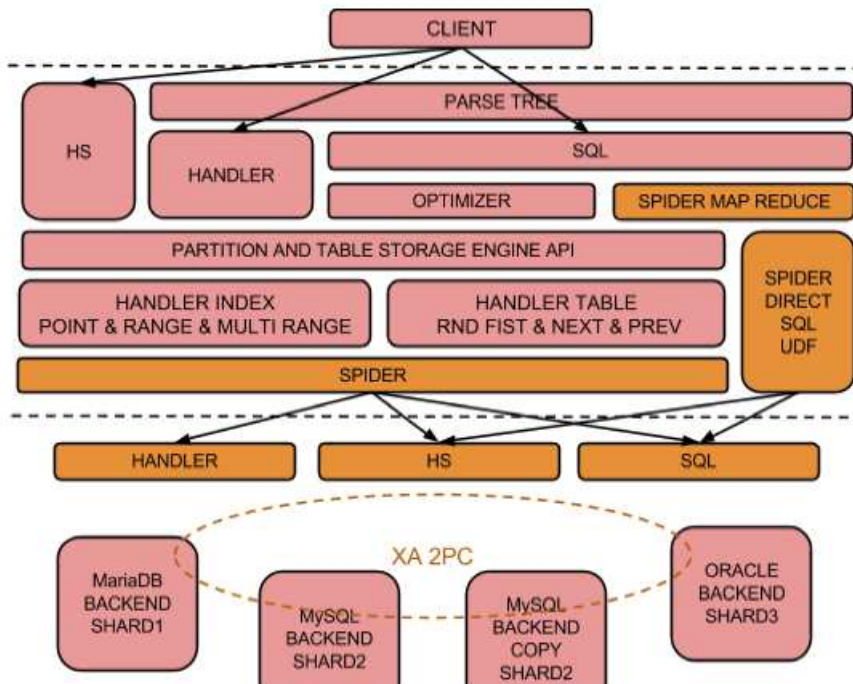

MariaDB starting with [10.7.5](#)

Spider's high availability feature has been deprecated ([MDEV-28479](#)), and will be deleted. Please use other high availability solutions like [replication](#) or [galera-cluster](#).

Spider Storage Engine Federation

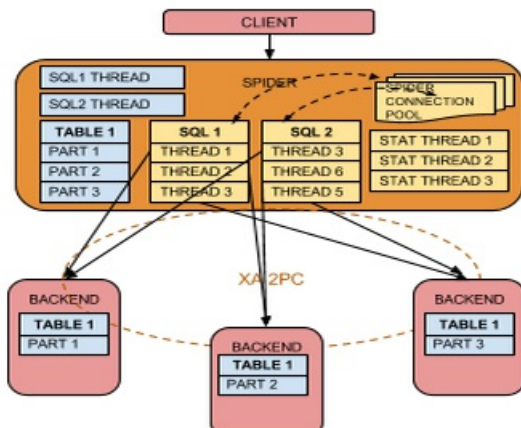

Spider is a pluggable Storage Engine, acting as a proxy between the optimizer and the remote backends. When the optimizer requests multiple calls to the storage engine, Spider enforces consistency using the 2 phase commit protocol to the backends and by creating transactions on the backends to preserve atomic operations for a single SQL execution. Preserving atomic operation during execution is used at multiple levels in the architecture. For the regular optimizer plan, it refers to `multiple split reads` and for concurrent partition scans, it will refer to `semi transactions`.

Costly queries can be more efficient when it is possible to fully push down part of the execution plan on each backend and reduce the result afterwards. Spider enables such execution with some direct execution shortcuts.

Spider Threading Model

Spider uses the per partitions and per table model to concurrently access the remote backend nodes. For memory workload that property can be used to define multiple partitions on a single remote backend node to better adapt the concurrency to available CPUs in the hardware.

Spider maintains an internal dictionary of Table and Index statistics based on separated threads. The statistics are pulled per default on a time line basis and refer to `crd` for cardinality and `sts` for table status.

Spider Memory Model

Spider stores resultsets into memory, but `spider_quick_mode=3` stores resultsets into internal temporary tables if the resultsets are larger than `quick_table_size`.

5.3.19.4 Spider Use Cases

Contents

1. [Introduction](#)
2. [Basic setup](#)
 1. [Setting the SUPER privilege for the Spider user on data nodes or alternatives to avoid privilege issues](#)
 2. [Create accounts for spider to connect with on backend servers](#)

 1. [Unable to Connect Errors](#)
3. [Use case 1: remote table](#)
4. [Use case 2: sharding by hash](#)
5. [Use case 3: sharding by range](#)
6. [Use case 4: sharding by list](#)

Introduction

This article will cover simple working examples for some standard use cases for Spider. The example will be illustrated using a sales opportunities table to be consistent throughout. In some cases the actual examples will be contrived but are used to illustrate the varying syntax options.

Basic setup

Have 3 or more servers available and Install MariaDB on each of these servers:

- **spider** server which will act as the front end server hosting the spider storage engine.
- **backend1** which will act as a backed server storing data
- **backend2** which will act as a second backend server storing data

Follow the instructions [here](#) to enable the Spider storage engine on the spider server:

```
INSTALL SONAME 'ha_spider';
```

Setting the SUPER privilege for the Spider user on data nodes or alternatives to avoid privilege issues

When explicitly setting the `spider_internal_sql_log_off` system variable, please note that Spider will execute matching `SET SQL_LOG_OFF` statements on each of the data nodes. It will attempt to do this on the data nodes using the `SUPER` privilege, which thus requires one to grant this privilege to the Spider user on the data nodes.

If the Spider user on the data note is not configured with the `SUPER` privilege, you may encounter issues when working with Spider tables like `ERROR 1227 (42000): Access denied for the missing SUPER privilege`. To avoid this, don't explicitly set `spider_internal_sql_log_off`, or set it to `-1`, or grant the `SUPER` privilege to the Spider user on the data node.

Create accounts for spider to connect with on backend servers

Spider needs a remote connection to the backend server to actually perform the remote query. So this should be setup on each backend server. In this case `172.21.21.2` is the ip address of the spider node limiting access to just that server.

```
backend1> mysql
grant all on test.* to spider@'172.21.21.2' identified by 'spider';
backend2> mysql
grant all on test.* to spider@'172.21.21.2' identified by 'spider';
```

Now verify that these connections can be used from the spider node (here `172.21.21.3` = backend1 and `172.21.21.4` = backend2):

```
spider> mysql -u spider -p -h 172.21.21.3 test
spider> mysql -u spider -p -h 172.21.21.4 test
```

Create table on backend servers

The table definition should be created in the test database on both backend1 and backend2 servers:

```
create table opportunities (  
  id int,  
  accountName varchar(20),  
  name varchar(128),  
  owner varchar(7),  
  amount decimal(10,2),  
  closeDate date,  
  stageName varchar(11),  
  primary key (id),  
  key (accountName)  
 ) engine=InnoDB;
```

Create server entries on spider server

While the connection information can also be specified inline in the comment or (from [MariaDB 10.8.1](#)) as table options, it is cleaner to define a server object representing each remote backend server connection:

```
create server backend1 foreign data wrapper mysql options  
(host '172.21.21.3', database 'test', user 'spider', password 'spider', port 3306);  
create server backend2 foreign data wrapper mysql options  
(host '172.21.21.4', database 'test', user 'spider', password 'spider', port 3306);
```

Unable to Connect Errors

Bear in mind, if you ever need to remove, recreate or otherwise modify the server definition for any reason, you need to also execute a [FLUSH TABLES](#) statement. Otherwise, Spider continues to use the old server definition, which can result in queries raising the error

```
Error 1429: Unable to connect to foreign data source
```

If you encounter this error when querying Spider tables, issue a [FLUSH TABLES](#) statement to update the server definitions.

```
FLUSH TABLES;
```

Use case 1: remote table

In this case, a spider table is created to allow remote access to the opportunities table hosted on backend1. This then allows for queries and remote dml into the backend1 server from the spider server:

```
create table opportunities (  
  id int,  
  accountName varchar(20),  
  name varchar(128),  
  owner varchar(7),  
  amount decimal(10,2),  
  closeDate date,  
  stageName varchar(11),  
  primary key (id),  
  key (accountName)  
 ) engine=spider comment='wrapper "mysql", srv "backend1" , table "opportunities";
```

Use case 2: sharding by hash

See also [hash-partitioning-type](#) .

In this case a spider table is created to distribute data across backend1 and backend2 by hashing the id column. Since the id column is an incrementing numeric value the hashing will ensure even distribution across the 2 nodes.

```

create table opportunities (
  id int,
  accountName varchar(20),
  name varchar(128),
  owner varchar(7),
  amount decimal(10,2),
  closeDate date,
  stageName varchar(11),
  primary key (id),
  key (accountName)
) engine=spider COMMENT='wrapper "mysql", table "opportunities"'
  PARTITION BY HASH (id)
(
  PARTITION pt1 COMMENT = 'srv "backend1"',
  PARTITION pt2 COMMENT = 'srv "backend2"'
) ;

```

Use case 3: sharding by range

See also [range-partitioning-type](#).

In this case a spider table is created to distribute data across backend1 and backend2 based on the first letter of the accountName field. All accountNames that start with the letter L and prior will be stored in backend1 and all other values stored in backend2. Note that the accountName column must be added to the primary key which is a requirement of MariaDB partitioning:

```

create table opportunities (
  id int,
  accountName varchar(20),
  name varchar(128),
  owner varchar(7),
  amount decimal(10,2),
  closeDate date,
  stageName varchar(11),
  primary key (id, accountName),
  key(accountName)
) engine=spider COMMENT='wrapper "mysql", table "opportunities"'
  PARTITION BY range columns (accountName)
(
  PARTITION pt1 values less than ('M') COMMENT = 'srv "backend1"',
  PARTITION pt2 values less than (maxvalue) COMMENT = 'srv "backend2"'
) ;

```

Use case 4: sharding by list

See also [list-partitioning-type](#).

In this case a spider table is created to distribute data across backend1 and backend2 based on specific values in the owner field. Bill, Bob, and Chris will be stored in backend1 and Maria and Olivier stored in backend2. Note that the owner column must be added to the primary key which is a requirement of MariaDB partitioning:

```

create table opportunities (
  id int,
  accountName varchar(20),
  name varchar(128),
  owner varchar(7),
  amount decimal(10,2),
  closeDate date,
  stageName varchar(11),
  primary key (id, owner),
  key(accountName)
) engine=spider COMMENT='wrapper "mysql", table "opportunities"'
  PARTITION BY list columns (owner)
(
  PARTITION pt1 values in ('Bill', 'Bob', 'Chris') COMMENT = 'srv "backend1"',
  PARTITION pt2 values in ('Maria', 'Olivier') COMMENT = 'srv "backend2"'
) ;

```

With [MariaDB 10.2](#) the following partition clause can be used to specify a default partition for all other values, however this must be a distinct partition / shard:

```
PARTITION partition_name DEFAULT
```

For a complete list of partition types, see [partitioning-types](#) .

5.3.19.5 Spider Cluster Management

Contents

1. [Direct SQL](#)
2. [Direct Handler Socket](#)
3. [Inter Nodes Copy Table](#)
4. [General Log](#)
5. [Compiling in Debug Mode](#)
6. [Compiling in Static](#)
7. [Status Variables](#)
8. [Information Schema Tables](#)
9. [Performance Schema](#)

Direct SQL

Direct SQL is a way to map reduced execution on remote backends and store the results in a local table. This can either be sequential, using the UDF function [spider_direct_sql](#), or concurrently, using [spider_bg_direct_sql](#).

```
spider1 backend << EOF
CREATE TEMPORARY TABLE res
(
  id int(10) unsigned NOT NULL,
  k int(10) unsigned NOT NULL DEFAULT '0',
  c char(120) NOT NULL DEFAULT '',
  pad char(60) NOT NULL DEFAULT ''
) ENGINE=MEMORY;

SELECT spider_direct_sql(
'SELECT * FROM sbtest s WHERE s.id IN(10,12,13)',
'res',
concat('host ', host, ', port ', port, ', user ', username, ', password ', password,
', database ', tgt_db_name, '')
) a
FROM
mysql.spider_tables
WHERE
db_name = 'backend' and table_name like 'sbtest#P#pt%';

SELECT * FROM res;
EOF
```

Or if you are using a [SERVER](#):

```
SELECT spider_direct_sql(
'SELECT * FROM sbtest s WHERE s.id IN(10,12,13)',
'res',
concat('server ', server, '')
) a
FROM mysql.spider_tables
WHERE db_name = 'backend' and table_name like 'sbtest#P#pt%' ;
```

The default for [spider_bg_direct_sql](#) is to access concurrently all backends. If you have multiple partitions store inside a single backend, you still can increase parallelism affecting different channels to each partitions.

```
CREATE TEMPORARY TABLE res
(
  id int(10) unsigned NOT NULL ,
  col_microsec DATETIME(6) default NOW(8),
  db varchar(20)
) ENGINE=MEMORY;

SELECT spider_bg_direct_sql( 'SELECT count(*) ,min(NOW(6)),min(DATABASE())) FROM sbtest',
'res', concat('srv "', server, '" cch ',@rn:=@rn+1 ) ) a FROM  mysql.spider_tables,(SELECT
@rn:=1) t2  WHERE  db_name = 'bsbackend' and table_name like 'sbtest#P#pt%';
```

Direct Handler Socket

MariaDB starting with [10.8.1](#)

The Spider Handler Socket support has been removed, see [MDEV-26858](#).

Check that [Handler Socket](#) is running on the backend nodes

```
:~# backend2 -e "show variables like 'handler%'"
+-----+-----+
| Variable_name | Value |
+-----+-----+
| handlersocket_accept_balance | 0 |
| handlersocket_address | 192.168.0.201 |
| handlersocket_backlog | 32768 |
| handlersocket_epoll | 1 |
| handlersocket_plain_secret | |
| handlersocket_plain_secret_wr | |
| handlersocket_port | 20500 |
| handlersocket_port_wr | 20501 |
| handlersocket_rcvbuf | 0 |
| handlersocket_readsize | 0 |
| handlersocket_sndbuf | 0 |
| handlersocket_threads | 4 |
| handlersocket_threads_wr | 1 |
| handlersocket_timeout | 300 |
| handlersocket_verbose | 10 |
| handlersocket_wrllock_timeout | 12 |
+-----+-----+
```

```
spider1 backend << EOF
CREATE TEMPORARY TABLE res
(
  id int(10) unsigned NOT NULL,
  k int(10) unsigned NOT NULL DEFAULT '0',
  c char(120) NOT NULL DEFAULT '',
  pad char(60) NOT NULL DEFAULT ''
) ENGINE=MEMORY;

SELECT spider_direct_sql('1\t=\t1\t2\t100000\t0','res', 'host "192.168.0.202", table "sbtest",
database "test", port "20500", access_mode "1"');
```

Inter Nodes Copy Table

MariaDB starting with [10.8.1](#)

The UDF `spider_copy_tables` relies on Spider's high availability feature, which has been deprecated ([MDEV-28479](#)), and will be deleted. Please use other high availability solutions like [replication](#) or [galera-cluster](#).

The UDF function `spider_copy_tables` is available for copying table data from the source link ID to the destination link ID list without stopping your service for copying

```
spider_copy_tables(Spider table name, source link ID, destination link ID list[, parameters])
```

- Returns 1 if copying data succeeded.
- Returns 0 if copying data failed.

If the Spider table is partitioned, you must set "Spider table name" with a part name such as "table_name#P#part_name".

You can check the table name and the link ID with the part name using the following SQL:

```
SELECT table_name FROM mysql.spider_tables;
```

General Log

To capture all queries sent to remote backends on a Spider Node :

```
SET GLOBAL general_log=ON;
SET GLOBAL spider_general_log=ON;
SET GLOBAL spider_log_result_errors=1;
SET GLOBAL spider_log_result_error_with_sql=3;
```

Compiling in Debug Mode

See [Compiling MariaDB for Debugging](#) and [Creating a Trace File](#).

Report the issue in [MariaDB JIRA](#) (see [Reporting Bugs](#)) or to the MariaDB Corporation support center.

Compiling in Static

Available since version 3.1.14

To activate spider as a static plugin change "MODULE_ONLY" to "MANDATORY" in storage/spider/CMakeList.txt before compiling

Note that Spider UDF functions will not work with such settings.

Status Variables

A number of new [status variables](#) have been introduced, see [Spider Status Variables](#) for a complete list.

Information Schema Tables

- A new [Information Schema](#) table is installed - [SPIDER_ALLOC_MEM](#).

Field	Type	Null	Key	Default	Extra
ID	int(10) unsigned	NO		0	
FUNC_NAME	varchar(64)	YES		NULL	
FILE_NAME	varchar(64)	YES		NULL	
LINE_NO	int(10) unsigned	YES		NULL	
TOTAL_ALLOC_MEM	bigint(20) unsigned	YES		NULL	
CURRENT_ALLOC_MEM	bigint(20)	YES		NULL	
ALLOC_MEM_COUNT	bigint(20) unsigned	YES		NULL	
FREE_MEM_COUNT	bigint(20) unsigned	YES		NULL	

From [MariaDB 10.5](#), Spider installs another Information Schema table, [SPIDER_WRAPPER_PROTOCOLS](#).

Performance Schema

The [Performance schema](#) is commonly used to troubleshoot issues that consume time inside your workload. The Performance schema should not be activated for servers that are experimenting constant heavy load, but most of time it is acceptable to lose 5% to 20% additional CPU to keep track of server internals execution.

To activate the performance schema, use the [performance_schema](#) system variable and add the following to the server section of the [MariaDB configuration file](#).

```
performance_schema=on
```

Activate the Spider probes to be monitored.

```
UPDATE performance_schema.setup_instruments SET
ENABLED='YES', TIMED='yes' WHERE NAME LIKE '%spider%';
```

Run your queries ...

And check the performance metrics. Remove specific Spider metrics to have a more global view.

```
SELECT * FROM performance_schema.events_waits_summary_global_by_event_name
WHERE COUNT_STAR<>0 AND EVENT_NAME LIKE '%spider%'
ORDER BY SUM_TIMER_WAIT DESC LIMIT 10;
```

5.3.19.6 Spider Feature Matrix

Not complete yet - still being updated

F(*) Federation only , P(*)partitioning only . Spider column is for SpiderForMySQL found on the Spider web site.

Feature	Spider	10.0
Clustering and High Availability		
Commit, Rollback transactions on multiple backend	Yes	Yes
Multiplexing to a number of replicas using xa protocol 2PC	Yes	Yes
Split brain resolution based on a majority decision, failed node is remove from the list of replicas	Yes	Yes
Enable a failed backend to re enter the cluster transparently	No	No
Synchronize DDL to backend, table modification, schema changes	No	No
Synchronize DDL to other Spider	No	No
GTID tracking per table on XA error	No	Yes
Transparent partitioning	No	No
Covered by generic SQL test case	Yes	Yes
Heterogenous Backends		
MariaDB and MySQL database backend	Yes	Yes
Oracle database backend, if build from source against the client library 'ORACLE_HOME'	Yes	Yes
Local table attachment	Yes	Yes
Performance		
Index Condition Pushdown	No	No
Engine Condition Pushdown	Yes	Yes
Concurrent backend scan	Yes	No
Concurrent partition scan	Yes	No
Batched key access	Yes	Yes
Block hash join	No	Yes
HANDLER backend propagation	Yes	Yes
HANDLER backend translation from SQL	Yes	Yes
HANDLER OPEN cache per connection	No	Yes
HANDLER use prepared statement	No	Yes
HANDLER_SOCKET protocol backend propagation	Yes	Yes
HANDLER_SOCKET backend translation from SQL	No	No
Map reduce for ORDER BY ... LIMIT	Yes	Yes
Map reduce for MAX & MIN & SUM	Yes	Yes
Map reduce for some GROUP BY	Yes	Yes
Batch multiple WRITES in auto commit to reduce network round trip	Yes	Yes
Relaxing backend consistency	Yes	Yes
Execution Control		
Configuration at table and partition level, settings can change per data collection	Yes	Yes
Configurable empty result set on errors. For API that does not have transactions replay	Yes	Yes
Query Cache tuning per table of the on remote backend	Yes	Yes
Index Hint per table imposed on remote backend	Yes	Yes
SSL connections to remote backend connections	Yes	Yes
Table definition discovery from remote backend	Yes	F(*)
Direct SQL execution to backend via UDF	Yes	Yes

Table re synchronization between backends via UDF	Yes	Yes
Maintain Index and Table Statistics of remote backends	Yes	Yes
Can use Independent Index and Table Statistics	No	Yes
Maintain local or remote table increments	Yes	Yes
LOAD DATA INFILE translate to bulk inserting	Yes	Yes
Performance Schema Probes	Yes	Yes
Load Balance Reads to replicate weight control	Yes	Yes
Fine tuning tcp timeout, connections retry	Yes	Yes

5.3.19.7 Spider System Variables

The following variables are available when the [Spider](#) storage engine has been installed.

See [Server System Variables](#) for a complete list of system variables and instructions on setting them.

See also the [Full list of MariaDB options, system and status variables](#).

MariaDB starting with [10.4.31](#)

Starting from [MariaDB 10.4.31](#), [MariaDB 10.5.22](#), [MariaDB 10.6.15](#), [MariaDB 10.9.8](#), [MariaDB 10.10.6](#), [MariaDB 10.11.5](#), [MariaDB 11.0.3](#), all spider system variables with the value -1 for deferring to table parameter values follow the correct overriding mechanism: table parameter (if set) overrides system variables (if not -1) overrides actual variable default. As a side effect, all such system variables in all versions have the same default value as the table param default value.

Before this change, a non-minus-one system variable value would override the table parameter value. That is, if both the system variable value and the table parameter value were set to be non-minus-one, the system variable value would prevail. For [MariaDB 10.7+](#) where the system variable default values were the same as table param default instead of -1, this means that if the system variable were not set, but a table param is set to a non-default value, the default would override the non-default value.

spider_auto_increment_mode

- **Description:** The [auto increment](#) mode.
 - -1 Falls back to the default value, if the [table parameter](#) is not set.
 - 0 Normal Mode. Uses a counter that Spider gets from the remote backend server with an exclusive lock for the auto-increment value. This mode is slow. Use Quick Mode (2), if you use Spider tables with the table partitioning feature and the auto-increment column is the first column of the index. Before [MariaDB 10.3](#), this value works as "1" for partitioned Spider tables.
 - 1 Quick Mode. Uses an internal Spider counter for the auto-increment value. This mode is fast, but it is possible for duplicates to occur when updating the same table from multiple Spider proxies.
 - 2 Set Zero Mode. The auto-increment value is given by the remote backend. Sets the column to 0, even if you set the value to the auto-increment column in your statement. If you use the table with the table partitioning feature, it sets to zero after choosing an inserted partition.
 - 3 When the auto-increment column is set to `NULL`, the value is given by the remote backend server. If you set the auto-increment column to 0, the value is given by the local server. Set [spider_reset_auto_incremnet](#) to 2 or 3 if you want to use an auto-increment column on the remote server.
- **Scope:** Global, Session
- **Dynamic:** Yes
- **Data Type:** `numeric`
- **Default Session Value:** 0
- **Default Table Value:** 0
- **Range:** -1 to 3
- **DSN Parameter Name:** `aim`

spider_bgs_first_read

- **Description:** Number of first read records to use when performing a concurrent background search. To start a range scan on the remote backend, the storage engine first needs to send the first record. Fetching a second record in the same query can save a network round trip stopping the plan if the backend has a single record. The first and second reads are used to warm up for background search. When not using [spider_split_read](#) and [spider_semi_split_read](#), the third read fetches the remaining data source in a single fetch.
 - -1 Falls back to the default value, if the [table parameter](#) is not set.
 - 0 Records are usually retrieved.
 - 1 and greater: Number of records.
- **Scope:** Global, Session
- **Dynamic:** Yes
- **Data Type:** `numeric`
- **Default Session Value:** 2
- **Default Table Value:** 2
- **Range:** -1 to 9223372036854775807
- **DSN Parameter Name:** `bfr`

spider_bgs_mode

- **Description:** Background search mode. This enables the use of a thread per data server connection if the query is not shard-based and must be distributed across shards. The partitioning plugin scans partitions one after the other to optimize memory usage. Because the shards are external, reading all shards can be performed in parallel when the plan prunes multiple partitions.
 - -1 Falls back to the default value, if the [table parameter](#) is not set.
 - 0 Disables background search.
 - 1 Uses background search when searching without locks
 - 2 Uses background search when searching without locks or with shared locks.
 - 3 Uses background search regardless of locks.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Default Session Value:** 0
 - **Default Table Value:** 0
 - **Range:** -1 to 3
 - **DSN Parameter Name:** `bmd`
-

spider_bgs_second_read

- **Description:** Number of second read records on the backend server when using background search. When the first records are found from [spider_bgs_first_read](#), the engine continues scanning a range adding a `LIMIT` of [spider_bgs_first_read](#) and [spider_bgs_second_read](#).
 - -1 Falls back to the default value, if the [table parameter](#) is not set.
 - 0 Records are usually retrieved.
 - 1 and greater: Number of records.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Default Session Value:** 100
 - **Default Table Value:** 100
 - **Range:** -1 to 9223372036854775807
 - **DSN Parameter Name:** `bsr`
-

spider_bka_engine

- **Description:** Storage engine used with temporary tables when the [spider_bka_mode](#) system variable is set to 1. Defaults to the value of the [table parameter](#), which is `MEMORY` by default.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** `string`
 - **Default Session Value:** ""
 - **Default Table Value:** `Memory`
 - **DSN Parameter Name:** `bke`
-

spider_bka_mode

- **Description:** Internal action to perform when multi-split reads are disabled. If the [spider_multi_split_read](#) system variable is set to 0, Spider uses this variable to determine how to handle statements when the optimizer resolves range retrieval to multiple conditions.
 - -1 Falls back to the default value, if the [table parameter](#) is not set.
 - 0 Uses "union all".
 - 1 Uses a temporary table, if it is judged acceptable.
 - 2 Uses a temporary table, if it is judged acceptable and avoids replication delay.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Default Session Value:** 1
 - **Default Table Value:** 1
 - **Range:** -1 to 2
 - **DSN Parameter Name:** `bkm`
-

spider_bka_table_name_type

- **Description:** The type of temporary table name for bka.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** numeric
 - **Default Session Value:** 1
 - **Range:** -1 to 1
-

spider_block_size

- **Description:** Size of memory block used in MariaDB. Can usually be left unchanged.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** numeric
 - **Default Session Value:** 16384
 - **Range:** 0 to 4294967295
 - **DSN Parameter Name:** bsz
-

spider_buffer_size

- **Description:** Buffer size. -1, the default, will use the [table parameter](#).
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** numeric
 - **Default Session Value:** 16000
 - **Default Table Value:** 16000
 - **Range:** -1 to 2147483647
 - **Introduced:** [MariaDB 10.5.4](#)
-

spider_bulk_size

- **Description:** Size in bytes of the buffer when multiple grouping multiple `INSERT` statements in a batch, (that is, bulk inserts).
 - -1 The [table parameter](#) is adopted.
 - 0 or greater: Size of the buffer.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** numeric
 - **Default Session Value:** 16000
 - **Default Table Value:** 16000
 - **Range:** -1 to 2147483647
 - **DSN Parameter Name:** bsz
-

spider_bulk_update_mode

- **Description:** Bulk update and delete mode. Note: If you use a non-default value for the [spider_bgs_mode](#) or [spider_split_read](#) system variables, Spider sets this variable to 2.
 - -1 Falls back to the default value, if the [table parameter](#) is not set.
 - 0 Sends `UPDATE` and `DELETE` statements one by one.
 - 1 Collects multiple `UPDATE` and `DELETE` statements, then sends the collected statements one by one.
 - 2 Collects multiple `UPDATE` and `DELETE` statements and sends them together.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** numeric
 - **Default Session Value:** 0
 - **Default Table Value:** 0
 - **Range:** -1 to 2
 - **DSN Parameter Name:** bum
-

spider_bulk_update_size

- **Description:** Size in bytes for `UPDATE` and `DELETE` queries when generating bulk updates.
 - `-1` The [table parameter](#) is adopted.
 - `0` or greater: Size of buffer.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Default Session Value:** `16000`
 - **Default Table Value:** `16000`
 - **Range:** `-1` to `2147483647`
 - **DSN Parameter Name:** `bus`
-

spider_casual_read

- **Description:** Casual Reads enables all isolation levels, (such as repeatable reads) to work with transactions on multiple backends. With auto-commit queries, you can relax read consistency and run on multiple connections to the backends. This enables parallel queries across partitions, even if multiple shards are stored on the same physical server. Deprecated in [MariaDB 11.5](#) due to the complexity of the code for little benefit.
 - `-1` Use [table parameter](#).
 - `0` Use casual read.
 - `1` Choose connection channel automatically.
 - `2` to `63` Number of connection channels.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Default Session Value:** `0`
 - **Default Table Value:** `0`
 - **Range:** `-1` to `63`
 - **DSN Parameter Name:** `##`
 - **Deprecated:** [MariaDB 11.5](#)
-

spider_conn_recycle_mode

- **Description:** Connection recycle mode.
 - `0` Disconnect.
 - `1` Recycle by all sessions.
 - `2` Recycle in the same session.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Range:** `0` to `2`
 - **Default Session Value:** `0`
-

spider_conn_recycle_strict

- **Description:** Whether to force the creation of new connections.
 - `1` Don't force.
 - `0` Force new connection
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Default Session Value:** `0`
 - **Range:** `0` to `1`
-

spider_conn_wait_timeout

- **Description:** Max waiting time in seconds for Spider to get a remote connection.
- **Scope:** Global
- **Dynamic:** Yes
- **Data Type:** `numeric`

- **Default Session Value:** 10
 - **Range:** 0 to 1000
 - **Introduced:** [MariaDB 10.3.3](#)
-

`spider_connect_error_interval`

- **Description:** Return same error code until interval passes if connection is failed
 - **Scope:** Global,
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Default Value:** 1
 - **Range:** 0 to 4294967295
-

`spider_connect_mutex`

- **Description:** Whether to serialize remote servers connections (use mutex at connecting). Use this parameter if you get an error or slowdown due to too many connection processes.
 - 0 Not serialized.
 - 1 : Serialized.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** `boolean`
 - **Default Session Value:** 0
-

`spider_connect_retry_count`

- **Description:** Number of times to retry connections that fail due to too many connection processes.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Default Session Value:** 2 (\geq [MariaDB 11.8](#)), 1000 (\leq [MariaDB 11.7](#))
 - **Range:** 0 to 2147483647
-

`spider_connect_retry_interval`

- **Description:** Interval in microseconds for connection failure due to too many connection processes.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Default Session Value:** 1000
 - **Range:** -1 to 9223372036854775807
-

`spider_connect_timeout`

- **Description:** Timeout in seconds to declare remote backend unresponsive when opening a connection. Change for high-latency networks.
 - -1 The [table parameter](#) is adopted.
 - 0 Less than 1.
 - 1 and greater: Number of seconds.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Default Session Value:** 6
 - **Default Table Value:** 0
 - **Range:** -1 to 2147483647
 - **DSN Parameter Name:** `cto`
-

`spider_crd_bg_mode`

- **Description:** Indexes cardinality statistics in the background. Disable when the `spider_crd_mode` system variable is set to `3` or when the `spider_crd_interval` variable is set to `0`.
 - `-1` Falls back to the default value, if the `table parameter` [↗](#) is not set.
 - `0` Disables background confirmation.
 - `2` Enables background confirmation.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Default Session Value:** `2`
 - **Default Table Value:** `1`
 - **Range:** `-1` to `2`
 - **DSN Parameter Name:** `cbm`
-

`spider_crd_interval`

- **Description:** Time interval in seconds of index cardinality statistics. Set to `0` to always get the latest information from remote servers.
 - `-1` The `table parameter` [↗](#) is adopted.
 - `1` or more: Interval in seconds table state confirmation.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Default Session Value:** `51`
 - **Default Table Value:** `51`
 - **Range:** `-1` to `2147483647`
 - **DSN Parameter Name:** `civ`
-

`spider_crd_mode`

- **Description:** Mode for index cardinality statistics. By default, uses `SHOW` at the table-level.
 - `-1,0` Uses the `table parameter` [↗](#).
 - `1` Uses the `SHOW` command.
 - `2` Uses the Information Schema.
 - `3` Uses the `EXPLAIN` command.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Default Session Value:** `1`
 - **Default Table Value:** `1`
 - **Range:** `-1` to `3`
 - **DSN Parameter Name:** `cmd`
 - **Deprecated:** [MariaDB 10.7.4 ↗](#), [MariaDB 10.8.3 ↗](#)
-

`spider_crd_sync`

- **Description:** Synchronize index cardinality statistics in partitioned tables.
 - `-1` Falls back to the default value, if the `table parameter` [↗](#) is not set.
 - `0` Disables synchronization.
 - `1` Uses table state synchronization when opening a table, but afterwards performs no synchronization.
 - `2` Enables synchronization.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Default Session Value:** `0`
 - **Default Table Value:** `0`
 - **Range:** `-1` to `2`
 - **DSN Parameter Name:** `csy`
-

`spider_crd_type`

- **Description:** Type of cardinality calculation. Only effective when the [spider_crd_mode](#) system variable is set to use `SHOW (1)` or to use the Information Schema (`2`).
 - `-1` Falls back to the default value, if the [table parameter](#) is not set.
 - `0` Uses the value of the [spider_crd_weight](#) system variable, as a fixed value.
 - `1` Uses the value of the [spider_crd_weight](#) system variable, as an addition value.
 - `2` Uses the value of the [spider_crd_weight](#) system variable, as a multiplication value.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Default Session Value:** `2`
 - **Default Table Value:** `2`
 - **Range:** `-1` to `2`
 - **DSN Parameter Name:** `ctp`
 - **Deprecated:** [MariaDB 10.7.4](#), [MariaDB 10.8.3](#)
-

`spider_crd_weight`

- **Description:** Weight coefficient used to calculate effectiveness of index from the cardinality of column. For more information, see the description for the [spider_crd_type](#) system variable.
 - `-1` Falls back to the default value, if the [table parameter](#) is not set.
 - `0` or greater: Weight.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Default Session Value:** `2`
 - **Default Table Value:** `2`
 - **Range:** `-1` to `2147483647`
 - **DSN Parameter Name:** `cwg`
 - **Deprecated:** [MariaDB 10.7.4](#), [MariaDB 10.8.3](#)
-

`spider_delete_all_rows_type`

- **Description:** The type of `delete_all_rows`.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Default Session Value:** `1`
 - **Range:** `-1` to `1`
-

`spider_direct_dup_insert`

- **Description:** Manages duplicate key check for [REPLACE](#), [INSERT IGNORE](#) and [LOAD DATA LOCAL INFILE](#) to remote servers. This can save on network roundtrips if the key always maps to a single partition. For bulk operations, records are checked for duplicate key errors one by one on the remote server, unless you set it to avoid duplicate checks on local servers (`1`).
 - `-1` Falls back to the default value, if the [table parameter](#) is not set.
 - `0` Performs duplicate checks on the local server.
 - `1` Avoids duplicate checks on the local server.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Default Session Value:** `0`
 - **Default Table Value:** `0`
 - **Range:** `-1` to `1`
 - **DSN Parameter Name:** `ddi`
-

`spider_direct_order_limit`

- **Description:** Pushes `ORDER BY` and `LIMIT` operations to the remote server.
 - `-1` Falls back to the default value, if the [table parameter](#) is not set.

- 0 Uses local execution.
 - 1 Uses push down execution.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Default Session Value:** 2
 - **Default Table Value:** 9223372036854775807
 - **Range:** -1 to 9223372036854775807
 - **DSN Parameter Name:** `do1`
-

`spider_disable_group_by_handler`

- **Description:** Whether to disable the spider group by handler, which if created takes over the query execution after query optimization is done.
 - `OFF` Does not disable the spider group by handler.
 - `ON` Disables the spider group by handler.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** `boolean`
 - **Default Value:** `OFF`
 - **Introduced:** [MariaDB 10.10.7](#)
-

`spider_dry_access`

- **Description:** Simulates an empty result-set. No queries are sent to the backend. Use for performance tuning.
 - 0 Normal access.
 - 1 All access from Spider to data node is suppressed.
 - **Scope:** Global
 - **Dynamic:** No
 - **Data Type:** `boolean`
 - **Default Value:** `OFF`
-

`spider_error_read_mode`

- **Description:** Sends an empty result-set when reading a backend server raises an error. Useful with applications that don't implement transaction replays.
 - -1 Falls back to the default value, if the [table parameter](#) is not set.
 - 0 Returns an error.
 - 1 Returns an empty result.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Default Session Value:** 0
 - **Default Table Value:** 0
 - **Range:** -1 to 1
 - **DSN Parameter Name:** `erm`
-

`spider_error_write_mode`

- **Description:** Sends an empty result-set when writing to a backend server raises an error. Useful with applications that don't implement transaction replays.
 - -1 Falls back to the default value, if the [table parameter](#) is not set.
 - 0 Returns an error.
 - 1 Returns an empty result-set on error.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Default Session Value:** 0
 - **Default Table Value:** 0
 - **Range:** -1 to 1
 - **DSN Parameter Name:** `ewm`
-

spider_first_read

- **Description:** Number of first read records to start a range scan on the backend server. Spider needs to send the first record. Fetching the second record saves network round-trips, stopping the plan if the backend has a single record. First read and second read are used to warm up for background searches, third reads without using the [spider_split_read](#) and [spider_semi_split_read](#) system variables fetches the remaining data source in a single last fetch.
 - -1 Use the [table parameter](#).
 - 0 Usually retrieves records.
 - 1 and greater: Sets the number of first read records.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** numeric
 - **Default Session Value:** 0
 - **Default Table Value:** 2
 - **Range:** -1 to 9223372036854775807
 - **DSN Parameter Name:** frd
-

spider_force_commit

- **Description:** Behavior when error occurs on `XA PREPARE`, `XA COMMIT`, and `XA ROLLBACK` statements.
 - 0 Returns the error.
 - 1 Returns the error when the `xid` doesn't exist, otherwise it continues processing the XA transaction.
 - 2 Continues processing the XA transaction, disregarding all errors.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** numeric
 - **Default Session Value:** 0
 - **Range:** 0 to 2
-

spider_general_log

- **Description:** Whether Spider logs all commands to the General Log. Spider logs error codes according to the [spider_log_result_errors](#) system variable.
 - OFF Logs no commands.
 - ON Logs commands to the General Log.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** boolean
 - **Default Session Value:** OFF
-

spider_ignore_comments

- **Description:** Whether to unconditionally ignore COMMENT and CONNECTION strings without checking whether table options are specified.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** boolean
 - **Default Value:** OFF
 - **Introduced:** [MariaDB 11.3.0](#)
-

spider_index_hint_pushdown

- **Description:** Whether to use pushdown index hints, like `force_index`.
 - 0 Do not use pushdown hints
 - 1 Use pushdown hints
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** boolean
 - **Default Session Value:** OFF
-

- **Introduced:** [MariaDB 10.3.3](#)
-

spider_init_sql_alloc_size

- **Description:** Initial size of the local SQL buffer.
 - -1 Falls back to the default value, if the [table parameter](#) is not set.
 - 0 or greater: Size of the buffer.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** numeric
 - **Default Session Value:** 1024
 - **Default Table Value:** 1024
 - **DSN Parameter Name:** isa
 - **Range:** -1 to 2147483647
 - **Deprecated:** [MariaDB 10.7.5](#), [MariaDB 10.8.4](#), [MariaDB 10.9.2](#)
-

spider_internal_limit

- **Description:** Limits the number of records when acquired from a remote server.
 - -1 The [table parameter](#) is adopted.
 - 0 or greater: Records limit.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** numeric
 - **Default Session Value:** 9223372036854775807
 - **Default Table Value:** 9223372036854775807
 - **Range:** -1 to 9223372036854775807
 - **DSN Parameter Name:** ilm
 - **Deprecated:** [MariaDB 10.7.4](#), [MariaDB 10.8.3](#)
-

spider_internal_offset

- **Description:** Skip records when acquired from the remote server.
 - -1 Falls back to the default value, if the [table parameter](#) is not set.
 - 0 or more : Number of records to skip.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** numeric
 - **Default Session Value:** 0
 - **Default Table Value:** 0
 - **Range:** -1 to 9223372036854775807
 - **DSN Parameter Name:** ios
 - **Deprecated:** [MariaDB 10.7.4](#), [MariaDB 10.8.3](#)
-

spider_internal_optimize

- **Description:** Whether to perform push down operations for [OPTIMIZE TABLE](#) statements.
 - -1 Falls back to the default value, if the [table parameter](#) is not set.
 - 0 Transmitted.
 - 1 Not transmitted.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** numeric
 - **Default Session Value:** 0
 - **Default Table Value:** 0
 - **Range:** -1 to 1
 - **DSN Parameter Name:** iom
-

spider_internal_optimize_local

- **Description:** Whether to transmit to remote servers when [OPTIMIZE TABLE](#) statements are executed on the local server.
 - -1 Falls back to the default value, if the [table parameter](#) is not set.
 - 0 Not transmitted.
 - 1 Transmitted.
 - **Default Session Value:** 0
 - **Default Table Value:** 0
 - **Range:** -1 to 1
 - **DSN Parameter Name:** `io1`
-

`spider_internal_sql_log_off`

- **Description:** Whether to log SQL statements sent to the remote server in the [General Query Log](#).
 - Explicitly setting this system variable to either `ON` or `OFF` causes the Spider node to send a `SET sql_log_off` statement to each of the data nodes using the `SUPER` privilege.
 - -1 Don't know or does not matter; don't send 'SET SQL_LOG_OFF' statement
 - 0 Send 'SET SQL_LOG_OFF 0' statement to data nodes (logs SQL statements to the remote server)
 - 1 Send 'SET SQL_LOG_OFF 1' statement to data nodes (doesn't log SQL statements to the remote server)
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** `numeric` (previously `boolean`)
 - **Range:** -1 to 1
 - **Default Session Value:** -1 (previously `ON`)
-

`spider_internal_unlock`

- **Description:** Whether to transmit unlock tables to the connection of the table used with `SELECT` statements.
 - 0 Not transmitted.
 - 1 Transmitted.
 - **Data Type:** `boolean`
 - **Default Session Value:** 0
-

`spider_internal_xa`

- **Description:** Whether to implement XA at the server- or storage engine-level. When using the server-level, set different values for the [server_id](#) system variable on all server instances to generate different `xid` values.
 - `OFF` Uses the storage engine protocol.
 - `ON` Uses the server protocol.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** `boolean`
 - **Default Session Value:** `OFF`
-

`spider_internal_xa_id_type`

- **Description:** The type of internal_xa id.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Default Session Value:** 0
 - **Range:** -1 to 1
-

`spider_internal_xa_snapshot`

- **Description:** Limitation for reading consistent data on all backend servers when using MariaDB's internal XA implementation and `START TRANSACTION WITH CONSISTENT SNAPSHOT`.
 - 0 Raise error when using a Spider table.
 - 1 Raise error when issued a `START TRANSACTION` statement.
 - 2 Takes a consistent snapshot on each backend, but loses global consistency.

- 3 Starts transactions with XA, but removes `CONSISTENT SNAPSHOT`.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Range:** 0 to 3
 - **Default Session Value:** 0
-

`spider_load_crd_at_startup`

- **Description:** Whether to load CRD from the system table at startup.
 - -1 Use [table parameter](#)
 - 0 Do not load
 - 1 Load
 - **Scope:** Global
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Default Session Value:** 1
 - **Range:** -1 to 1
 - **Introduced:** [MariaDB 10.3.3](#)
 - **Deprecated:** [MariaDB 10.7.4](#), [MariaDB 10.8.3](#)
-

`spider_load_sts_at_startup`

- **Description:** Whether to load STS from the system table at startup.
 - -1 Use [table parameter](#)
 - 0 Do not load
 - 1 Load
 - **Scope:** Global
 - **Dynamic:** Yes
 - **Data Type:** `boolean`
 - **Default Session Value:** 1
 - **Range:** -1 to 1
 - **Introduced:** [MariaDB 10.3.3](#)
 - **Deprecated:** [MariaDB 10.7.4](#), [MariaDB 10.8.3](#)
-

`spider_local_lock_table`

- **Description:** Whether to push `LOCK TABLES` statements down to the remote server.
 - 0 Transmitted.
 - 1 Not transmitted.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** `boolean`
 - **Default Value:** 0
-

`spider_lock_exchange`

- **Description:** Whether to convert `SELECT... LOCK IN SHARE MODE` and `SELECT... FOR UPDATE` statements into a `LOCK TABLE` statement.
 - 0 Not converted.
 - 1 Converted.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** `boolean`
 - **Default Value:** 0
-

`spider_log_result_error_with_sql`

- **Description:** How to log SQL statements with result errors.
 - 0 No log

- 1 Log error
 - 2 Log warning summary
 - 3 Log warning
 - 4 Log info (Added in [MariaDB 10.5.4](#))
 - **Scope:** Global
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Default Value:** 0
 - **Range:** 0 to 4
-

`spider_log_result_errors`

- **Description:** Log results from data nodes to the Spider node in the [Error Log](#). Performs no logging by default.
 - 0 : Logs no errors from data nodes.
 - 1 : Logs errors from data nodes.
 - 2 : Logs errors from data nodes, as well as warning summaries.
 - 3 : Logs errors from data nodes, as well as warning summaries and details.
 - 4 : Logs errors from data nodes, as well as warning summaries and details, and result summaries.
 - **Scope:** Global
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Default Value:** 0
 - **Range:** 0 to 4
-

`spider_low_mem_read`

- **Description:** Whether to use low memory mode when executing queries issued internally to remote servers that return result-sets.
 - -1 Falls back to the default value, if the [table parameter](#) is not set.
 - 0 Doesn't use low memory mode.
 - 1 Uses low memory mode.
 - **Data Type:** `numeric`
 - **Default Session Value:** 1
 - **Default Table Value:** 1
 - **Range:** -1 to 1
-

`spider_max_connections`

- **Description:** Maximum number of connections from Spider to a remote MariaDB servers. Defaults to 0 , which is no limit.
 - **Command-line:** `--spider-max-connections`
 - **Scope:** Global
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Default Session Value:** 0
 - **Range:** 0 to 99999
 - **Introduced:** [MariaDB 10.3.3](#)
-

`spider_max_order`

- **Description:** Maximum number of columns for `ORDER BY` operations.
 - -1 The [table parameter](#) is adopted.
 - 0 and greater: Maximum number of columns.
- **Scope:** Global, Session
- **Dynamic:** Yes
- **Data Type:** `numeric`
- **Default Session Value:** 32767
- **Default Table Value:** 32767
- **Range:** -1 to 32767
- **DSN Parameter Name:** `mod`

spider_multi_split_read

- **Description:** Whether to divide a statement into multiple SQL statements sent to the remote backend server when the optimizer resolves range retrievals to multiple conditions.
 - -1 Falls back to the default value, if the [table parameter](#) is not set.
 - 0 Doesn't divide statements.
 - 1 Divides statements.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** numeric
 - **Default Session Value:** 100
 - **Default Table Value:** 100
 - **Range:** -1 to 2147483647
 - **DSN Parameter Name:** msr
-

spider_net_read_timeout

- **Description:** TCP timeout in seconds to declare remote backend servers unresponsive when reading from a connection. Change for high latency networks.
 - -1 Falls back to the default value, if the [table parameter](#) is not set.
 - 0 Less than 1 second timeout.
 - 1 and greater: Timeout in seconds.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** numeric
 - **Default Session Value:** 600
 - **Default Table Value:** 600
 - **Range:** -1 to 2147483647
 - **DSN Parameter Name:** nrt
-

spider_net_write_timeout

- **Description:** TCP timeout in seconds to declare remote backend servers unresponsive when writing to a connection. Change for high latency networks.
 - -1 The [table parameter](#) is adopted.
 - 0 Less than 1 second timeout.
 - 1 and more: Timeout in seconds.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** numeric
 - **Default Session Value:** 600
 - **Default Table Value:** 600
 - **Range:** -1 to 2147483647
 - **DSN Parameter Name:** nwt
-

spider_ping_interval_at_trx_start

- **Description:** Resets the connection with keepalive timeout in seconds by sending a ping.
 - 0 At every transaction.
 - 1 and greater: Number of seconds.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** numeric
 - **Default Value:** 3600
 - **Range:** 0 to 2147483647
-

spider_quick_mode

- **Description:** Sets the backend query buffering to cache on the remote backend server or in the local buffer.
-

- -1 Falls back to the default value, if the [table parameter](#) is not set.
 - 0 Local buffering, it acquires records collectively with `store_result`.
 - 1 Remote buffering, it acquires records one by one. Interrupts don't wait and recovery on context switch back.
 - 2 Remote buffering, it acquires records one by one. Interrupts wait to the end of the acquisition.
 - 3 Local buffering, uses a temporary table on disk when the result-set is greater than the value of the [spider_quick_page_size](#) system variable.
- **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Default Session Value:** 3
 - **Default Table Value:** 3
 - **Range:** -1 to 3
 - **DSN Parameter Name:** `qmd`
-

`spider_quick_page_byte`

- **Description:** Memory limit by size in bytes in a page when acquired record by record.
 - -1 The [table parameter](#) is used. When `quick_mode` is 1 or 2, Spider stores at least 1 record even if `quick_page_byte` is smaller than 1 record. When `quick_mode` is 3, `quick_page_byte` is used for judging using temporary tables. That is given priority when `spider_quick_page_byte` is set.
 - 0 or greater: Memory limit.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Default Session Value:** 10485760
 - **Range:** -1 to 9223372036854775807
 - **Introduced:** [MariaDB 10.4.3](#), [MariaDB 10.3.13](#)
-

`spider_quick_page_size`

- **Description:** Number of records in a page when acquired record by record.
 - -1 The [table parameter](#) is adopted.
 - 0 or greater: Number of records.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Default Session Value:** 1024 ([>=MariaDB 10.7](#)), -1 ([<= MariaDB 10.6](#))
 - **Default Table Value:** 100
 - **Range:** -1 to 9223372036854775807
 - **DSN Parameter Name:** `qps`
-

`spider_read_only_mode`

- **Description:** Whether to allow writes on Spider tables.
 - -1 Falls back to the default value, if the [table parameter](#) is not set.
 - 0 Allows writes to Spider tables.
 - 1 Makes tables read- only.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Default Session Value:** 0 ([>=MariaDB 10.7](#)), -1 ([<= MariaDB 10.6](#))
 - **Default Table Value:** 0
 - **Range:** -1 to 1
 - **DSN Parameter Name:** `rom`
-

`spider_remote_access_charset`

- **Description:** Forces the specified session [character set](#) when connecting to the backend server. This can improve connection time performance.
- **Scope:** Global, Session
- **Dynamic:** Yes

- **Data Type:** `string`
 - **Default Session Value:** `null`
-

`spider_remote_autocommit`

- **Description:** Sets the auto-commit mode when connecting to backend servers. This can improve connection time performance.
 - `-1` Doesn't change the auto-commit mode.
 - `0` Sets the auto-commit mode to `0`.
 - `1` Sets the auto-commit mode to `1`.
 - **Scope:** Global
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Default Session Value:** `-1`
 - **Range:** `-1` to `1`
-

`spider_remote_default_database`

- **Description:** Sets the local default database when connecting to backend servers. This can improve connection time performance.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** `string`
 - **Default Session Value:** Empty string
-

`spider_remote_sql_log_off`

- **Description:** Sets the `sql_log_off` system variable to use when connecting to backend servers.
 - `-1` Doesn't set the value.
 - `0` Doesn't log Spider SQL statements to remote backend servers.
 - `1` Logs SQL statements on remote backend
 - **Scope:** Global
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Default Session Value:** `-1`
 - **Range:** `-1` to `1`
-

`spider_remote_time_zone`

- **Description:** Forces the specified [time zone](#) setting when connecting to backend servers. This can improve connection performance when you know the time zone.
 - **Scope:** Global
 - **Dynamic:** Yes
 - **Data Type:** `string`
 - **Default Session Value:** `null`
-

`spider_remote_trx_isolation`

- **Description:** Sets the [Transaction Isolation Level](#) when connecting to the backend server.
 - `-1` Doesn't set the Isolation Level.
 - `0` Sets to the `READ UNCOMMITTED` level.
 - `1` Sets to the `READ COMMITTED` level.
 - `2` Sets to the `REPEATABLE READ` level.
 - `3` Sets to the `SERIALIZABLE` level.
 - **Scope:** Global
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Default Session Value:** `-1`
 - **Range:** `-1` to `3`
-

spider_remote_wait_timeout

- **Description:** Wait timeout in seconds on remote server. -1 means not set.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** numeric
 - **Default Value:** -1
 - **Range:** -1 to 2147483647
 - **Introduced:** [MariaDB 10.4.5](#)
-

spider_reset_sql_alloc

- **Description:** Resets the per connection SQL buffer after an SQL statement executes.
 - -1 Falls back to the default value, if the [table parameter](#) is not set.
 - 0 Doesn't reset.
 - 1 Resets.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** numeric
 - **Default Session Value:** 1
 - **Default Table Value:** 1
 - **Range:** -1 to 1
 - **DSN Parameter Name:** `rsa`
-

spider_same_server_link

- **Description:** Enables the linking of a table to the same local instance.
 - 0 Disables linking.
 - 1 Enables linking.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** boolean
 - **Default Session Value:** OFF
-

spider_second_read

- **Description:** Number of second read records on the backend server when the first records are found from the first read. Spider continues scanning a range, adding a `LIMIT` using the [spider_first_read](#) and [spider_second_read](#) variables.
 - -1 Falls back to the default value, if the [table parameter](#) is not set.
 - 0 Usually retrieves records.
 - 1 and greater: Number of records.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Default Session Value:** 0
 - **Default Table Value:** 0
 - **Range:** -1 to 9223372036854775807
 - **DSN Parameter Name:** `srd`
-

spider_select_column_mode

- **Description:** Mode for column retrieval from remote backend server.
 - -1 Falls back to the default value, if the [table parameter](#) is not set.
 - 0 Uses index columns when the `SELECT` statement can resolve with an index, otherwise uses all columns.
 - 1 Uses all columns judged necessary to resolve the query.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** numeric
 - **Default Session Value:** 1
 - **Default Table Value:** 1
 - **Range:** -1 to 1
-

- **DSN Parameter Name:** scm
-

spider_selupd_lock_mode

- **Description:** Local lock mode on `INSERT SELECT`.
 - -1 Falls back to the default value, if the [table parameter](#) is not set.
 - 0 Takes no locks.
 - 1 Takes shared locks.
 - 2 Takes exclusive locks.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** numeric
 - **Default Session Value:** 1
 - **Default Table Value:** 1
 - **Range:** -1 to 2
 - **DSN Parameter Name:** slm#
-

spider_semi_split_read

- **Description:** Whether to use chunk retrieval with offset and limit parameters on SQL statements sent to the remote backend server when using the [spider_split_read](#) system variable.
 - -1 Falls back to the default value, if the [table parameter](#) is not set.
 - 0 Doesn't use chunk retrieval.
 - 1 or more Uses chunk retrieval.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** numeric
 - **Default Session Value:** 2
 - **Default Table Value:** 2
 - **Range:** -1 to 2147483647
 - **DSN Parameter Name:** ssr#
-

spider_semi_split_read_limit

- **Description:** Sets the limit value for the [spider_semi_split_read](#) system variable.
 - -1 Falls back to the default value, if the [table parameter](#) is not set.
 - 0 or more: The limit value.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** numeric
 - **Default Session Value:** 9223372036854775807
 - **Default Table Value:** 9223372036854775807
 - **Range:** -1 to 9223372036854775807
 - **DSN Parameter Name:** ssl#
-

spider_semi_table_lock

- **Description:** Enables semi-table locking. This adds a [LOCK TABLES](#) statement to SQL executions sent to the remote backend server when using non-transactional storage engines to preserve consistency between roundtrips.
 - 0 Disables semi-table locking.
 - 1 Enables semi-table locking.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** numeric
 - **Default Session Value:** 0 ([>=MariaDB 10.8](#)), 1 ([<= MariaDB 10.7](#))
 - **Range:** 0 to 1
 - **DSN Parameter Name:** stl#
-

spider_semi_table_lock_connection

- **Description:** Whether to use multiple connections with semi-table locking. To enable semi-table locking, use the [spider_semi_table_lock](#) system variable.
 - -1 Falls back to the default value, if the [table parameter](#) is not set.
 - 0 Uses the same connection.
 - 1 Uses different connections.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** numeric
 - **Default Session Value:** 1
 - **Default Table Value:** 1
 - **Range:** -1 to 1
 - **DSN Parameter Name:** stc#
-

spider_semi_trx

- **Description:** Enables semi-transactions. This controls transaction consistency when an SQL statement is split into multiple statements issued to the backend servers. You can preserve or relax consistency as need. Spider encapsulates auto-committed SQL statements within a transaction on the remote backend server. When using `READ COMMITTED` or `READ UNCOMMITTED` [transaction isolation levels](#) to force consistency, set the [spider_semi_trx_isolation](#) system variable to 2 .
 - 0 Disables semi-transaction consistency.
 - 1 Enables semi-transaction consistency.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** boolean
 - **Default Session Value:** ON
-

spider_semi_trx_isolation

- **Description:** Set consistency during range SQL execution when [spider_sync_trx_isolation](#) is 1
 - -1 OFF
 - 0 READ UNCOMMITTED
 - 1 READ COMMITTED
 - 2 REPEATABLE READ
 - 3 SERIALIZABLE
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** numeric
 - **Default Session Value:** -1
 - **Range:** -1 to 3
-

spider_skip_default_condition

- **Description:** Whether to compute condition push downs.
 - -1 Falls back to the default value, if the [table parameter](#) is not set.
 - 0 Computes condition push downs.
 - 1 Doesn't compute condition push downs.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** numeric
 - **Default Session Value:** 0
 - **Default Table Value:** 0
 - **Range:** -1 to 1
 - **DSN Parameter Name:** sdc
-

spider_skip_parallel_search

- **Description:** Whether to skip parallel search by specific conditions.
 - -1 :use [table parameter](#)
 - 0 :not skip

- 1 :skip parallel search if query is not SELECT statement
 - 2 :skip parallel search if query has SQL_NO_CACHE
 - 3 :1+2
 - **Commandline:** `--spider-skip-parallel-search=#`
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Default Session Value:** 0
 - **Range:** -1 to 3
 - **Introduced:** [MariaDB 10.3.3](#)
-

`spider_slave_trx_isolation`

- **Description:** Transaction isolation level when Spider table is used by slave SQL thread.
 - -1 off
 - 0 read uncommitted
 - 1 read committed
 - 2 repeatable read
 - 3 serializable
 - **Commandline:** `--spider-slave-trx-isolation=#`
 - **Scope:** Global
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Default Session Value:** -1
 - **Range:** -1 to 3
 - **Introduced:** [MariaDB 10.4.3](#), [MariaDB 10.3.13](#)
-

`spider_split_read`

- **Description:** Number of records in chunk to retry the result when a range query is sent to remote backend servers.
 - -1 Falls back to the default value, if the [table parameter](#) is not set.
 - 0 or more: Number of records.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Default Session Value:** 9223372036854775807
 - **Default Table Value:** 9223372036854775807
 - **Range:** -1 to 9223372036854775807
 - **DSN Parameter Name:** `srd`
-

`spider_store_last_crd`

- **Description:** Whether to store last CRD result in the system table.
 - -1 Use [table parameter](#).
 - 0 Do not store last CRD result in the system table.
 - 1 Store last CRD result in the system table.
 - **Commandline:** `--spider-store-last-crd=#`
 - **Scope:** Global
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Default Session Value:** 1
 - **Range:** -1 to 1
 - **Introduced:** [MariaDB 10.3.3](#)
 - **Deprecated:** [MariaDB 10.7.4](#), [MariaDB 10.8.3](#)
-

`spider_store_last_sts`

- **Description:** Whether to store last STS result in the system table.
 - -1 Use [table parameter](#).
 - 0 Do not store last STS result in the system table.

- 1 Store last STS result in the system table.
 - **Commandline:** `--spider-store-last-sts=#`
 - **Scope:** Global
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Default Session Value:** 1
 - **Range:** -1 to 1
 - **Introduced:** [MariaDB 10.3.3](#)
 - **Deprecated:** [MariaDB 10.7.4](#), [MariaDB 10.8.3](#)
-

`spider_strict_group_by`

- **Description:** Whether to use columns in select clause strictly for group by clause
 - -1 Use the [table parameter](#).
 - 0 Do not strictly use columns in select clause for group by clause
 - 1 Use columns in select clause strictly for group by clause
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Default Session Value:** 1
 - **Range:** -1 to 1
 - **Introduced:** [MariaDB 10.5.4](#)
-

`spider_sts_bg_mode`

- **Description:** Enables background confirmation for table statistics. When background confirmation is enabled, Spider uses one thread per partition to maintain table status. Disable when the [spider_sts_interval](#) system variable is set to 0, which causes Spider to always retrieve the latest information as need. It is effective, when the [spider_sts_interval](#) system variable is set to 10.
 - -1 Falls back to the default value, if the [table parameter](#) is not set.
 - 0 Disables background confirmation.
 - 1 Enables background confirmation (create thread per table/partition).
 - 2 Enables background confirmation (use static threads). (from MariaDB 10.)
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Default Session Value:** 2
 - **Range:** -1 to 2
 - **DSN Parameter Name:** `sbm`
-

`spider_sts_interval`

- **Description:** Time interval of table statistics from the remote backend servers.
 - -1 Falls back to the default value, if the [table parameter](#) is not set.
 - 0 Retrieves the latest table statistics on request.
 - 1 or more: Interval in seconds for table state confirmation.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Default Session Value:** 10
 - **Default Table Value:** 10
 - **Range:** -1 to 2147483647
 - **DSN Parameter Name:** `siv`
-

`spider_sts_mode`

- **Description:** Table statistics mode. Mode for table statistics. The `SHOW` command is used at the table level default.
 - -1,0 Uses the [table parameter](#).
 - 1 Uses the `SHOW` command.
 - 2 Uses the Information Schema.
 - **Scope:** Global, Session
-

- **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Default Session Value:** 1
 - **Default Table Value:** 1
 - **Range:** -1 to 2
 - **DSN Parameter Name:** `smd`
 - **Deprecated:** [MariaDB 10.7.4](#), [MariaDB 10.8.3](#)
-

`spider_sts_sync`

- **Description:** Synchronizes table statistics in partitioned tables.
 - -1 Falls back to the default value, if the [table parameter](#) is not set.
 - 0 Doesn't synchronize table statistics in partitioned tables.
 - 1 Synchronizes table state when opening a table, doesn't synchronize after opening.
 - 2 Synchronizes table statistics.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Default Session Value:** 0
 - **Default Table Value:** 0
 - **Range:** -1 to 2
 - **DSN Parameter Name:** `ssy`
-

`spider_support_xa`

- **Description:** XA Protocol for mirroring and for multi-shard transactions.
 - 1 Enables XA Protocol for these Spider operations.
 - 0 Disables XA Protocol for these Spider operations.
 - **Scope:** Global
 - **Dynamic:** No
 - **Data Type:** `boolean`
 - **Default Table Value:** 1
-

`spider_suppress_comment_ignored_warning`

- **Description:** Whether to suppress warnings that table COMMENT or CONNECTION strings are ignored due to specified table options.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** `boolean`
 - **Default Value:** OFF
 - **Introduced:** [MariaDB 11.3.0](#)
-

`spider_sync_autocommit`

- **Description:** Whether to push down local auto-commits to remote backend servers.
 - OFF Pushes down local auto-commits.
 - ON Doesn't push down local auto-commits.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** `boolean`
 - **Default Session Value:** ON
-

`spider_sync_sql_mode`

- **Description:** Whether to sync [sql_mode](#).
 - OFF No sync
 - ON Sync
- **Scope:** Global, Session
- **Dynamic:** Yes

- **Data Type:** `boolean`
 - **Default Value:** `ON`
 - **Introduced:** [MariaDB 10.4.7](#)
-

`spider_sync_time_zone`

- **Description:** Whether to push the local time zone down to remote backend servers.
 - `OFF` Doesn't synchronize time zones.
 - `ON` Synchronize time zones.
 - **Scope:** Global
 - **Dynamic:** Yes
 - **Data Type:** `boolean`
 - **Default Session Value:** `OFF`
 - **Removed:** [MariaDB 10.3.9](#)
-

`spider_sync_trx_isolation`

- **Description:** Pushes local transaction isolation levels down to remote backend servers.
 - `OFF` Doesn't push down local isolation levels.
 - `ON` Pushes down local isolation levels.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** `boolean`
 - **Default Session Value:** `ON`
-

`spider_table_crd_thread_count`

- **Description:** Static background thread count of table `crd`.
 - **Commandline:** `--spider-table-crd-thread-count=#`
 - **Scope:** Global
 - **Dynamic:** No
 - **Data Type:** `numeric`
 - **Default Value:**
 - `1` (`>=` [MariaDB 10.4.33](#), [MariaDB 10.5.24](#), [MariaDB 10.6.17](#), [MariaDB 10.11.7](#), [MariaDB 11.0.5](#), [MariaDB 11.1.4](#), [MariaDB 11.2.3](#))
 - `10` (`<=` [MariaDB 10.4.32](#), [MariaDB 10.5.23](#), [MariaDB 10.6.16](#), [MariaDB 10.11.6](#), [MariaDB 11.0.4](#), [MariaDB 11.1.3](#), [MariaDB 11.2.2](#))
 - **Range:** `1` to `4294967295`
 - **Deprecated:** [MariaDB 11.7](#)
-

`spider_table_init_error_interval`

- **Description:** Interval in seconds where the same error code is returned if table initialization fails. Use to protect against infinite loops in table links.
 - **Scope:** Global
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Default Value:** `1`
 - **Range:** `0` to `4294967295`
-

`spider_table_sts_thread_count`

- **Description:** Static background thread count of table `sts`.
 - **Commandline:** `--spider-table-sts-thread-count=#`
 - **Scope:** Global
 - **Dynamic:** No
 - **Data Type:** `numeric`
 - `1` (`>=` [MariaDB 10.4.33](#), [MariaDB 10.5.24](#), [MariaDB 10.6.17](#), [MariaDB 10.11.7](#), [MariaDB 11.0.5](#), [MariaDB 11.1.4](#), [MariaDB 11.2.3](#))
 - `10` (`<=` [MariaDB 10.4.32](#), [MariaDB 10.5.23](#), [MariaDB 10.6.16](#), [MariaDB 10.11.6](#), [MariaDB 11.0.4](#),
-

- **Range:** 1 to 4294967295
 - **Deprecated:** [MariaDB 11.7](#)
-

spider_udf_ct_bulk_insert_interval

- **Description:** Interval in milliseconds between bulk inserts at copying. For use with the UDF `spider_copy_tables`, which copies table data linked to a Spider table from the source server to destination server using bulk insert. If this interval is 0, it may cause higher write traffic.
 - -1 Uses the UDF parameter.
 - 0 and more: Time in milliseconds.
 - **Scope:** Global
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Default Value:** 10
 - **Default Table Value:** 10
 - **Range:** -1 to 2147483647
 - **Deprecated:** [MariaDB 10.7.4](#), [MariaDB 10.8.3](#)
 - **Removed:** [MariaDB 10.10](#)
-

spider_udf_ct_bulk_insert_rows

- **Description:** Number of rows to insert at a time when copying during bulk inserts.
 - -1, 0: Uses the [table parameter](#).
 - 1 and more: Number of rows
 - **Scope:** Global
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Default Value:** 100
 - **Default Table Value:** 100
 - **Range:** -1 to 9223372036854775807
 - **Deprecated:** [MariaDB 10.7.4](#), [MariaDB 10.8.3](#)
 - **Removed:** [MariaDB 10.10](#)
-

spider_udf_ds_bulk_insert_rows

- **Description:** Number of rows inserted at a time during bulk inserts when the result-set is stored in a temporary table on executing a UDF.
 - -1, 0 Uses the UDF parameter.
 - 1 or more: Number of rows
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Default Value:** 3000
 - **Default Table Value:** 3000
 - **Range:** -1 to 9223372036854775807
 - **Deprecated:** [MariaDB 10.7.4](#), [MariaDB 10.8.3](#)
 - **Removed:** [MariaDB 10.10](#)
-

spider_udf_ds_table_loop_mode

- **Description:** Whether to store the result-set in the same temporary table when the temporary table list count for UDF is less than the result-set count on UDF execution.
 - -1 Falls back to the default value, if the [table parameter](#) is not set.
 - 0 Drops records.
 - 1 Inserts the last table.
 - 2 Inserts the first table and loops again.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Default Value:** 0
-

- **Range:** -1 to 2
 - **Deprecated:** [MariaDB 10.7.4](#), [MariaDB 10.8.3](#)
 - **Removed:** [MariaDB 10.10](#)
-

spider_udf_ds_use_real_table

- **Description:** Whether to use real table for temporary table list.
 - -1 Use UDF parameter.
 - 0 Do not use real table.
 - 1 Use real table.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** numeric
 - **Default Value:** 0
 - **Range:** -1 to 1
 - **Deprecated:** [MariaDB 10.7.4](#), [MariaDB 10.8.3](#)
 - **Removed:** [MariaDB 10.10](#)
-

spider_udf_table_lock_mutex_count

- **Description:** Mutex count of table lock for Spider UDFs.
- **Scope:** Global
- **Dynamic:** No
- **Data Type:** numeric
- **Default Value:** 20
- **Range:** 1 to 4294967295
- **Removed:** [MariaDB 10.10](#)

spider_udf_table_mon_mutex_count

- **Description:** Mutex count of table mon for Spider UDFs.
 - **Scope:** Global
 - **Dynamic:** No
 - **Data Type:** numeric
 - **Default Value:** 20
 - **Range:** 1 to 4294967295
 - **Removed:** [MariaDB 10.10](#)
-

spider_use_all_conns_snapshot

- **Description:** Whether to pass `START TRANSACTION WITH SNAPSHOT` statements to all connections.
 - OFF Doesn't pass statement to all connections.
 - ON Passes statement to all connections.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** boolean
 - **Default Session Value:** OFF
-

spider_use_cond_other_than_pk_for_update

- **Description:** Whether to use all conditions even if condition has a primary key.
 - 0 Don't use all conditions
 - 1 Use all conditions
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** numeric
 - **Default Value:** 1
 - **Range:** 0 to 1
 - **Introduced:** [MariaDB 10.3.13](#), [MariaDB 10.4.3](#)
-

spider_use_consistent_snapshot

- **Description:** Whether to push a local `START TRANSACTION WITH CONSISTENT` statement down to remote backend servers.
 - `OFF` Doesn't push the local statement down.
 - `ON` Pushes the local statement down.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** `boolean`
 - **Default Value:** `OFF`
-

spider_use_default_database

- **Description:** Whether to use the default database.
 - `OFF` Doesn't use the default database.
 - `ON` Uses the default database.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** `boolean`
 - **Default Value:** `ON`
-

spider_use_flash_logs

- **Description:** Whether to push `FLUSH LOGS` statements down to remote backend servers.
 - `OFF` Doesn't push the statement down.
 - `ON` Pushes the statement down.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** `boolean`
 - **Default Value:** `OFF`
-

spider_use_handler

- **Description:** Converts `HANDLER` SQL statements. When the `spider_sync_trx_isolation` system variable is set to `0`, Spider disables `HANDLER` conversions to prevent use of the statement on the `SERIALIZABLE` isolation level.
 - `-1` Falls back to the default value, if the `table parameter` [🔗](#) is not set.
 - `0` Converts `HANDLER` statements into `SELECT` statements.
 - `1` Passes `HANDLER` to the remote backend server.
 - `2` Converts SQL statements to `HANDLER` statements.
 - `3` Converts SQL statements to `HANDLER` statements and `HANDLER` statements to SQL statements.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Default Value:** `0`
 - **Default Table Value:** `0`
 - **Range:** `-1` to `3`
 - **DSN Parameter Name:** `uhd`
 - **Deprecated:** [MariaDB 10.7.4](#) [🔗](#), [MariaDB 10.8.3](#) [🔗](#)
 - **Removed:** [MariaDB 10.10](#)
-

spider_use_pushdown_udf

- **Description:** When using a UDF function in a condition and the `engine_condition_pushdown` system variable is set to `1`, whether to execute the UDF function locally or push it down.
 - `-1` Falls back to the default value, if the `table parameter` [🔗](#) is not set.
 - `0` Doesn't transmit the UDF
 - `1` Transmits the UDF.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Default Value:** `-1`
-

- **Default Table Value:** 1
 - **Range:** -1 to 1
 - **DSN Parameter Name:** upu
-

spider_use_snapshot_with_flush_tables

- **Description:** Whether to encapsulate [FLUSH LOGS](#) and [UNLOCK TABLES](#) statements when `START TRANSACTION WITH CONSISTENT` and `FLUSH TABLE WITH READ LOCK` statements are sent to the remote backend servers.
 - 0 : No encapsulation.
 - 1 : Encapsulates, only when the `spider_use_all_conns_snapshot` system variable is set to 1.
 - 2 : Synchronizes the snapshot using a [LOCK TABLES](#) statement and `[flush|FLUSH TABLES]]` at the XA transaction level. This is only effective when the `spider_use_all_cons_snapshot` system variable is set to 1.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** numeric
 - **Default Value:** 0
 - **Range:** 0 to 2
-

spider_use_table_charset

- **Description:** Whether to use the local table [character set](#) for the remote backend server connections.
 - -1 Falls back to the default value, if the [table parameter](#) [is not set](#).
 - 0 Use `utf8`.
 - 1 Uses the table character set.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** numeric
 - **Default Value:** 1
 - **Default Table Value:** 1
 - **Range:** -1 to 1
 - **DSN Parameter Name:** utc
-

spider_version

- **Description:** The current Spider version. Removed in [MariaDB 10.9.2](#) [when the Spider version number was matched with the server version](#).
 - **Scope:** Global
 - **Dynamic:** No
 - **Data Type:** string
 - **Removed:** [MariaDB 10.9.2](#) [when the Spider version number was matched with the server version](#)
-

spider_wait_timeout

- **Description:** Wait timeout in seconds of setting to remote server. -1 means not set.
 - **Scope:** Global, Session
 - **Dynamic:** Yes
 - **Data Type:** numeric
 - **Default Value:** 604800
 - **Range:** -1 to 2147483647
 - **Introduced:** [MariaDB 10.4.5](#) [when the Spider version number was matched with the server version](#)
-

spider_xa_register_mode

- **Description:** Mode of XA transaction register into system table.
 - 0 Register all XA transactions
 - 1 Register only write XA transactions
- **Command-line:** `--spider-xa-register-mode=#`
- **Scope:** Global, Session
- **Dynamic:** Yes

- **Data Type:** numeric
- **Default Value:** 1
- **Range:** 0 to 1
- **Introduced:** [MariaDB 10.3.3](#)
- **Deprecated:** [MariaDB 10.7.4](#), [MariaDB 10.8.3](#)

5.3.19.8 Spider Table Parameters

When a table uses the [Spider](#) storage engine, the following Spider table parameters can be set in the `COMMENT` clause of the `CREATE TABLE` statement. Many Spider table parameters have corresponding system variables, so they can be set for all Spider tables on the node. For additional information, see the [Spider System Variables](#) page.

From [MariaDB 11.3](#), many table parameters can be set using dedicated Spider table options, see the Table Option Name fields below. From [MariaDB 11.4](#), using the `COMMENT` clause is deprecated, as well as table parameters that do not have corresponding table options.

`access_balances`

- **Description:** Connection load balancing integer weight.

- **Default Table Value:** 0
- **DSN Parameter Name:** `abl`
- **Deprecated:** [MariaDB 11.4.0](#)

`active_link_count`

- **Description:** Number of active remote servers, for use in load balancing read connections
- **Default Table Value:** `all backends`
- **DSN Parameter Name:** `alc`
- **Deprecated:** [MariaDB 11.4.0](#)

`auto_increment_mode`

- **Description:** The table level value of [spider_auto_increment_mode](#)
- **Table Option Name:** `AUTO_INCREMENT_MODE`
- **Table Option Introduced:** [MariaDB 11.3.0](#) [↗](#)

`bgs_mode`

- **Description:** The table level value of [spider_bgs_mode](#).
- **Table Option Name:** `BGS_MODE`
- **Table Option Introduced:** [MariaDB 11.3.0](#) [↗](#)

`bulk_size`

- **Description:** The table level value of [spider_bulk_size](#).
- **Table Option Name:** `BULK_SIZE`
- **Table Option Introduced:** [MariaDB 11.3.0](#) [↗](#)

`bulk_update_size`

- **Description:** The table level value of [spider_bulk_update_size](#).
- **Table Option Name:** `BULK_UPDATE_SIZE`
- **Table Option Introduced:** [MariaDB 11.3.0](#) [↗](#)

`casual_read`

- **Description:**
- **Default Table Value:**
- **DSN Parameter Name:**
- **Introduced:** Spider 3.2
- **Deprecated:** [MariaDB 11.4.0](#)

`connect_timeout`

- **Description:** The table level value of [spider_connect_timeout](#).
- **Table Option Name:** `CONNECT_TIMEOUT`
- **Table Option Introduced:** [MariaDB 11.3.0](#) [↗](#)

`database`

- **Description:** Database name for reference table that exists on remote backend server.
- **Default Table Value:** `local table database`
- **DSN Parameter Name:** `database`
- **Table Option Name:** `REMOTE_DATABASE`
- **Table Option Introduced:** [MariaDB 10.8.0](#) [↗](#)

`default_file`

- **Description:** Configuration file used when connecting to remote servers. When the [default_group](#) table variable is set, this variable defaults to the values of the `--defaults-extra-file` or `--defaults-file` options. When the [default_group](#) table variable is not set, it defaults to `none`.
- **Default Table Value:** `none`
- **DSN Parameter Name:** `dff`
- **Table Option Name:** `DEFAULT_FILE`

- **Table Option Introduced:** [MariaDB 11.3.0](#)

default_group

- **Description:** Group name in configuration file used when connecting to remote servers.
- **Default Table Value:** none
- **DSN Parameter Name:** dfg
- **Table Option Name:** DEFAULT_GROUP
- **Table Option Introduced:** [MariaDB 11.3.0](#)

delete_all_rows_type

- **Description:** The table level value of [spider_delete_all_rows_type](#).
- **Introduced:** Spider 3.2
- **Table Option Name:** DELETE_ALL_ROWS_TYPE
- **Table Option Introduced:** [MariaDB 11.3.0](#)

force_bulk_delete

- **Description:**
- **Introduced:** [MariaDB 10.0.5](#)
- **Table Option Name:** FORCE_BULK_DELETE
- **Table Option Introduced:** [MariaDB 11.3.0](#)

force_bulk_update

- **Description:**
- **Introduced:** [MariaDB 10.0.5](#)
- **Table Option Name:** FORCE_BULK_UPDATE
- **Table Option Introduced:** [MariaDB 11.3.0](#)

host

- **Description:** Host name of remote server.
- **Default Table Value:** localhost
- **DSN Parameter Name:** host
- **Table Option Name:** REMOTE_HOST
- **Table Option Introduced:** [MariaDB 11.3.0](#)

idx000

- **Description:** When using an index on Spider tables for searching, Spider uses this hint to search the remote table. The remote table index is related to the Spider table index by this hint. The number represented by 000 is the index ID, which is the number of the index shown by the [SHOW CREATE TABLE](#) statement. 000 is the Primary Key. For instance, `idx000 "force index(PRIMARY)"` (in abbreviated format `idx000 "f PRIMARY"`).
 - f force index
 - u use index
 - ig ignore index
- **Default Table Value:** none
- **Table Option Name:** IDX
- **Table Option Introduced:** [MariaDB 11.3.0](#)

link_status

- **Description:** Change status of the remote backend server link.
 - 0 Doesn't change status.
 - 1 Changes status to OK.
 - 2 Changes status to RECOVERY.
 - 3 Changes status to no more in group communication.
- **Default Table Value:** 0
- **DSN Parameter Name:** lst
- **Deprecated:** [MariaDB 11.4.0](#)

monitoring_bg_interval

- **Description:** Interval of background monitoring in microseconds.
- **Default Table Value:** 10000000
- **DSN Parameter Name:** mbi
- **Deprecated:** [MariaDB 11.4.0](#)

monitoring_bg_kind

- **Description:** Kind of background monitoring to use.
 - 0 Disables background monitoring.
 - 1 Monitors connection state.
 - 2 Monitors state of table without `WHERE` clause.
 - 3 Monitors state of table with `WHERE` clause (currently unsupported).
- **Default Table Value:** 0
- **DSN Parameter Name:** mbk
- **Deprecated:** [MariaDB 11.4.0](#)

monitoring_kind

- **Description:** Kind of monitoring.
 - 0 Disables monitoring
 - 1 Monitors connection state.
 - 2 Monitors state of table without `WHERE` clause.
 - 3 Monitors state of table with `WHERE` clause (currently unsupported).
- **Default Table Value:** 0
- **DSN Parameter Name:** mkd
- **Deprecated:** [MariaDB 11.4.0](#)

monitoring_limit

- **Description:** Limits the number of records in the monitoring table. This is only effective when Spider monitors the state of a table, which occurs when the `monitoring_kind` table variable is set to a value greater than 1 .
- **Default Table Value:** 1
- **Range:** 0 upwards
- **DSN Parameter Name:** mlt
- **Deprecated:** [MariaDB 11.4.0](#)

monitoring_server_id

- **Description:** Preferred monitoring `@@server_id` for each backend failure. You can use this to geo-localize backend servers and set the first Spider monitoring node to contact for failover. In the event that this monitor fails, other monitoring nodes are contacted. For multiple copy backends, you can set a lazy configuration with a single MSI instead of one per backend.
- **Default Table Value:** `server_id`
- **DSN Parameter Name:** msi
- **Deprecated:** [MariaDB 11.4.0](#)

multi_split_read

- **Description:** The table level value of `spider_multi_split_read`.
- **Table Option Name:** `MULTI_SPLIT_READ`
- **Table Option Introduced:** [MariaDB 11.3.0](#) 

net_read_timeout

- **Description:** The table level value of `spider_net_read_timeout`.
- **Table Option Name:** `NET_READ_TIMEOUT`
- **Table Option Introduced:** [MariaDB 11.3.0](#) 

net_write_timeout

- **Description:** The table level value of `spider_net_write_timeout`.
- **Table Option Name:** `NET_WRITE_TIMEOUT`
- **Table Option Introduced:** [MariaDB 11.3.0](#) 

password

- **Description:** Remote server password.
- **Default Table Value:** `none`
- **DSN Parameter Name:** `password`
- **Table Option Name:** `REMOTE_PASSWORD`
- **Table Option Introduced:** [MariaDB 11.3.0](#) 

port

- **Description:** Remote server port.
- **Default Table Value:** `3306`
- **DSN Parameter Name:** `port`
- **Table Option Name:** `REMOTE_PORT`
- **Table Option Introduced:** [MariaDB 11.3.0](#) 

priority

- **Description:** Priority. Used to define the order of execution. For instance, Spider uses priority when deciding the order in which to lock tables on a remote server.
- **Default Table Value:** `1000000`
- **DSN Parameter Name:** `prt`
- **Table Option Name:** `PRIORITY`
- **Table Option Introduced:** [MariaDB 11.3.0](#) 

query_cache

- **Description:** Uses the option for the [Query Cache](#) when issuing `SELECT` statements to the remote server.
 - `0` No option used.
 - `1` Uses the `SQL_CACHE` option.
 - `2` Uses the `SQL_NO_CACHE` option.
- **Default Table Value:** `0`
- **DSN Parameter Name:** `qch`
- **Table Option Name:** `QUERY_CACHE`
- **Table Option Introduced:** [MariaDB 11.3.0](#) 

query_cache_sync

- **Description:** A two-bit bitmap. Whether to pass the option for the [Query Cache](#) (if any) when issuing `SELECT` statements to the remote server.
 - `0` No option passed.
 - `1` Passes the `SQL_CACHE` option, if specified in the query to the spider table.
 - `2` Passes the `SQL_NO_CACHE` option, if specified in the query to the spider table.
 - `3` Passes both the `SQL_CACHE` option and the `SQL_NO_CACHE` option, if specified in the query to the spider table.
- **Default Table Value:** `3`
- **Table Option Name:** `QUERY_CACHE_SYNC`
- **Table Option Introduced:** [MariaDB 11.3.0](#) 

read_rate

- **Description:** Rate used to calculate the amount of time Spider requires when executing index scans.
- **Default Table Value:** `0.0002`
- **DSN Parameter Name:** `rrt`
- **Deprecated:** [MariaDB 11.4.0](#)

scan_rate

- **Description:** Rate used to calculate the amount of time Spider requires when scanning tables.
- **Default Table Value:** `0.0001`
- **DSN Parameter Name:** `srt`
- **Deprecated:** [MariaDB 11.4.0](#)

server

- **Description:** Server name. Used when generating connection information with `CREATE SERVER` statements.
- **Default Table Value:** `none`

- **DSN Parameter Name:** `srv`
- **Table Option Name:** `REMOTE_SERVER`
- **Table Option Introduced:** [MariaDB 10.8.0](#) 

`skip_parallel_search`

- **Description:** The table level value of `spider_skip_parallel_search`.
- **Table Option Name:** `SKIP_PARALLEL_SEARCH`
- **Table Option Introduced:** [MariaDB 11.3.0](#) 

`socket`

- **Description:** Remote server socket.
- **Default Table Value:** `none`
- **DSN Parameter Name:** `socket`
- **Table Option Name:** `REMOTE_SOCKET`
- **Table Option Introduced:** [MariaDB 11.3.0](#) 

`ssl_ca`

- **Description:** Path to the Certificate Authority file.
- **Default Table Value:** `none`
- **DSN Parameter Name:** `sca`
- **Table Option Name:** `SSL_CA`
- **Table Option Introduced:** [MariaDB 11.3.0](#) 

`ssl_capath`

- **Description:** Path to directory containing trusted TLS CA certificates in PEM format.
- **Default Table Value:** `none`
- **DSN Parameter Name:** `scp`
- **Table Option Name:** `SSL_CAPATH`
- **Table Option Introduced:** [MariaDB 11.3.0](#) 

`ssl_cert`

- **Description:** Path to the certificate file.
- **Default Table Value:** `none`
- **DSN Parameter Name:** `scr`
- **Table Option Name:** `SSL_CERT`
- **Table Option Introduced:** [MariaDB 11.3.0](#) 

`ssl_cipher`

- **Description:** List of allowed ciphers to use with [TLS encryption](#).
- **Default Table Value:** `none`
- **DSN Parameter Name:** `sch`
- **Table Option Name:** `SSL_CIPHER`
- **Table Option Introduced:** [MariaDB 11.3.0](#) 

`ssl_key`

- **Description:** Path to the key file.
- **Default Table Value:** `none`
- **DSN Parameter Name:** `sky`
- **Table Option Name:** `SSL_KEY`
- **Table Option Introduced:** [MariaDB 11.3.0](#) 

`ssl_verify_server_cert`

- **Description:** Enables verification of the server's Common Name value in the certificate against the host name used when connecting to the server.
 - 0 Disables verification.
 - 1 Enables verification.
- **Default Table Value:** 0

- **DSN Parameter Name:** `svc`
- **Table Option Name:** `SSL_VSC`
- **Table Option Introduced:** [MariaDB 11.3.0](#)

`table`

- **Description:** Destination table name.
- **Default Table Value:** Same table name
- **DSN Parameter Name:** `tbl`
- **Table Option Name:** `REMOTE_TABLE`
- **Table Option Introduced:** [MariaDB 10.8.0](#)

`table_count_mode`

- **Description:** for setting table flags `HA_STATS_RECORDS_IS_EXACT` and `HA_HAS_RECORDS`.
- **Default Table Value:** `0`
- **Table Option Name:** `TABLE_COUNT_MODE`
- **Table Option Introduced:** [MariaDB 11.3.0](#)

`username`

- **Description:** user name for the data node.
- **Default Table Value:** Same user name
- **Table Option Name:** `REMOTE_USERNAME`
- **Table Option Introduced:** [MariaDB 11.3.0](#)

`use_pushdown_udf`

- **Description:** The table level value of `spider_use_pushdown_udf`.
- **Table Option Name:** `USE_PUSHDOWN_UDF`
- **Table Option Introduced:** [MariaDB 11.3.0](#)

`wrapper`

- **Description:** wrapper for the data node.
- **Table Option Name:** `WRAPPER`
- **Table Option Introduced:** [MariaDB 11.3.0](#)

5.3.19.9 Spider Status Variables

Contents

1. [Spider_direct_aggregate](#)
2. [Spider_direct_delete](#)
3. [Spider_direct_order_limit](#)
4. [Spider_direct_update](#)
5. [Spider_mon_table_cache_version](#)
6. [Spider_mon_table_cache_version_req](#)
7. [Spider_parallel_search](#)

The following status variables are associated with the [Spider storage engine](#). See [Server Status Variables](#) for a complete list of status variables that can be viewed with `SHOW STATUS`.

See also the [Full list of MariaDB options, system and status variables](#).

`Spider_direct_aggregate`

- **Description:** Number of times direct aggregate has happened in spider. That is, in a partitioned spider table, instead of scanning individual rows in remote tables corresponding to partitions for aggregation functions like `SUM` and `COUNT`, spider forwards aggregate queries to these tables directly and aggregate the results.
- **Scope:** Global, Session
- **Data Type:** `numeric`

`Spider_direct_delete`

- **Description:**
 - **Scope:** Global, Session
 - **Data Type:** `numeric`
 - **Introduced:** [MariaDB 10.3.3](#) 
-

`Spider_direct_order_limit`

- **Description:**
 - **Scope:** Global, Session
 - **Data Type:** `numeric`
-

`Spider_direct_update`

- **Description:**
 - **Scope:** Global, Session
 - **Data Type:** `numeric`
 - **Introduced:** [MariaDB 10.3.3](#) 
-

`Spider_mon_table_cache_version`

- **Description:** The version of the spider monitoring table cache, always less than or equal to `Spider_mon_table_cache_version_req`. If the inequality is strict, then the cache is refreshed when the spider udf `spider_ping_table` is called. When the cache is refreshed, the value of `Spider_mon_table_cache_version` is brought up to be the same value as `Spider_mon_table_cache_version_req`.
 - **Scope:** Global, Session
 - **Initial value:** 0
 - **Data Type:** `numeric`
-

`Spider_mon_table_cache_version_req`

- **Description:** The required version of the spider monitoring table cache. A call to the spider udf `spider_flush_table_mon_cache` will cause its value to be incremented by one, thus ensuring a refresh of the cache will happen when needed.
 - **Scope:** Global, Session
 - **Initial value:** 1
 - **Data Type:** `numeric`
-

`Spider_parallel_search`

- **Description:**
 - **Scope:** Global, Session
 - **Data Type:** `numeric`
 - **Introduced:** [MariaDB 10.3.3](#)

5.3.19.14 Spider Differences Between SpiderForMySQL and MariaDB

Contents

1. [SQL Syntax](#)
2. [Features](#)

SQL Syntax

- With `SpiderForMySQL`, the `CREATE TABLE` statement uses `CONNECTION` to define spider table variables whereas MariaDB uses `COMMENT`.

Features

- `HANDLER` can not be translated to SQL in MariaDB
- Concurrent background search is not yet implemented in MariaDB
- Vertical partitioning storage engine VP is not implemented in MariaDB
- `CREATE TABLE` can use `table discovery` in MariaDB
- `JOIN` performance improvement using `join_cache_level>1` and `join_buffer_size` in MariaDB

5.3.19.15 Spider Case Studies

A list of users or clients that are using Spider and agree to be referenced:

- Tencent Games. They handle 100TB data on 396 Spider nodes and 2800 data nodes. They use this cluster for their online games.

5.3.19.16 Spider Benchmarks

This is best run on a cluster of 3 nodes intel NUC servers 12 virtual cores model name : Intel® Core(TM) i3-3217U CPU @ 1.80GHz

All nodes have been running a mysqlslap client attached to the local spider node in the best run.

```
/usr/local/skysql/mysql-client/bin/mysqlslap --user=skysql --password=skyvodka --
host=192.168.0.201 --port=5012 -i1000000 -c32 -q "insert into test(c) values('0-31091-
138522330')" --create-schema=test
```

```
spider_conn_recycle_mode=1;
```

The read point select is produce with a 10M rows sysbench table

The write insert a single string into a memory table

Before Engine Condition Push Down patch .

Spider can benefit by 10% additional performance with Independent Storage Engine Statistics.

```
set global use_stat_tables='preferably';
USE backend;
ANALYZE TABLE sbtest;
```

5.3.19.17 Spider FAQ

Contents

1. [What does "\[ERROR\] mysql: Can't find record in 'spider_tables'" mean?](#)
2. [Are there minimum Spider settings?](#)
3. [What does "select spider_ping_table\(\)" in the general log mean?](#)
4. [Do I need a primary key on physical tables?](#)
5. [Can I use Spider on top of Galera shards?](#)
6. [What are the most used architectures for Spider HA?](#)
7. [What are the most used architectures for Spider Map Reduce?](#)
8. [What about Grants on shards?](#)

What does "[ERROR] mysql: Can't find record in 'spider_tables'" mean?

This happens when you have a Spider table defined that does not point to an existing table on a data node.

Are there minimum Spider settings?

```
myisam-recover=FORCE, BACKUP
```

MariaDB until [10.1.1](#)

```
optimizer_switch='engine_condition_pushdown=on'
```

MariaDB until [10.3.7](#)

When using `spider_autoincrement_mode = 0`, partitioned Spider tables work as `spider_autoincrement_mode = 1` see : [MDEV-21404](#)

What does "select spider_ping_table()" in the general log mean?

This is used by Spider monitoring to ask other monitoring nodes the status of a table.

Do I need a primary key on physical tables?

Not having a primary key will generate errors for resynchronizing tables via `spider_copy_table()`.

Can I use Spider on top of Galera shards?

Yes, XA transactions can be disabled from Spider. Until Galera 4.0 fully supports xa transactions, spider can point to a maxscale proxy that can manage transparent node election in case of failure inside a shard group. Note that disabling XA will break cross shard WRITES in case of transaction ROLLBACK. This architecture need to be used with care if you have a highly transactional workload that can generate cross shard deadlocks.

What are the most used architectures for Spider HA?

- Delegation of shard node replication using asynchronous replication and slave election with GTID.
- Delegation of shard node replication via active passive HA solutions.
- Shard builds via replication into Spider tables is interesting when you can route READS to a pool of Spider nodes reattaching the shards.

What are the most used architectures for Spider Map Reduce?

- Map reduce in Spider is limited to a single table. Building spider on top of some views can eliminate the need to use joins.
- Replication to universal tables to every shard is commonly used to enable the views on each shard.

What about Grants on shards?

- When using MRR and BKA (and you do so with network storage), when Spider needs to create temporary tables on the backends, use the CREATE TEMPORARY TABLES privilege. Spider can still switch to a lower performance solution using `spider_bka_mode=2`, or Query push down or range predicate using `spider_bka_mode=0`

Are storage engines designed for MySQL compatible with MariaDB? In most cas...

Engine-defined New Table/Field/Index Attributes

A storage engine can allow the user to specify additional attributes per index, field, or table.

Table Discovery

Mechanism for an engine to tell the server that the table exists

Table Discovery (before 10.0.2)

[This page describes the old discovery API, created in MySQL for NDB Cluste...](#)

There are [1 related questions](#).

5.3.22.1 Storage Engine FAQ

Are storage engines designed for MySQL compatible with MariaDB?

In most cases, yes. MariaDB tries to keep API compatibility with MySQL, even across major versions.

Will storage engines created for MariaDB work in MySQL?

It will mostly work. It would need #ifdef's to adjust to MySQL-5.6 API, for example, for multi-read-range API, for table discovery API, etc. But most of the code will work as is, without any changes.

Do storage engine binaries need to be recompiled for MariaDB?

Yes. You will need to recompile the storage engine against the exact version of MySQL or MariaDB you intend to run it on. This is due to the version of the server being stored in the storage engine binary, and the server will refuse to load it if it was compiled for a different version.

5.3.22.2 Engine-defined New Table/Field/Index Attributes

Contents

- [1. API](#)
- [2. SQL](#)

In MariaDB, a storage engine can allow the user to specify additional attributes per index, field, or table. The engine needs to declare what attributes it introduces.

API

There are three new members in the `handler_ton` structure, they can be set in the engine's initialization function as follows:

```
example_hnton->table_options= example_table_option_array;  
example_hnton->field_options= example_field_option_array;  
example_hnton->index_options= example_index_option_array;
```

The arrays are declared statically, as in the following example:

```

static MYSQL_THDVAR_ULONG(varopt_default, PLUGIN_VAR_RQCMDARG,
    "default value of the VAROPT table option", NULL, NULL, 5, 0, 100, 0);

struct ha_table_option_struct
{
    char *strparam;
    ulonglong ullparam;
    uint enumparam;
    bool boolparam;
    ulonglong varparam;
};

ha_create_table_option example_table_option_list[]=
{
    HA_TOPTION_NUMBER("NUMBER", ullparam, UINT_MAX32, 0, UINT_MAX32, 10),
    HA_TOPTION_STRING("STR", strparam),
    HA_TOPTION_ENUM("ONE_OR_TWO", enumparam, "one,two", 0),
    HA_TOPTION_BOOL("YESNO", boolparam, 1),
    HA_TOPTION_SYSVAR("VAROPT", varopt, varparam),
    HA_TOPTION_END
};

```

The engine declares a structure `ha_table_option_struct` that will hold values of these new attributes.

And it describes these attributes to MySQL by creating an array of `HA_TOPTION_*` macros. Note a detail: these macros expect a structure called `ha_table_option_struct`, if the structure is called differently, a `#define` will be needed.

There are five supported kinds of attributes:

macro name	attribute value type	corresponding C type	additional parameters of a macro
<code>HA_TOPTION_NUMBER</code>	an integer number	unsigned long long	a default value, minimal allowed value, maximal allowed value, a factor, that any allowed should be a multiple of.
<code>HA_TOPTION_STRING</code>	a string	<code>char *</code>	none. The default value is a null pointer.
<code>HA_TOPTION_ENUM</code>	one value from a list of allowed values	unsigned int	a string with a comma-separated list of allowed values, and a default value as a number, starting from 0.
<code>HA_TOPTION_BOOL</code>	a boolean	<code>bool</code>	a default value
<code>HA_TOPTION_SYSVAR</code>	defined by the system variable	defined by the system variable	system variable name

Do not use `enum` for your `HA_TOPTION_ENUM` C structure members, the size of the `enum` depends on the compiler, and even on the compilation options, and the plugin API uses only types with known storage sizes.

In all macros the first two parameters are name of the attribute as should be used in SQL in the `CREATE TABLE` statement, and the name of the corresponding member of the `ha_table_option_struct` structure.

The `HA_TOPTION_SYSVAR` stands aside a bit. It does not specify the attribute type or the default value, instead it binds the attribute to a system variable. The attribute type and the range of allowed values will be the same as of the corresponding system variable. The attribute **default value** will be the **current value** of its system variable. And unlike other attribute types that are only stored in the `.frm` file if explicitly set in the `CREATE TABLE` statement, the `HA_TOPTION_SYSVAR` attributes are always stored. If the system variable value is changed, it will not affect existing tables. Note that for this very reason, if a table was created in the old version of a storage engine, and a new version has introduced a `HA_TOPTION_SYSVAR` attribute, the attribute value in the old tables will be the **default** value of the system variable, not its **current** value.

The array ends with a `HA_TOPTION_END` macro.

Field and index (key) attributes are declared similarly using `HA_FOPTION_*` and `HA_IPTION_*` macros.

When in a `CREATE TABLE` statement, the `::create()` handler method is called, the table attributes are available in the `table_arg->s->option_struct`, field attributes - in the `option_struct` member of the individual fields (objects of the `Field` class), index attributes - in the `option_struct` member of the individual keys (objects of the `KEY` class).

Additionally, they are available in most other handler methods: the attributes are stored in the `.frm` file and on every open MySQL makes them available to the engine by filling the corresponding `option_struct` members of the table, fields, and keys.

The `ALTER TABLE` needs a special support from the engine. MySQL compares old and new table definitions to decide

whether it needs to rebuild the table or not. As the semantics of the engine declared attributes is unknown, MySQL cannot make this decision by analyzing attribute values - this is delegated to the engine. The `HA_CREATE_INFO` structure has three new members:

```
ha_table_option_struct *option_struct;          ///< structure with parsed table options
ha_field_option_struct **fields_option_struct;  ///< array of field option structures
ha_index_option_struct **indexes_option_struct; ///< array of index option structures
```

The engine (in the `::check_if_incompatible_data()` method) is responsible for comparing new values of the attributes from the `HA_CREATE_INFO` structure with the old values from the table and returning `COMPATIBLE_DATA_NO` if they were changed in such a way that requires the table to be rebuilt.

The example of declaring the attributes and comparing the values for the `ALTER TABLE` can be found in the `EXAMPLE` engine.

SQL

The engine declared attributes can be specified per field, index, or table in the `CREATE TABLE` or `ALTER TABLE`. The syntax is the conventional:

```
CREATE TABLE ... (
  field ... [attribute=value [attribute=value ...]],
  ...
  index ... [attribute=value [attribute=value ...]],
  ...
) ... [attribute=value [attribute=value ...]]
```

All values must be specified as literals, not expressions. The value of a boolean option may be specified as one of YES, NO, ON, OFF, 1, or 0. A string value may be specified either quoted or not, as an identifier (if it is a valid identifier, of course). Compare with the old behavior:

```
CREATE TABLE ... ENGINE=FEDERATED CONNECTION='mysql://[email protected]';
```

where the value of the `ENGINE` attribute is specified not quoted, while the value of the `CONNECTION` is quoted.

When an attribute is set, it will be stored with the table definition and shown in the `SHOW CREATE TABLE`;

. To remove an attribute from a table definition use `ALTER TABLE` to set its value to a `DEFAULT`

The values of unknown attributes or attributes with the illegal values cause an error by default. But with `ALTER TABLE` one can change the storage engine and some previously valid attributes may become unknown — to the new engine. They are not removed automatically, though, because the table might be altered back to the first engine, and these attributes will be valid again. Still `SHOW CREATE TABLE` will comment these unknown attributes out in the output, otherwise they would make a generated `CREATE TABLE` statement invalid.

With the `IGNORE_BAD_TABLE_OPTIONS`

`sql mode` this behavior changes. Unknown attributes do not cause an error, they only result in a warning. And `SHOW CREATE TABLE` will not comment them out. This mode is implicitly enabled in the replication slave thread.

5.3.22.3 Table Discovery

In MariaDB it is not always necessary to run an explicit `CREATE TABLE` statement for a table to appear. Sometimes a table may already exist in the storage engine, but the server does not know about it, because there is no `.frm` file for this table. This can happen for various reasons; for example, for a cluster engine the table might have been created in the cluster by another MariaDB server node. Or for the engine that supports table shipping a table file might have been simply copied into the MariaDB data directory. But no matter what the reason is, there is a mechanism for an engine to tell the server that the table exists. This mechanism is called **table discovery** and if an engine wants the server to discover its tables, the engine should support the table discovery API.

Contents

1. Automatic Discovery
 1. handlerton::tablefile_extensions
 2. handlerton::discover_table_names()
 3. handlerton::discover_table_existence()
 4. handlerton::discover_table()
 5. TABLE_SHARE::init_from_binary_frm_image()
 6. TABLE_SHARE::init_from_sql_statement_string()
 7. TABLE_SHARE::read_frm_image()
 8. TABLE_SHARE::free_frm_image()
 9. HA_ERR_TABLE_DEF_CHANGED
 10. TABLE_SHARE::tabledef_version
2. Assisted discovery
 1. handlerton::discover_table_structure()
3. The role of .frm files

There are two different kinds of table discovery — a fully automatic discovery and a user-assisted one. In the former, the engine can automatically discover the table whenever an SQL statement needs it. In MariaDB, the [Archive](#) and [Sequence](#) engines support this kind of discovery. For example, one can copy a `t1.ARZ` file into the database directory and immediately start using it — the corresponding `.frm` file will be created automatically. Or one can select from say, the `seq_1_to_10` table without any explicit `CREATE TABLE` statement.

In the latter, user-assisted, discovery the engine does not have enough information to discover the table all on its own. But it can discover the table structure if the user provides certain additional information. In this case, an explicit `CREATE TABLE` statement is still necessary, but it should contain no table structure — only the table name and the table attributes. In MariaDB, the [FederatedX](#) storage engine supports this. When creating a table, one only needs to specify the `CONNECTION` attribute and the table structure — fields and indexes — will be provided automatically by the engine.

Automatic Discovery

As far as automatic table discovery is concerned, the tables, from the server point of view, may appear, disappear, or change structure anytime. Thus the server needs to be able to ask whether a given table exists and what its structure is. It needs to be notified when a table structure changes outside of the server. And it needs to be able to get a list of all (unknown to the server) tables, for statements like `SHOW TABLES`. The server does all that by invoking specific methods of the `handlerton`:

```
const char **tablefile_extensions;
int (*discover_table_names)(handlerton *hton, LEX_STRING *db, MY_DIR *dir,
                           discovered_list *result);
int (*discover_table_existence)(handlerton *hton, const char *db,
                                const char *table_name);
int (*discover_table)(handlerton *hton, THD* thd, TABLE_SHARE *share);
```

handlerton::tablefile_extensions

Engines that store tables in separate files (one table might occupy many files with different extensions, but having the same base file name) should store the list of possible extensions in the `tablefile_extensions` member of the `handlerton` (earlier this list was returned by the `handler::bas_ext()` method). This will significantly simplify the discovery implementation for these engines, as you will see below.

handlerton::discover_table_names()

When a user asks for a list of tables in a specific database — for example, by using `SHOW TABLES` or by selecting from `INFORMATION_SCHEMA.TABLES` — the server invokes `discover_table_names()` method of the `handlerton`. For convenience this method, besides the database name in question, gets the list of all files in this database directory, so that the engine can look for table files without doing any filesystem i/o. All discovered tables should be added to the `result` collector object. It is defined as

```
class discovered_list
{
public:
    bool add_table(const char *tname, size_t tlen);
    bool add_file(const char *fname);
};
```

and the engine should call `result->add_table()` or `result->add_file()` for every discovered table (use

`add_file()` if the name to add is in the MariaDB file name encoding, and `add_table()` if it's a true table name, as shown in `SHOW TABLES`).

If the engine is file-based, that is, it has non-empty list in the `tablefile_extensions`, this method is optional. For any file-based engine that does not implement `discover_table_names()`, MariaDB will automatically discover the list of all tables of this engine, by looking for files with the extension `tablefile_extensions[0]`.

handler::discover_table_existence()

In some rare cases MariaDB needs to know whether a given table exists, but does not particularly care about this table structure (for example, when executing a `DROP TABLE` statement). In these cases, the server uses the **discover_table_existence()** method to find out whether a table with the given name exists in the engine.

This method is optional. For the engine that does not implement it, MariaDB will look for files with the `tablefile_extensions[0]`, if possible. But if the engine is not file-based, MariaDB will use the `discover_table()` method to perform a full table discovery. While this will allow determining correctly whether a table exists, a full discovery is usually slower than the simple existence check. In other words, engines that are not file-based might want to support `discover_table_existence()` method as a useful optimization.

handler::discover_table()

This is the main method of table discovery, the heart of it. The server invokes it when it wants to use the table. The **discover_table()** method gets the `TABLE_SHARE` structure, which is not completely initialized — only the table and the database name (and a path to the table file) are filled in. It should initialize this `TABLE_SHARE` with the desired table structure.

MariaDB provides convenient and easy to use helpers that allow the engine to initialize the `TABLE_SHARE` with minimal efforts. They are the `TABLE_SHARE` methods `init_from_binary_frm_image()` and `init_from_sql_statement_string()`.

TABLE_SHARE::init_from_binary_frm_image()

This method is used by engines that use "frm shipping" — such as [Archive](#) or NDB Cluster in MySQL. An frm shipping engine reads the frm file for a given table, exactly as it was generated by the server, and stores it internally. Later it can discover the table structure by using this very frm image. In this sense, a separate frm file in the database directory becomes redundant, because a copy of it is stored in the engine.

TABLE_SHARE::init_from_sql_statement_string()

This method allows initializing the `TABLE_SHARE` using a conventional SQL `CREATE TABLE` syntax.

TABLE_SHARE::read_frm_image()

Engines that use frm shipping need to get the frm image corresponding to a particular table (typically in the `handler::create()` method). They do it via the **read_frm_image()** method. It returns an allocated buffer with the binary frm image, that the engine can use the way it needs.

TABLE_SHARE::free_frm_image()

The frm image that was returned by `read_frm_image()` must be freed with the **free_frm_image()**.

HA_ERR_TABLE_DEF_CHANGED

One of the consequences of automatic discovery is that the table definition might change when the server doesn't expect it to. Between two `SELECT` queries, for example. If this happens, if the engine detects that the server is using an outdated version of the table definition, it should return a **HA_ERR_TABLE_DEF_CHANGED** handler error. Depending on when in the query processing this error has happened, MariaDB will either re-discover the table and execute the query with the correct table structure, or abort the query and return an error message to the user.

TABLE_SHARE::tabledef_version

The previous paragraph doesn't cover one important question — how can the engine know that the server uses an outdated table definition? The answer is — by checking the **tabledef_version**, the table definition version. Every table gets a unique `tabledef_version` value. Normally it is generated automatically when a table is created. When a table is discovered the engine can force it to have a specific `tabledef_version` value (simply by setting it in the `TABLE_SHARE` before calling the `init_from_binary_frm_image()` or `init_from_sql_statement_string()` methods).

Now the engine can compare the table definition version that the server is using (from any handler method it can be accessed as `this->table->s->tabledef_version`) with the version of the actual table definition. If they differ — it is `HA_ERR_TABLE_DEF_CHANGED`.

Assisted discovery

Assisted discovery is a lot simpler from the server point of view, a lot more controlled. The table cannot appear or disappear at will, one still needs explicit DDL statements to manipulate it. There is only one new handler method that the server uses to discover the table structure when a user has issued an explicit `CREATE TABLE` statement without declaring any columns or indexes.

```
int (*discover_table_structure)(handler_ton *hton, THD* thd,
                               TABLE_SHARE *share, HA_CREATE_INFO *info);
```

The assisted discovery API is pretty much independent from the automatic discovery API. An engine can implement either of them or both (or none); there is no requirement to support automatic discovery if only assisted discovery is needed.

handler_ton::discover_table_structure()

Much like the `discover_table()` method, the **discover_table_structure()** handler method gets a partially initialized `TABLE_SHARE` with the table name, database name, and a path to table files filled in, but without a table structure. Unlike `discover_table()`, here the `TABLE_SHARE` has all the [engine-defined table attributes](#) in the `TABLE_SHARE::option_struct` structure. Based on the values of these attributes the `discover_table_structure()` method should initialize the `TABLE_SHARE` with the desired set of fields and keys. It can use `TABLE_SHARE` helper methods `init_from_binary_frm_image()` and `init_from_sql_statement_string()` for that.

The role of `.frm` files

Before table discovery was introduced, MariaDB used `.frm` files to store the table definition. But now the engine can store the table definition (if the engine supports automatic discovery, of course), and `.frm` files become redundant. Still, the server *can* use `.frm` files for such an engine — but they are no longer the only source of the table definition. Now `.frm` files are merely a *cache* of the table definition, while the original authoritative table definition is stored in the engine. Like any cache, its purpose is to reduce discovery attempts for a table. The engine decides whether it makes sense to cache table definition in the `.frm` file or not (see the second argument for the `TABLE_SHARE::init_from_binary_frm_image()`). For example, the [Archive](#) engine uses `.frm` cache, while the [Sequence](#) engine does not. In other words, MariaDB creates `.frm` files for [Archive](#) tables, but not for [Sequence](#) tables.

The cache is completely transparent for a user; MariaDB makes sure that it always stores the actual table definition and invalidates the `.frm` file automatically when it becomes out of date. This can happen, for example, if a user copies a new [Archive](#) table into the datadir and forgets to delete the `.frm` file of the old table with the same name.

5.3.23 Converting Tables from MyISAM to InnoDB

Contents

1. [The task](#)
2. [INDEX Issues](#)
3. [Non-INDEX Issues](#)

The task

You have decided to change one or more tables from [MyISAM](#) to [InnoDB](#). That should be as simple as `ALTER TABLE foo ENGINE=InnoDB`. But you have heard that there might be some subtle issues.

This describes possible issues that may arise and what to do about them.

Recommendation. One way to assist in searching for issues in is to do (at least in *nix)

```
mysqldump --no-data --all-databases >schemas
egrep 'CREATE|PRIMARY' schemas # Focusing on PRIMARY KEYS
egrep 'CREATE|FULLTEXT' schemas # Looking for FULLTEXT indexes
egrep 'CREATE|KEY' schemas # Looking for various combinations of indexes
```

Understanding how the indexes work will help you better understand what might run faster or slower in InnoDB.

INDEX Issues

(Most of these Recommendations and some of these Facts have exceptions.)

Fact. Every InnoDB table has a PRIMARY KEY. If you do not provide one, then the first non-NULL UNIQUE key is used. If that can't be done, then a 6-byte, hidden, integer is provided.

Recommendation. Look for tables without a PRIMARY KEY. Explicitly specify a PRIMARY KEY, even if it's an artificial AUTO_INCREMENT. This is not an absolute requirement, but it is a stronger admonishment for InnoDB than for MyISAM. Some day you may need to walk through the table; without an explicit PK, you can't do it.

Fact. The fields of the PRIMARY KEY are included in each Secondary key.

- Check for redundant indexes with this in mind.

```
PRIMARY KEY(id),
INDEX(b), -- effectively the same as INDEX(b, id)
INDEX(b, id) -- effectively the same as INDEX(b)
```

(Keep one of the INDEXes, not both)

- Note subtle things like

```
PRIMARY KEY(id),
UNIQUE(b), -- keep for uniqueness constraint
INDEX(b, id) -- DROP this one
```

- Also, since the PK and the data coexist:

```
PRIMARY KEY(id),
INDEX(id, b) -- DROP this one; it adds almost nothing
```

Contrast. This feature of MyISAM is not available in InnoDB; the value of 'id' will start over at 1 for each different value of 'abc':

```
id INT UNSIGNED NOT NULL AUTO_INCREMENT,
PRIMARY KEY (abc, id)
```

A way to simulate the MyISAM 'feature' might be something like: What you want is this, but it won't work because it is referencing the table twice:

```
INSERT INTO foo
(other, id, ...)
VALUES
(123, (SELECT MAX(id)+1 FROM foo WHERE other = 123), ...);
```

Instead, you need some variant on this. (You may already have a BEGIN...COMMIT.)

```
BEGIN;
SELECT @id := MAX(id)+1 FROM foo WHERE other = 123 FOR UPDATE;
INSERT INTO foo
(other, id, ...)
VALUES
(123, @id, ...);
COMMIT;
```

Having a transaction is mandatory to prevent another thread from grabbing the same id.

Recommendation. Look for such PRIMARY KEYS. If you find such, ponder how to change the design. There is no straightforward workaround. However, the following may be ok. (Be sure that the datatype for id is big enough since it won't start over.):

```
id INT UNSIGNED NOT NULL AUTO_INCREMENT,
PRIMARY KEY (abc, id),
UNIQUE(id)
```

Recommendation. Keep the PRIMARY KEY short. If you have Secondary keys, remember that they include the fields of the PK. A long PK would make the Secondary keys bulky. Well, maybe not — if there is a lot of overlap in fields. Example:

```
PRIMARY KEY(a,b,c), INDEX(c,b,a) — no extra bulk.
```

Recommendation. Check AUTO_INCREMENT sizes.

- BIGINT is almost never needed. It wastes at least 4 bytes per row (versus INT).
- Always use UNSIGNED and NOT NULL.
- MEDIUMINT UNSIGNED (16M max) might suffice instead of INT
- Be sure to be pessimistic — it is painful to ALTER.

Contrast. "Vertical Partitioning". This is where you artificially split a table to move bulky columns (eg, a BLOB) into another, parallel, table. It is beneficial in MyISAM to avoid stepping over the blob when you don't need to read it. InnoDB stores BLOB and TEXT differently — 767 bytes are in the record, the rest is in some other block. So, it may (or may not) be worth putting the tables back together. Caution: An InnoDB row is limited to 8KB, and the 767 counts against that.

Fact. FULLTEXT (prior to [MariaDB 10.0.5](#)) and SPATIAL indexes are not available in InnoDB. Note that MyISAM and InnoDB FULLTEXT indexes use different [stopword](#) lists and different system variables.

Recommendation. Search for such indexes. Keep such tables in MyISAM. Better yet, do Vertical Partitioning (see above) to split out the minimum number of columns from InnoDB.

Fact. The maximum length of an INDEX is different between the Engines. (This change is not likely to hit you, but watch out.) MyISAM allows 1000 bytes; InnoDB allows 767 bytes, just big enough for a

```
VARCHAR(255) CHARACTER SET utf8.
```

```
ERROR 1071 (42000): Specified key was too long; max key length is 767 bytes
```

Fact. The PRIMARY KEY is included in the data. Hence, SHOW TABLE STATUS will show and `Index_length` of 0 bytes (or 16KB) for a table with no secondary indexes. Otherwise, `Index_length` is the total size for the secondary keys.

Fact. The PRIMARY KEY is included in the data. Hence, exact match by PK may be a little faster with InnoDB. And, "range" scans by PK are likely to be faster.

Fact. A lookup by Secondary Key traverses the secondary key's BTree, grabs the PRIMARY KEY, then traverses the PK's BTree. Hence, secondary key lookups are a little more cumbersome in InnoDB.

Contrast. The fields of the PRIMARY KEY are included in each Secondary key. This may lead to "Using index" (in the EXPLAIN plan) for InnoDB for cases where it did not happen in MyISAM. (This is a slight performance boost, and counteracts the double-lookup otherwise needed.) However, when "Using index" would be useful on the PRIMARY KEY, MyISAM would do an "index scan", yet InnoDB effectively has to do a "table scan".

Same as MyISAM. Almost always

```
INDEX(a) -- DROP this one because the other one handles it.  
INDEX(a,b)
```

Contrast. The data is stored in PK order. This means that "recent" records are 'clustered' together at the end. This may give you better 'locality of reference' than in MyISAM.

Same as MyISAM. The optimizer almost never uses two indexes in a single SELECT. (5.1 will occasionally do "index merge".) SELECT in subqueries and UNIONS can independently pick indexes.

Subtle issue. When you DELETE a row, the AUTO_INCREMENT id will be burned. Ditto for REPLACE, which is a DELETE plus an INSERT.

Very subtle issue. Replication occurs on COMMIT. If you have multiple threads using transactions, the AUTO_INCREMENTS can arrive at a slave out of order. One transaction BEGINS, grabs an id. Then another transaction grabs an id but COMMITs before the first finishes.

Same as MyISAM. "Prefix" indexing is usually bad in both InnoDB and MyISAM. Example: `INDEX(foo(30))`

Non-INDEX Issues

Disk space for InnoDB is likely to be 2-3 times as much as for MyISAM.

MyISAM and InnoDB use RAM radically differently. If you change all your tables, you should make significant adjustments:

- `key_buffer_size` — small but non-zero; say, 10M;
- `innodb_buffer_pool_size` — 70% of available RAM

InnoDB has essentially no need for CHECK, OPTIMIZE, or ANALYZE. Remove them from your maintenance scripts. (No real harm if you keep them.)

Backup scripts may need checking. A MyISAM table can be backed up by copying three files. With InnoDB this is only possible if `innodb_file_per_table` is set to 1. Before [MariaDB 10.0](#), capturing a table or database for copying from production to a development environment was not possible. Change to `mysqldump`. Since [MariaDB 10.0](#) a hot copy can be created - see [Backup and restore overview](#).

Before [MariaDB 5.5](#), the `DATA DIRECTORY table option` was not supported for InnoDB. Since [MariaDB 5.5](#) it is supported, but only in `CREATE TABLE`. `INDEX DIRECTORY` has no effect, since InnoDB does not use separate files for indexes. To better balance the workload through several disks, the paths of some InnoDB log files can also be changed.

Understand autocommit and `BEGIN/COMMIT`.

- (default) `autocommit = 1`: In the absence of any `BEGIN` or `COMMIT` statements, every statement is a transaction by itself. This is close to the MyISAM behavior, but is not really the best.
- `autocommit = 0`: `COMMIT` will close a transaction and start another one. To me, this is kludgy.
- (recommended) `BEGIN...COMMIT` gives you control over what sequence of operation(s) are to be considered a transaction and "atomic". Include the `ROLLBACK` statement if you need to undo stuff back to the `BEGIN`.

Perl's `DBIx::DWIW` and Java's `JDBC` have API calls to do `BEGIN` and `COMMIT`. These are probably better than 'executing' `BEGIN` and `COMMIT`.

Test for errors everywhere! Because InnoDB uses row-level locking, it can stumble into deadlocks that you are not expecting. The engine will automatically `ROLLBACK` to the `BEGIN`. The normal recovery is to redo, beginning at the `BEGIN`. Note that this is a strong reason to have `BEGINs`.

`LOCK/UNLOCK TABLES` — remove them. Replace them (sort of) with `BEGIN ... COMMIT`. (`LOCK` will work if `innodb_table_locks` is set to 1, but it is less efficient, and may have subtle issues.)

In 5.1, `ALTER ONLINE TABLE` can speed up some operations significantly. (Normally `ALTER TABLE` copies the table over and rebuilds the indexes.)

The "limits" on virtually everything are different between MyISAM and InnoDB. Unless you have huge tables, wide rows, lots of indexes, etc, you are unlikely to stumble into a different limit.

Mixture of MyISAM and InnoDB? This is OK. But there are caveats.

- RAM settings should be adjusted to accordingly.
- JOINing tables of different Engines works.
- A transaction that affects tables of both types can `ROLLBACK` InnoDB changes, but will leave MyISAM changes intact.
- Replication: MyISAM statements are replicated when finished; InnoDB statements are held until the `COMMIT`.

`FIXED` (vs `DYNAMIC`) is meaningless in InnoDB.

`PARTITION` — You can partition MyISAM and InnoDB tables. Remember the screwball rule: You must either

- have no `UNIQUE` (or `PRIMARY`) keys, or
- have the value you are "partitioning on" in every `UNIQUE` key.

The former is not advised for InnoDB. The latter is messy if you want an `AUTO_INCREMENT`.

`PRIMARY KEY` in `PARTITION` — Since every key must include the field on which you are `PARTITIONing`, how can `AUTO_INCREMENT` work? Well, there seems to be a convenient special case:

- This works: `PRIMARY KEY(autoinc, partition_key)`
- This does not work for InnoDB: `PRIMARY KEY(partition_key, autoinc)`

That is, an `AUTO_INCREMENT` will correctly increment, and be unique across all `PARTITIONs`, when it is the first field of the `PRIMARY KEY`, but not otherwise.

5.3.24 Machine Learning with MindsDB

Contents

1. [Overview](#)
2. [Installation](#)
3. [Usage](#)

Overview

[MindsDB](#) is a third-party application that interfaces with MariaDB Server to provide Machine Learning capabilities through SQL. The interface is done via the [Connect Storage Engine](#).

Installation

To get a functional MariaDB - MindsDB installation, one needs to install the following components:

- **MindsDB:** follow the instructions in the project's [official documentation](#).
- **Connect Storage Engine** must be enabled for the integration to work. See [installing the connect storage engine](#).

MindsDB connects to MariaDB Server via a regular user to setup a dedicated database called `mindsdb`. Which user will be used is specified within MindsDB's [configuration file](#).

For example, if MindsDB is installed locally, one can create a user called `mindsdb@localhost`. MindsDB only authenticates via the `mysql_native_password` plugin, hence one must set a password for the user:

```
CREATE USER mindsdb@localhost;  
SET PASSWORD FOR mindsdb@localhost=PASSWORD("password");
```

The user must be granted the global `FILE` privilege and all privileges on the `mindsdb` database.

```
GRANT FILE ON *.* TO mindsdb@localhost;  
GRANT ALL ON mindsdb.* TO mindsdb@localhost;
```

Assuming MindsDB is in the python path one can start up MindsDB with the following parameters:

```
python -m mindsdb --config=$CONFIG_PATH --api=http,mysql
```

Make sure `$CONFIG_PATH` points to the appropriate MindsDB configuration file.

Usage

Always consult the project's [official documentation](#) for up-to-date usage scenarios as MindsDB is an actively developed project.

For a step-by-step example, you can consult the following [blog post](#).

If the connection between MindsDB and MariaDB is successful, you should see the `mindsdb` database present and two tables within it: `commands` and `predictors`.

MindsDB, as an AutoML framework does all the work when it comes to training the AI model. What is necessary is to pass it the initial data, which MindsDB retrieves via a `SELECT` statement. This can be done by inserting into the `predictors` table.

```
INSERT INTO `predictors`  
(`name`, `predict`, `select_data_query`)  
VALUES ('bikes_model', 'count', 'SELECT * FROM test.bike_data');
```

The values inserted into `predictors` act as a command instructing MindsDB to:

1. Train a model called 'bikes_model'
2. From the input data, learn to predict the 'count' column.
3. The input data is generated via the select statement 'SELECT * FROM test.bike_data'. The `select_data_query` should be a valid select that MindsDB can run against MariaDB.

5.4 Plugins

MariaDB supports the use of plugins, software components that may be added to the core software without having to rebuild the MariaDB server from source code. Therefore, plugins can be loaded at start-up, or loaded and unloaded while the server is running without interruption. Plugins are commonly used for adding desired storage engines, additional security requirements, and logging special information about the server.

 4. [Configuring the Plugin Directory](#)
 5. [Configuring the Minimum Plugin Maturity](#)
 6. [Configuring Plugin Activation at Server Startup](#)
3. [Uninstalling Plugins](#)

Plugins are server components that enhance MariaDB in some way. These can be anything from new storage engines, plugins for enhancing full-text parsing, or even small enhancements, such as a plugin to get a timestamp as an integer.

Querying Plugin Information

There are a number of ways to see which plugins are currently active.

A server almost always has a large number of active plugins, because the server contains a large number of built-in plugins, which are active by default and cannot be uninstalled.

Querying Plugin Information with `SHOW PLUGINS`

The `SHOW PLUGINS` statement can be used to query information about all active plugins.

For example:

```
SHOW PLUGINS\G;
***** 1. row *****
  Name: binlog
  Status: ACTIVE
  Type: STORAGE ENGINE
  Library: NULL
  License: GPL
***** 2. row *****
  Name: mysql_native_password
  Status: ACTIVE
  Type: AUTHENTICATION
  Library: NULL
  License: GPL
***** 3. row *****
  Name: mysql_old_password
  Status: ACTIVE
  Type: AUTHENTICATION
  Library: NULL
  License: GPL
...
```

If a plugin's `Library` column has a `NULL` value, then the plugin is built-in, and it cannot be uninstalled.

Querying Plugin Information with `information_schema.PLUGINS`

The `information_schema.PLUGINS` table can be queried to get more detailed information about plugins.

For example:

```

SELECT * FROM information_schema.PLUGINS\G
...
***** 65. row *****
    PLUGIN_NAME: user_variables
    PLUGIN_VERSION: 1.0
    PLUGIN_STATUS: ACTIVE
    PLUGIN_TYPE: INFORMATION SCHEMA
    PLUGIN_TYPE_VERSION: 110600.0
    PLUGIN_LIBRARY: NULL
    PLUGIN_LIBRARY_VERSION: NULL
    PLUGIN_AUTHOR: Sergey Vojtovich
    PLUGIN_DESCRIPTION: User-defined variables
    PLUGIN_LICENSE: GPL
    LOAD_OPTION: ON
    PLUGIN_MATURITY: Stable
    PLUGIN_AUTH_VERSION: 1.0
***** 66. row *****
    PLUGIN_NAME: wsrep_provider
    PLUGIN_VERSION: 1.0
    PLUGIN_STATUS: ACTIVE
    PLUGIN_TYPE: REPLICATION
    PLUGIN_TYPE_VERSION: 2.0
    PLUGIN_LIBRARY: NULL
    PLUGIN_LIBRARY_VERSION: NULL
    PLUGIN_AUTHOR: Codership Oy
    PLUGIN_DESCRIPTION: Wsrep provider plugin
    PLUGIN_LICENSE: GPL
    LOAD_OPTION: ON
    PLUGIN_MATURITY: Alpha
    PLUGIN_AUTH_VERSION: 1.0
***** 67. row *****
    PLUGIN_NAME: THREAD_POOL_GROUPS
    PLUGIN_VERSION: 1.0
    PLUGIN_STATUS: ACTIVE
    PLUGIN_TYPE: INFORMATION SCHEMA
    PLUGIN_TYPE_VERSION: 110600.0
    PLUGIN_LIBRARY: NULL
    PLUGIN_LIBRARY_VERSION: NULL
    PLUGIN_AUTHOR: Vladislav Vaintroub
    PLUGIN_DESCRIPTION: Provides information about threadpool groups.
    PLUGIN_LICENSE: GPL
    LOAD_OPTION: ON
    PLUGIN_MATURITY: Stable
    PLUGIN_AUTH_VERSION: 1.0
...

```

If a plugin's `PLUGIN_LIBRARY` column has the `NULL` value, then the plugin is built-in, and it cannot be uninstalled.

Querying Plugin Information with `mysql.plugin`

The `mysql.plugin` table can be queried to get information about installed plugins.

This table only contains information about plugins that have been installed via the following methods:

- The `INSTALL SONAME` statement.
- The `INSTALL PLUGIN` statement.
- The `mariadb-plugin` utility.

This table does not contain information about:

- Built-in plugins.
- Plugins loaded with the `--plugin-load-add` option.
- Plugins loaded with the `--plugin-load` option.

This table only contains enough information to reload the plugin when the server is restarted, which means it only contains the plugin name and the plugin library.

For example:

```
SELECT * FROM mysql.plugin;
```

```
+-----+-----+
| name | dl          |
+-----+-----+
| PBXT | libpbxt.so |
+-----+-----+
```

Installing a Plugin

There are three primary ways to install a plugin:

- A plugin can be installed dynamically with an SQL statement.
- A plugin can be installed with a [mariadb](#) option, but it requires a server restart.
- A plugin can be installed with the [mariadb-plugin](#) utility, while the server is completely offline.

When you are installing a plugin, you also have to ensure that:

- The server's plugin directory is properly configured, and the plugin's library is in the plugin directory.
- The server's minimum plugin maturity is properly configured, and the plugin is mature enough to be installed.

Installing a Plugin Dynamically

A plugin can be installed dynamically by executing either the [INSTALL SONAME](#) or the [INSTALL PLUGIN](#) statement.

If a plugin is installed with one of these statements, then a record will be added to the [mysql.plugins](#) table for the plugin. This means that the plugin will automatically be loaded every time the server restarts, unless specifically uninstalled or deactivated.

Installing a Plugin with `INSTALL SONAME`

You can install a plugin dynamically by executing the [INSTALL SONAME](#) statement. [INSTALL SONAME](#) installs all plugins from the given plugin library. This could be required for some plugin libraries.

For example, to install all plugins in the `server_audit` plugin library (which is currently only the [server_audit](#) audit plugin), you could execute the following:

```
INSTALL SONAME 'server_audit';
```

Installing a Plugin with `INSTALL PLUGIN`

You can install a plugin dynamically by executing the [INSTALL PLUGIN](#) statement. [INSTALL PLUGIN](#) installs a single plugin from the given plugin library.

For example, to install the [server_audit](#) audit plugin from the `server_audit` plugin library, you could execute the following:

```
INSTALL PLUGIN server_audit SONAME 'server_audit';
```

Installing a Plugin with Plugin Load Options

A plugin can be installed with a [mariadb](#) option by providing either the [--plugin-load-add](#) or the [--plugin-load](#) option.

If a plugin is installed with one of these options, then a record will **not** be added to the [mysql.plugins](#) table for the plugin. This means that if the server is restarted without the same option set, then the plugin will **not** automatically be loaded.

Installing a Plugin with `--plugin-load-add`

You can install a plugin with the [--plugin-load-add](#) option by specifying the option as a command-line argument to [mariadb](#) or by specifying the option in a relevant server [option group](#) in an [option file](#).

The [--plugin-load-add](#) option uses the following format:

- Plugins can be specified in the format `name=library`, where `name` is the plugin name and `library` is the plugin library. This format installs a single plugin from the given plugin library.
- Plugins can also be specified in the format `library`, where `library` is the plugin library. This format installs all plugins from the given plugin library.
- Multiple plugins can be specified by separating them with semicolons.

For example, to install all plugins in the `server_audit` plugin library (which is currently only the [server_audit](#) audit

plugin) and also the [ed25519](#) authentication plugin from the `auth_ed25519` plugin library, you could set the option to the following values on the command-line:

```
$ mariadb --user=mysql --plugin-load-add='server_audit' --plugin-load-add='ed25519=auth_ed25519'
```

You could also set the option to the same values in an [option file](#):

```
[mariadb]
...
plugin_load_add = server_audit
plugin_load_add = ed25519=auth_ed25519
```

Special care must be taken when specifying both the `--plugin-load` option and the `--plugin-load-add` option together. The `--plugin-load` option resets the plugin load list, and this can cause unexpected problems if you are not aware. The `--plugin-load-add` option does **not** reset the plugin load list, so it is much safer to use. See [Specifying Multiple Plugin Load Options](#) for more information.

Installing a Plugin with `--plugin-load`

You can install a plugin with the `--plugin-load` option by specifying the option as a command-line argument to `mariadb` or by specifying the option in a relevant server [option group](#) in an [option file](#).

The `--plugin-load` option uses the following format:

- Plugins can be specified in the format `name=library`, where `name` is the plugin name and `library` is the plugin library. This format installs a single plugin from the given plugin library.
- Plugins can also be specified in the format `library`, where `library` is the plugin library. This format installs all plugins from the given plugin library.
- Multiple plugins can be specified by separating them with semicolons.

For example, to install all plugins in the `server_audit` plugin library (which is currently only the `server_audit` audit plugin) and also the `ed25519` authentication plugin from the `auth_ed25519` plugin library, you could set the option to the following values on the command-line:

```
$ mariadb --user=mysql --plugin-load='server_audit;ed25519=auth_ed25519'
```

You could also set the option to the same values in an [option file](#):

```
[mariadb]
...
plugin_load = server_audit;ed25519=auth_ed25519
```

Special care must be taken when specifying the `--plugin-load` option multiple times, or when specifying both the `--plugin-load` option and the `--plugin-load-add` option together. The `--plugin-load` option resets the plugin load list, and this can cause unexpected problems if you are not aware. The `--plugin-load-add` option does **not** reset the plugin load list, so it is much safer to use. See [Specifying Multiple Plugin Load Options](#) for more information.

Specifying Multiple Plugin Load Options

Special care must be taken when specifying the `--plugin-load` option multiple times, or when specifying both the `--plugin-load` option and the `--plugin-load-add` option. The `--plugin-load` option resets the plugin load list, and this can cause unexpected problems if you are not aware. The `--plugin-load-add` option does **not** reset the plugin load list, so it is much safer to use.

This can have the following consequences:

- If the `--plugin-load` option is specified **multiple times**, then only the last instance will have any effect. For example, in the following case, the first instance of the option is reset:

```
[mariadb]
...
plugin_load = server_audit
plugin_load = ed25519=auth_ed25519
```

- If the `--plugin-load` option is specified **after** the `--plugin-load-add` option, then it will also reset the changes made by that option. For example, in the following case, the `--plugin-load-add` option does not do anything, because the subsequent `--plugin-load` option resets the plugin load list:

```
[mariadb]
...
plugin_load_add = server_audit
plugin_load = ed25519=auth_ed25519
```

- In contrast, if the `--plugin-load` option is specified **before** the `--plugin-load-add` option, then it will work fine, because the `--plugin-load-add` option does not reset the plugin load list. For example, in the following case, both plugins are properly loaded:

```
[mariadb]
...
plugin_load = server_audit
plugin_load_add = ed25519=auth_ed25519
```

Installing a Plugin with mariadb-plugin

A plugin can be installed with the [mariadb-plugin](#) utility if the server is completely offline.

The syntax is:

```
mariadb-plugin [options] <plugin> ENABLE|DISABLE
```

For example, to install the [server_audit](#) audit plugin, you could execute the following:

```
mariadb-plugin server_audit ENABLE
```

If a plugin is installed with this utility, then a record will be added to the [mysql.plugins](#) table for the plugin. This means that the plugin will automatically be loaded every time the server restarts, unless specifically uninstalled or deactivated.

Configuring the Plugin Directory

When a plugin is being installed, the server looks for the plugin's library in the server's plugin directory. This directory is configured by the [plugin_dir](#) system variable. This can be specified as a command-line argument to [mariadb](#) or it can be specified in a relevant server [option group](#) in an [option file](#). For example:

```
[mariadb]
...
plugin_dir = /usr/lib64/mysql/plugin
```

Configuring the Minimum Plugin Maturity

When a plugin is being installed, the server compares the plugin's maturity level against the server's minimum allowed plugin maturity. This can help prevent users from using unstable plugins on production servers. This minimum plugin maturity is configured by the [plugin_maturity](#) system variable. This can be specified as a command-line argument to [mariadb](#) or it can be specified in a relevant server [option group](#) in an [option file](#). For example:

```
[mariadb]
...
plugin_maturity = stable
```

Configuring Plugin Activation at Server Startup

A plugin will be loaded by default when the server starts if:

- The plugin was installed with the [INSTALL SONAME](#) statement.
- The plugin was installed with the [INSTALL PLUGIN](#) statement.
- The plugin was installed with the [mariadb-plugin](#) utility.
- The server is configured to load the plugin with the `--plugin-load-add` option.
- The server is configured to load the plugin with the `--plugin-load` option.

This behavior can be changed with special options that take the form `--plugin-name`. For example, for the

`server_audit` audit plugin, the special option is called `--server-audit`.

The possible values for these special options are:

Option Value	Description
OFF	Disables the plugin without removing it from the <code>mysql.plugins</code> table.
ON	Enables the plugin. If the plugin cannot be initialized, then the server will still continue starting up, but the plugin will be disabled.
FORCE	Enables the plugin. If the plugin cannot be initialized, then the server will fail to start with an error.
FORCE_PLUS_PERMANENT	Enables the plugin. If the plugin cannot be initialized, then the server will fail to start with an error. In addition, the plugin cannot be uninstalled with <code>UNINSTALL SONAME</code> or <code>UNINSTALL PLUGIN</code> while the server is running.

A plugin's status can be found by looking at the `PLUGIN_STATUS` column of the `information_schema.PLUGINS` table.

Uninstalling Plugins

Plugins that are found in the `mysql.plugin` table, that is those that were installed with `INSTALL SONAME`, `INSTALL PLUGIN` or `mariadb-plugin` can be uninstalled in one of two ways:

- The `UNINSTALL SONAME` or the `UNINSTALL PLUGIN` statement while the server is running
- With `mariadb-plugin` while the server is offline.

Plugins that were enabled as a `--plugin-load` option do not need to be uninstalled. If `--plugin-load` is omitted the next time the server starts, or the plugin is not listed as one of the `--plugin-load` entries, the plugin will not be loaded.

`UNINSTALL PLUGIN` uninstalls a single installed plugin, while `UNINSTALL SONAME` uninstalls all plugins belonging to a given library.

Contents

1. [MariaDB Plugin Maturity](#)

MariaDB Plugin Maturity

The following table lists the various plugins included in MariaDB ordered by their maturity. Note that maturity will differ across MariaDB versions - see below for an easy way to get a complete list of plugins and their maturity in your version of MariaDB:

Plugin	Version	Maturity	Version
Archive	3.0	Stable	
Aria	1.5	Stable	
Audit Plugin	1.4	Stable	
aws_key_management	1.0	Stable	
binlog	1.0	Stable	
Blackhole	1.0	Stable	

Connect	1.7	Stable	MariaDB 10.4.12 , MariaDB 10.3.22
CLIENT_STATISTICS	2.0	Stable	
cracklib_password_check	1.0	Stable	
CSV	1.0	Stable	
DISKS	1.1	Stable	MariaDB 10.4.7 , MariaDB 10.3.17
ed25519	1.1	Stable	MariaDB 10.4.0
FederatedX ^[1]	2.1	Stable	
Feedback	1.1	Stable	
file_key_management	1.0	Stable	
gssapi	1.0	Stable	
INDEX_STATISTICS	2.0	Stable	
INET6	1.0	Stable	MariaDB 10.5.12
InnoDB	10.*	Stable	
LOCALES	1.0	Stable	
Memory	1.0	Stable	
METADATA_LOCK_INFO	0.1	Stable	
MRG_MyISAM	1.0	Stable	
Mroonga	7.7	Stable	
MyISAM	1.0	Stable	
MyRocks	1.0	Stable	MariaDB 10.3.7
mysql_json	0.1	Stable	MariaDB 10.5.17
mysql_native_password	1.0	Stable	
mysql_old_password	1.0	Stable	
named_pipe	1.0	Stable	
pam	1.0	Stable	
password_reuse_check	2.0	Stable	MariaDB 10.8.7 , MariaDB 10.9.5 , MariaDB 10.10.2
partition	1.0	Stable	
Performance_Schema	0.1	Stable	
QUERY_CACHE_INFO	1.1	Stable	
query_response_time	1.0	Stable	
S3	1.0	Stable	MariaDB 10.5.12
semisync	1.0	Stable	Built-in, no longer a plugin from MariaDB 10.3.3
Sequence	1.0	Stable	
SERVER_AUDIT	1.4	Stable	
simple_password_check	1.0	Stable	
Spider	3.3	Stable	<= MariaDB 10.4 , MariaDB 10.5.7
SQL_ERROR_LOG	1.0	Stable	
TABLE_STATISTICS	2.0	Stable	
USER_STATISTICS	2.0	Stable	
user_variables	1.0	Stable	MariaDB 10.3.13
TokuDB	4.0	Stable	Disabled in MariaDB 10.5 and removed in MariaDB 10.6
unix_socket	1.0	Stable	
UUID	1.0	Stable	MariaDB 10.9.1

wsrep	1.0	Stable	
WSREP_INFO	1.0	Stable	
Plugin	Version	Maturity	From
Federated 	1.0	Gamma	
OQGraph	3.0	Gamma	
Sphinx	2.0	Gamma	
Plugin	Version	Maturity	From
Columnstore	1.0	Beta	MariaDB 10.5.4
handlersocket	1.0	Beta	
Plugin	Version	Maturity	From
Cassandra 	0.1	Experimental	Removed in MariaDB 10.6
debug_key_management	1.0	Experimental	
example_key_management	1.0	Experimental	
Plugin	Version	Maturity	Version

Execute the following on your MariaDB server to get a complete list of plugins and their maturity for your version of MariaDB:

```
SELECT plugin_name, plugin_version, plugin_maturity
FROM information_schema.plugins
ORDER BY plugin_name;

5. [Encryption Plugins](#)
6. [Function Plugins](#)
7. [Plugin Declaration Structure](#)
 1. [Example Plugin Declaration](#)

About

Generally speaking, writing plugins for MariaDB is very similar to writing plugins for MySQL.

Authentication Plugins

See [Pluggable Authentication](#).

Storage Engine Plugins

Storage engines can extend `CREATE TABLE` syntax with optional index, field, and table attribute clauses. See [Extending CREATE TABLE](#) for more information.

See [Storage Engine Development](#).

Information Schema Plugins

Information Schema plugins can have their own `FLUSH` and `SHOW` statements. See [FLUSH and SHOW for Information Schema plugins](#).

Encryption Plugins

[Encryption plugins](#) in MariaDB are used for the [data at rest encryption](#) feature. They are responsible for both key management and for the actual encryption and decryption of data.

Function Plugins

Function plugins add new SQL functions to MariaDB. Unlike the old `UDF` API, function plugins can do almost anything that a built-function can.

Plugin Declaration Structure

The MariaDB plugin declaration differs from the MySQL plugin declaration in the following ways:

1. it has no useless 'reserved' field (the very last field in the MySQL plugin declaration)
2. it has a 'maturity' declaration
3. it has a field for a text representation of the version field

MariaDB can load plugins that only have the MySQL plugin declaration but both `PLUGIN_MATURITY` and `PLUGIN_AUTH_VERSION` will show up as 'Unknown' in the [INFORMATION_SCHEMA.PLUGINS](#) table.

For compiled-in (not dynamically loaded) plugins, the presence of the MariaDB plugin declaration is mandatory.

Example Plugin Declaration

The MariaDB plugin declaration looks like this:

```
/* MariaDB plugin declaration */
maria_declare_plugin(example)
{
    MYSQL_STORAGE_ENGINE_PLUGIN, /* the plugin type (see include/mysql/plugin.h) */
    &example_storage_engine_info, /* pointer to type-specific plugin descriptor */
    "EXAMPLEDB", /* plugin name */
    "John Smith", /* plugin author */
    "Example of plugin interface", /* the plugin description */
    PLUGIN_LICENSE_GPL, /* the plugin license (see include/mysql/plugin.h) */
    example_init_func, /* Pointer to plugin initialization function */
    example_deinit_func, /* Pointer to plugin deinitialization function */
    0x0001 /* Numeric version 0xAABB means AA.BB version */,
    example_status_variables, /* Status variables */
    example_system_variables, /* System variables */
    "0.1 example", /* String version representation */
    MariaDB_PLUGIN_MATURITY_EXPERIMENTAL /* Maturity (see include/mysql/plugin.h) */
}
maria_declare_plugin_end;
```

5.4.5 MariaDB Audit Plugin

Contents

1. [Additional documentation](#)
2. [Tutorials](#)
3. [Blog Articles](#)
4. [Sub-Documents](#)

MariaDB and MySQL are used in a broad range of environments, but if you needed to record user access to be in compliance with auditing regulations for your organization, you would previously have had to use other database solutions. To meet this need, though, MariaDB has developed the MariaDB Audit Plugin. Although the MariaDB Audit Plugin has some unique features available only for MariaDB, it can be used also with MySQL.

Basically, the purpose of the MariaDB Audit Plugin is to log the server's activity. For each client session, it records who connected to the server (i.e., user name and host), what queries were executed, and which tables were accessed and server variables that were changed. This information is stored in a rotating log file or it may be sent to the local `syslogd`.

The MariaDB Audit Plugin works with MariaDB, MySQL (as of, version 5.5.34 and 10.0.7) and Percona Server. MariaDB started including by default the Audit Plugin from versions 10.0.10 and 5.5.37, and it can be installed in any version from [MariaDB 5.5.20](#).

5.4.5.1 MariaDB Audit Plugin - Installation

The `server_audit` plugin logs the server's activity. For each client session, it records who connected to the server (i.e., user name and host), what queries were executed, and which tables were accessed and server variables that were changed. This information is stored in a rotating log file or it may be sent to the local syslogd.

Contents

- [1. Locating the Plugin](#)
- [2. Installing the Plugin](#)
- [3. Uninstalling the Plugin](#)
- [4. Prohibiting Uninstallation](#)

Locating the Plugin

The `server_audit` plugin's shared library is included in MariaDB packages as the `server_audit.so` or `server_audit.dll` shared library on systems where it can be built.

The plugin must be located in the plugin directory, the directory containing all plugin libraries for MariaDB. The path to this directory is configured by the `plugin_dir` system variable. To see the value of this variable and thereby determine the file path of the plugin library, execute the following SQL statement:

```
SHOW GLOBAL VARIABLES LIKE 'plugin_dir';

+-----+-----+
| Variable_name | Value                               |
+-----+-----+
| plugin_dir    | /usr/lib64/mysql/plugin/          |
+-----+-----+
```

Check the directory returned at the filesystem level to make sure that you have a copy of the plugin library, `server_audit.so` or `server_audit.dll`, depending on your system. It's included in recent installations of MariaDB. If you do not have it, you should upgrade MariaDB.

Installing the Plugin

Although the plugin's shared library is distributed with MariaDB by default, the plugin is not actually installed by MariaDB by default. There are two methods that can be used to install the plugin with MariaDB.

The first method can be used to install the plugin without restarting the server. You can install the plugin dynamically by executing `INSTALL SONAME` or `INSTALL PLUGIN`. For example:

```
INSTALL SONAME 'server_audit';
```

The second method can be used to tell the server to load the plugin when it starts up. The plugin can be installed this way by providing the `--plugin-load` or the `--plugin-load-add` options. This can be specified as a command-line argument to `mysqld` or it can be specified in a relevant server [option group](#) in an [option file](#). For example:

```
[mariadb]
...
plugin_load_add = server_audit
```

Uninstalling the Plugin

You can uninstall the plugin dynamically by executing `UNINSTALL SONAME` or `UNINSTALL PLUGIN`. For example:

```
UNINSTALL SONAME 'server_audit';
```

If you installed the plugin by providing the `--plugin-load` or the `--plugin-load-add` options in a relevant server [option group](#) in an [option file](#), then those options should be removed to prevent the plugin from being loaded the next time the server is restarted.

Prohibiting Uninstallation

The `UNINSTALL SONAME` or `UNINSTALL PLUGIN` statements may be used to uninstall plugins. For the `server_audit` plugin, you might want to disable this capability. To prevent the plugin from being uninstalled, you could set the `server_audit` option to `FORCE_PLUS_PERMANENT` in a relevant server [option group](#) in an [option file](#) after the plugin is loaded once:

```
[mariadb]
...
plugin_load_add = server_audit
server_audit=FORCE_PLUS_PERMANENT
```

Once you've added the option to the server's option file and restarted the server, the plugin can't be uninstalled. If someone tries to uninstall the audit plugin, then an error message will be returned. Below is an example of the error message:

```
UNINSTALL PLUGIN server_audit;

ERROR 1702 (HY000):
Plugin 'server_audit' is force_plus_permanent and can not be unloaded
```

For more information on `FORCE_PLUS_PERMANENT` and other option values for the `server_audit` option, see [Plugin Overview: Configuring Plugin Activation at Server Startup](#) for more information.

5.4.5.2 MariaDB Audit Plugin - Configuration

After the audit plugin has been installed and loaded, there will be some new global variables within MariaDB. These can be used to configure many components, limits, and methods related to auditing the server. You may set these variables related to the logs, such as their location, size limits, rotation parameters, and method of logging information. You may also set what information is logged, such connects, disconnects, and failed attempts to connect. You can also have the audit plugin log queries, read and write access to tables. So as not to overload your logs, the audit plugin can be configured based on lists of users. You can include or exclude the activities of specific users in the logs.

To see a list of [audit plugin-related variables](#) on the server and their values, execute the follow while connected to the server:

```
SHOW GLOBAL VARIABLES LIKE 'server_audit%';
```

```
+-----+-----+
| Variable_name | Value |
+-----+-----+
| server_audit_events | CONNECT, QUERY, TABLE |
| server_audit_excl_users | |
| server_audit_file_path | server_audit.log |
| server_audit_file_rotate_now | OFF |
| server_audit_file_rotate_size | 1000000 |
| server_audit_file_rotations | 9 |
| server_audit_incl_users | |
| server_audit_logging | ON |
| server_audit_mode | 0 |
| server_audit_output_type | file |
| server_audit_query_log_limit | 1024 |
| server_audit_syslog_facility | LOG_USER |
| server_audit_syslog_ident | mysql-server_auditing |
| server_audit_syslog_info | |
| server_audit_syslog_priority | LOG_INFO |
+-----+-----+
```

The values of these variables can be changed by an administrator with the `SUPER` privilege, using the `SET` statement. Below is an example of how to disable audit logging:

```
SET GLOBAL server_audit_logging=OFF;
```

Although it is possible to change all of the variables shown above, some of them may be reset when the server restarts. Therefore, you may want set them in the configuration file (e.g., `/etc/my.cnf.d/server.cnf`) to ensure the values are the same after a restart:

```
[server]
...
server_audit_logging=OFF
...
```

For the reason given in the paragraph above, you would not generally set variables related to the auditing plugin using the `SET` statement. However, you might do so to test settings before making them more permanent. Since one cannot always restart the server, you would use the `SET` statement to change immediately the variables and then include the same settings in the configuration file so that the variables are set again as you prefer when the server is restarted.

Configuring Logs and Setting Other Variables

Of all of the server variables you can set, you may want to set initially the `server_audit_events` variable to tell the Audit Plugin which events to log. The [Log Settings documentation page](#) describes in detail the choices you have and provides examples of log entries related to them.

You can see a detailed list of system variables related to the MariaDB Audit Plugin on the [System Variables documentation page](#). Status variables related to the Audit Plugin are listed and explained on the [Status Variables documentation page](#).

5.4.5.3 MariaDB Audit Plugin - Log Settings

Events that are logged by the MariaDB Audit Plugin are grouped generally into different types: connect, query, and table events. To log based on these types of events, set the variable, `server_audit_events` to `CONNECT`, `QUERY`, or `TABLE`. To have the Audit Plugin log more than one type of event, put them in a comma-separated list like so:

```
SET GLOBAL server_audit_events = 'CONNECT, QUERY, TABLE';
```

Contents

1. [Logging Connect Events](#)
2. [Logging Query Events](#)
 1. [Queries Not Included in Subordinate Query Event Types](#)
3. [Logging Table Events](#)
4. [Logging User Activities](#)
5. [Excluding or Including Users](#)

You can put the equivalent of this in the configuration file like so:

```
[mysqld]
...
server_audit_events=connect,query
```

By default, logging is set to `OFF`. To enable it, set the `server_audit_logging` variable to `ON`. Note that if the `query cache` is enabled, and a query is returned from the query cache, no `TABLE` records will appear in the log since the server didn't open or access any tables and instead relied on the cached results. So you may want to disable query caching.

There are actually a few types of events that may be logged, not just the three common ones mentioned above. A full list of related system variables is detailed on the [Server Audit System Variables](#) page, and status variables on the [Server Audit Status Variables](#) page of this documentation. Some of the major ones are highlighted below:

Type	Description
CONNECT	Connects, disconnects and failed connects—including the error code
QUERY	Queries executed and their results in plain text, including failed queries due to syntax or permission errors
TABLE	Tables affected by query execution
QUERY_DDL	Similar to <code>QUERY</code> , but filters only DDL-type queries (<code>CREATE</code> , <code>ALTER</code> , <code>DROP</code> , <code>RENAME</code> and <code>TRUNCATE</code>). There are some exceptions however. <code>RENAME USER</code> is not logged, while <code>CREATE/DROP [PROCEDURE / FUNCTION / USER]</code> are only logged from MariaDB 10.2.38 , MariaDB 10.3.29 , MariaDB 10.4.22 , MariaDB 10.5.13 and MariaDB 10.6.5 . In earlier versions they are not logged. See MDEV-23457 .
QUERY_DML	Similar to <code>QUERY</code> , but filters only DML-type queries (<code>DO</code> , <code>CALL</code> , <code>LOAD DATA/XML</code> , <code>DELETE</code> , <code>INSERT</code> , <code>SELECT</code> , <code>UPDATE</code> , <code>HANDLER</code> and <code>REPLACE</code> statements)
QUERY_DML_NO_SELECT	Similar to <code>QUERY_DML</code> , but doesn't log <code>SELECT</code> queries. (since version 1.4.4) (<code>DO</code> , <code>CALL</code> , <code>LOAD DATA/XML</code> , <code>DELETE</code> , <code>INSERT</code> , <code>UPDATE</code> , <code>HANDLER</code> and <code>REPLACE</code> statements)
QUERY_DCL	Similar to <code>QUERY</code> , but filters only DCL-type queries (<code>CREATE USER</code> , <code>DROP USER</code> , <code>RENAME USER</code> , <code>GRANT</code> , <code>REVOKE</code> and <code>SET PASSWORD</code> statements)

Since there are other types of queries besides DDL and DML, using the `QUERY_DDL` and `QUERY_DML` options together is not equivalent to using `QUERY`. Starting in version 1.3.0 of the Audit Plugin, there is the `QUERY_DCL` option for logging DCL types of queries (e.g., `GRANT` and `REVOKE` statements). In the same version, the `server_audit_query_log_limit` variable was added to be able to set the length of a log record. Previously, a log entry would be truncated due to long query strings.

Logging Connect Events

If the Audit Plugin has been configured to log connect events, it will log connects, disconnects, and failed connects. For a failed connection, the log includes the error code.

It's possible to define a list of users for which events can be excluded or included for tracing their database activities. This list will be ignored, though, for the loggings of connect events. This is because auditing standards distinguish between technical and physical users. Connects need to be logged for all types of users; access to objects need to be logged only for physical users.

Logging Query Events

If `QUERY`, `QUERY_DDL`, `QUERY_DML`, `QUERY_DML_NO_SELECT`, and/or `QUERY_DCL` event types are enabled, then the corresponding types of queries that are executed will be logged for defined users. The queries will be logged exactly as they are executed, in plain text. This is a security vulnerability: anyone who has access to the log files will be able to read the queries. So make sure that only trusted users have access to the log files and that the files are in a protected location. An alternative is to use `TABLE` event type instead of the query-related event types.

Queries are also logged if they cannot be executed, if they're unsuccessful. For example, a query will be logged because of a syntax error or because the user doesn't have the privileges necessary to access an object. These queries can be parsed by the error code that's provided in the log.

You may find failed queries to be more interesting: They can reveal problems with applications (e.g., an SQL statement in an application that doesn't match the current schema). They can also reveal if a malicious user is guessing at the names of tables and columns to try to get access to data.

Below is an example in which a user attempts to execute an `UPDATE` statement on a table for which he does not have permission:

```
UPDATE employees
SET salary = salary * 1.2
WHERE emp_id = 18236;

ERROR 1142 (42000):
UPDATE command denied to user 'bob'@'localhost' for table 'employees'
```

Looking in the Audit Plugin log (`server_audit.log`) for this entry, you can see the following entry:

```
20170817 11:07:18,ip-172-30-0-38,bob,localhost,15,46,QUERY,company,
'UPDATE employees SET salary = salary * 1.2 WHERE emp_id = 18236',1142
```

This log entry would be on one line, but it's reformatted here for better rendering. Looking at this log entry, you can see the date and time of the query, followed by the server host, the user and host for the account. Next is the connection and query identification numbers (i.e., `15` and `46`). After the log event type (i.e., `QUERY`), the database name (i.e., `company`), the query, and the error number is recorded.

Notice that the last value in the log entry is `1142` . That's the error number for the query. To find failed queries, you would look for two elements: the notation indicating that it's a `QUERY` entry, and the last value for the entry. If the query is successful, the value will be `0` .

Queries Not Included in Subordinate Query Event Types

Note that the `QUERY` event type will log queries that are not included in any of the subordinate `QUERY_*` event types, such as:

- CREATE FUNCTION
- DROP FUNCTION
- CREATE PROCEDURE
- DROP PROCEDURE
- SET
- CHANGE MASTER TO
- FLUSH
- KILL
- CHECK
- OPTIMIZE
- LOCK
- UNLOCK
- ANALYZE
- INSTALL PLUGIN
- UNINSTALL PLUGIN
- INSTALL SONAME
- UNINSTALL SONAME
- EXPLAIN

Logging Table Events

MariaDB has the ability to record table events in the logs—this is not a feature of MySQL. This feature is the only way to log which tables have been accessed through a view, a stored procedure, a stored function, or a trigger. Without this feature, a log entry for a query shows only the view, stored procedure or function used, not the underlying tables. Of course, you could create a custom application to parse each query executed to find the SQL statements used and the tables accessed, but that would be a drain on system resources. Table event logging is much simpler: it adds a line to the log for each table accessed, without any parsing. It includes notes as to whether it was a read or a write.

If you want to monitor user access to specific databases or tables (e.g., `mysql.user`), you can search the log for them. Then if you want to see a query which accessed a certain table, the audit log entry will include the query identification number. You can use it to search the same log for the query entry. This can be useful when searching a log containing tens of thousands of entries.

Because of the `TABLE` option, you may disable query logging and still know who accessed which tables. You might want to disable `QUERY` event logging to prevent sensitive data from being logged. Since `table` event logging will log who accessed which table, you can still watch for malicious activities with the log. This is often enough to fulfill auditing requirements.

Below is an example with both `TABLE` and `QUERY` events logging. For this scenario, suppose there is a [VIEW](#) in which

columns are selected from a few tables in a `company` database. The underlying tables are related to sensitive employee information, in particular salaries. Although we may have taken precautions to ensure that only certain user accounts have access to those tables, we will monitor the Audit Plugin logs for anyone who queries them—directly or indirectly through a view.

```
20170817 16:04:33, ip-172-30-0-38, root, localhost, 29, 913, READ, company, employees,
20170817 16:04:33, ip-172-30-0-38, root, localhost, 29, 913, READ, company, employees_salaries,
20170817 16:04:33, ip-172-30-0-38, root, localhost, 29, 913, READ, company, ref_job_titles,
20170817 16:04:33, ip-172-30-0-38, root, localhost, 29, 913, READ, company, org_departments,
20170817 16:04:33, ip-172-30-0-38, root, localhost, 29, 913, QUERY, company,
'SELECT * FROM employee_pay WHERE title LIKE \'%Executive%' OR title LIKE \'%Manager%',0
```

Although the user executed only one `SELECT` statement, there are multiple entries to the log: one for each table accessed and one entry for the query on the view, (i.e., `employee_pay`). We know primarily this is all for one query because they all have the same connection and query identification numbers (i.e., `29` and `913`).

Logging User Activities

The Audit Plugin will log the database activities of all users, or only the users that you specify. A database activity is defined as a *query* event or a *table* event. *Connect* events are logged for all users.

You may specify users to include in the log with the `server_audit_incl_users` variable or exclude users with the `server_audit_excl_users` variable. This can be useful if you would like to log entries, but are not interested in entries from trusted applications and would like to exclude them from the logs.

You would typically use either the `server_audit_incl_users` variable or the `server_audit_excl_users` variable. You may, though, use both variables. If a username is inadvertently listed in both variables, database activities for that user will be logged because `server_audit_incl_users` takes priority.

Although MariaDB considers a user as the combination of the username and hostname, the Audit Plugin logs only based on the username. MariaDB uses both the username and hostname so as to grant privileges relevant to the location of the user. Privileges are not relevant though for tracing the access to database objects. The host name is still recorded in the log, but logging is not determined based on that information.

The following example shows how to add a new username to the `server_audit_incl_users` variable without removing previous usernames:

```
SET GLOBAL server_audit_incl_users = CONCAT(@@global.server_audit_incl_users, ',Maria');
```

Remember to add also any new users to be included in the logs to the same variable in MariaDB configuration file. Otherwise, when the server restarts it will discard the setting.

Excluding or Including Users

By default events from all users are logged, but certain users can be excluded from logging by using the `server_audit_excl_users` variable. For example, to exclude users `valerianus` and `rocky` from having their events logged:

```
server_audit_excl_users=valerianus,rocky
```

This option is primarily used to exclude the activities of trusted applications.

Alternatively, `server_audit_incl_users` can be used to specifically include users. Both variables can be used, but if a user appears on both lists, `server_audit_incl_users` has a higher priority, and their activities will be logged.

Note that `CONNECT` events are always logged for all users, regardless of these two settings. Logging is also based on username only, not the username and hostname combination that MariaDB uses to determine privileges.

5.4.5.4 MariaDB Audit Plugin - Location and Rotation of Logs

Contents

1. [Separate log files](#)
2. [System logs](#)

Logs can be written to a separate file or to the system logs. If you prefer to have the logging separated from other system

information, the value of the variable, `server_audit_output_type` should be set to `file`. Incidentally, `file` is the only option on Windows systems.

You can force a rotation by enabling the `server_audit_file_rotate_now` variable like so:

```
SET GLOBAL server_audit_file_rotate_now = ON;
```

Separate log files

In addition to setting `server_audit_output_type`, you will have to provide the file path and name of the audit file. This is set in the variable, `server_audit_file_path`. You can set the file size limit of the log file with the variable, `server_audit_file_rotate_size`.

So, if rotation is on and the log file has reached the size limit you set, a copy is created with a consecutive number as extension, the original file will be truncated to be used for the auditing again. To limit the number of log files created, set the variable, `server_audit_file_rotations`. You can force log file rotation by setting the variable, `server_audit_file_rotate_now` to a value of `ON`. When the number of files permitted is reached, the oldest file will be overwritten. Below is an example of how the variables described above might be set in a server's configuration files:

```
[mysqld]
...
server_audit_file_rotate_now=ON
server_audit_file_rotate_size=1000000
server_audit_file_rotations=5
...
```

System logs

For security reasons, it's better sometimes to use the system logs instead of a local file owned by the `mysql` user. To do this, the value of `server_audit_output_type` needs to be set to `syslog`. Advanced configurations, such as using a remote `syslogd` service, are part of the `syslogd` configuration.

The variables, `server_audit_syslog_ident` and `server_audit_syslog_info` can be used to identify a system log entry made by the audit plugin. If a remote `syslogd` service is used for several MariaDB servers, these same variables are also used to identify the MariaDB server.

Below is an example of a system log entry taken from a server which had `server_audit_syslog_ident` set to the default value of `mysql -server_auditing`, and `server_audit_syslog_info` set to `<prod1>`.

```
Aug 717:19:58localhostmysql- server_auditing:
<prod1> localhost.localdomain,root,localhost,1,7,
QUERY, mysql, 'SELECT * FROM user',0
```

Although the default values for `server_audit_syslog_facility` and `server_audit_syslog_priority` should be sufficient in most cases, they can be changed based on the definition in `syslog.h` for the functions `openlog()` and `syslog()`.

5.4.5.5 MariaDB Audit Plugin - Log Format

The audit plugin logs user access to MariaDB and its objects. The audit trail (i.e., audit log) is a set of records, written as a list of fields to a file in a plain-text format. The fields in the log are separated by commas. The format used for the plugin's own log file is slightly different from the format used if it logs to the system log because it has its own standard format. The general format for the logging to the plugin's own file is defined like the following:

```
[timestamp],[serverhost],[username],[host],[connectionid],
[queryid],[operation],[database],[object],[retcode]
```

If the `server_audit_output_type` variable is set to `syslog` instead of the default, `file`, the audit log file format will be as follows:

```
[timestamp][syslog_host][syslog_ident]:[syslog_info][serverhost],[username],[host],
[connectionid],[queryid],[operation],[database],[object],[retcode]
```

Item logged	Description
timestamp	Time at which the event occurred. If syslog is used, the format is defined by <code>syslogd</code> .

syslog_host	Host from which the syslog entry was received.
syslog_ident	For identifying a system log entry, including the MariaDB server.
syslog_info	For providing information for identifying a system log entry.
serverhost	The MariaDB server host name.
username	Connected user.
host	Host from which the user connected.
connectionid	Connection ID number for the related operation.
queryid	Query ID number, which can be used for finding the relational table events and related queries. For TABLE events, multiple lines will be added.
operation	Recorded action type: CONNECT, QUERY, READ, WRITE, CREATE, ALTER, RENAME, DROP.
database	Active database (as set by USE).
object	Executed query for QUERY events, or the table name in the case of TABLE events.
retcode	Return code of the logged operation.

Various events will result in different audit records. Some events will not return a value for some fields (e.g., when the active database is not set when connecting to the server).

Below is a generic example of the output for connect events, with placeholders representing data. These are events in which a user connected, disconnected, or tried unsuccessfully to connect to the server.

```
[timestamp],[serverhost],[username],[host],[connectionid],0,CONNECT,[database],,0
[timestamp],[serverhost],[username],[host],[connectionid],0,DISCONNECT,,,0
[timestamp],[serverhost],[username],[host],[connectionid],0,FAILED_CONNECT,,,[retcode]
```

Here is the one audit record generated for each query event:

```
[timestamp],[serverhost],[username],[host],[connectionid],[queryid],QUERY,[database],[object],
[retcode]
```

Below are generic examples of records that are entered in the audit log for each type of table event:

```
[timestamp],[serverhost],[username],[host],[connectionid],[queryid],CREATE,[database],[object],
[timestamp],[serverhost],[username],[host],[connectionid],[queryid],READ,[database],[object],
[timestamp],[serverhost],[username],[host],[connectionid],[queryid],WRITE,[database],[object],
[timestamp],[serverhost],[username],[host],[connectionid],[queryid],ALTER,[database],[object],
[timestamp],[serverhost],[username],[host],[connectionid],[queryid],RENAME,[database],
[object_old]|[database_new].[object_new],
[timestamp],[serverhost],[username],[host],[connectionid],[queryid],DROP,[database],[object],
```

Starting in version 1.2.0, passwords are hidden in the log for certain types of queries. They are replaced with asterisks for `GRANT`, `CREATE USER`, `CREATE MASTER`, `CREATE SERVER`, and `ALTER SERVER` statements. Passwords, however, are not replaced for the `PASSWORD()` and `OLD_PASSWORD()` functions when they are used inside other SQL statements (i.e., `SET PASSWORD`).

5.4.5.6 MariaDB Audit Plugin - Versions

Below is a list of the releases of the MariaDB Audit Plugin, the most recent version first, and in which versions of MariaDB each plugin version was included.

Version Introduced

1.4.13 [MariaDB 10.2.38](#), [MariaDB 10.3.29](#), [MariaDB 10.4.19](#), [MariaDB 10.5.10](#)

1.4.10 [MariaDB 10.2.35](#), [MariaDB 10.3.26](#), [MariaDB 10.5.7](#)

1.4.7 [MariaDB 10.1.41](#), [MariaDB 10.2.26](#), [MariaDB 10.3.17](#), [MariaDB 10.4.7](#)

1.4.5 [MariaDB 10.2.24](#), [MariaDB 10.3.15](#), [MariaDB 10.4.5](#)

1.4.4 [MariaDB 5.5.61](#), [MariaDB 10.0.36](#), [MariaDB 10.1.34](#), [MariaDB 10.2.15](#), [MariaDB 10.3.7](#), [MariaDB 10.4.0](#)

- 1.4.0 [MariaDB 5.5.48](#), [MariaDB 10.0.24](#), [MariaDB 10.1.11](#)
- 1.3.0 [MariaDB 5.5.43](#), [MariaDB 10.0.18](#), [MariaDB 10.1.5](#)
- 1.2.0 [MariaDB 5.5.42](#), [MariaDB 10.0.17](#), [MariaDB 10.1.4](#)
- 1.1.7 [MariaDB 5.5.38](#), [MariaDB 10.0.11](#), [MariaDB 10.1.0](#)
- 1.1.6 [MariaDB 5.5.37](#), [MariaDB 10.0.10](#)
- 1.1.5 [MariaDB 10.0.09](#)
- 1.1.4 [MariaDB 5.5.36](#)
- 1.1.3 [MariaDB 5.5.34](#), [MariaDB 10.0.7](#)

5.4.5.7 MariaDB Audit Plugin Options and System Variables

Contents

1. System Variables
 1. [server_audit_events](#)
 2. [server_audit_excl_users](#)
 3. [server_audit_file_path](#)
 4. [server_audit_file_rotate_now](#)
 5. [server_audit_file_rotate_size](#)
 6. [server_audit_file_rotations](#)
 7. [server_audit_incl_users](#)
 8. [server_audit_loc_info](#)
 9. [server_audit_logging](#)
 10. [server_audit_mode](#)
 11. [server_audit_output_type](#)
 12. [server_audit_query_log_limit](#)
 13. [server_audit_syslog_facility](#)
 14. [server_audit_syslog_ident](#)
 15. [server_audit_syslog_info](#)
 16. [server_audit_syslog_priority](#)
2. Options
 1. [server_audit](#)

There are a several options and system variables related to the [MariaDB Audit Plugin](#), once it has been [installed](#). System variables can be displayed using the `SHOW VARIABLES` statement like so:

```
SHOW GLOBAL VARIABLES LIKE '%server_audit%';
```

Variable_name	Value
server_audit_events	CONNECT, QUERY, TABLE
server_audit_excl_users	
server_audit_file_path	server_audit.log
server_audit_file_rotate_now	OFF
server_audit_file_rotate_size	1000000
server_audit_file_rotations	9
server_audit_incl_users	
server_audit_logging	ON
server_audit_mode	0
server_audit_output_type	file
server_audit_query_log_limit	1024
server_audit_syslog_facility	LOG_USER
server_audit_syslog_ident	mysql-server_auditing
server_audit_syslog_info	
server_audit_syslog_priority	LOG_INFO

To change the value of one of these variables, you can use the `SET` statement, or set them at the command-line when starting MariaDB. It's recommended that you set them in the MariaDB configuration for the server like so:

```
[mariadb]
...
server_audit_excl_users='bob,ted'
...
```

System Variables

Below is a list of all system variables related to the Audit Plugin. See [Server System Variables](#) for a complete list of system variables and instructions on setting them. See also the [full list of MariaDB options, system and status variables](#).

server_audit_events

- **Description:** If set, then this restricts audit logging to certain event types. If not set, then every event type is logged to the audit log. For example: `SET GLOBAL server_audit_events='connect, query'`
- **Commandline:** `--server-audit-events=value`
- **Scope:** Global
- **Dynamic:** Yes
- **Data Type:** `string`
- **Default Value:** Empty string
- **Valid Values:**
 - `CONNECT, QUERY, TABLE` (MariaDB Audit Plugin < 1.2.0)
 - `CONNECT, QUERY, TABLE, QUERY_DDL, QUERY_DML` (MariaDB Audit Plugin >= 1.2.0)
 - `CONNECT, QUERY, TABLE, QUERY_DDL, QUERY_DML, QUERY_DCL` (MariaDB Audit Plugin >=1.3.0)
 - `CONNECT, QUERY, TABLE, QUERY_DDL, QUERY_DML, QUERY_DCL, QUERY_DML_NO_SELECT` (MariaDB Audit Plugin >= 1.4.4)
 - See [MariaDB Audit Plugin - Versions](#) to determine which MariaDB releases contain each MariaDB Audit Plugin versions.

server_audit_excl_users

- **Description:** If not empty, it contains the list of users whose activity will NOT be logged. For example: `SET GLOBAL server_audit_excl_users='user_foo, user_bar'`. `CONNECT` records aren't affected by this variable - they are always logged. The user is still logged if it's specified in [server_audit_incl_users](#).
- **Commandline:** `--server-audit-excl-users=value`
- **Scope:** Global
- **Dynamic:** Yes
- **Data Type:** `string`
- **Default Value:** Empty string
- **Size limit:** 1024 characters

server_audit_file_path

- **Description:** When [server_audit_output_type=file](#), sets the path and the filename to the log file. If the specified path exists as a directory, then the log will be created inside that directory with the name 'server_audit.log'. Otherwise the value is treated as a filename. The default value is 'server_audit.log', which means this file will be created in the database directory.
- **Commandline:** `--server-audit-file-path=value`
- **Scope:** Global
- **Dynamic:** Yes
- **Data Type:** `string`
- **Default Value:** `server_audit.log`

server_audit_file_rotate_now

- **Description:** When [server_audit_output_type=file](#), the user can force the log file rotation by setting this variable to `ON` or `1`.
- **Commandline:** `--server-audit-rotate-now[={0|1}]`
- **Scope:** Global
- **Dynamic:** Yes
- **Data Type:** `boolean`
- **Default Value:** `OFF`

server_audit_file_rotate_size

- **Description:** When [server_audit_output_type=file](#), it limits the size of the log file to the given amount of bytes. Reaching that limit turns on the rotation - the current log file is renamed as 'file_path.1'. The empty log file is created as 'file_path' to log into it. The default value is 1000000.
 - **Commandline:** `--server-audit-rotate-size=#`
 - **Scope:** Global
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Default Value:** 1000000
 - **Range:** 100 to 9223372036854775807
-

server_audit_file_rotations

- **Description:** When [server_audit_output_type=file](#), this specifies the number of rotations to save. If set to 0 then the log never rotates. The default value is 9.
 - **Commandline:** `--server-audit-rotations=#`
 - **Scope:** Global
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Default Value:** 9
 - **Range:** 0 to 999
-

server_audit_incl_users

- **Description:** If not empty, it contains a comma-delimited list of users whose activity will be logged. For example: `SET GLOBAL server_audit_incl_users='user_foo, user_bar'`. `CONNECT` records aren't affected by this variable - they are always logged. This setting has higher priority than [server_audit_excl_users](#). So if the same user is specified both in `incl_` and `excl_` lists, they will still be logged.
 - **Commandline:** `--server-audit-incl-users=value`
 - **Scope:** Global
 - **Dynamic:** Yes
 - **Data Type:** `string`
 - **Default Value:** Empty string
 - **Size limit:** 1024 characters
-

server_audit_loc_info

- **Description:** Used by plugin internals. It has no useful meaning to users.
 - In earlier versions, users see it as a read-only variable.
 - In later versions, it is hidden from the user.
 - **Commandline:** N/A
 - **Scope:** Global
 - **Dynamic:** No
 - **Data Type:** `string`
 - **Default Value:** Empty string
 - **Introduced:** [MariaDB 10.1.12](#), [MariaDB 10.0.24](#), [MariaDB 5.5.48](#)
 - **Hidden:** [MariaDB 10.1.18](#), [MariaDB 10.0.28](#), [MariaDB 5.5.53](#)
-

server_audit_logging

- **Description:** Enables/disables the logging. Expected values are ON/OFF. For example: `SET GLOBAL server_audit_logging=on` If the `server_audit_output_type` is `FILE`, this will actually create/open the logfile so the [server_audit_file_path](#) should be properly specified beforehand. Same about the `SYSLOG`-related parameters. The logging is turned off by default.
 - **Commandline:** `--server-audit-logging[={0|1}]`
 - **Scope:** Global
 - **Dynamic:** Yes
 - **Data Type:** `boolean`
 - **Default Value:** `OFF`
-

server_audit_mode

- **Description:** This variable doesn't have any distinctive meaning for a user. Its value mostly reflects the server version with which the plugin was started and is intended to be used by developers for testing.
 - **Commandline:** `--server-audit-mode[=#]`
 - **Scope:** Global
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Default Value:** `0`
 - **Range:** `0` to `1`
-

server_audit_output_type

- **Description:** Specifies the desired output type. Can be `SYSLOG`, `FILE` or null as no output. For example: `SET GLOBAL server_audit_output_type=file` file: log records will be saved into the rotating log file. The name of the file set by `server_audit_file_path` variable. `syslog`: log records will be sent to the local `syslogd` daemon with the standard `<syslog.h>` API. The default value is 'file'.
 - **Commandline:** `--server-audit-output-type=value`
 - **Scope:** Global
 - **Dynamic:** Yes
 - **Data Type:** `enum`
 - **Default Value:** `file`
 - **Valid Values:** `SYSLOG`, `FILE`
-

server_audit_query_log_limit

- **Description:** Limit on the length of the query string in a record.
 - **Commandline:** `--server-audit-query-log-limit=#`
 - **Scope:** Global
 - **Dynamic:** Yes
 - **Data Type:** `numeric`
 - **Default Value:** `1024`
 - **Range:** `0` to `2147483647`
-

server_audit_syslog_facility

- **Description:** `SYSLOG`-mode variable. It defines the 'facility' of the records that will be sent to the `syslog`. Later the log can be filtered by this parameter.
 - **Commandline:** `--server-audit-syslog-facility=value`
 - **Scope:** Global
 - **Dynamic:** Yes
 - **Data Type:** `enum`
 - **Default Value:** `LOG_USER`
 - **Valid Values:** `LOG_USER`, `LOG_MAIL`, `LOG_DAEMON`, `LOG_AUTH`, `LOG_SYSLOG`, `LOG_LPR`, `LOG_NEWS`, `LOG_UUCP`, `LOG_CRON`, `LOG_AUTHPRIV`, `LOG_FTP`, and `LOG_LOCAL0` – `LOG_LOCAL7`.
-

server_audit_syslog_ident

- **Description:** `SYSLOG`-mode variable. String value for the 'ident' part of each `syslog` record. Default value is 'mysql-server_auditing'. New value becomes effective only after restarting the logging.
 - **Commandline:** `--server-audit-syslog-ident=value`
 - **Scope:** Global
 - **Dynamic:** Yes
 - **Data Type:** `string`
 - **Default Value:** `mysql-server_auditing`
-

server_audit_syslog_info

- **Description:** `SYSLOG`-mode variable. The 'info' string to be added to the `syslog` records. Can be changed any time.
-

- **Commandline:** `--server-audit-syslog-info=value`
- **Scope:** Global
- **Dynamic:** Yes
- **Data Type:** `string`
- **Default Value:** Empty string

server_audit_syslog_priority

- **Description:** SYSLOG-mode variable. Defines the priority of the log records for the syslogd.
- **Commandline:** `--server-audit-syslog-priority=value`
- **Scope:** Global
- **Dynamic:** Yes
- **Data Type:** `enum`
- **Default Value:** `LOG_INFO`
- **Valid Values:** `LOG_EMERG`, `LOG_ALERT`, `LOG_CRIT`, `LOG_ERR`, `LOG_WARNING`, `LOG_NOTICE`, `LOG_INFO`, `LOG_DEBUG`

Options

server_audit

- **Description:** Controls how the server should treat the plugin when the server starts up.
 - Valid values are:
 - `OFF` - Disables the plugin without removing it from the `mysql.plugins` table.
 - `ON` - Enables the plugin. If the plugin cannot be initialized, then the server will still continue starting up, but the plugin will be disabled.
 - `FORCE` - Enables the plugin. If the plugin cannot be initialized, then the server will fail to start with an error.
 - `FORCE_PLUS_PERMANENT` - Enables the plugin. If the plugin cannot be initialized, then the server will fail to start with an error. In addition, the plugin cannot be uninstalled with `UNINSTALL SONAME` or `UNINSTALL PLUGIN` while the server is running.
 - See [MariaDB Audit Plugin - Installation: Prohibiting Uninstallation](#) for more information on one use case.
 - See [Plugin Overview: Configuring Plugin Activation at Server Startup](#) for more information.
- **Commandline:** `--server-audit=val`
- **Data Type:** `enumerated`
- **Default Value:** `ON`
- **Valid Values:** `OFF`, `ON`, `FORCE`, `FORCE_PLUS_PERMANENT`

5.4.5.8 MariaDB Audit Plugin - Status Variables

Contents

1. [Status Variables](#)
 1. [Server_audit_active](#)
 2. [Server_audit_current_log](#)
 3. [Server_audit_last_error](#)
 4. [Server_audit_writes_failed](#)

There are a few status variables related to the [MariaDB Audit Plugin](#), once it has been [installed](#). These variables can be displayed using the `SHOW STATUS` statement like so:

```
SHOW STATUS LIKE 'server_audit%';

+-----+-----+
| Variable_name          | Value                |
+-----+-----+
| Server_audit_active    | ON                   |
| Server_audit_current_log | server_audit.log     |
| Server_audit_last_error |                      |
| Server_audit_writes_failed | 0                    |
+-----+-----+
```

Status Variables

Below is a list of all status variables related to the Audit Plugin. These cannot be set: These are not to be confused with system variables, which can be set. See [Server Status Variables](#) for a complete list of status variables that can be viewed with the [SHOW STATUS](#) statement. See also the [Full list of MariaDB options, system and status variables](#).

Server_audit_active

- **Description:** If the auditing is actually working. It gets the ON value when the logging is successfully started. Then it can get the OFF value if the logging was stopped or log records can't be properly stored due to file or syslog errors.
- **Data Type:** `boolean`

Server_audit_current_log

- **Description:** The name of the logfile or the SYSLOG parameters that are in current use.
- **Data Type:** `string`

Server_audit_last_error

- **Description:** If something went wrong with the logging here you can see the message.
- **Data Type:** `string`

Server_audit_writes_failed

- **Description:** The number of log records since last logging-start that weren't properly stored because of errors of any kind. The global value can be flushed by [FLUSH STATUS](#) .
- **Data Type:** `numeric`
- **Default Value:** `0`

5.4.6 Authentication Plugins

When a user attempts to log in, the authentication plugin controls how MariaDB Server determines whether the connection is from a legitimate user.

When creating or altering a user account with the [GRANT](#), [CREATE USER](#) or [ALTER USER](#) statements, you can specify the authentication plugin you want the user account to use by providing the `IDENTIFIED VIA` clause. By default, when you create a user account without specifying an authentication plugin, MariaDB uses the [mysql_native_password](#) plugin.

From [MariaDB 10.4](#):

- One can specify multiple authentication plugins for each user account.
- The `root@localhost` user created by [mariadb-install-db](#) is created with the ability to use two authentication plugins. First, it is configured to try to use the [unix_socket](#) authentication plugin. This allows the `root@localhost` user to login without a password via the local Unix socket file defined by the `socket` system variable, as long as the login is attempted from a process owned by the operating system `root` user account. Second, if authentication fails with the [unix_socket](#) authentication plugin, then it is configured to try to use the [mysql_native_password](#) authentication plugin. However, an invalid password is initially set, so in order to authenticate this way, a password must be set with [SET PASSWORD](#).

Pluggable Authentication Overview

The authentication of users is delegated to plugins.

Authentication Plugin - `mysql_native_password`

Uses the password hashing algorithm introduced in MySQL 4.1.

Authentication Plugin - `mysql_old_password`

The `mysql_old_password` authentication plugin uses the pre-MySQL 4.1 password hashing algorithm.

Authentication Plugin - `ed25519`

Uses the Elliptic Curve Digital Signature Algorithm to securely store users' passwords.

Authentication Plugin - GSSAPI

The `gssapi` authentication plugin uses the GSSAPI interface to authenticate with Kerberos or NTLM.

Authentication with Pluggable Authentication Modules (PAM)

Uses the Pluggable Authentication Module (PAM) framework to authenticate MariaDB users.

Authentication Plugin - Unix Socket

Uses the user name that owns the process connected to MariaDB's unix socket file.

Authentication Plugin - Named Pipe

Uses the user name that owns the process connected to MariaDB's named pipe on Windows.

Authentication Plugin - SHA-256

MySQL supports the `sha256_password` and `caching_sha2_password` authentication plugins.

Authentication Plugin - PARSEC

The PARSEC Authentication Plugin was introduced in MariaDB 11.6

When a user attempts to log in, the authentication plugin controls how MariaDB Server determines whether the connection is from a legitimate user.

When creating or altering a user account with the `GRANT`, `CREATE USER` or `ALTER USER` statements, you can specify the authentication plugin you want the user account to use by providing the `IDENTIFIED VIA` clause. By default, when you create a user account without specifying an authentication plugin, MariaDB uses the `mysql_native_password` plugin.

MariaDB starting with 10.4

In MariaDB 10.4 and later, there are some notable changes, such as:

- You can specify multiple authentication plugins for each user account.
- The `root@localhost` user created by `mariadb-install-db` is created with the ability to use two authentication plugins. First, it is configured to try to use the `unix_socket` authentication plugin. This allows the the `root@localhost` user to login without a password via the local Unix socket file defined by the `socket` system

variable, as long as the login is attempted from a process owned by the operating system `root` user account. Second, if authentication fails with the `unix_socket` authentication plugin, then it is configured to try to use the `mysql_native_password` authentication plugin. However, an invalid password is initially set, so in order to authenticate this way, a password must be set with `SET PASSWORD`.

Supported Authentication Plugins

The authentication process is a conversation between the server and a client. MariaDB implements both server-side and client-side authentication plugins.

Supported Server Authentication Plugins

MariaDB provides seven server-side authentication plugins:

- `mysql_native_password`
- `mysql_old_password`
- `ed25519`
- `gssapi`
- `pam` (Unix only)
- `unix_socket` (Unix only)
- `named_pipe` (Windows only)

Supported Client Authentication Plugins

MariaDB provides eight client-side authentication plugins:

- `mysql_native_password`
- `mysql_old_password`
- `client_ed25519`
- `auth_gssapi_client`
- `dialog`
- `mysql_clear_password`
- `sha256_password`
- `caching_sha256_password`

Options Related to Authentication Plugins

Server Options Related to Authentication Plugins

MariaDB supports the following server options related to authentication plugins:

Server Option	Description
<code>old_passwords={1 0}</code>	If set to <code>1</code> (<code>0</code> is default), MariaDB reverts to using the <code>mysql_old_password</code> authentication plugin by default for newly created users and passwords, instead of the <code>mysql_native_password</code> authentication plugin.
<code>plugin_dir=path</code>	Path to the <code>plugin</code> directory. For security reasons, either make sure this directory can only be read by the server, or set <code>secure_file_priv</code> .
<code>plugin_maturity=level</code>	The lowest acceptable <code>plugin</code> maturity. MariaDB will not load plugins less mature than the specified level.
<code>secure_auth</code>	Connections will be blocked if they use the <code>mysql_old_password</code> authentication plugin. The server will also fail to start if the privilege tables are in the old, pre-MySQL 4.1 format.

Client Options Related to Authentication Plugins

Most `clients` and `utilities` support some command line arguments related to client authentication plugins:

Client Option	Description
<code>--connect-expired-password</code>	Notify the server that this client is prepared to handle <code>expired password sandbox mode</code> even if <code>--batch</code> was specified. From MariaDB 10.4.3 .

<code>--default-auth=name</code>	Default authentication client-side plugin to use.
<code>--plugin-dir=path</code>	Directory for client-side plugins.
<code>--secure-auth</code>	Refuse to connect to the server if the server uses the mysql_old_password authentication plugin. This mode is off by default, which is a difference in behavior compared to MySQL 5.6 and later, where it is on by default.

Developers who are using [MariaDB Connector/C](#) can implement similar functionality in their application by setting the following options with the [mysql_optionsv](#) function:

- `MYSQL_OPT_CAN_HANDLE_EXPIRED_PASSWORDS`
- `MYSQL_PLUGIN_DIR`
- `MYSQL_DEFAULT_AUTH`
- `MYSQL_SECURE_AUTH`

For example:

```
mysql_optionsv(mysql, MYSQL_OPT_CAN_HANDLE_EXPIRED_PASSWORDS, 1);
mysql_optionsv(mysql, MYSQL_DEFAULT_AUTH, "name");
mysql_optionsv(mysql, MYSQL_PLUGIN_DIR, "path");
mysql_optionsv(mysql, MYSQL_SECURE_AUTH, 1);
```

Installation Options Related to Authentication Plugins

`mariadb-install-db` supports the following installation options related to authentication plugins:

Installation Option	Description
<code>--auth-root-authentication-method={normal socket}</code>	If set to <code>normal</code> , it creates a <code>root@localhost</code> account that authenticates with the mysql_native_password authentication plugin and that has no initial password set, which can be insecure. If set to <code>socket</code> , it creates a <code>root@localhost</code> account that authenticates with the unix_socket authentication plugin. Set to <code>normal</code> by default. Available since MariaDB 10.1 .
<code>--auth-root-socket-user=USER</code>	Used with <code>--auth-root-authentication-method=socket</code> . It specifies the name of the second account to create with SUPER privileges in addition to <code>root</code> , as well as of the system account allowed to access it. Defaults to the value of <code>--user</code> .

Extended SQL Syntax

MariaDB has extended the SQL standard [GRANT](#), [CREATE USER](#), and [ALTER USER](#) statements, so that they support specifying different authentication plugins for specific users. An authentication plugin can be specified with these statements by providing the `IDENTIFIED VIA` clause.

For example, the [GRANT](#) syntax is:

```
GRANT <privileges> ON <level> TO <user>
  IDENTIFIED VIA <plugin> [ USING <string> ]
```

And the [CREATE USER](#) syntax is:

```
CREATE USER <user>
  IDENTIFIED VIA <plugin> [ USING <string> ]
```

And the [ALTER USER](#) syntax is:

```
ALTER USER <user>
  IDENTIFIED VIA <plugin> [ USING <string> ]
```

The optional `USING` clause allows users to provide an authentication string to a plugin. The authentication string's format and meaning is completely defined by the plugin.

For example, for the [mysql_native_password](#) authentication plugin, the authentication string should be a password hash:

```
CREATE USER mysqltest_up1
  IDENTIFIED VIA mysql_native_password USING '*E8D46CE25265E545D225A8A6F1BAF642FEBEE5CB';
```

Since `mysql_native_password` is the default authentication plugin, the above is just another way of saying the following:

```
CREATE USER mysqltest_up1
  IDENTIFIED BY PASSWORD '*E8D46CE25265E545D225A8A6F1BAF642FEBEE5CB';
```

In contrast, for the `pam` authentication plugin, the authentication string should refer to a [PAM service name](#):

```
CREATE USER mysqltest_up1
  IDENTIFIED VIA pam USING 'mariadb';
```

MariaDB starting with 10.4

In [MariaDB 10.4](#) and later, a user account can be associated with multiple authentication plugins.

For example, to configure the `root@localhost` user account to try the `unix_socket` authentication plugin, followed by the `mysql_native_password` authentication plugin as a backup, you could execute the following:

```
CREATE USER root@localhost
  IDENTIFIED VIA unix_socket
  OR mysql_native_password USING PASSWORD("verysecret");
```

See [Authentication from MariaDB 10.4](#) for more information.

Authentication Plugins Installed by Default

Server Authentication Plugins Installed by Default

Not all server-side authentication plugins are installed by default. If a specific server-side authentication plugin is not installed by default, then you can find the installation procedure on the documentation page for the specific authentication plugin.

MariaDB starting with 10.4

In [MariaDB 10.4](#) and later, the following server-side authentication plugins are installed by default:

- The `mysql_native_password` and `mysql_old_password` authentication plugins are installed by default in all builds.
- The `unix_socket` authentication plugin is installed by default in all builds on Unix and Linux.
- The `named_pipe` authentication plugin is installed by default in all builds on Windows.

MariaDB until 10.3

In [MariaDB 10.3](#) and below, the following server-side authentication plugins are installed by default:

- The `mysql_native_password` and `mysql_old_password` authentication plugins are installed by default in all builds.
- The `unix_socket` authentication plugin is installed by default in **new installations** that use the `.deb` packages provided by Debian's default repositories in Debian 9 and later and Ubuntu's default repositories in Ubuntu 15.10 and later. See [Differences in MariaDB in Debian \(and Ubuntu\)](#) for more information.
- The `named_pipe` authentication plugin is installed by default in all builds on Windows.

Client Authentication Plugins Installed by Default

Client-side authentication plugins do not need to be *installed* in the same way that server-side authentication plugins do. If the client uses either the `libmysqlclient` or [MariaDB Connector/C](#) library, then the library automatically loads client-side authentication plugins from the library's plugin directory whenever they are needed.

Most [clients and utilities](#) support the `--plugin-dir` command line argument that can be used to set the path to the library's plugin directory:

Client Option	Description
<code>--plugin-dir=path</code>	Directory for client-side plugins.

Developers who are using [MariaDB Connector/C](#) can implement similar functionality in their application by setting the `MYSQL_PLUGIN_DIR` option with the `mysql_optionsv` function.

For example:

```
mysql_optionsv(mysql, MYSQL_PLUGIN_DIR, "path");
```

If your client encounters errors similar to the following, then you may need to set the path to the library's plugin directory:

```
ERROR 2059 (HY000): Authentication plugin 'dialog' cannot be loaded:
/usr/lib/mysql/plugin/dialog.so: cannot open shared object file: No such file or directory
```

If the client does **not** use either the `libmysqlclient` or [MariaDB Connector/C](#) library, then you will have to determine which authentication plugins are supported by the specific client library used by the client.

If the client uses either the `libmysqlclient` or [MariaDB Connector/C](#) library, but the client is not bundled with either library's *optional* client authentication plugins, then you can only use the conventional authentication plugins (like `mysql_native_password` and `mysql_old_password`) and the non-conventional authentication plugins that don't require special client-side authentication plugins (like `unix_socket` and `named_pipe`).

Default Authentication Plugin

Default Server Authentication Plugin

The `mysql_native_password` authentication plugin is currently the default authentication plugin in all versions of MariaDB if the `old_passwords` system variable is set to `0`, which is the default.

On a system with the `old_passwords` system variable set to `0`, this means that if you create a user account with either the `GRANT` or `CREATE USER` statements, and if you do not specify an authentication plugin with the `IDENTIFIED VIA` clause, then MariaDB will use the `mysql_native_password` authentication plugin for the user account.

For example, this user account will use the `mysql_native_password` authentication plugin:

```
CREATE USER username@hostname;
```

And so will this user account:

```
CREATE USER username@hostname IDENTIFIED BY 'notagoodpassword';
```

The `mysql_old_password` authentication plugin becomes the default authentication plugin in all versions of MariaDB if the `old_passwords` system variable is explicitly set to `1`.

However, the `mysql_old_password` authentication plugin is not considered secure, so it is recommended to avoid using this authentication plugin. To help prevent undesired use of the `mysql_old_password` authentication plugin, the server supports the `secure_auth` system variable that can be used to configured the server to refuse connections that try to use the `mysql_old_password` authentication plugin:

Server Option	Description
<code>old_passwords=</code> {1 0}	If set to <code>1</code> (<code>0</code> is default), MariaDB reverts to using the <code>mysql_old_password</code> authentication plugin by default for newly created users and passwords, instead of the <code>mysql_native_password</code> authentication plugin.
<code>secure_auth</code>	Connections will be blocked if they use the the <code>mysql_old_password</code> authentication plugin. The server will also fail to start if the privilege tables are in the old, pre-MySQL 4.1 format.

Most [clients and utilities](#) also support the `--secure-auth` command line argument that can also be used to configure the client to refuse to connect to servers that use the `mysql_old_password` authentication plugin:

Client Option	Description
---------------	-------------

<pre>-- secure- auth</pre>	<p>Refuse to connect to the server if the server uses the mysql_old_password authentication plugin. This mode is off by default, which is a difference in behavior compared to MySQL 5.6 and later, where it is on by default.</p>
----------------------------	--

Developers who are using [MariaDB Connector/C](#) can implement similar functionality in their application by setting the `MYSQL_SECURE_AUTH` option with the [mysql_optionsv](#) function.

For example:

```
mysql_optionsv(mysql, MYSQL_SECURE_AUTH, 1);
```

Default Client Authentication Plugin

The default client-side authentication plugin depends on a few factors.

If a client doesn't explicitly set the default client-side authentication plugin, then the client will determine which authentication plugin to use by checking the length of the scramble in the server's handshake packet.

If the server's handshake packet contains a 9-byte scramble, then the client will default to the [mysql_old_password](#) authentication plugin.

If the server's handshake packet contains a 20-byte scramble, then the client will default to the [mysql_native_password](#) authentication plugin.

Setting the Default Client Authentication Plugin

Most [clients and utilities](#) support the `--default-auth` command line argument that can be used to set the default client-side authentication plugin:

Client Option	Description
<code>--default-auth=name</code>	Default authentication client-side plugin to use.

Developers who are using [MariaDB Connector/C](#) can implement similar functionality in their application by setting the `MYSQL_DEFAULT_AUTH` option with the [mysql_optionsv](#) function.

For example:

```
mysql_optionsv(mysql, MYSQL_DEFAULT_AUTH, "name");
```

If you know that your user account is configured to require a client-side authentication plugin that isn't [mysql_old_password](#) or [mysql_native_password](#), then it can help speed up your connection process to explicitly set the default client-side authentication plugin.

According to the [client-server protocol](#), the server first sends the handshake packet to the client, then the client replies with a packet containing the user name of the user account that is requesting access. The server handshake packet initially tells the client to use the default server authentication plugin, and the client reply initially tells the server that it will use the default client authentication plugin.

However, the server-side and client-side authentication plugins mentioned in these initial packets may not be the correct ones for this specific user account. The server only knows what authentication plugin to use for this specific user account after reading the user name from the client reply packet and finding the appropriate row for the user account in either the [mysql.user](#) table or the [mysql.global_priv](#) table, depending on the MariaDB version.

If the server finds that either the server-side or client-side default authentication plugin does not match the actual authentication plugin that should be used for the given user account, then the server restarts the authentication on either the server side or the client side.

This means that, if you know what client authentication plugin your user account requires, then you can avoid an unnecessary authentication restart and you can save two packets and two round-trips between the client and server by configuring your client to use the correct authentication plugin by default.

Authentication Plugins

Server Authentication Plugins

`mysql_native_password`

The [mysql_native_password](#) authentication plugin uses the password hashing algorithm introduced in MySQL 4.1, which is

also used by the `PASSWORD()` function when `old_passwords=0` is set. This hashing algorithm is based on [SHA-1](#).

mysql_old_password

The `mysql_old_password` authentication plugin uses the pre-MySQL 4.1 password hashing algorithm, which is also used by the `OLD_PASSWORD()` function and by the `PASSWORD()` function when `old_passwords=1` is set.

ed25519

The `ed25519` authentication plugin uses [Elliptic Curve Digital Signature Algorithm](#) to securely store users' passwords and to authenticate users. The `ed25519` algorithm is the same one that is used by [OpenSSH](#). It is based on the elliptic curve and code created by [Daniel J. Bernstein](#).

From a user's perspective, the `ed25519` authentication plugin still provides conventional password-based authentication.

gssapi

The `gssapi` authentication plugin allows the user to authenticate with services that use the [Generic Security Services Application Program Interface \(GSSAPI\)](#). Windows has a slightly different but very similar API called [Security Support Provider Interface \(SSPI\)](#).

On Windows, this authentication plugin supports [Kerberos](#) and [NTLM](#) authentication. Windows authentication is supported regardless of whether a [domain](#) is used in the environment.

On Unix systems, the most dominant GSSAPI service is [Kerberos](#). However, it is less commonly used on Unix systems than it is on Windows. Regardless, this authentication plugin also supports Kerberos authentication on Unix.

The `gssapi` authentication plugin is most often used for authenticating with [Microsoft Active Directory](#).

pam

The `pam` authentication plugin allows MariaDB to offload user authentication to the system's [Pluggable Authentication Module \(PAM\)](#) framework. PAM is an authentication framework used by Linux, FreeBSD, Solaris, and other Unix-like operating systems.

unix_socket

The `unix_socket` authentication plugin allows the user to use operating system credentials when connecting to MariaDB via the local Unix socket file. This Unix socket file is defined by the `socket` system variable.

The `unix_socket` authentication plugin works by calling the `getsockopt` system call with the `SO_PEERCREC` socket option, which allows it to retrieve the `uid` of the process that is connected to the socket. It is then able to get the user name associated with that `uid`. Once it has the user name, it will authenticate the connecting user as the MariaDB account that has the same user name.

For example:

```
$ mysql -uroot
MariaDB []> CREATE USER serg IDENTIFIED VIA unix_socket;
MariaDB []> CREATE USER monty IDENTIFIED VIA unix_socket;
MariaDB []> quit
Bye
$ whoami
serg
$ mysql --user=serg
Welcome to the MariaDB monitor.  Commands end with ; or \g.
Your MariaDB connection id is 2
Server version: 5.2.0-MariaDB-alpha-debug Source distribution
MariaDB []> quit
Bye
$ mysql --user=monty
ERROR 1045 (28000): Access denied for user 'monty'@'localhost' (using password: NO)
```

In this example, a user `serg` is already logged into the operating system and has full shell access. He has already authenticated with the operating system and his MariaDB account is configured to use the `unix_socket` authentication plugin, so he does not need to authenticate again for the database. MariaDB accepts his operating system credentials and allows him to connect. However, any attempt to connect to the database as another operating system user will be denied.

named_pipe

The [named_pipe](#) authentication plugin allows the user to use operating system credentials when connecting to MariaDB via named pipe on Windows. Named pipe connections are enabled by the [named_pipe](#) system variable.

The [named_pipe](#) authentication plugin works by using [named pipe impersonation](#) and calling `GetUserName()` to retrieve the user name of the process that is connected to the named pipe. Once it has the user name, it authenticates the connecting user as the MariaDB account that has the same user name.

For example:

```
CREATE USER wlad IDENTIFIED VIA named_pipe;
CREATE USER monty IDENTIFIED VIA named_pipe;
quit

C:\>echo %USERNAME%
wlad

C:\> mysql --user=wlad --protocol=PIPE
Welcome to the MariaDB monitor.  Commands end with ; or \g.
Your MariaDB connection id is 4
Server version: 10.1.12-MariaDB-debug Source distribution

Copyright (c) 2000, 2015, Oracle, MariaDB Corporation Ab and others.

Type 'help;' or '\h' for help. Type '\c' to clear the current input statement.

MariaDB [(none)]> quit
Bye

C:\> mysql --user=monty --protocol=PIPE
ERROR 1698 (28000): Access denied for user 'monty'@'localhost'
```

Authentication Plugin API

The authentication plugin API is extensively documented in the [source code](#) in the following files:

- [mysql/plugin_auth.h](#) (server part)
- [mysql/client_plugin.h](#) (client part)
- [mysql/plugin_auth_common.h](#) (common parts)

The MariaDB [source code](#) also contains some authentication plugins that are intended explicitly to be examples for developers. They are located in `plugin/auth_examples`.

The definitions of two example authentication plugins called `two_questions` and `three_attempts` can be seen in `plugin/auth_examples/dialog_examples.c`. These authentication plugins demonstrate how to communicate with the user using the [dialog](#) client authentication plugin.

The `two_questions` authentication plugin asks the user for a password and a confirmation ("Are you sure?").

The `three_attempts` authentication plugin gives the user three attempts to enter a correct password.

The password for both of these plugins should be specified in the plain text in the `USING` clause:

```
CREATE USER insecure IDENTIFIED VIA two_questions USING 'notverysecret';
```

Dialog Client Authentication Plugin - Client Library Extension

The [dialog](#) client authentication plugin, strictly speaking, is not part of the client-server or authentication plugin API. But it can be loaded into any client application that uses the `libmysqlclient` or [MariaDB Connector/C](#) libraries. This authentication plugin provides a way for the application to customize the UI of the dialog function.

In order to use the [dialog](#) client authentication plugin to communicate with the user in a customized way, the application will need to implement a function with the following signature:

```
extern "C" char *mysql_authentication_dialog_ask(
    MYSQL *mysql, int type, const char *prompt, char *buf, int buf_len)
```

The function takes the following arguments:

- The connection handle.

- A question "type", which has one of the following values:
 - 1 - Normal question
 - 2 - Password (no echo)
- A prompt.
- A buffer.
- The length of the buffer.

The function returns a pointer to a string of characters, as entered by the user. It may be stored in `buf` or allocated with `malloc()`.

Using this function a GUI application can pop up a dialog window, a network application can send the question over the network, as required. If no `mysql_authentication_dialog_ask` function is provided by the application, the `dialog` client authentication plugin falls back to `fputs()` and `fgets()`.

Providing this callback is particularly important on Windows, because Windows GUI applications have no associated console and the default dialog function will not be able to reach the user. An example of Windows GUI client that does it correctly is [HeidiSQL](#).

5.4.6.2 Authentication Plugin - `mysql_native_password`

The `mysql_native_password` authentication plugin is the default authentication plugin that will be used for an account created when no authentication plugin is explicitly mentioned and `old_passwords=0` is set. It uses the password hashing algorithm introduced in MySQL 4.1, which is also used by the `PASSWORD()` function when `old_passwords=0` is set. This hashing algorithm is based on [SHA-1](#).

It is not recommended to use the `mysql_native_password` authentication plugin for new installations that require **high password security**. If someone is able to both listen to the connection protocol and get a copy of the `mysql.user` table, then the person would be able to use this information to connect to the MariaDB server. The [ed25519](#) authentication plugin is a more modern authentication plugin that provides simple password authentication using a more secure algorithm.

Contents

1. [Installing the Plugin](#)
2. [Creating Users](#)
3. [Changing User Passwords](#)
4. [Client Authentication Plugins](#)
 1. [mysql_native_password](#)
5. [Support in Client Libraries](#)
6. [Known Old Issues \(Only Relevant for Old Installations\)](#)
 1. [Mismatches Between Password and authentication_string Columns](#)

Installing the Plugin

The `mysql_native_password` authentication plugin is statically linked into the server, so no installation is necessary.

Creating Users

The easiest way to create a user account with the `mysql_native_password` authentication plugin is to make sure that `old_passwords=0` is set, and then create a user account via `CREATE USER` that does not specify an authentication plugin, but does specify a password via the `IDENTIFIED BY` clause. For example:

```
SET old_passwords=0;
CREATE USER username@hostname IDENTIFIED BY 'mariadb';
```

If `SQL_MODE` does not have `NO_AUTO_CREATE_USER` set, then you can also create the user account via `GRANT`. For example:

```
SET old_passwords=0;
GRANT SELECT ON db.* TO username@hostname IDENTIFIED BY 'mariadb';
```

You can also create the user account by providing a password hash via the `IDENTIFIED BY PASSWORD` clause, and

MariaDB will validate whether the password hash is one that is compatible with `mysql_native_password`. For example:

```
SET old_passwords=0;

SELECT PASSWORD('mariadb');
+-----+
| PASSWORD('mariadb') |
+-----+
| *54958E764CE10E50764C2EECB71D01F08549980 |
+-----+

CREATE USER username@hostname
  IDENTIFIED BY PASSWORD '*54958E764CE10E50764C2EECB71D01F08549980';
```

Similar to all other [authentication plugins](#), you could also specify the name of the plugin in the `IDENTIFIED VIA` clause while providing the password hash as the `USING` clause. For example:

```
CREATE USER username@hostname
  IDENTIFIED VIA mysql_native_password USING '*54958E764CE10E50764C2EECB71D01F08549980';
```

Changing User Passwords

You can change a user account's password with the `SET PASSWORD` statement while providing the plain-text password as an argument to the `PASSWORD()` function. For example:

```
SET PASSWORD = PASSWORD('new_secret');
```

You can also change the user account's password with the `ALTER USER` statement. You would have to make sure that `old_passwords=0` is set, and then you would have to specify a password via the `IDENTIFIED BY` clause. For example:

```
SET old_passwords=0;
ALTER USER username@hostname IDENTIFIED BY 'new_secret';
```

Client Authentication Plugins

For clients that use the `libmysqlclient` or [MariaDB Connector/C](#) libraries, MariaDB provides one client authentication plugin that is compatible with the `mysql_native_password` authentication plugin:

- `mysql_native_password`

When connecting with a [client or utility](#) to a server as a user account that authenticates with the `mysql_native_password` authentication plugin, you may need to tell the client where to find the relevant client authentication plugin by specifying the `--plugin-dir` option. For example:

```
mysql --plugin-dir=/usr/local/mysql/lib64/mysql/plugin --user=alice
```

However, the `mysql_native_password` client authentication plugin is generally statically linked into client libraries like `libmysqlclient` or [MariaDB Connector/C](#), so this is not usually necessary.

`mysql_native_password`

The `mysql_native_password` client authentication plugin hashes the password before sending it to the server.

Support in Client Libraries

The `mysql_native_password` authentication plugin is one of the conventional authentication plugins, so all client libraries should support it.

Known Old Issues (Only Relevant for Old Installations)

Mismatches Between Password and `authentication_string` Columns

For compatibility reasons, the `mysql_native_password` authentication plugin tries to read the password hash from both the `Password` and `authentication_string` columns in the `mysql.user` table. This has caused issues in the past if one of the columns had a different value than the other.

Starting with [MariaDB 10.2.19](#) and [MariaDB 10.3.11](#), `CREATE USER`, `ALTER USER`, `GRANT`, and `SET PASSWORD` will set both columns whenever an account's password is changed.

See [MDEV-16774](#) for more information.

5.4.6.3 Authentication Plugin - `mysql_old_password`

The `mysql_old_password` authentication plugin is the default authentication plugin that will be used for an account created when no authentication plugin is explicitly mentioned and `old_passwords=1` is set. It uses the pre-MySQL 4.1 password hashing algorithm, which is also used by the `OLD_PASSWORD()` function and by the `PASSWORD()` function when `old_passwords=1` is set.

It is not recommended to use the `mysql_old_password` authentication plugin for new installations. The password hashing algorithm is no longer as secure as it used to be, and the plugin is primarily provided for backward-compatibility. The `ed25519` authentication plugin is a more modern authentication plugin that provides simple password authentication.

Contents

- [1. Installing the Plugin](#)
- [2. Creating Users](#)
- [3. Changing User Passwords](#)
- [4. Client Authentication Plugins](#)
 - [1. `mysql_old_password`](#)
- [5. Support in Client Libraries](#)

Installing the Plugin

The `mysql_old_password` authentication plugin is statically linked into the server, so no installation is necessary.

Creating Users

The easiest way to create a user account with the `mysql_old_password` authentication plugin is to make sure that `old_passwords=1` is set, and then create a user account via `CREATE USER` that does not specify an authentication plugin, but does specify a password via the `IDENTIFIED BY` clause. For example:

```
SET old_passwords=1;
CREATE USER username@hostname IDENTIFIED BY 'mariadb';
```

If `SQL_MODE` does not have `NO_AUTO_CREATE_USER` set, then you can also create the user via `GRANT`. For example:

```
SET old_passwords=1;
GRANT SELECT ON db.* TO username@hostname IDENTIFIED BY 'mariadb';
```

You can also create the user account by providing a password hash via the `IDENTIFIED BY PASSWORD` clause, and MariaDB will validate whether the password hash is one that is compatible with `mysql_old_password`. For example:

```

SET old_passwords=1;
Query OK, 0 rows affected (0.000 sec)

SELECT PASSWORD('mariadb');
+-----+
| PASSWORD('mariadb') |
+-----+
| 021bec665bf663f1   |
+-----+
1 row in set (0.000 sec)

CREATE USER username@hostname IDENTIFIED BY PASSWORD '021bec665bf663f1';
Query OK, 0 rows affected (0.000 sec)

```

Similar to all other [authentication plugins](#), you could also specify the name of the plugin in the `IDENTIFIED VIA` clause while providing the password hash as the `USING` clause. For example:

```

CREATE USER username@hostname IDENTIFIED VIA mysql_old_password USING '021bec665bf663f1';
Query OK, 0 rows affected (0.000 sec)

```

Changing User Passwords

You can change a user account's password with the `SET PASSWORD` statement while providing the plain-text password as an argument to the `PASSWORD()` function. For example:

```

SET PASSWORD = PASSWORD('new_secret')

```

You can also change the user account's password with the `ALTER USER` statement. You would have to make sure that `old_passwords=1` is set, and then you would have to specify a password via the `IDENTIFIED BY` clause. For example:

```

SET old_passwords=1;
ALTER USER username@hostname IDENTIFIED BY 'new_secret';

```

Client Authentication Plugins

For clients that use the `libmysqlclient` or [MariaDB Connector/C](#) libraries, MariaDB provides one client authentication plugin that is compatible with the `mysql_old_password` authentication plugin:

- `mysql_old_password`

When connecting with a [client or utility](#) to a server as a user account that authenticates with the `mysql_old_password` authentication plugin, you may need to tell the client where to find the relevant client authentication plugin by specifying the `--plugin-dir` option. For example:

```

mysql --plugin-dir=/usr/local/mysql/lib64/mysql/plugin --user=alice

```

However, the `mysql_old_password` client authentication plugin is generally statically linked into client libraries like `libmysqlclient` or [MariaDB Connector/C](#), so this is not usually necessary.

`mysql_old_password`

The `mysql_old_password` client authentication plugin hashes the password before sending it to the server.

Support in Client Libraries

The `mysql_old_password` authentication plugin is one of the conventional authentication plugins, so all client libraries should support it.

5.4.6.4 Authentication Plugin - ed25519

MySQL has used SHA-1 based authentication since version 4.1. Since [MariaDB 5.2](#) this authentication plugin has been called `mysql_native_password`. Over the years as computers became faster, new attacks on SHA-1 were being developed.

Nowadays SHA-1 is no longer considered as secure as it was in 2001. That's why the `ed25519` authentication plugin was created.

The `ed25519` authentication plugin uses [Elliptic Curve Digital Signature Algorithm \(ECDSA\)](#) to securely store users' passwords and to authenticate users. The `ed25519` algorithm is the same one that is [used by OpenSSH](#). It is based on the elliptic curve and code created by [Daniel J. Bernstein](#).

From a user's perspective, the `ed25519` authentication plugin still provides conventional password-based authentication.

 5. [Using the Plugin with MySQLConnector for .NET](#)
7. [Versions](#)
8. [Options](#)
 1. [ed25519](#)

Installing the Plugin

Although the plugin's shared library is distributed with MariaDB by default as `auth_ed25519.so` or `auth_ed25519.dll` depending on the operating system, the plugin is not actually installed by MariaDB by default. There are two methods that can be used to install the plugin with MariaDB.

The first method can be used to install the plugin without restarting the server. You can install the plugin dynamically by executing `INSTALL SONAME` or `INSTALL PLUGIN`. For example:

```
INSTALL SONAME 'auth_ed25519';
```

The second method can be used to tell the server to load the plugin when it starts up. The plugin can be installed this way by providing the `--plugin-load` or the `--plugin-load-add` options. This can be specified as a command-line argument to `mariadb` or it can be specified in a relevant server [option group](#) in an [option file](#). For example:

```
[mariadb]
...
plugin_load_add = auth_ed25519
```

Uninstalling the Plugin

You can uninstall the plugin dynamically by executing `UNINSTALL SONAME` or `UNINSTALL PLUGIN`. For example:

```
UNINSTALL SONAME 'auth_ed25519';
```

If you installed the plugin by providing the `--plugin-load` or the `--plugin-load-add` options in a relevant server [option group](#) in an [option file](#), then those options should be removed to prevent the plugin from being loaded the next time the server is restarted.

Creating Users

MariaDB starting with [10.4](#)

In [MariaDB 10.4](#) and later, you can create a user account by executing the `CREATE USER` statement and providing the `IDENTIFIED VIA` clause followed by the the name of the plugin, which is `ed25519`, and providing the the `USING` clause followed by the `PASSWORD()` function with the plain-text password as an argument. For example:

```
CREATE USER username@hostname IDENTIFIED VIA ed25519 USING PASSWORD('secret');
```

If `SQL_MODE` does not have `NO_AUTO_CREATE_USER` set, then you can also create the user account via `GRANT`. For

example:

```
GRANT SELECT ON db.* TO username@hostname IDENTIFIED VIA ed25519 USING PASSWORD('secret');
```

MariaDB until 10.3

In [MariaDB 10.3](#) and before, the `PASSWORD()` function and `SET PASSWORD` statement did not work with the `ed25519` authentication plugin. Instead, you would have to use the `UDF` that comes with the authentication plugin to calculate the password hash. For example:

```
CREATE FUNCTION ed25519_password RETURNS STRING SONAME "auth_ed25519.so";
```

Now you can calculate a password hash by executing:

```
SELECT ed25519_password("secret");
+-----+
| SELECT ed25519_password("secret"); |
+-----+
| ZIgUREUg5PVgQ6LskhXmO+eZLS0nC8be6HPjYWR4YJY |
+-----+
```

Now you can use it to create the user account using the new password hash. As with any password, you should always use a complex password that no one can guess. If not, if anyone gets access to the stored passwords in the `mysql.user` table, they could use rainbow tables to figure out the original password.

To create a user account via `CREATE USER`, specify the name of the plugin in the `IDENTIFIED VIA` clause while providing the password hash as the `USING` clause. For example:

```
CREATE USER username@hostname IDENTIFIED VIA ed25519
USING 'ZIgUREUg5PVgQ6LskhXmO+eZLS0nC8be6HPjYWR4YJY';
```

If `SQL_MODE` does not have `NO_AUTO_CREATE_USER` set, then you can also create the user account via `GRANT`. For example:

```
GRANT SELECT ON db.* TO username@hostname IDENTIFIED VIA ed25519
USING 'ZIgUREUg5PVgQ6LskhXmO+eZLS0nC8be6HPjYWR4YJY';
```

Note that users require a password in order to be able to connect. It is possible to create a user without specifying a password, but they will be unable to connect.

Changing User Passwords

MariaDB starting with 10.4

In [MariaDB 10.4](#) and later, you can change a user account's password by executing the `SET PASSWORD` statement followed by the `PASSWORD()` function and providing the plain-text password as an argument. For example:

```
SET PASSWORD = PASSWORD('new_secret')
```

You can also change the user account's password with the `ALTER USER` statement. You would have to specify the name of the plugin in the `IDENTIFIED VIA` clause while providing the plain-text password as an argument to the `PASSWORD()` function in the `USING` clause. For example:

```
ALTER USER username@hostname IDENTIFIED VIA ed25519 USING PASSWORD('new_secret');
```

MariaDB until 10.3

In [MariaDB 10.3](#) and before, the `PASSWORD()` function and `SET PASSWORD` statement did not work with the `ed25519` authentication plugin. Instead, you would have to use the `UDF` that comes with the authentication plugin to calculate the password hash. For example:

```
CREATE FUNCTION ed25519_password RETURNS STRING SONAME "auth_ed25519.so";
```

Now you can calculate a password hash by executing:

```
SELECT ed25519_password("secret");
+-----+
| SELECT ed25519_password("secret"); |
+-----+
| ZIqUREUg5PVgQ6LskhXmO+eZLS0nC8be6HPjYWR4YJY |
+-----+
```

Now you can change the user account's password using the new password hash.

You can change the user account's password with the [ALTER USER](#) statement. You would have to specify the name of the plugin in the [IDENTIFIED VIA](#) clause while providing the password hash as the `USING` clause. For example:

```
ALTER USER username@hostname IDENTIFIED VIA ed25519
USING 'ZIqUREUg5PVgQ6LskhXmO+eZLS0nC8be6HPjYWR4YJY';
```

Client Authentication Plugins

For clients that use the `libmysqlclient` or [MariaDB Connector/C](#) libraries, MariaDB provides one client authentication plugin that is compatible with the `ed25519` authentication plugin:

- `client_ed25519`

When connecting with a [client or utility](#) to a server as a user account that authenticates with the `ed25519` authentication plugin, you may need to tell the client where to find the relevant client authentication plugin by specifying the `--plugin-dir` option. For example:

```
mysql --plugin-dir=/usr/local/mysql/lib64/mysql/plugin --user=alice
```

`client_ed25519`

The `client_ed25519` client authentication plugin hashes and signs the password using the [Elliptic Curve Digital Signature Algorithm \(ECDSA\)](#) before sending it to the server.

Support in Client Libraries

Using the Plugin with MariaDB Connector/C

[MariaDB Connector/C](#) supports `ed25519` authentication using the [client authentication plugins](#) mentioned in the previous section since MariaDB Connector/C 3.1.0.

Using the Plugin with MariaDB Connector/ODBC

[MariaDB Connector/ODBC](#) supports `ed25519` authentication using the [client authentication plugins](#) mentioned in the previous section since MariaDB Connector/ODBC 3.1.2.

Using the Plugin with MariaDB Connector/J

[MariaDB Connector/J](#) supports `ed25519` authentication since MariaDB Connector/J 2.2.1.

Using the Plugin with MariaDB Connector/Node.js

[MariaDB Connector/Node.js](#) supports `ed25519` authentication since MariaDB Connector/Node.js 2.1.0.

Using the Plugin with MySqlConnection for .NET

[MySqlConnection for ADO.NET](#) supports `ed25519` authentication since MySqlConnection 0.56.0.

The connector implemented support for this authentication plugin in a separate [NuGet](#) package called [MySqlConnection.Authentication.Ed25519](#). After the package is installed, your application must call `Ed25519AuthenticationPlugin.Install` to enable it.

Versions

Version	Status	Introduced
1.1	Stable	MariaDB 10.4.0
1.0	Stable	MariaDB 10.3.8 , MariaDB 10.2.17 , MariaDB 10.1.35
1.0	Beta	MariaDB 10.2.5 , MariaDB 10.1.22

Options

ed25519

- **Description:** Controls how the server should treat the plugin when the server starts up.
 - Valid values are:
 - `OFF` - Disables the plugin without removing it from the `mysql.plugins` table.
 - `ON` - Enables the plugin. If the plugin cannot be initialized, then the server will still continue starting up, but the plugin will be disabled.
 - `FORCE` - Enables the plugin. If the plugin cannot be initialized, then the server will fail to start with an error.
 - `FORCE_PLUS_PERMANENT` - Enables the plugin. If the plugin cannot be initialized, then the server will fail to start with an error. In addition, the plugin cannot be uninstalled with `UNINSTALL SONAME` or `UNINSTALL PLUGIN` while the server is running.
 - See [Plugin Overview: Configuring Plugin Activation at Server Startup](#) for more information.
- **Commandline:** `--ed25519=value`
- **Data Type:** `enumerated`
- **Default Value:** `ON`
- **Valid Values:** `OFF`, `ON`, `FORCE`, `FORCE_PLUS_PERMANENT`

5.4.6.5 Authentication Plugin - GSSAPI

The `gssapi` authentication plugin allows the user to authenticate with services that use the [Generic Security Services Application Program Interface \(GSSAPI\)](#). Windows has a slightly different but very similar API called [Security Support Provider Interface \(SSPI\)](#). The GSSAPI is a standardized API described in [RFC2743](#) and [RFC2744](#). The client and server negotiate using a standardized protocol described in [RFC7546](#).

On Windows, this authentication plugin supports [Kerberos](#) and [NTLM](#) authentication. Windows authentication is supported regardless of whether a [domain](#) is used in the environment.

On Unix systems, the most dominant GSSAPI service is [Kerberos](#). However, it is less commonly used on Unix systems than it is on Windows. Regardless, this authentication plugin also supports Kerberos authentication on Unix.

The `gssapi` authentication plugin is most often used for authenticating with [Microsoft Active Directory](#).

This article gives instructions on configuring the `gssapi` authentication plugin for MariaDB for passwordless login.

Installing the Plugin's Package

Since [MariaDB 10.11](#), on Windows, the plugin is included in the server, and there is no need for separate installation.

The `gssapi` authentication plugin's shared library is included in MariaDB packages as the `auth_gssapi.so` or `auth_gssapi.dll` shared library on systems where it can be built.

Installing on Linux

The `gssapi` authentication plugin is included in [binary tarballs](#) on Linux.

Installing with a Package Manager

The `gssapi` authentication plugin can also be installed via a package manager on Linux. In order to do so, your system needs to be configured to install from one of the MariaDB repositories.

You can configure your package manager to install it from MariaDB Corporation's MariaDB Package Repository by using the [MariaDB Package Repository setup script](#).

You can also configure your package manager to install it from MariaDB Foundation's MariaDB Repository by using the [MariaDB Repository Configuration Tool](#).

Installing with yum/dnf

On RHEL, CentOS, Fedora, and other similar Linux distributions, it is highly recommended to install the relevant [RPM package](#) from MariaDB's repository using `yum` or `dnf`. Starting with RHEL 8 and Fedora 22, `yum` has been replaced by `dnf`, which is the next major version of `yum`. However, `yum` commands still work on many systems that use `dnf`. For example:

```
sudo yum install MariaDB-gssapi-server
```

Installing with apt-get

On Debian, Ubuntu, and other similar Linux distributions, it is highly recommended to install the relevant [DEB package](#) from MariaDB's repository using `apt-get` [🔗](#). For example:

```
sudo apt-get install mariadb-plugin-gssapi-server
```

Installing with zypper

On SLES, OpenSUSE, and other similar Linux distributions, it is highly recommended to install the relevant [RPM package](#) from MariaDB's repository using `zypper`. For example:

```
sudo zypper install MariaDB-gssapi-server
```

Installing on Windows

Since [MariaDB 10.11](#), the plugin is included in the server, and there is no need for separate installation.

Before [MariaDB 10.11](#), the `gssapi` authentication plugin is included in [MSI](#) and [ZIP](#) packages on Windows.

Installing the Plugin

Since [MariaDB 10.11](#), on Windows, the plugin is included in the server, and there is no need for separate installation.

Before [MariaDB 10.11](#) on Windows, and on other operating systems, although the plugin's shared library is distributed with MariaDB by default, the plugin is not actually installed by MariaDB by default. There are two methods that can be used to install the plugin with MariaDB.

The first method can be used to install the plugin without restarting the server. You can install the plugin dynamically by executing `INSTALL SONAME` or `INSTALL PLUGIN`. For example:

```
INSTALL SONAME 'auth_gssapi';
```

The second method can be used to tell the server to load the plugin when it starts up. The plugin can be installed this way by providing the `--plugin-load` or the `--plugin-load-add` options. This can be specified as a command-line argument to `mariadb` or it can be specified in a relevant server [option group](#) in an [option file](#). For example:

```
[mariadb]
...
plugin_load_add = auth_gssapi
```

Uninstalling the Plugin

You can uninstall the plugin dynamically by executing `UNINSTALL SONAME` or `UNINSTALL PLUGIN`. For example:

```
UNINSTALL SONAME 'auth_gssapi';
```

If you installed the plugin by providing the `--plugin-load` or the `--plugin-load-add` options in a relevant server [option group](#) in an [option file](#), then those options should be removed to prevent the plugin from being loaded the next time the server is restarted.

Configuring the Plugin

If the MariaDB server is running on Unix, then some additional configuration steps will need to be implemented in order to use the plugin.

If the MariaDB server is running on Windows, then no special configuration steps will need to be implemented in order to use the plugin, as long as the following is true:

- The Windows server is joined to a domain.
- The MariaDB server process is running as either a [NetworkService Account](#) [🔗](#) or a [Domain User Account](#) [🔗](#).

Creating a Keytab File on Unix

If the MariaDB server is running on Unix, then the KDC server will need to create a keytab file for the MariaDB server. The

keytab file contains the service principal name, which is the identity that the MariaDB server will use to communicate with the KDC server. The keytab will need to be transferred to the MariaDB server, and the `mysqld` server process will need read access to this keytab file.

How this keytab file is generated depends on whether the KDC server is [Microsoft Active Directory KDC](#) or [MIT Kerberos KDC](#).

Creating a Keytab File with Microsoft Active Directory

If you are using [Microsoft Active Directory KDC](#), then you may need to create a keytab using the `ktpass.exe` utility on a Windows host. The service principal will need to be mapped to an existing domain user. To do so, follow the steps listed below.

Be sure to replace the following items in the step below:

- Replace `${HOST}` with the fully qualified DNS name for the MariaDB server host.
- Replace `${DOMAIN}` with the Active Directory domain.
- Replace `${AD_USER}` with the existing domain user.
- Replace `${PASSWORD}` with the password for the service principal.

To create the service principal, execute the following:

```
ktpass.exe /princ mariadb/${HOST}@${DOMAIN} /mapuser ${AD_USER} /pass ${PASSWORD} /out mariadb.keytab /crypto all /ptype KRB5_NT_PRINCIPAL /mapop set
```

Creating a Keytab File with MIT Kerberos

If you are using [MIT Kerberos KDC](#), then you can create a `keytab` file using the `kadmin` utility. To do so, follow the steps listed below.

In the following steps, be sure to replace `${HOST}` with the fully qualified DNS name for the MariaDB server host.

First, create the service principal using the `kadmin` utility. For example:

```
kadmin -q "addprinc -randkey mariadb/${HOST}"
```

Then, export the newly created user to the keytab file using the `kadmin` utility. For example:

```
kadmin -q "ktadd -k /path/to/mariadb.keytab mariadb/${HOST}"
```

More details can be found at the following links:

- [MIT Kerberos Documentation: Database administration](#)
- [MIT Kerberos Documentation: Application servers](#)

Configuring the Path to the Keytab File on Unix

If the MariaDB server is running on Unix, then the path to the keytab file that was previously created can be set by configuring the `gssapi_keytab_path` system variable. This can be specified as a command-line argument to `mysqld` or it can be specified in a relevant server `option group` in an `option file`. For example:

```
[mariadb]
...
gssapi_keytab_path=/path/to/mariadb.keytab
```

Configuring the Service Principal Name

The service principal name can be set by configuring the `gssapi_principal_name` system variable. This can be specified as a command-line argument to `mysqld` or it can be specified in a relevant server `option group` in an `option file`. For example:

```
[mariadb]
...
gssapi_principal_name=service_principal_name/host.domain.com@REALM
```

If a service principal name is not provided, then the plugin will try to use `mariadb/host.domain.com@REALM` by default.

If the MariaDB server is running on Unix, then the plugin needs a service principal name in order to function.

If the MariaDB server is running on Windows, then the plugin does not usually need a service principal in order to function. However, if you want to use one anyway, then one can be created with the [setspn](#) utility.

Different KDC implementations may use different canonical forms to identify principals. See [RFC2744: Section 3.10](#) to learn what the standard says about principal names.

More details can be found at the following links:

- [Active Directory Domain Services: Service Principal Names](#)
- [MIT Kerberos Documentation: Realm configuration decisions](#)
- [MIT Kerberos Documentation: Principal names and DNS](#)

Creating Users

To create a user account via `CREATE USER`, specify the name of the plugin in the `IDENTIFIED VIA` clause. For example:

```
CREATE USER username@hostname IDENTIFIED VIA gssapi;
```

If `SQL_MODE` does not have `NO_AUTO_CREATE_USER` set, then you can also create the user account via `GRANT`. For example:

```
GRANT SELECT ON db.* TO username@hostname IDENTIFIED VIA gssapi;
```

You can also specify the user's [realm](#) for MariaDB with the `USING` clause. For example:

```
CREATE USER username@hostname IDENTIFIED VIA gssapi USING '[email protected]';
```

The format of the realm depends on the specific authentication mechanism that is used. For example, the format would need to be `machine\username` for Windows users authenticating with NTLM.

If the realm is not provided in the user account's definition, then the realm is **not** used for comparison. Therefore, `''`, `''` and `'mymachine\usr1'` would all identify as the following user account:

```
CREATE USER usr1@hostname IDENTIFIED VIA gssapi;
```

Creating Users Identified Via Group Membership or SID (Windows-specific)

Since 10.6.0, on Windows only, it is possible to login using a AD or local group-membership. This is achieved by using `GROUP` prefix in `IDENTIFIED ... AS`

```
CREATE USER root IDENTIFIED VIA gssapi AS 'GROUP:Administrators'  
CREATE USER root IDENTIFIED VIA gssapi AS 'GROUP:BUILTIN\Administrators'
```

Effect of the above definition is that every user that identifies as member of group Administrators can login using user name `root`, passwordless.

User can also login using own or group [SID](#)

```
CREATE USER root IDENTIFIED VIA gssapi AS 'SID:S-1-5-32-544'
```

Using SIDs will perform slightly faster than using name (since it will spare translation between SID and name which is otherwise done), also SIDs immune against user or group renaming.

Passwordless login on Windows

MariaDB starting with [10.11](#)

From [MariaDB 10.11](#), on Windows, in addition to the usual authentication with a password, passwordless authentication is permitted, when creating the 'root' user during install.

This works in a similar manner to [Unix socket authentication](#). However, since `auth_gssapi`, unlike `unix_socket`, requires client support, to avoid failures when MariaDB is used with 3rd party drivers, authentication on Windows first attempts password-based `native_authentication`, and only if it fails, falls back to passwordless `auth_gssapi`.

Client Authentication Plugins

For clients that use the `libmysqlclient` or [MariaDB Connector/C](#) libraries, MariaDB provides one client authentication plugin that is compatible with the `gssapi` authentication plugin:

- `auth_gssapi_client`

When connecting with a [client or utility](#) to a server as a user account that authenticates with the `gssapi` authentication plugin, you may need to tell the client where to find the relevant client authentication plugin by specifying the `--plugin-dir` option. For example:

```
mysql --plugin-dir=/usr/local/mysql/lib64/mysql/plugin --user=alice
```

`auth_gssapi_client`

The `auth_gssapi_client` client authentication plugin receives the principal name from the server, and then uses either the `gss_init_sec_context` function (on Unix) or the `InitializeSecurityContext` function (on Windows) to establish a security context on the client.

Support in Client Libraries

Using the Plugin with MariaDB Connector/C

[MariaDB Connector/C](#) supports `gssapi` authentication using the [client authentication plugins](#) mentioned in the previous section since MariaDB Connector/C 3.0.1.

Using the Plugin with MariaDB Connector/ODBC

[MariaDB Connector/ODBC](#) supports `gssapi` authentication using the [client authentication plugins](#) mentioned in the previous section since MariaDB Connector/ODBC 3.0.0.

Using the Plugin with MariaDB Connector/J

[MariaDB Connector/J](#) supports `gssapi` authentication since MariaDB Connector/J 1.4.0. Current documentation can be found [here](#).

Using the Plugin with MariaDB Connector/Node.js

[MariaDB Connector/Node.js](#) does not yet support `gssapi` authentication. See [CONJS-72](#) for more information.

Using the Plugin with MySqlConnection for .NET

[MySqlConnection for ADO.NET](#) supports `gssapi` authentication since MySqlConnection 0.47.0.

The support is transparent. Normally, the connector only needs to be provided the correct user name, and no other parameters are required.

However, this connector also supports the [ServerSPN](#) connection string parameter, which can be used for mutual authentication.

.NET specific problems/workarounds

When connecting from Unix client to Windows server with ADO.NET, in an Active Directory domain environment, be aware that .NET Core on Unix does not support principal names in UPN(User Principal Name) form, which is default on Windows (e.g [\[email protected\]](#)). Thus, upon encountering an authentication exception with "server not found in Kerberos database", use one of workarounds below

- Force host-based SPN on server side.
 - For example, this can be done by setting the `gssapi_principal_name` system variable to `HOST/machine` in a server [option group](#) in an [option file](#).
- Pass host-based SPN on client side.
 - For example, this can be done by setting the connector's [ServerSPN](#) connection string parameter to `HOST/machine`.

Versions

Version	Status	Introduced
1.0	Stable	MariaDB 10.1.15
1.0	Beta	MariaDB 10.1.11

System Variables

`gssapi_keytab_path`

- **Description:** Defines the path to the server's keytab file.
 - This system variable is only meaningful on **Unix**.
 - See [Creating a Keytab File on Unix](#) and [Configuring the Path to the Keytab File on Unix](#) for more information.
 - **Commandline:** `--gssapi-keytab-path`
 - **Scope:** Global
 - **Dynamic:** No
 - **Data Type:** `string`
 - **Default Value:** `"`
 - **Introduced:** [MariaDB 10.1.11](#)
-

`gssapi_principal_name`

- **Description:** Name of the service principal.
 - See [Configuring the Service Principal Name](#) for more information.
 - **Commandline:** `--gssapi-principal-name`
 - **Scope:** Global
 - **Dynamic:** No
 - **Data Type:** `string`
 - **Default Value:** `"`
 - **Introduced:** [MariaDB 10.1.11](#)
-

`gssapi_mech_name`

- **Description:** Name of the SSPI package used by server. Can be either 'Kerberos' or 'Negotiate'. Set it to 'Kerberos', to prevent less secure NTLM in domain environments, but leave it as default (Negotiate) to allow non-domain environments (e.g if server does not run in a domain environment).
 - This system variable is only meaningful on **Windows**.
 - **Commandline:** `--gssapi-mech-name`
 - **Scope:** Global
 - **Dynamic:** No
 - **Data Type:** `enumerated`
 - **Default Value:** `Negotiate`
 - **Valid Values:** `Kerberos`, `Negotiate`
 - **Introduced:** [MariaDB 10.1.11](#)
-

Options

`gssapi`

- **Description:** Controls how the server should treat the plugin when the server starts up.
 - Valid values are:
 - `OFF` - Disables the plugin without removing it from the `mysql.plugins` table.
 - `ON` - Enables the plugin. If the plugin cannot be initialized, then the server will still continue starting up, but the plugin will be disabled.
 - `FORCE` - Enables the plugin. If the plugin cannot be initialized, then the server will fail to start with an error.
 - `FORCE_PLUS_PERMANENT` - Enables the plugin. If the plugin cannot be initialized, then the server will fail

to start with an error. In addition, the plugin cannot be uninstalled with `UNINSTALL SONAME` or `UNINSTALL PLUGIN` while the server is running.

◦ See [Plugin Overview: Configuring Plugin Activation at Server Startup](#) for more information.

- **Commandline:** `--gssapi=value`
- **Data Type:** `enumerated`
- **Default Value:** `ON`
- **Valid Values:** `OFF`, `ON`, `FORCE`, `FORCE_PLUS_PERMANENT`
- **Introduced:** [MariaDB 10.1.11](#) 

5.4.6.6 Authentication with Pluggable Authentication Modules (PAM)

Authentication Plugin - PAM

Uses the Pluggable Authentication Module (PAM) framework to authenticate MariaDB users.

User and Group Mapping with PAM

Configure PAM to map a given PAM user or group to a different MariaDB user.

Configuring PAM Authentication and User Mapping with Unix Authentication

Walkthrough configuration of PAM authentication and user mapping with Unix authentication.

Configuring PAM Authentication and User Mapping with LDAP Authentication

Configuring PAM authentication and user mapping with LDAP authentication.

5.4.6.6.1 Authentication Plugin - PAM

The `pam` authentication plugin allows MariaDB to offload user authentication to the system's [Pluggable Authentication Module \(PAM\)](#)  framework. PAM is an authentication framework used by Linux, FreeBSD, Solaris, and other Unix-like operating systems.

Note: Windows does not support PAM, so the `pam` authentication plugin does not support Windows. However, one can use a MariaDB client on Windows to connect to MariaDB server that is installed on a Unix-like operating system and that is configured to use the `pam` authentication plugin. For an example of how to do this, see the blog post: [MariaDB: Improve Security with Two-Step Verification](#) .

Use Cases

PAM makes it possible to implement various authentication scenarios of different complexity. For example,

- Authentication using passwords from `/etc/shadow` (indeed, this is what a default PAM configuration usually does). See the [pam_unix](#) PAM module.
- Authentication using LDAP. See the [pam_ldap](#) PAM module.
- Authentication using Microsoft's Active Directory. See the [pam_lsass](#), [pam_winbind](#), and [pam_centrifydc](#) PAM modules.
- Authentication using one-time passwords (even with SMS confirmation!). See the [pam_google_authenticator](#) and [pam_secured](#) PAM modules.
- Authentication using SSH keys. See the [pam_ssh](#) PAM module.
- User and group mapping. See the [pam_user_map](#) PAM module.
- Combining different authentication modules in interesting ways in a [PAM service](#).
- Password expiration.

- Limiting access by time, date, day of the week, etc. See the [pam_time](#) PAM module.
- Logging every login attempt.
- and so on, the list is in no way exhaustive.

Installing the Plugin

The `pam` authentication plugin's library is provided in [binary packages](#) in all releases on Linux.

Although the plugin's shared library is distributed with MariaDB by default, the plugin is not actually installed by MariaDB by default. There are two methods that can be used to install the plugin with MariaDB.

The first method can be used to install the plugin without restarting the server. You can install the plugin dynamically by executing [INSTALL SONAME](#) or [INSTALL PLUGIN](#). For example:

```
INSTALL SONAME 'auth_pam';
```

The second method can be used to tell the server to load the plugin when it starts up. The plugin can be installed this way by providing the `--plugin-load` or the `--plugin-load-add` options. This can be specified as a command-line argument to [mysql](#) or it can be specified in a relevant server [option group](#) in an [option file](#). For example:

```
[mariadb]
...
plugin_load_add = auth_pam
```

Installing the v1 Plugin

MariaDB starting with [10.4.0](#)

Starting in [MariaDB 10.4.0](#), the `auth_pam` shared library actually refers to version `2.0` of the `pam` authentication plugin. [MariaDB 10.4.0](#) and later also provides version `1.0` of the plugin as the `auth_pam_v1` shared library.

In [MariaDB 10.4.0](#) and later, if you need to install version `1.0` of the authentication plugin instead of version `2.0`, then you can do so. For example, with [INSTALL SONAME](#) or [INSTALL PLUGIN](#):

```
INSTALL SONAME 'auth_pam_v1';
```

Or by specifying in a relevant server [option group](#) in an [option file](#):

```
[mariadb]
...
plugin_load_add = auth_pam_v1
```

Uninstalling the Plugin

You can uninstall the plugin dynamically by executing [UNINSTALL SONAME](#) or [UNINSTALL PLUGIN](#). For example:

```
UNINSTALL SONAME 'auth_pam';
```

If you installed the plugin by providing the `--plugin-load` or the `--plugin-load-add` options in a relevant server [option group](#) in an [option file](#), then those options should be removed to prevent the plugin from being loaded the next time the server is restarted.

Uninstalling the v1 Plugin

If you installed version `1.0` of the authentication plugin, then you can uninstall that by executing a similar statement for `auth_pam_v1`. For example:

```
UNINSTALL SONAME 'auth_pam_v1';
```

Configuring PAM

The `pam` authentication plugin tells MariaDB to delegate the authentication to the PAM authentication framework. How exactly that authentication is performed depends on how PAM was configured.

Configuring the PAM Service

PAM is divided into `services`. PAM services are configured by [PAM configuration files](#). Typically, the global PAM configuration file is located at `/etc/pam.conf` and [PAM directory-based configuration files](#) for individual services are located in `/etc/pam.d/`.

If you want to use a PAM service called `mariadb` for your MariaDB PAM authentication, then the PAM configuration file for that service would also be called `mariadb`, and it would typically be located at `/etc/pam.d/mariadb`.

For example, here is a minimal PAM service configuration file that performs simple password authentication with UNIX passwords:

```
auth required pam_unix.so audit
account required pam_unix.so audit
```

Let's breakdown this relatively simple PAM service configuration file.

Each line of a PAM service configuration file has the following general format:

type control module-path module-arguments

The above PAM service configuration file instructs the PAM authentication framework that for successful **authentication** (i.e. `type=auth`), it is **required** that the `pam_unix.so` PAM module returns a success.

The above PAM service configuration file also instructs the PAM authentication framework that for an **account** (i.e. `type=account`) to be valid, it is **required** that the `pam_unix.so` PAM module returns a success.

PAM also supports [session](#) and [password](#) types, but MariaDB's `pam` authentication plugin does not support those.

The above PAM service configuration file also provides the `audit` module argument to the `pam_unix` PAM module. The [pam_unix manual](#) says that this module argument enables extreme debug logging to the `syslog`.

On most systems, you can find many other examples of PAM service configuration files in your `/etc/pam.d/` directory.

Configuring the pam_unix PAM Module

If you configure PAM to use the [pam_unix](#) PAM module (as in the above example), then you might notice on some systems that this will fail by default with errors like the following:

```
Apr 14 12:56:23 localhost unix_chkpwd[3332]: check pass; user unknown
Apr 14 12:56:23 localhost unix_chkpwd[3332]: password check failed for user (alice)
Apr 14 12:56:23 localhost mysqld: pam_unix(mysql:auth): authentication failure; logname= uid=991
euid=991 tty= ruser= rhost= user=alice
```

The problem is that on some systems, the `pam_unix` PAM module needs access to `/etc/shadow` in order to function, and most systems only allow `root` to access that file by default.

Newer versions of PAM do not have this limitation, so you may want to try upgrading your version of PAM to see if that fixes the issue.

If that does not work, then you can work around this problem by giving the user that runs `mysqld` access to `/etc/shadow`. For example, if the `mysql` user runs `mysqld`, then you could do the following:

```
sudo groupadd shadow
sudo usermod -a -G shadow mysql
sudo chown root:shadow /etc/shadow
sudo chmod g+r /etc/shadow
```

And then you would have to [restart the server](#).

At that point, the server should be able to read `/etc/shadow`.

MariaDB starting with 10.4.0

Starting in [MariaDB 10.4.0](#), the `pam` authentication plugin uses a [setuid](#) wrapper to perform its PAM checks, so it should not need any special workarounds to perform privileged operations, such as reading `/etc/shadow` when using the `pam_unix` PAM module. See [MDEV-7032](#) for more information.

Creating Users

Similar to all other [authentication plugins](#), to create a user in MariaDB which uses the `pam` authentication plugin, you would execute `CREATE USER` while specifying the name of the plugin in the `IDENTIFIED VIA` clause. For example:

```
CREATE USER username@hostname IDENTIFIED VIA pam;
```

If `SQL_MODE` does not have `NO_AUTO_CREATE_USER` set, then you can also create the user this way with `GRANT`. For example:

```
GRANT SELECT ON db.* TO username@hostname IDENTIFIED VIA pam;
```

You can also specify a [PAM service name](#) for MariaDB to use by providing it with the `USING` clause. For example:

```
CREATE USER username@hostname IDENTIFIED VIA pam USING 'mariadb';
```

This line creates a user that needs to be authenticated via the `pam` authentication plugin using the [PAM service name](#) `mariadb`. As mentioned in a previous section, this service's configuration file will typically be present in `/etc/pam.d/mariadb`.

If no service name is specified, then the plugin will use `mysql` as the default [PAM service name](#).

Client Authentication Plugins

For clients that use the `libmysqlclient` or [MariaDB Connector/C](#) libraries, MariaDB provides two client authentication plugins that are compatible with the `pam` authentication plugin:

- `dialog`
- `mysql_clear_password`

When connecting with a [client or utility](#) to a server as a user account that authenticates with the `pam` authentication plugin, you may need to tell the client where to find the relevant client authentication plugin by specifying the `--plugin-dir` option. For example:

```
mariadb --plugin-dir=/usr/local/mysql/lib64/mysql/plugin --user=alice
```

Both the `dialog` and the `mysql_clear_password` client authentication plugins transmit the password to the server in clear text. Therefore, when you use the `pam` authentication plugin, it is incredibly important to [encrypt client connections using TLS](#) to prevent the clear-text passwords from being seen by unauthorized users.

`dialog`

Usually the `pam` authentication plugin uses the `dialog` client authentication plugin to communicate with the user. This client authentication plugin allows MariaDB to support arbitrarily complex PAM configurations with regular or one-time passwords, challenge-response, multiple questions, or just about anything else. When using a MariaDB client library, there is no need to install or enable anything — the `dialog` client authentication plugin is loaded by the client library completely automatically and transparently for the application.

The `dialog` client authentication plugin was developed by MariaDB, so MySQL's clients and client libraries as well as third party applications that bundle MySQL's client libraries do not support the `dialog` client authentication plugin out of the box. If the server tells an unsupported client to use the `dialog` client authentication plugin, then the client is likely to throw an error like the following:

```
ERROR 2059 (HY000): Authentication plugin 'dialog' cannot be loaded:
/usr/lib/mysql/plugin/dialog.so: cannot open shared object file: No such file or directory
```

For some libraries or applications, this problem can be fixed by copying `dialog.so` or `dialog.dll` from a MariaDB client installation that is compatible with the system into the system's MySQL client authentication plugin directory. However, not all clients are compatible with the `dialog` client authentication plugin, so this may not work for every client.

If your client does not support the `dialog` client authentication plugin, then you may need to use the [mysql_clear_password](#) client authentication plugin instead.

The `dialog` client authentication plugin transmits the password to the server in clear text. Therefore, when you use

the `pam` authentication plugin, it is incredibly important to [encrypt client connections using TLS](#) to prevent the clear-text passwords from being seen by unauthorized users.

mysql_clear_password

Users can instruct the `pam` authentication plugin to use the `mysql_clear_password` client authentication plugin instead of the `dialog` client authentication plugin by configuring the `pam_use_cleartext_plugin` system variable on the server. It can be set in a relevant server [option group](#) in an [option file](#). For example:

```
[mariadb]
...
pam_use_cleartext_plugin
```

It is important to note that the `mysql_clear_password` plugin has very limited functionality.

- The `mysql_clear_password` client authentication plugin only supports PAM services that require password-based authentication.
- The `mysql_clear_password` client authentication plugin also only supports PAM services that ask the user a single question.
- If the PAM service requires challenge-responses, multiple questions, or other similar complicated authentication schemes, then the PAM service is not compatible with `mysql_clear_password` client authentication plugin. In that case, the `dialog` client authentication plugin will have to be used instead.

The `mysql_clear_password` client authentication plugin transmits the password to the server in clear text. Therefore, when you use the `pam` authentication plugin, it is incredibly important to [encrypt client connections using TLS](#) to prevent the clear-text passwords from being seen by unauthorized users.

Compatibility with MySQL Clients and Client Libraries

The `mysql_clear_password` client authentication plugin is similar to MySQL's [mysql_clear_password](#) client authentication plugin.

The `mysql_clear_password` client authentication plugin is compatible with MySQL clients and most MySQL client libraries, while the `dialog` client authentication plugin is not always compatible with them. Therefore, the `mysql_clear_password` client authentication plugin is most useful if you need some kind of MySQL compatibility in your environment, but you still want to use the `pam` authentication plugin.

Even though the `mysql_clear_password` client authentication plugin is compatible with MySQL clients and most MySQL client libraries, the `mysql_clear_password` client authentication plugin may be disabled by default by these clients and client libraries. For example, MySQL's version of the [mysql](#) command-line client has the `--enable-cleartext-plugin` option that must be set in order to use the `mysql_clear_password` client authentication plugin. For example:

```
mysql --enable-cleartext-plugin --user=alice -p
```

Other clients may require other methods to enable the authentication plugin. For example, [MySQL Workbench](#) has a checkbox titled **Enable Cleartext Authentication Plugin** under the **Advanced** tab on the connection configuration screen.

For applications that use MySQL's `libmysqlclient`, the authentication plugin can be enabled by setting the `MYSQL_ENABLE_CLEARTEXT_PLUGIN` option with the `mysql_options()` function. For example:

```
mysql_options(mysql, MYSQL_ENABLE_CLEARTEXT_PLUGIN, 1);
```

For MySQL compatibility, [MariaDB Connector/C](#) also allows applications to set the `MYSQL_ENABLE_CLEARTEXT_PLUGIN` option with the `mysql_optionsv` function. However, this option does not actually do anything in [MariaDB Connector/C](#), because the `mysql_clear_password` client authentication plugin is always enabled for MariaDB clients and client libraries.

Support in Client Libraries

Using the Plugin with MariaDB Connector/C

[MariaDB Connector/C](#) supports `pam` authentication using the [client authentication plugins](#) mentioned in the previous section since MariaDB Connector/C 2.1.0, regardless of the value of the `pam_use_cleartext_plugin` system variable.

Using the Plugin with MariaDB Connector/ODBC

[MariaDB Connector/ODBC](#) supports `pam` authentication using the [client authentication plugins](#) mentioned in the previous section since MariaDB Connector/ODBC 1.0.0, regardless of the value of the `pam_use_cleartext_plugin` system variable.

Using the Plugin with MariaDB Connector/J

[MariaDB Connector/J](#) supports `pam v1` authentication since MariaDB Connector/J 1.4.0, regardless of the value of the `pam_use_cleartext_plugin` system variable.

[MariaDB Connector/J](#) supports `pam v2` authentication since MariaDB Connector/J 2.4.4, regardless of the value of the `pam_use_cleartext_plugin` system variable.

Using the Plugin with MariaDB Connector/Node.js

[MariaDB Connector/Node.js](#) supports `pam` authentication since MariaDB Connector/Node.js 0.7.0, regardless of the value of the `pam_use_cleartext_plugin` system variable.

Using the Plugin with MySqlConnection for .NET

[MySqlConnection for ADO.NET](#) supports `pam` authentication since MySqlConnection 0.20.0, but only if the `pam_use_cleartext_plugin` system variable is enabled on the server.

Logging

PAM Module Logging

Errors and messages from PAM modules are usually logged using the [syslog](#) daemon with the `authpriv` facility. To determine the specific log file where the `authpriv` facility is logged, you can check [rsyslog.conf](#).

On RHEL, CentOS, Fedora, and other similar Linux distributions, the default location for these messages is usually `/var/log/secure`.

On Debian, Ubuntu, and other similar Linux distributions, the default location for these messages is usually `/var/log/auth.log`.

For example, the syslog can contain messages like the following when MariaDB's `pam` authentication plugin is configured to use the `pam_unix` PAM module, and the user enters an incorrect password:

```
Jan  9 05:35:41 ip-172-30-0-198 unix_chkpwd[1205]: password check failed for user (foo)
Jan  9 05:35:41 ip-172-30-0-198 mysqld: pam_unix(mariadb:auth): authentication failure; logname=
uid=997 euid=997 tty= ruser= rhost= user=foo
```

PAM Authentication Plugin's Debug Logging

MariaDB's `pam` authentication plugin can also log additional verbose debug logging to the [error log](#). This is only done if the plugin is a [debug build](#) and if `pam_debug` is set.

The output looks like this:

```
PAM: pam_start(mariadb, alice)
PAM: pam_authenticate(0)
PAM: conv: send(Enter PASSCODE:)
PAM: conv: recv(123456789)
PAM: pam_acct_mgmt(0)
PAM: pam_get_item(PAM_USER)
PAM: status = 0 user = 00\>
```

Custom Logging with pam_exec

The `pam_exec` PAM module can be used to implement some custom logging. This can be very useful when debugging

certain kinds of issues.

For example, first, create a script that writes the log output:

```
tee /tmp/pam_log_script.sh <<EOF
#!/bin/bash
echo "\${PAM_SERVICE}:\${PAM_TYPE} - \${PAM_RUSER}@ \${PAM_RHOST} is authenticating as \${PAM_USER}"
EOF
chmod 0775 /tmp/pam_log_script.sh
```

And then change the [PAM service configuration](#) to execute the script using the [pam_exec](#) PAM module. For example:

```
auth optional pam_exec.so log=/tmp/pam_output.txt /tmp/pam_log_script.sh
auth required pam_unix.so audit
account optional pam_exec.so log=/tmp/pam_output.txt /tmp/pam_log_script.sh
account required pam_unix.so audit
```

Whenever the above PAM service is used, the output of the script will be written to `/tmp/pam_output.txt`. It may look similar to this:

```
*** Tue May 14 14:53:23 2019
mariadb:auth - @ is authenticating as alice
*** Tue May 14 14:53:25 2019
mariadb:account - @ is authenticating as alice
*** Tue May 14 14:53:28 2019
mariadb:auth - @ is authenticating as alice
*** Tue May 14 14:53:31 2019
mariadb:account - @ is authenticating as alice
```

User and Group Mapping

Even when using the `pam` authentication plugin, the authenticating PAM user account still needs to exist in MariaDB, and the account needs to have privileges in the database. Creating these MariaDB accounts and making sure the privileges are correct can be a lot of work. To decrease the amount of work involved, some users would like to be able to map a PAM user to a different MariaDB user. For example, let's say that `alice` and `bob` are both DBAs. It would be nice if each of them could log into MariaDB with their own PAM username and password, while MariaDB sees both of them as the same `dba` user. That way, there is only one MariaDB account to keep track of. See [User and Group Mapping with PAM](#) for more information on how to do this.

PAM Modules

There are many PAM modules. The ones described below are the ones that have been seen most often by MariaDB.

pam_unix

The [pam_unix](#) PAM module provides support for Unix password authentication. It is the default PAM module on most systems.

For a tutorial on setting up PAM authentication and user or group mapping with Unix authentication, see [Configuring PAM Authentication and User Mapping with Unix Authentication](#).

pam_user_map

The [pam_user_map](#) PAM module was developed by MariaDB to support user and group mapping.

pam_ldap

The [pam_ldap](#) PAM module provides support for LDAP authentication.

For a tutorial on setting up PAM authentication and user or group mapping with LDAP authentication, see [Configuring PAM Authentication and User Mapping with LDAP Authentication](#).

This can also be configured for [Active Directory](#) authentication.

pam_sss

The [pam_sss](#) PAM module provides support for authentication with [System Security Services Daemon \(SSSD\)](#).

This can be configured for [Active Directory](#) authentication.

pam_lsass

The `pam_lsass` PAM module provides support for [Active Directory](#) authentication. It is provided by [PowerBroker Identity Services – Open Edition](#).

pam_winbind

The [pam_winbind](#) PAM module provides support for [Active Directory](#) authentication. It is provided by [winbindd](#) from the [samba](#) suite.

This PAM module converts all provided user names to lowercase. There is no way to disable this functionality. If you do not want to be forced to use all lowercase user names, then you may need to configure the [pam_winbind_workaround](#) system variable. See [MDEV-18686](#) for more information.

pam_centrifydc

The [pam_centrifydc](#) PAM module provides support for [Active Directory](#) authentication. It integrates with the commercial [Active Directory Bridge from Centrify](#).

pam_krb5

The [pam_krb5](#) PAM module provides support for [Kerberos](#) authentication.

This can be configured for [Active Directory](#) authentication.

pam_google_authenticator

The `pam_google_authenticator` PAM module provides two-factor identification with Google Authenticator. It is from Google's [google-authenticator-libpam](#) open-source project. The PAM module should work with the open-source mobile apps built by Google's [google-authenticator](#) and [google-authenticator-android](#) projects as well as the the closed source Google Authenticator mobile apps that are present in each mobile app store.

For an example of how to use this PAM module, see the blog post: [MariaDB: Improve Security with Two-Step Verification](#).

pam_secured

The `pam_secured` PAM module provides support for multi-factor authentication. It is part of the commercial [RSA SecurID Suite](#).

Note that current versions of this module are not [safe for multi-threaded environments](#), and the vendor does not officially support the product on MariaDB. See [MDEV-10361](#) about that. However, the module may work with [MariaDB 10.4.0](#) and above.

pam_ssh

The [pam_ssh](#) PAM module provides authentication using SSH keys.

pam_time

The [pam_time](#) PAM module provides time-controlled access.

Known Issues

Multi-Threaded Issues

MariaDB is a multi-threaded program, which means that different connections concurrently run in different threads. Current versions of MariaDB's `pam` authentication plugin execute PAM module code in the server address space. This means that any PAM modules used with MariaDB must be safe for multi-threaded environments. Otherwise, if multiple clients try to authenticate with the same PAM module in parallel, undefined behavior can occur. For example, the `pam_fprintd` PAM module is not safe for multi-threaded environments, and if you use it with MariaDB, you may experience server crashes.

MariaDB starting with [10.4.0](#)

Starting in [MariaDB 10.4.0](#), the `pam` authentication plugin isolates PAM module code from the server address space, so even PAM modules that are known to be unsafe for multi-threaded environments should not cause issues with MariaDB. See [MDEV-15473](#) for more information.

Conflicts with Password Validation

When a [password validation plugin](#) is enabled, MariaDB won't allow an account to be created if the password validation plugin says that the account's password is too weak. This creates a problem for accounts that authenticate with the `pam` authentication plugin, since MariaDB has no knowledge of the user's password. When a user tries to create an account that authenticates with the `pam` authentication plugin, the password validation plugin would throw an error, even with `strict_password_validation=OFF` set.

The workaround is to uninstall the [password validation plugin](#) with `UNINSTALL PLUGIN`, and then create the account, and then reinstall the [password validation plugin](#) with `INSTALL PLUGIN`.

For example:

```
INSTALL PLUGIN simple_password_check SONAME 'simple_password_check';
Query OK, 0 rows affected (0.002 sec)

SET GLOBAL strict_password_validation=OFF;
Query OK, 0 rows affected (0.000 sec)

CREATE USER '@%' IDENTIFIED VIA pam USING 'mariadb';
ERROR 1819 (HY000): Your password does not satisfy the current policy requirements
UNINSTALL PLUGIN simple_password_check;
Query OK, 0 rows affected (0.000 sec)

CREATE USER '@%' IDENTIFIED VIA pam USING 'mariadb';
Query OK, 0 rows affected (0.000 sec)

INSTALL PLUGIN simple_password_check SONAME 'simple_password_check';
Query OK, 0 rows affected (0.001 sec)
```

MariaDB starting with [10.4.0](#)

Starting in [MariaDB 10.4.0](#), accounts that authenticate with the `pam` authentication plugin should be exempt from password validation checks. See [MDEV-12321](#) and [MDEV-10457](#) for more information.

SELinux

[SELinux](#) may cause issues when using the `pam` authentication plugin. For example, using `pam_unix` with the `pam` authentication plugin while SELinux is enabled can sometimes lead to SELinux errors involving [unix_chkpwd](#), such as the following::

```
Apr 14 12:37:59 localhost setroubleshoot: Plugin Exception restorecon_source
Apr 14 12:37:59 localhost setroubleshoot: SELinux is preventing /usr/sbin/unix_chkpwd from
execute access on the file . For complete SELinux messages. run sealert -l c56fe6e0-c78c-4bdb-
a80f-27ef86alea85
Apr 14 12:37:59 localhost python: SELinux is preventing /usr/sbin/unix_chkpwd from execute
access on the file .

**** Plugin catchall (100. confidence) suggests ****

If you believe that unix_chkpwd should be allowed execute access on the file by default.
Then you should report this as a bug.
You can generate a local policy module to allow this access.
Do
allow this access for now by executing:
# grep unix_chkpwd /var/log/audit/audit.log | audit2allow -M mypol
# semodule -i mypol.pp
```

Sometimes issues like this can be fixed by updating the system's SELinux policies. You may be able to update the policies using [audit2allow](#). See [SELinux: Generating SELinux Policies with audit2allow](#) for more information.

If you can't get the `pam` authentication plugin to work with SELinux at all, then it can help to disable SELinux entirely. See [SELinux: Changing SELinux's Mode](#) for information on how to do this.

Memory Overcommit

On [MariaDB 10.4](#) and later you may run into authentication failures with the following log message in the MariaDB error log:

```
pam: cannot exec /usr/lib64/mysql/plugin/auth_pam_tool_dir/auth_pam_tool (errno: 12 "Cannot alloc
```

This can happen on operating system setups that are configured to prevent memory overcommit. When the MariaDB server process spawns the `auth_pam_tool` helper process there's a brief period where the new process inherits the memory of the MariaDB process before releasing that memory and executing the new command. When having a MariaDB server configured to use more than 50% of the server machines RAM -- which is common for dedicated database servers -- this duplication would lead to an over-commit situation.

Starting with [MariaDB 10.4.25](#), [MariaDB 10.5.16](#), [MariaDB 10.6.8](#), and [MariaDB 10.7.4](#), we changed to use `posix_spawn()` instead of the classic `fork();exec()` to prevent this, but systems with older glibc versions prior to 2.26 still use `fork();exec()` to implement `posix_spawn()` internally and so are still affected; this is for example still the case on RedHat Enterprise Linux 7.

To solve this you can either:

- change the `vm.overcommit_memory` kernel setting to allow memory overcommit
- install the older `auth_pam_v1` plugin version that does not spawn a helper process (but may run into problems with file permissions or multi threading with some PAM modules)

See also [MDEV-26212](#) and [MDEV-30734](#)

Tutorials

You may find the following PAM-related tutorials helpful:

- [Configuring PAM Authentication and User Mapping with Unix Authentication](#)
- [Configuring PAM Authentication and User Mapping with LDAP Authentication](#)

Versions

Version	Status	Introduced
2.0	Beta	MariaDB 10.4.0
1.0	Stable	MariaDB 10.0.10
1.0	Beta	MariaDB 5.2.10

System Variables

`pam_debug`

- **Description:** Enables verbose debug logging to the [error log](#) for all authentication handled by the plugin.
 - This system variable is only available when the plugin is a [debug build](#).
- **Commandline:** `--pam-debug`
- **Scope:** Global
- **Dynamic:** No
- **Data Type:** `boolean`
- **Default Value:** `OFF`
- **Introduced:** [MariaDB 10.2.2](#), [MariaDB 10.1.17](#)

`pam_use_cleartext_plugin`

- **Description:** Use the [mysql_clear_password](#) client authentication plugin instead of the [dialog](#) client authentication plugin. This may be needed for compatibility reasons, but it only supports simple PAM configurations that don't require any input besides a password.
- **Commandline:** `--pam-use-cleartext-plugin`
- **Scope:** Global
- **Dynamic:** No
- **Data Type:** `boolean`

- **Default Value:** OFF
- **Introduced:** [MariaDB 10.1.1](#), [MariaDB 5.5.32](#)

pam_winbind_workaround

- **Description:** Configures the authentication plugin to compare the user name provided by the client with the user name returned by the PAM module in a case insensitive manner. This may be needed if you use the [pam_winbind](#) PAM module, which is known to convert all user names to lowercase, and which does not allow this behavior to be disabled.
- **Commandline:** `--pam-winbind-workaround`
- **Scope:** Global
- **Dynamic:** Yes
- **Data Type:** `boolean`
- **Default Value:** OFF
- **Introduced:** [MariaDB 10.4.5](#), [MariaDB 10.3.15](#), [MariaDB 10.2.24](#), [MariaDB 10.1.39](#)

Options

pam

- **Description:** Controls how the server should treat the plugin when the server starts up.
 - Valid values are:
 - `OFF` - Disables the plugin without removing it from the [mysql.plugins](#) table.
 - `ON` - Enables the plugin. If the plugin cannot be initialized, then the server will still continue starting up, but the plugin will be disabled.
 - `FORCE` - Enables the plugin. If the plugin cannot be initialized, then the server will fail to start with an error.
 - `FORCE_PLUS_PERMANENT` - Enables the plugin. If the plugin cannot be initialized, then the server will fail to start with an error. In addition, the plugin cannot be uninstalled with [UNINSTALL SONAME](#) or [UNINSTALL PLUGIN](#) while the server is running.
 - See [Plugin Overview: Configuring Plugin Activation at Server Startup](#) for more information.
- **Commandline:** `--pam=value`
- **Data Type:** `enumerated`
- **Default Value:** ON
- **Valid Values:** `OFF`, `ON`, `FORCE`, `FORCE_PLUS_PERMANENT`

5.4.6.6.2 User and Group Mapping with PAM

Even when using the `pam` authentication plugin, the authenticating PAM user account still needs to exist in MariaDB, and the account needs to have privileges in the database. Creating these MariaDB accounts and making sure the privileges are correct can be a lot of work. To decrease the amount of work involved, some users would like to be able to map a PAM user to a different MariaDB user. For example, let's say that `alice` and `bob` are both DBAs. It would be nice if each of them could log into MariaDB with their own PAM username and password, while MariaDB sees both of them as the same `dba` user. That way, there is only one MariaDB account to keep track of.

Although most PAM modules usually do not do things like this, PAM supports the ability to change the user name in the process of authentication. The MariaDB `pam` authentication plugin fully supports this feature of PAM.

The pam_user_map PAM Module

Rather than building user and group mapping into the `pam` authentication plugin, MariaDB thought that it would cover the most use cases and offer the most flexibility to offload this functionality to an external PAM module. The `pam_user_map` PAM module was implemented by MariaDB to facilitate this. This PAM module can be [configured in the PAM service](#) used by the `pam` authentication plugin, just like other PAM modules.

Lack of Support for MySQL/Percona Group Mapping Syntax

Unlike MariaDB, MySQL and Percona implemented group mapping in their PAM authentication plugins. If you've read through [MySQL's PAM authentication documentation on group mapping](#) or [Percona's PAM authentication documentation on group mapping](#), you've probably seen syntax where the group mappings are provided in the `CREATE USER` statement like this:

```
CREATE USER ''@''
  IDENTIFIED WITH authentication_pam
  AS 'mysql, root=developer, users=data_entry';
```

Since MariaDB's user and group mapping is performed by an external PAM module, MariaDB's `pam` authentication plugin does not support this syntax. Instead, the user and group mappings for the `pam_user_map` PAM module are configured in an external configuration file. This is discussed in a later section.

Installing the pam_user_map PAM Module

The `pam_user_map` PAM module gets installed as part of all our MariaDB server packages since [MariaDB 10.5](#), and was added since 10.2.31, 10.3.22, and 10.4.12 in previous MariaDB major releases where it was not present from the beginning.

Some Linux distributions have not picked up this change in their own packages yet, so when e.g. installing MariaDB server from stock Ubuntu packages on Ubuntu 20.04LTS you still won't have the `pam_user_map` module installed even though the MariaDB server installed is more recent than [MariaDB 10.3.22](#).

When using such an installation, and not being able to switch to our own MariaDB package repositories, it may be necessary to compile the PAM module from source as described in the next section, or to manually extract it from one of our server packages and copy it to the target system.

Installing the pam_user_map PAM Module from Source

Installing Compilation Dependencies

Before the module can be compiled from source, you may need to install some dependencies.

On RHEL, CentOS, and other similar Linux distributions that use [RPM packages](#), you need to install `gcc`, `pam-devel` and `MariaDB-devel`. For example:

```
sudo yum install gcc pam-devel MariaDB-devel
```

On Debian, Ubuntu, and other similar Linux distributions that use [DEB packages](#), you need to install `gcc`, `libpam0g-dev`. For example:

```
sudo apt-get install gcc libpam0g-dev libmariadb-dev
```

Compiling and Installing the pam_user_map PAM Module

The `pam_user_map` PAM module can be built by downloading `plugin/auth_pam/mapper/pam_user_map.c` file from the MariaDB source tree and compiling it after minor adjustments. Once it is built, it can be installed to the system's PAM module directory, which is typically `/lib64/security/`.

For example: (replace 10.4 in the URL with the actual server versions)

```
wget https://raw.githubusercontent.com/MariaDB/server/10.4/plugin/auth_pam/mapper/pam_user_map.c
sed -ie 's/config_auth_pam/plugin_auth_common/' pam_user_map.c
gcc -I/usr/include/mysql/ pam_user_map.c -shared -lpam -fPIC -o pam_user_map.so
sudo install --mode=0755 pam_user_map.so /lib64/security/
```

You will also need to adjust the major version number in the URL on the first line to match your installed MariaDB version, and the `#-I#` include path argument on the `gcc` line, as depending on operating system and MariaDB server version the `plugin_auth_common.h` file may be installed in different directories than `/usr/include/mysql/`

Configuring the pam_user_map PAM Module

The `pam_user_map` PAM module uses the configuration file at the path `/etc/security/user_map.conf` to determine its user and group mappings. The file's format is described below.

To map a specific PAM user to a specific MariaDB user:

```
orig_pam_user_name: mapped_mariadb_user_name
```

Or to map any PAM user in a specific PAM group to a specific MariaDB user, the group name is prefixed with `@`:

```
@orig_pam_group_name: mapped_mariadb_user_name
```

For example, here is an example `/etc/security/user_map.conf`:

```
=====
#comments and empty lines are ignored
john: jack
bob:  admin
top:  accounting
@group_ro: readonly
```

Configuring PAM

With user and group mapping, configuring PAM is done similar to how it is [normally done with the pam authentication plugin](#). However, when configuring the PAM service, you will have to add an `auth` line for the `pam_user_map` PAM module to the service's PAM configuration file. For example:

```
auth required pam_unix.so audit
auth required pam_user_map.so
account required pam_unix.so audit
```

Creating Users

With user and group mapping, creating users is done similar to how it is [normally done with the pam authentication plugin](#). However, one major difference is that you will need to `GRANT` the `PROXY` privilege on the mapped user to the original user.

For example, if you have the following configured in `/etc/security/user_map.conf`:

```
foo: bar
@dba:dba
```

Then you could execute the following to grant the relevant privileges:

```

CREATE USER 'bar'@'%' IDENTIFIED BY 'strongpassword';
GRANT ALL PRIVILEGES ON *.* TO 'bar'@'%' ;

CREATE USER 'dba'@'%' IDENTIFIED BY 'strongpassword';
GRANT ALL PRIVILEGES ON *.* TO 'dba'@'%' ;

CREATE USER ''@'%' IDENTIFIED VIA pam USING 'mariadb';
GRANT PROXY ON 'bar'@'%' TO ''@'%;
GRANT PROXY ON 'dba'@'%' TO ''@'%;

```

Note that the ''@'%' account is a special catch-all [anonymous account](#). Any login by a user that has no more specific account match in the system will be matched by this anonymous account.

Also note that you might not be able to create the ''@'%' anonymous account by default on some systems without doing some extra steps first. See [Fixing a Legacy Default Anonymous Account](#) for more information.

Verifying that Mapping is Occurring

In case any user mapping is performed, the original user name is returned by the SQL function `USER()`, while the authenticated user name is returned by the SQL function `CURRENT_USER()`. The latter actually defines what privileges are available to a connected user.

For example, if we have the following configured:

```
foo: bar
```

Then the following output would verify that it is working properly:

```

$ mysql -u foo -h 172.30.0.198
[mariadb] Password:
Welcome to the MariaDB monitor.  Commands end with ; or \g.
Your MariaDB connection id is 22
Server version: 10.3.10-MariaDB MariaDB Server

Copyright (c) 2000, 2018, Oracle, MariaDB Corporation Ab and others.

Type 'help;' or '\h' for help. Type '\c' to clear the current input statement.

MariaDB [(none)]> SELECT USER(), CURRENT_USER();
+-----+-----+
| USER() | CURRENT_USER() |
+-----+-----+
| [email protected] | bar@% |
+-----+-----+
1 row in set (0.000 sec)

```

We can verify that our `foo` PAM user was properly mapped to the `bar` MariaDB user by looking at the return value of `CURRENT_USER()`.

Logging

By default, the `pam_user_map` PAM module does not perform any logging. However, if you want to enable debug logging, then you can add the `debug` module argument to the service's PAM configuration file. For example:

```

auth required pam_unix.so audit
auth required pam_user_map.so debug
account required pam_unix.so audit

```

When debug logging is enabled, the `pam_user_map` PAM module will write log entries to the [same syslog location](#) as other PAM modules, which is typically `/var/log/secure` on many systems.

For example, this debug log output can look like the following:

```

Jan  9 05:42:13 ip-172-30-0-198 mysqld: pam_user_map(mariadb:auth): Opening file
'/etc/security/user_map.conf'.
Jan  9 05:42:13 ip-172-30-0-198 mysqld: pam_user_map(mariadb:auth): Incoming username 'alice'.
Jan  9 05:42:13 ip-172-30-0-198 mysqld: pam_user_map(mariadb:auth): User belongs to 2 groups
[alice,dba].
Jan  9 05:42:13 ip-172-30-0-198 mysqld: pam_user_map(mariadb:auth): Check if user is in group
'dba': YES
Jan  9 05:42:13 ip-172-30-0-198 mysqld: pam_user_map(mariadb:auth): User mapped as 'dba'
Jan  9 05:43:36 ip-172-30-0-198 mysqld: pam_user_map(mariadb:auth): Opening file
'/etc/security/user_map.conf'.
Jan  9 05:43:36 ip-172-30-0-198 mysqld: pam_user_map(mariadb:auth): Incoming username 'bob'.
Jan  9 05:43:36 ip-172-30-0-198 mysqld: pam_user_map(mariadb:auth): User belongs to 2 groups
[bob,dba].
Jan  9 05:43:36 ip-172-30-0-198 mysqld: pam_user_map(mariadb:auth): Check if user is in group
'dba': YES
Jan  9 05:43:36 ip-172-30-0-198 mysqld: pam_user_map(mariadb:auth): User mapped as 'dba'
Jan  9 06:08:36 ip-172-30-0-198 mysqld: pam_user_map(mariadb:auth): Opening file
'/etc/security/user_map.conf'.
Jan  9 06:08:36 ip-172-30-0-198 mysqld: pam_user_map(mariadb:auth): Incoming username 'foo'.
Jan  9 06:08:36 ip-172-30-0-198 mysqld: pam_user_map(mariadb:auth): User belongs to 1 group
[foo].
Jan  9 06:08:36 ip-172-30-0-198 mysqld: pam_user_map(mariadb:auth): Check if user is in group
'dba': NO
Jan  9 06:08:36 ip-172-30-0-198 mysqld: pam_user_map(mariadb:auth): Check if username 'foo': YES
Jan  9 06:08:36 ip-172-30-0-198 mysqld: pam_user_map(mariadb:auth): User mapped as 'bar'

```

Known Issues

PAM User with Same Name as Mapped MariaDB User Must Exist

With user and group mapping, any PAM user or any PAM user in a given PAM group can be mapped to a specific MariaDB user account. However, due to the way PAM works, a PAM user with the same name as the mapped MariaDB user account must exist.

For example, if the configuration file for the PAM service file contained the following:

```

auth required pam_sss.so
auth required pam_user_map.so debug
account sufficient pam_unix.so
account sufficient pam_sss.so

```

And if `/etc/security/user_map.conf` contained the following:

```
@dba: dba
```

Then any PAM user in the PAM group `dba` would be mapped to the MariaDB user account `dba`. But if a PAM user with the name `dba` did not also exist, then the `pam_user_map` PAM module's debug logging would write errors to the syslog like the following:

```

Sep 27 17:17:05 dbserver1 mysqld: pam_user_map(mysql:auth): Opening file
'/etc/security/user_map.conf'.
Sep 27 17:17:05 dbserver1 mysqld: pam_user_map(mysql:auth): Incoming username 'alice'.
Sep 27 17:17:05 dbserver1 mysqld: pam_user_map(mysql:auth): User belongs to 4 groups
[dba,mongod,mongodba,mysql].
Sep 27 17:17:05 dbserver1 mysqld: pam_user_map(mysql:auth): Check if user is in group 'mysql':
YES
Sep 27 17:17:05 dbserver1 mysqld: pam_user_map(mysql:auth): User mapped as 'dba'
Sep 27 17:17:05 dbserver1 mysqld: pam_unix(mysql:account): could not identify user (from
getpwnam(dba))
Sep 27 17:17:05 dbserver1 mysqld: pam_sss(mysql:account): Access denied for user dba: 10 (User
not known to the underlying authentication module)
Sep 27 17:17:05 dbserver1 mysqld: 2018-09-27 17:17:05 72 [Warning] Access denied for user
'alice'@'localhost' (using password: NO)

```

In the above log snippet, notice that both the `pam_unix` and the `pam_sss` PAM modules are complaining that the `dba` PAM user does not appear to exist, and that these complaints cause the PAM authentication process to fail, which causes the MariaDB authentication process to fail as well.

This can be fixed by creating a PAM user with the same name as the mapped MariaDB user account, which is `dba` in this case.

You may also be able to work around this problem by essentially disabling PAM's account verification for the service with the `pam_permit` PAM module. For example, in the above case, that would be:

```
auth required pam_sss.so
auth required pam_user_map.so debug
account required pam_permit.so
```

See [MDEV-17315](#) for more information.

- [Configuring PAM Authentication and User Mapping with LDAP Authentication](#)

5.4.6.6.3 Configuring PAM Authentication and User Mapping with Unix Authentication

In this article, we will walk through the configuration of PAM authentication using the `pam` authentication plugin and user and group mapping with the `pam_user_map` PAM module. The primary authentication will be handled by the `pam_unix` PAM module, which performs standard Unix password authentication.

Contents

1. [Hypothetical Requirements](#)
2. [Creating Our Unix Users and Groups](#)
3. [Installing the `pam_user_map` PAM Module](#)
4. [Configuring the `pam_user_map` PAM Module](#)
5. [Installing the PAM Authentication Plugin](#)
6. [Configuring the PAM Service](#)
7. [Configuring the `pam_unix` PAM Module](#)
8. [Creating MariaDB Users](#)
9. [Testing our Configuration](#)

Hypothetical Requirements

In this walkthrough, we are going to assume the following hypothetical requirements:

- The Unix user `foo` should be mapped to the MariaDB user `bar`. (`foo: bar`)
- Any Unix user in the Unix group `dba` should be mapped to the MariaDB user `dba`. (`@dba: dba`)

Creating Our Unix Users and Groups

Let's go ahead and create the Unix users and groups that we are using for this hypothetical scenario.

First, let's create the `foo` user and a couple users to go into the `dba` group. Note that each of these users needs a password.

```
sudo useradd foo
sudo passwd foo
sudo useradd alice
sudo passwd alice
sudo useradd bob
sudo passwd bob
```

And then let's create our `dba` group and add our two users to it:

```
sudo groupadd dba
sudo usermod -a -G dba alice
sudo usermod -a -G dba bob
```

We also need to create Unix users with the same name as the `bar` and `dba` MariaDB users. See [here](#) to read more about why. No one will be logging in as these users, so they do not need passwords.

```
sudo useradd bar
sudo useradd dba -g dba
```

Installing the pam_user_map PAM Module

Next, let's [install the pam_user_map PAM module](#).

Before the module can be compiled from source, we may need to install some dependencies.

On RHEL, CentOS, and other similar Linux distributions that use [RPM packages](#), we need to install `gcc` and `pam-devel` :

```
sudo yum install gcc pam-devel
```

On Debian, Ubuntu, and other similar Linux distributions that use [DEB packages](#), we need to install `gcc` and `libpam0g-dev` :

```
sudo apt-get install gcc libpam0g-dev
```

And then we can build and install the library with the following:

```
wget https://raw.githubusercontent.com/MariaDB/server/10.4/plugin/auth_pam/mapper/pam_user_map.c
gcc pam_user_map.c -shared -lpam -fPIC -o pam_user_map.so
sudo install --mode=0755 pam_user_map.so /lib64/security/
```

Configuring the pam_user_map PAM Module

Next, let's [configure the pam_user_map PAM module](#) based on our hypothetical requirements.

The configuration file for the `pam_user_map` PAM module is `/etc/security/user_map.conf`. Based on our hypothetical requirements, ours would look like:

```
foo: bar
@dba:dba
```

Installing the PAM Authentication Plugin

Next, let's [install the pam authentication plugin](#).

Log into the MariaDB Server and execute the following:

```
INSTALL SONAME 'auth_pam';
```

Configuring the PAM Service

Next, let's [configure the PAM service](#). We will call our service `mariadb`, so our PAM service configuration file will be located at `/etc/pam.d/mariadb` on most systems.

Since we are only doing Unix authentication with the `pam_unix` PAM module and group mapping with the `pam_user_map` PAM module, our configuration file would look like this:

```
auth required pam_unix.so audit
auth required pam_user_map.so
account required pam_unix.so audit
```

Configuring the pam_unix PAM Module

The `pam_unix` PAM module adds [some additional configuration steps](#) on a lot of systems. We basically have to give the user that runs `mysqld` access to `/etc/shadow`.

If the `mysql` user is running `mysqld`, then we can do that by executing the following:

```
sudo groupadd shadow
sudo usermod -a -G shadow mysql
sudo chown root:shadow /etc/shadow
sudo chmod g+r /etc/shadow
```

The [server needs to be restarted](#) for this change to take affect.

Creating MariaDB Users

Next, let's [create the MariaDB users](#). Remember that our PAM service is called `mariadb`.

First, let's create the MariaDB user for the user mapping: `foo: bar`

That means that we need to create a `bar` user:

```
CREATE USER 'bar'@'%' IDENTIFIED BY 'strongpassword';
GRANT ALL PRIVILEGES ON *.* TO 'bar'@'%' ;
```

And then let's create the MariaDB user for the group mapping: `@dba: dba`

That means that we need to create a `dba` user:

```
CREATE USER 'dba'@'%' IDENTIFIED BY 'strongpassword';
GRANT ALL PRIVILEGES ON *.* TO 'dba'@'%' ;
```

And then to allow for the user and group mapping, we need to [create an anonymous user that authenticates with the pam authentication plugin](#) that is also able to `PROXY` as the `bar` and `dba` users. Before we can create the proxy user, we might need to [clean up some defaults](#):

```
DELETE FROM mysql.db WHERE User='' AND Host='%';
FLUSH PRIVILEGES;
```

And then let's create the anonymous proxy user:

```
CREATE USER ''@'%' IDENTIFIED VIA pam USING 'mariadb';
GRANT PROXY ON 'bar'@'%' TO ''@'%;
GRANT PROXY ON 'dba'@'%' TO ''@'%;
```

Testing our Configuration

Next, let's test out our configuration by [verifying that mapping is occurring](#). We can verify this by logging in as each of our users and comparing the return value of `USER()`, which is the original user name and the return value of `CURRENT_USER()`, which is the authenticated user name.

First, let's test out our `foo` user:

```
$ mysql -u foo -h 172.30.0.198
[mariadb] Password:
Welcome to the MariaDB monitor.  Commands end with ; or \g.
Your MariaDB connection id is 22
Server version: 10.3.10-MariaDB MariaDB Server

Copyright (c) 2000, 2018, Oracle, MariaDB Corporation Ab and others.

Type 'help;' or '\h' for help. Type '\c' to clear the current input statement.

MariaDB [(none)]> SELECT USER(), CURRENT_USER();
+-----+-----+
| USER() | CURRENT_USER() |
+-----+-----+
| [email protected] | bar@% |
+-----+-----+
1 row in set (0.000 sec)
```

We can verify that our `foo` Unix user was properly mapped to the `bar` MariaDB user by looking at the return value of `CURRENT_USER()`.

Then let's test out our `alice` user in the `dba` group:

```
$ mysql -u alice -h 172.30.0.198
[mariadb] Password:
Welcome to the MariaDB monitor.  Commands end with ; or \g.
Your MariaDB connection id is 19
Server version: 10.3.10-MariaDB MariaDB Server

Copyright (c) 2000, 2018, Oracle, MariaDB Corporation Ab and others.

Type 'help;' or '\h' for help. Type '\c' to clear the current input statement.

MariaDB [(none)]> SELECT USER(), CURRENT_USER();
+-----+-----+
| USER() | CURRENT_USER() |
+-----+-----+
| [email protected] | dba@% |
+-----+-----+
1 row in set (0.000 sec)
```

And then let's test out our `bob` user in the `dba` group:

```
$ mysql -u bob -h 172.30.0.198
[mariadb] Password:
Welcome to the MariaDB monitor.  Commands end with ; or \g.
Your MariaDB connection id is 20
Server version: 10.3.10-MariaDB MariaDB Server

Copyright (c) 2000, 2018, Oracle, MariaDB Corporation Ab and others.

Type 'help;' or '\h' for help. Type '\c' to clear the current input statement.

MariaDB [(none)]> SELECT USER(), CURRENT_USER();
+-----+-----+
| USER() | CURRENT_USER() |
+-----+-----+
| [email protected] | dba@% |
+-----+-----+
1 row in set (0.000 sec)
```

We can verify that our `alice` and `bob` Unix users in the `dba` Unix group were properly mapped to the `dba` MariaDB user by looking at the return values of `CURRENT_USER()`.

5.4.6.6.4 Configuring PAM Authentication and User Mapping with LDAP Authentication

In this article, we will walk through the configuration of PAM authentication using the `pam` authentication plugin and user and group mapping with the `pam_user_map` PAM module. The primary authentication will be handled by the `pam_ldap` PAM module, which performs LDAP authentication. We will also set up an OpenLDAP server.

 1. Configuring the pam_unix PAM Module
4. Creating MariaDB Users
5. Testing our Configuration
 1. Testing LDAP Authentication
 2. Testing Local Unix Authentication

Hypothetical Requirements

In this walkthrough, we are going to assume the following hypothetical requirements:

- The LDAP user `foo` should be mapped to the MariaDB user `bar`. (`foo: bar`)
- Any LDAP user in the LDAP group `dba` should be mapped to the MariaDB user `dba`. (`@dba: dba`)

Setting up the OpenLDAP Server

Before we can use LDAP authentication, we first need to set up our OpenLDAP Server. This is usually done on a server that is completely separate from the database server.

Installing the OpenLDAP Server and Client Components

On the server acting as the OpenLDAP Server, first, we need to install the OpenLDAP components.

On RHEL, CentOS, and other similar Linux distributions that use [RPM packages](#), that would go like this:

```
sudo yum install openldap openldap-servers openldap-clients nss-pam-ldapd
```

Configuring the OpenLDAP Server

Next, let's configure the OpenLDAP Server. The easiest way to do that is to copy the template configuration file that is included with the installation. In many installations, that will be at `/usr/share/openldap-servers/DB_CONFIG.example`.

For example:

```
sudo cp /usr/share/openldap-servers/DB_CONFIG.example /var/lib/ldap/DB_CONFIG
sudo chown ldap. /var/lib/ldap/DB_CONFIG
```

Configuring the OpenLDAP Port

Sometimes it is useful to change the port used by OpenLDAP. For example, some cloud environments block well-known authentication services, so they block the default LDAP port.

On some systems, the port can be changed by setting `SLAPD_URLS` in `/etc/sysconfig/slapd`:

```
SLAPD_URLS="ldapi:/// ldap://0.0.0.0:3306/"
```

I used `3306` because that is the port that is usually used by `mysqld`, so I know that it is not blocked.

Starting the OpenLDAP Server

Next, let's start the OpenLDAP Server and configure it to start on reboot. On `systemd` systems, that would go like this:

```
sudo systemctl start slapd
sudo systemctl enable slapd
```

Installing the Standard LDAP objectClasses

In order to use LDAP for authentication, we also need to install some standard `objectClasses`, such as `posixAccount` and `posixGroup`. In LDAP, things like `objectClasses` are defined in `LDIF` files. In many installations, these specific `objectClasses` are defined in `/etc/openldap/schema/nis.ldif`. `nis.ldif` also depends on `core.ldif` and `cosine.ldif`. However, `core.ldif` is usually installed by default.

We can install them with `ldapmodify`:

```
sudo ldapmodify -a -Y EXTERNAL -H ldapi:/// -f /etc/openldap/schema/cosine.ldif
sudo ldapmodify -a -Y EXTERNAL -H ldapi:/// -f /etc/openldap/schema/nis.ldif
```

Creating the LDAP Directory Manager User

Next, let's create a directory manager user. We can do this by using OpenLDAP's `olc` configuration system to change the `olcRootDN` directive to the DN of the directory manager user, which means that the user will be a privileged LDAP user that is not subject to access controls. We will also set the root password for the user by changing the `olcRootPW` directive.

We will also set the DN suffix for our backend LDAP database by changing the `olcSuffix` directive.

Let's use the `slappasswd` utility to generate a password hash from a clear-text password. Simply execute:

```
slappasswd
```

This utility should provide a password hash that looks kind of like this: `{SSHA}AwT4jrvmokeCkbDrFAnGvzzjCmb7bvE1`

OpenLDAP's `olc` configuration system also uses `LDIF` files. Now that we have the password hash, let's create an `LDIF` file to create the directory manager user:

```

tee ~/setupDirectoryManager.ldif <<EOF
dn: olcDatabase={1}monitor,cn=config
changetype: modify
replace: olcAccess
olcAccess: {0}to *
    by dn.base="gidNumber=0+uidNumber=0,cn=peercred,cn=external,cn=auth" read
    by dn.base="cn=Manager,dc=support,dc=mariadb,dc=com" read
    by * none

dn: olcDatabase={2}hdb,cn=config
changetype: modify
replace: olcSuffix
olcSuffix: dc=support,dc=mariadb,dc=com

dn: olcDatabase={2}hdb,cn=config
changetype: modify
replace: olcRootDN
olcRootDN: cn=Manager,dc=support,dc=mariadb,dc=com

dn: olcDatabase={2}hdb,cn=config
changetype: modify
add: olcRootPW
olcRootPW: {SSHA}AwT4jrvmokeCkbDrFAnGvzzjCmb7bvEl

dn: olcDatabase={2}hdb,cn=config
changetype: modify
add: olcAccess
olcAccess: {0}to attrs=userPassword,shadowLastChange
    by dn="cn=Manager,dc=support,dc=mariadb,dc=com" write
    by anonymous auth
    by self write
    by * none
olcAccess: {1}to dn.base=""
    by * read
olcAccess: {2}to *
    by dn="cn=Manager,dc=support,dc=mariadb,dc=com" write
    by * read
EOF

```

Note that I am using the `dc=support,dc=mariadb,dc=com` domain for my directory. You can change this to whatever is relevant to you.

Now let's run the ldif file with `ldapmodify` [🔗](#):

```
sudo ldapmodify -Y EXTERNAL -H ldapi:/// -f ~/setupDirectoryManager.ldif
```

We will use the new directory manager user to make changes to the LDAP directory after this step.

Creating the Structure of the Directory

Next, let's create the structure of the directory by creating parts of our tree.

```
tee ~/setupDirectoryStructure.ldif <<EOF
dn: dc=support,dc=mariadb,dc=com
objectClass: top
objectClass: dcObject
objectClass: organization
o: MariaDB Support Team
dc: support

dn: cn=Manager,dc=support,dc=mariadb,dc=com
objectClass: top
objectClass: organizationalRole
cn: Manager
description: Directory Manager

dn: ou=People,dc=support,dc=mariadb,dc=com
objectClass: top
objectClass: organizationalUnit
ou: People

dn: ou=Groups,dc=support,dc=mariadb,dc=com
objectClass: top
objectClass: organizationalUnit
ou: Groups

dn: ou=System Users,dc=support,dc=mariadb,dc=com
objectClass: top
objectClass: organizationalUnit
ou: System Users
EOF
```

Now let's use our new directory manager user and run the [LDIF](#) file with `ldapmodify`:

```
ldapmodify -a -x -D cn=Manager,dc=support,dc=mariadb,dc=com -W -f ~/setupDirectoryStructure.ldif
```

Creating the LDAP Users and Groups

Let's go ahead and create the LDAP users and groups that we are using for this hypothetical scenario.

First, let's create the `foo` user:

```
tee ~/createFooUser.ldif <<EOF
dn: uid=foo,ou=People,dc=support,dc=mariadb,dc=com
objectClass: top
objectClass: account
objectClass: posixAccount
objectClass: shadowAccount
cn: foo
uid: foo
uidNumber: 16859
gidNumber: 100
homeDirectory: /home/foo
loginShell: /bin/bash
gecos: foo
userPassword: {crypt}x
shadowLastChange: -1
shadowMax: -1
shadowWarning: 0
EOF
ldapmodify -a -x -D cn=Manager,dc=support,dc=mariadb,dc=com -W -f ~/createFooUser.ldif
```

Then let's create a couple users to go into the `dba` group:

```
tee ~/createDbasUsers.ldif <<EOF
dn: uid=gmontee,ou=People,dc=support,dc=mariadb,dc=com
objectClass: top
objectClass: account
objectClass: posixAccount
objectClass: shadowAccount
cn: gmontee
uid: gmontee
uidNumber: 16860
gidNumber: 100
homeDirectory: /home/gmontee
loginShell: /bin/bash
gecos: gmontee
userPassword: {crypt}x
shadowLastChange: -1
shadowMax: -1
shadowWarning: 0

dn: uid=bstillman,ou=People,dc=support,dc=mariadb,dc=com
objectClass: top
objectClass: account
objectClass: posixAccount
objectClass: shadowAccount
cn: bstillman
uid: bstillman
uidNumber: 16861
gidNumber: 100
homeDirectory: /home/bstillman
loginShell: /bin/bash
gecos: bstillman
userPassword: {crypt}x
shadowLastChange: -1
shadowMax: -1
shadowWarning: 0
EOF
ldapmodify -a -x -D cn=Manager,dc=support,dc=mariadb,dc=com -W -f ~/createDbasUsers.ldif
```

Note that each of these users needs a password, so we can set it for each user with [ldappasswd](#) :

```
ldappasswd -x -D cn=Manager,dc=support,dc=mariadb,dc=com -W -S
uid=foo,ou=People,dc=support,dc=mariadb,dc=com
ldappasswd -x -D cn=Manager,dc=support,dc=mariadb,dc=com -W -S
uid=gmontee,ou=People,dc=support,dc=mariadb,dc=com
ldappasswd -x -D cn=Manager,dc=support,dc=mariadb,dc=com -W -S
uid=bstillman,ou=People,dc=support,dc=mariadb,dc=com
```

And then let's create our dba group

```
tee ~/createDbasGroup.ldif <<EOF
dn: cn=dba,ou=Groups,dc=support,dc=mariadb,dc=com
objectClass: top
objectClass: posixGroup
gidNumber: 678
EOF
ldapmodify -a -x -D cn=Manager,dc=support,dc=mariadb,dc=com -W -f ~/createDbasGroup.ldif
```

And then let's add our two users to it:

```
tee ~/addUsersToDbasGroup.ldif <<EOF
dn: cn=dba,ou=Groups,dc=support,dc=mariadb,dc=com
changetype: modify
add: memberuid
memberuid: gmontee

dn: cn=dba,ou=Groups,dc=support,dc=mariadb,dc=com
changetype: modify
add: memberuid
memberuid: bstillman
EOF
ldapmodify -a -x -D cn=Manager,dc=support,dc=mariadb,dc=com -W -f ~/addUsersToDbasGroup.ldif
```

We also need to create LDAP users with the same name as the `bar` and `dba` MariaDB users. See [here](#) to read more about why. No one will be logging in as these users, so they do not need passwords. Instead of the `People` `organizationalUnit`, we will create them in the `System Users` `organizationalUnit`.

```
tee ~/createSystemUsers.ldif <<EOF
dn: uid=bar,ou=System Users,dc=support,dc=mariadb,dc=com
objectClass: top
objectClass: account
objectClass: posixAccount
objectClass: shadowAccount
cn: bar
uid: bar
uidNumber: 16862
gidNumber: 100
homeDirectory: /home/bar
loginShell: /bin/bash
gecos: bar
userPassword: {crypt}x
shadowLastChange: -1
shadowMax: -1
shadowWarning: 0

dn: uid=dba,ou=System Users,dc=support,dc=mariadb,dc=com
objectClass: top
objectClass: account
objectClass: posixAccount
objectClass: shadowAccount
cn: dba
uid: dba
uidNumber: 16863
gidNumber: 100
homeDirectory: /home/dba
loginShell: /bin/bash
gecos: dba
userPassword: {crypt}x
shadowLastChange: -1
shadowMax: -1
shadowWarning: 0
EOF
ldapmodify -a -x -D cn=Manager,dc=support,dc=mariadb,dc=com -W -f ~/createSystemUsers.ldif
```

Setting up the MariaDB Server

At this point, we can move onto setting up the MariaDB Server.

Installing LDAP and PAM Libraries

First, we need to make sure that the LDAP and PAM libraries are installed.

On RHEL, CentOS, and other similar Linux distributions that use [RPM packages](#), we need to install the following packages:

```
sudo yum install openldap-clients nss-pam-ldapd pam pam-devel
```

Configuring LDAP

Next, let's configure LDAP on the system. We can use [authconfig](#) for this:

```
sudo authconfig --enableldap \
  --enableldapauth \
  --ldapservers="ldap://172.30.0.238:3306" \
  --ldapbasedn="dc=support,dc=mariadb,dc=com" \
  --enablemkhomedir \
  --update
```

Be sure to replace `--ldapservers` and `--ldapbasedn` with values that are relevant for your environment.

Installing the `pam_user_map` PAM Module

The following steps apply to MariaDB Server in versions 10.2.32.7, 10.3.23., 10.4.13.6, 10.5.2 and earlier. In later releases, the `pam_user_map` PAM module is now included in the base install.

Next, let's [install the `pam_user_map` PAM module](#).

Before the module can be compiled from source, we may need to install some dependencies.

On RHEL, CentOS, and other similar Linux distributions that use [RPM packages](#), we need to install `gcc` and `pam-devel`:

```
sudo yum install gcc pam-devel
```

On Debian, Ubuntu, and other similar Linux distributions that use [DEB packages](#), we need to install `gcc` and `libpam0g-dev`:

```
sudo apt-get install gcc libpam0g-dev
```

And then we can build and install the library with the following:

```
wget https://raw.githubusercontent.com/MariaDB/server/10.4/plugin/auth_pam/mapper/pam_user_map.c
gcc pam_user_map.c -shared -lpam -fPIC -o pam_user_map.so
sudo install --mode=0755 pam_user_map.so /lib64/security/
```

Configuring the `pam_user_map` PAM Module

Next, let's [configure the `pam_user_map` PAM module](#) based on our hypothetical requirements.

The configuration file for the `pam_user_map` PAM module is `/etc/security/user_map.conf`. Based on our hypothetical requirements, ours would look like:

```
foo: bar
@dba:dba
```

Installing the PAM Authentication Plugin

Next, let's [install the `pam` authentication plugin](#).

Log into the MariaDB Server and execute the following:

```
INSTALL SONAME 'auth_pam';
```

Configuring the PAM Service

Next, let's [configure the PAM service](#). We will call our service `mariadb`, so our PAM service configuration file will be located at `/etc/pam.d/mariadb` on most systems.

Configuring PAM to Allow Only LDAP Authentication

Since we are only doing LDAP authentication with the [pam_ldap](#) PAM module and group mapping with the `pam_user_map` PAM module, our configuration file would look like this:

```
auth required pam_ldap.so
auth required pam_user_map.so
account required pam_ldap.so
```

Configuring PAM to Allow LDAP and Local Unix Authentication

If we want to allow authentication from LDAP users **and** from local Unix users through [pam_unix](#), while giving priority to the local users, then we could do this instead:

```
auth [success=1 new_authtok_reqd=1 default=ignore] pam_unix.so audit
auth required pam_ldap.so try_first_pass
auth required pam_user_map.so
account sufficient pam_unix.so audit
account required pam_ldap.so
```

Configuring the pam_unix PAM Module

If you also want to allow authentication from local Unix users, the `pam_unix` PAM module adds [some additional configuration steps](#) on a lot of systems. We basically have to give the user that runs `mysqld` access to `/etc/shadow`.

If the `mysql` user is running `mysqld`, then we can do that by executing the following:

```
sudo groupadd shadow
sudo usermod -a -G shadow mysql
sudo chown root:shadow /etc/shadow
sudo chmod g+r /etc/shadow
```

The [server needs to be restarted](#) for this change to take affect.

Creating MariaDB Users

Next, let's [create the MariaDB users](#). Remember that our PAM service is called `mariadb`.

First, let's create the MariaDB user for the user mapping: `foo: bar`

That means that we need to create a `bar` user:

```
CREATE USER 'bar'@'%' IDENTIFIED BY 'strongpassword';
GRANT ALL PRIVILEGES ON *.* TO 'bar'@'%' ;
```

And then let's create the MariaDB user for the group mapping: `@dba: dba`

That means that we need to create a `dba` user:

```
CREATE USER 'dba'@'%' IDENTIFIED BY 'strongpassword';
GRANT ALL PRIVILEGES ON *.* TO 'dba'@'%' ;
```

And then to allow for the user and group mapping, we need to [create an anonymous user that authenticates with the pam authentication plugin](#) that is also able to `PROXY` as the `bar` and `dba` users. Before we can create the proxy user, we might need to [clean up some defaults](#):

```
DELETE FROM mysql.db WHERE User='' AND Host='%';
FLUSH PRIVILEGES;
```

And then let's create the anonymous proxy user:

```
CREATE USER ''@'%' IDENTIFIED VIA pam USING 'mariadb';
GRANT PROXY ON 'bar'@'%' TO ''@'%;
GRANT PROXY ON 'dba'@'%' TO ''@'%;
```

Testing our Configuration

Next, let's test out our configuration by [verifying that mapping is occurring](#). We can verify this by logging in as each of our users and comparing the return value of `USER()`, which is the original user name and the return value of `CURRENT_USER()`, which is the authenticated user name.

Testing LDAP Authentication

First, let's test out our `foo` user:

```

$ mysql -u foo -h 172.30.0.198
[mariadb] Password:
Welcome to the MariaDB monitor.  Commands end with ; or \g.
Your MariaDB connection id is 134
Server version: 10.3.10-MariaDB MariaDB Server

Copyright (c) 2000, 2018, Oracle, MariaDB Corporation Ab and others.

Type 'help;' or '\h' for help. Type '\c' to clear the current input statement.

MariaDB [(none)]> SELECT USER(), CURRENT_USER();
+-----+-----+
| USER() | CURRENT_USER() |
+-----+-----+
| [email protected] | bar@% |
+-----+-----+
1 row in set (0.000 sec)

```

We can verify that our `foo` LDAP user was properly mapped to the `bar` MariaDB user by looking at the return value of `CURRENT_USER()`.

Then let's test out our `gmontee` user in the `dba` group:

```

$ mysql -u gmontee -h 172.30.0.198
[mariadb] Password:
Welcome to the MariaDB monitor.  Commands end with ; or \g.
Your MariaDB connection id is 135
Server version: 10.3.10-MariaDB MariaDB Server

Copyright (c) 2000, 2018, Oracle, MariaDB Corporation Ab and others.

Type 'help;' or '\h' for help. Type '\c' to clear the current input statement.

MariaDB [(none)]> SELECT USER(), CURRENT_USER();
+-----+-----+
| USER() | CURRENT_USER() |
+-----+-----+
| [email protected] | dba@% |
+-----+-----+
1 row in set (0.000 sec)

```

And then let's test out our `bstillman` user in the `dba` group:

```

$ mysql -u bstillman -h 172.30.0.198
[mariadb] Password:
Welcome to the MariaDB monitor.  Commands end with ; or \g.
Your MariaDB connection id is 136
Server version: 10.3.10-MariaDB MariaDB Server

Copyright (c) 2000, 2018, Oracle, MariaDB Corporation Ab and others.

Type 'help;' or '\h' for help. Type '\c' to clear the current input statement.

MariaDB [(none)]> SELECT USER(), CURRENT_USER();
+-----+-----+
| USER() | CURRENT_USER() |
+-----+-----+
| [email protected] | dba@% |
+-----+-----+
1 row in set (0.000 sec)

```

We can verify that our `gmontee` and `bstillman` LDAP users in the `dba` LDAP group were properly mapped to the `dba` MariaDB user by looking at the return values of `CURRENT_USER()`.

Testing Local Unix Authentication

If you chose the option that also allowed local Unix authentication, then let's test that out. Let's create a Unix user and give the user a password real quick:

```
sudo useradd alice
sudo passwd alice
```

And let's also map this user to `dba`:

```
@dba:dba
foo: bar
alice: dba
```

And we know that the existing anonymous user already has the `PROXY` privilege granted to the `dba` user, so this should just work without any other configuration. Let's test it out:

```
$ mysql -u alice -h 172.30.0.198
[mariadb] Password:
Welcome to the MariaDB monitor.  Commands end with ; or \g.
Your MariaDB connection id is 141
Server version: 10.3.10-MariaDB MariaDB Server

Copyright (c) 2000, 2018, Oracle, MariaDB Corporation Ab and others.

Type 'help;' or '\h' for help. Type '\c' to clear the current input statement.

MariaDB [(none)]> SELECT USER(), CURRENT_USER();
+-----+-----+
| USER() | CURRENT_USER() |
+-----+-----+
| [email protected] | dba@% |
+-----+-----+
1 row in set (0.000 sec)
```

We can verify that our `alice` Unix user was properly mapped to the `dba` MariaDB user by looking at the return values of `CURRENT_USER()`.

5.4.6.7 Authentication Plugin - Unix Socket

In [MariaDB 10.4.3](#) and later, the `unix_socket` authentication plugin is installed by default, and it is used by the `'root'@'localhost'` user account by default. See [Authentication from MariaDB 10.4](#) for more information.

The `unix_socket` authentication plugin allows the user to use operating system credentials when connecting to MariaDB via the local Unix socket file. This Unix socket file is defined by the `socket` system variable.

The `unix_socket` authentication plugin works by calling the `getsockopt` system call with the `SO_PEERCREC` socket option, which allows it to retrieve the `uid` of the process that is connected to the socket. It is then able to get the user name associated with that `uid`. Once it has the user name, it will authenticate the connecting user as the MariaDB account that has the same user name.

The `unix_socket` authentication plugin is not suited to multiple Unix users accessing a single MariaDB user account.

Security

A `unix_socket` authentication plugin is a passwordless security mechanism. Its security is in the strength of the access to the Unix user rather than the complexity and the secrecy of the password. As the security is different from passwords, the strengths and weaknesses need to be considered, and these aren't the same in every installation.

Strengths

- Access is limited to the Unix user so, for example, a `www-data` user cannot access `root` with the `unix_socket` authentication plugin.
- There is no password to brute force.
- There is no password that can be accidentally exposed by user accident, poor security on backups, or poor security on passwords in configuration files.
- Default Unix user security is usually strong on preventing remote access and password brute force attempts.

Weaknesses

The strength of a `unix_socket` authentication plugin is effectively the strength of the security of the Unix users on the system. The Unix user default installation in most cases is sufficiently secure, however, business requirements or unskilled management may expose risks. The following is a non-exhaustive list of potential Unix user security issues that may arise.

- Common access areas without screen locks, where an unauthorized user accesses the logged in Unix user of an authorized user.
- Extensive sudo access grants that provide users with access to execute commands of a different Unix user.
- Scripts writable by Unix users other than the Unix user that are executed (cron or directly) by the unix user.
- Web pages that are susceptible to command injection, where the Unix user running the web page has elevated privileges in the database that weren't intended to be used.
- Poor Unix user password practices including weak user passwords, password exposure and password reuse accompanied by an access vulnerability/mechanism of an unauthorized user to exploit this weakness.
- Weak remote access mechanisms and network file system privileges.
- Poor user security behavior including running untrusted scripts and software.

In some of these scenarios a database password may prevent these security exploits, however it will remove all the strengths of the `unix_socket` authentication plugin previously mentioned.

Disabling the Plugin

In [MariaDB 10.4.3](#) and later, the `unix_socket` authentication plugin is installed by default, so **if you do not want it to be available by default on those versions, then you will need to disable it.**

The `unix_socket` authentication plugin is also installed by default in **new installations** that use the `.deb` packages provided by Debian's default repositories in Debian 9 and later and Ubuntu's default repositories in Ubuntu 15.10 and later, so **if you do not want it to be available by default on those systems when those packages are used, then you will need to disable it.** See [Differences in MariaDB in Debian \(and Ubuntu\)](#) for more information.

The `unix_socket` authentication plugin can be disabled by starting the server with the `unix_socket` option set to `OFF`. This can be specified as a command-line argument to `mysqld` or it can be specified in a relevant server [option group](#) in an [option file](#). For example:

```
[mariadb]
...
unix_socket=OFF
```

As an alternative, the `unix_socket` option can also be set to `OFF` by pairing the option with the `disable` [option prefix](#). For example:

```
[mariadb]
...
disable_unix_socket
```

Installing the Plugin

In [MariaDB 10.4.3](#) and later, the `unix_socket` authentication plugin is installed by default, so **this step can be skipped on those versions.**

The `unix_socket` authentication plugin is also installed by default in **new installations** that use the `.deb` packages provided by Debian's default repositories in Debian 9 and later and Ubuntu's default repositories in Ubuntu 15.10 and later, so **this step can be skipped on those systems when those packages are used**. See [Differences in MariaDB in Debian \(and Ubuntu\)](#) for more information.

In other systems, although the plugin's shared library is distributed with MariaDB by default as `auth_socket.so`, the plugin is not actually installed by MariaDB by default. There are two methods that can be used to install the plugin with MariaDB.

The first method can be used to install the plugin without restarting the server. You can install the plugin dynamically by executing `INSTALL SONAME` or `INSTALL PLUGIN`. For example:

```
INSTALL SONAME 'auth_socket';
```

The second method can be used to tell the server to load the plugin when it starts up. The plugin can be installed this way by providing the `--plugin-load` or the `--plugin-load-add` options. This can be specified as a command-line argument to `mysqld` or it can be specified in a relevant server [option group](#) in an [option file](#). For example:

```
[mariadb]
...
plugin_load_add = auth_socket
```

Uninstalling the Plugin

You can uninstall the plugin dynamically by executing `UNINSTALL SONAME` or `UNINSTALL PLUGIN`. For example:

```
UNINSTALL SONAME 'auth_socket';
```

If you installed the plugin by providing the `--plugin-load` or the `--plugin-load-add` options in a relevant server [option group](#) in an [option file](#), then those options should be removed to prevent the plugin from being loaded the next time the server is restarted.

Creating Users

To create a user account via `CREATE USER`, specify the name of the plugin in the `IDENTIFIED VIA` clause. For example:

```
CREATE USER username@hostname IDENTIFIED VIA unix_socket;
```

If `SQL_MODE` does not have `NO_AUTO_CREATE_USER` set, then you can also create the user account via `GRANT`. For example:

```
GRANT SELECT ON db.* TO username@hostname IDENTIFIED VIA unix_socket;
```

MariaDB starting with 11.6

Prior to [MariaDB 11.6](#), the plugin only checked whether the OS socket user id matched the MariaDB user name, and ignored the authentication string.

From [MariaDB 11.6](#), the authentication string, if present, will be compared with the socket's user name, and authentication can proceed if there's a match. The `external_user` system variable will contain the OS user in this case.

For example, assuming an OS user of 'bob':

```
CREATE USER A identified via unix_socket as 'bob';
```

To connect:

```
mariadb -uA
```

or, to access the sock file directly, something like:

```
mariadb -uA -S /var/run/mysqld/mysqld.sock
```

Once connected:

```

select user(), @@external_user;
+-----+-----+
| user()      | @@external_user |
+-----+-----+
| A@localhost | bob              |
+-----+-----+

```

Switching to Password-based Authentication

Sometimes Unix socket authentication does not meet your needs, so it can be desirable to switch a user account back to password-based authentication. This can easily be done by telling MariaDB to use another [authentication plugin](#) for the account by executing the `ALTER USER` statement. The specific authentication plugin is specified with the `IDENTIFIED VIA` clause. For example, if you wanted to switch to the `mysql_native_password` authentication plugin, then you could execute:

```

ALTER USER root@localhost IDENTIFIED VIA mysql_native_password;
SET PASSWORD = PASSWORD('foo');

```

Note that if your operating system has scripts that require password-less access to MariaDB, then this may break those scripts. You may be able to fix that by setting a password in the `[client]` [option group](#) in your `/root/.my.cnf` [option file](#). For example:

```

[client]
password=foo

```

Client Authentication Plugins

The `unix_socket` authentication plugin does not require any specific client authentication plugins. It should work with all clients.

Support in Client Libraries

The `unix_socket` authentication plugin does not require any special support in client libraries. It should work with all client libraries.

Example

```

$ mysql -uroot
MariaDB []> CREATE USER serg IDENTIFIED VIA unix_socket;
MariaDB []> CREATE USER monty IDENTIFIED VIA unix_socket;
MariaDB []> quit
Bye
$ whoami
serg
$ mysql --user=serg
Welcome to the MariaDB monitor.  Commands end with ; or \g.
Your MariaDB connection id is 2
Server version: 5.2.0-MariaDB-alpha-debug Source distribution
MariaDB []> quit
Bye
$ mysql --user=monty
ERROR 1045 (28000): Access denied for user 'monty'@'localhost' (using password: NO)

```

In this example, a user `serg` is already logged into the operating system and has full shell access. He has already authenticated with the operating system and his MariaDB account is configured to use the `unix_socket` authentication plugin, so he does not need to authenticate again for the database. MariaDB accepts his operating system credentials and allows him to connect. However, any attempt to connect to the database as another operating system user will be denied.

Versions

Version	Status	Introduced
1.0	Stable	MariaDB 10.0.11 
1.0	Beta	MariaDB 5.2.0 

Options

`unix_socket`

- **Description:** Controls how the server should treat the plugin when the server starts up.
 - Valid values are:
 - `OFF` - Disables the plugin without removing it from the `mysql.plugin` table.
 - `ON` - Enables the plugin. If the plugin cannot be initialized, then the server will still continue starting up, but the plugin will be disabled.
 - `FORCE` - Enables the plugin. If the plugin cannot be initialized, then the server will fail to start with an error.
 - `FORCE_PLUS_PERMANENT` - Enables the plugin. If the plugin cannot be initialized, then the server will fail to start with an error. In addition, the plugin cannot be uninstalled with `UNINSTALL SONAME` or `UNINSTALL PLUGIN` while the server is running.
 - See [Plugin Overview: Configuring Plugin Activation at Server Startup](#) for more information.
- **Commandline:** `--unix-socket=value`
- **Data Type:** `enumerated`
- **Default Value:** `ON`
- **Valid Values:** `OFF`, `ON`, `FORCE`, `FORCE_PLUS_PERMANENT`

5.4.6.8 Authentication Plugin - Named Pipe

The `named_pipe` authentication plugin allows the user to use operating system credentials when connecting to MariaDB via named pipe on Windows. Named pipe connections are enabled by the `named_pipe` system variable.

The `named_pipe` authentication plugin works by using [named pipe impersonation](#)  and calling `GetUserName()` to retrieve the user name of the process that is connected to the named pipe. Once it has the user name, it authenticates the connecting user as the MariaDB account that has the same user name.

Contents

1. [Installing the Plugin](#)
2. [Uninstalling the Plugin](#)
3. [Creating Users](#)
4. [Client Authentication Plugins](#)
5. [Support in Client Libraries](#)
6. [Example](#)
7. [Versions](#)
8. [Options](#)
 1. [named_pipe](#)

Installing the Plugin

Although the plugin's shared library is distributed with MariaDB by default, the plugin is not actually installed by MariaDB by default. There are two methods that can be used to install the plugin with MariaDB.

The first method can be used to install the plugin without restarting the server. You can install the plugin dynamically by executing `INSTALL SONAME` or `INSTALL PLUGIN`. For example:

```
INSTALL SONAME 'auth_named_pipe';
```

The second method can be used to tell the server to load the plugin when it starts up. The plugin can be installed this way by providing the `--plugin-load` or the `--plugin-load-add` options. This can be specified as a command-line argument to `mysqld` or it can be specified in a relevant server [option group](#) in an [option file](#). For example:

```
[mariadb]
...
plugin_load_add = auth_named_pipe
```

Uninstalling the Plugin

You can uninstall the plugin dynamically by executing `UNINSTALL SONAME` or `UNINSTALL PLUGIN`. For example:

```
UNINSTALL SONAME 'auth_named_pipe';
```

If you installed the plugin by providing the `--plugin-load` or the `--plugin-load-add` options in a relevant server [option group](#) in an [option file](#), then those options should be removed to prevent the plugin from being loaded the next time the server is restarted.

Creating Users

To create a user account via `CREATE USER`, specify the name of the plugin in the `IDENTIFIED VIA` clause. For example:

```
CREATE USER username@hostname IDENTIFIED VIA named_pipe;
```

If `SQL_MODE` does not have `NO_AUTO_CREATE_USER` set, then you can also create the user account via `GRANT`. For example:

```
GRANT SELECT ON db.* TO username@hostname IDENTIFIED VIA named_pipe;
```

Client Authentication Plugins

The `named_pipe` authentication plugin does not require any specific client authentication plugins. It should work with all clients.

Support in Client Libraries

The `named_pipe` authentication plugin does not require any special support in client libraries. It should work with all client libraries.

Example

```
CREATE USER wlad IDENTIFIED VIA named_pipe;
CREATE USER monty IDENTIFIED VIA named_pipe;
quit

C:\>echo %USERNAME%
wlad

C:\> mysql --user=wlad --protocol=PIPE
Welcome to the MariaDB monitor.  Commands end with ; or \g.
Your MariaDB connection id is 4
Server version: 10.1.12-MariaDB-debug Source distribution

Copyright (c) 2000, 2015, Oracle, MariaDB Corporation Ab and others.

Type 'help;' or '\h' for help. Type '\c' to clear the current input statement.

MariaDB [(none)]> quit
Bye

C:\> mysql --user=monty --protocol=PIPE
ERROR 1698 (28000): Access denied for user 'monty'@'localhost'
```

In this example, a user `wlad` is already logged into the system. Because he has identified himself to the operating system, he does not need to do it again for the database — MariaDB trusts the operating system credentials. However, he cannot connect to the database as another user.

Versions

Version	Status	Introduced
1.0	Stable	MariaDB 10.1.11

Options

`named_pipe`

- **Description:** Controls how the server should treat the plugin when the server starts up.
 - Valid values are:
 - `OFF` - Disables the plugin without removing it from the `mysql.plugins` table.
 - `ON` - Enables the plugin. If the plugin cannot be initialized, then the server will still continue starting up, but the plugin will be disabled.
 - `FORCE` - Enables the plugin. If the plugin cannot be initialized, then the server will fail to start with an error.
 - `FORCE_PLUS_PERMANENT` - Enables the plugin. If the plugin cannot be initialized, then the server will fail to start with an error. In addition, the plugin cannot be uninstalled with `UNINSTALL SONAME` or `UNINSTALL PLUGIN` while the server is running.
 - See [Plugin Overview: Configuring Plugin Activation at Server Startup](#) for more information.
 - There may be ambiguity between this option and the `named_pipe` system variable. See [MDEV-19625](#) about that.
- **Commandline:** `--named-pipe=value`

5.4.6.9 Authentication Plugin - SHA-256

Contents

1. [Support in MariaDB Server](#)
2. [Support in Client Libraries](#)
 1. [Client Authentication Plugins](#)
 1. [sha256_password](#)
 2. [caching_sha256_password](#)
 2. [Using the Plugin with MariaDB Connector/C](#)
 3. [Using Plugins with MariaDB Connector/ODBC](#)
 4. [Using Plugins with MariaDB Connector/J](#)
 5. [Using Plugins with MariaDB Connector/Node.js](#)

MySQL 5.6 added support for the [sha256_password](#) authentication plugin, and MySQL 8.0 also added support for the [caching_sha2_password](#) authentication plugin.

The `caching_sha2_password` plugin is now the default authentication plugin in MySQL 8.0.4 and above, based on the value of the `default_authentication_plugin` system variable.

Support in MariaDB Server

MariaDB Server does not currently support either the [sha256_password](#) or the [caching_sha2_password](#) authentication plugins. See [MDEV-9804](#) for more information. The majority of this article is about how to use MariaDB clients and connectors to connect to a MySQL server!

MariaDB Server does not support either of these authentication plugins. This is mainly because:

- To use the protocol, one has to distribute the server's public key to all MariaDB users, which can be cumbersome and impractical.
- The server gets the password in clear text which can cause problems if the user is convinced to connect to a malicious server.

If you are replacing a MySQL instance, that is using SHA-256 authentication, with MariaDB, you should start by changing SHA-256 authentication to use `mysql_native_authentication`.

```
ALTER USER user_name IDENTIFIED WITH mysql_native_password BY 'new_password'
```

Support in Client Libraries

Client Authentication Plugins

For clients that use the [MariaDB Connector/C](#) library, MariaDB provides two client authentication plugins that are compatible with MySQL's SHA-256 authentication plugins:

- `sha256_password`
- `caching_sha256_password`

When connecting with a [client or utility](#) to a server as a user account that authenticates with the `sha256_password` or `caching_sha256_password` authentication plugin, you may need to tell the client where to find the relevant client authentication plugin by specifying the `--plugin-dir` option. For example:

```
mysql --plugin-dir=/usr/local/mysql/lib64/mysql/plugin --user=alice
```

For clients that use MariaDB's `libmysqlclient` library instead of [MariaDB Connector/C](#), these client authentication plugins are not supported.

`sha256_password`

The `sha256_password` client authentication plugin is compatible with MySQL's `sha256_password` authentication plugin, which was added in MySQL 5.6.

`caching_sha256_password`

The `caching_sha256_password` client authentication plugin is compatible with MySQL's `caching_sha2_password` authentication plugin, which was added in MySQL 8.0.

The `caching_sha2_password` plugin is now the default authentication plugin in MySQL 8.0.4 and above, based on the value of the `default_authentication_plugin` system variable.

Using the Plugin with MariaDB Connector/C

[MariaDB Connector/C](#) supports `sha256_password` and `caching_sha2_password` authentication using the [client authentication plugins](#) mentioned in the previous section.

It has supported the `sha256_password` client authentication plugin since MariaDB Connector/C 3.0.2. See [CONC-229](#) for more information.

It has supported the `caching_sha256_password` client authentication plugin since MariaDB Connector/C 3.0.8 and MariaDB Connector/C 3.1.0. See [CONC-312](#) for more information.

Using Plugins with MariaDB Connector/ODBC

[MariaDB Connector/ODBC](#) supports `sha256_password` and `caching_sha2_password` authentication using the [client authentication plugins](#) mentioned in the previous section.

It has supported `sha256_password` and `caching_sha2_password` authentication since MariaDB Connector/ODBC 3.1.4. See [ODBC-241](#) for more information.

Using Plugins with MariaDB Connector/J

[MariaDB Connector/J](#) supports `sha256_password` and `caching_sha2_password` authentication since MariaDB Connector/J 2.5.0. See [CONJ-327](#) and [CONJ-663](#) for more information.

note: The version 3.x being a rewrite of the connector, only `caching_sha2_password` is implemented, since `sha256_password` is only implemented on EOL version.

Using Plugins with MariaDB Connector/Node.js

5.4.6.10 Authentication Plugin - PARSEC

MariaDB starting with [11.6](#)

The PARSEC Authentication Plugin was introduced in [MariaDB 11.6](#). It is intended to be the default in a future release.

The PARSEC (Password Authentication using Response Signed with Elliptic Curve) authentication plugin uses salted passwords, key derivation, extensible password storage format, and both server- and client-side scrambles.

It signs the response with ed25519, but it uses stock unmodified ed25519 as provided by OpenSSL/WolfSSL/GnuTLS.

Description

- the KDF function is pbkdf2 (supported by everything, including [windows native](#), Java, javascript, PHP, .NET)
- parameters to the pbkdf2 are stored in with authentication plugin data : hash function (SHA512,SHA256), iteration count, salt, key_length, together with derived key = PBKDF2(func, password, salt, iteration_count, key_length)
- number of iterations is a power of 2, greater than 9
- the algorithm is ed25519, "hash" is the public key generated using ed25519 from the PBKDF2(password)

The authentication string, stored by the server, is

```
concat('P', conv(log2(iterations)-10, 10, 62), ':', base64(salt), ':', base64(hash))
```

for example P0:WW9sXaaL/o:vubFBzIrapbfHct1/J72dnUryz5VS71A6XHH8sIx4TI

- it consists of colon-separated fields
- first field is 'P' (denotes KDF algorithm = PBKDF2) and the number of iterations, '0' means 1024, '1' means 2048, etc
- then salt
- then the password hash

first two fields together are called below *ext-salt*, extended salt.

Login Process, Packet Exchange

1. Server sends an [Authentication Switch Request](#) with a 32-byte random scramble
2. Client sends an empty packet to the server to request the [ext-salt](#)
3. Server sends the [ext-salt](#) to the client
4. Client sends the random 32-byte scramble, and the concat(server scramble, client scramble) ed25519-signed by a secret key generated from the PBKDF2(password, ext-salt)
5. Server replies with "ok" or "access denied"

Installing

```
install soname 'auth_parsec';
```

Example

```
create user test1@'%' identified via parsec using PASSWORD('pwd');
```

5.4.7 Password Validation Plugins

Simple Password Check Plugin

This plugin checks that passwords meet certain simple criteria.

Cracklib Password Check Plugin

This plugin checks password strength using the CrackLib library.

Password Reuse Check Plugin

Plugin for preventing password reuse.

Password Validation Plugin API

Allows the creation of password validation plugins to check user passwords as they are set.

password_reuse_check_interval

Retention period for password history.

5.4.7.1 Simple Password Check Plugin

`simple_password_check` is a [password validation](#) plugin. It can check whether a password contains at least a certain number of characters of a specific type. When first installed, a password is required to be at least eight characters, and requires at least one digit, one uppercase character, one lowercase character, and one character that is neither a digit nor a letter.

Note that passwords can be directly set as a hash, bypassing the password validation, if the [strict_password_validation](#) variable is `OFF` (it is `ON` by default).

Contents

1. [Installing the Plugin](#)
2. [Uninstalling the Plugin](#)
3. [Example](#)
4. [Known Issues](#)
 1. [Issues with PAM Authentication Plugin](#)
5. [Versions](#)
6. [System Variables](#)
 1. [simple_password_check_digits](#)
 2. [simple_password_check_letters_same_case](#)
 3. [simple_password_check_minimal_length](#)
 4. [simple_password_check_other_characters](#)
7. [Options](#)
 1. [simple_password_check](#)

Installing the Plugin

Although the plugin's shared library is distributed with MariaDB by default, the plugin is not actually installed by MariaDB by default. There are two methods that can be used to install the plugin with MariaDB.

The first method can be used to install the plugin without restarting the server. You can install the plugin dynamically by executing `INSTALL SONAME` or `INSTALL PLUGIN`. For example:

```
INSTALL SONAME 'simple_password_check';
```

The second method can be used to tell the server to load the plugin when it starts up. The plugin can be installed this way by providing the `--plugin-load` or the `--plugin-load-add` options. This can be specified as a command-line argument to `mysqld` or it can be specified in a relevant server [option group](#) in an [option file](#). For example:

```
[mariadb]
...
plugin_load_add = simple_password_check
```

Uninstalling the Plugin

You can uninstall the plugin dynamically by executing `UNINSTALL SONAME` or `UNINSTALL PLUGIN`. For example:

```
UNINSTALL SONAME 'simple_password_check';
```

If you installed the plugin by providing the `--plugin-load` or the `--plugin-load-add` options in a relevant server [option group](#) in an [option file](#), then those options should be removed to prevent the plugin from being loaded the next time the server is restarted.

Example

When creating a new password, if the criteria are not met, the following error is returned:

```
SET PASSWORD FOR 'bob'@'%'.loc.gov' = PASSWORD('abc');
ERROR 1819 (HY000): Your password does not satisfy the current policy requirements
```

Known Issues

Issues with PAM Authentication Plugin

Prior to [MariaDB 10.4.0](#), all [password validation plugins](#) are incompatible with the [pam](#) authentication plugin. See [Authentication Plugin - PAM: Conflicts with Password Validation](#) for more information.

Versions

Version	Status	Introduced
1.0	Stable	MariaDB 10.1.18
1.0	Gamma	MariaDB 10.1.13
1.0	Beta	MariaDB 10.1.11
1.0	Alpha	MariaDB 10.1.2

System Variables

`simple_password_check_digits`

- **Description:** A password must contain at least this many digits.
- **Commandline:** `--simple-password-check-digits=#`
- **Scope:** Global
- **Dynamic:** Yes
- **Data Type:** `numeric`
- **Default Value:** 1
- **Range:** 0 to 1000

`simple_password_check_letters_same_case`

- **Description:** A password must contain at least this many upper-case and this many lower-case letters.
- **Commandline:** `--simple-password-check-letters-same-case=#`
- **Scope:** Global
- **Dynamic:** Yes
- **Data Type:** `numeric`
- **Default Value:** 1
- **Range:** 0 to 1000

`simple_password_check_minimal_length`

- **Description:** A password must contain at least this many characters.
- **Commandline:** `--simple-password-check-minimal-length=#`
- **Scope:** Global
- **Dynamic:** Yes
- **Data Type:** `numeric`
- **Default Value:** 8
- **Range:** 0 to 1000

`simple_password_check_other_characters`

- **Description:** A password must contain at least this many characters that are neither digits nor letters.
- **Commandline:** `--simple-password-check-other-characters=#`
- **Scope:** Global
- **Dynamic:** Yes

- **Data Type:** numeric
- **Default Value:** 1
- **Range:** 0 to 1000

Options

`simple_password_check`

- **Description:** Controls how the server should treat the plugin when the server starts up.
 - Valid values are:
 - `OFF` - Disables the plugin without removing it from the `mysql.plugins` table.
 - `ON` - Enables the plugin. If the plugin cannot be initialized, then the server will still continue starting up, but the plugin will be disabled.
 - `FORCE` - Enables the plugin. If the plugin cannot be initialized, then the server will fail to start with an error.
 - `FORCE_PLUS_PERMANENT` - Enables the plugin. If the plugin cannot be initialized, then the server will fail to start with an error. In addition, the plugin cannot be uninstalled with `UNINSTALL SONAME` or `UNINSTALL PLUGIN` while the server is running.
 - See [Plugin Overview: Configuring Plugin Activation at Server Startup](#) for more information.
- **Commandline:** `--simple-password-check=value`
- **Data Type:** enumerated
- **Default Value:** `ON`
- **Valid Values:** `OFF`, `ON`, `FORCE`, `FORCE_PLUS_PERMANENT`

5.4.7.2 Cracklib Password Check Plugin

Contents

1. [Installing the Plugin's Package](#)
 1. [Installing on Linux](#)
 1. [Installing with a Package Manager](#)
 1. [Installing with yum/dnf](#)
 2. [Installing with apt-get](#)
 3. [Installing with zypper](#)
 2. [Installing the Plugin](#)

 5. [Example](#)
 6. [Known Issues](#)
 1. [Issues with PAM Authentication Plugin](#)
 2. [SELinux](#)
 7. [Versions](#)
 8. [System Variables](#)
 1. [cracklib_password_check_dictionary](#)
 9. [Options](#)
 1. [cracklib_password_check](#)

`cracklib_password_check` is a [password validation](#) plugin. It uses the [CrackLib](#) library to check the strength of new passwords. CrackLib is installed by default in many Linux distributions, since the system's [Pluggable Authentication Module \(PAM\)](#) authentication framework is usually configured to check the strength of new passwords with the `pam_cracklib` PAM module.

Note that passwords can be directly set as a hash, bypassing the password validation, if the `strict_password_validation` variable is `OFF` (it is `ON` by default).

The plugin requires at least cracklib 2.9.0, so it is not available on Debian/Ubuntu builds before Debian 8 Jessie/Ubuntu 14.04 Trusty, RedHat Enterprise Linux / CentOS 6.

Installing the Plugin's Package

The `cracklib_password_check` plugin's shared library is included in MariaDB packages as the `cracklib_password_check.so` or `cracklib_password_check.dll` shared library on systems where it can be built.

Installing on Linux

The `cracklib_password_check` plugin is included in `systemd` [binary tarballs](#) on Linux, but not in the older generic and `glibc_214` tarballs.

Installing with a Package Manager

The `cracklib_password_check` plugin can also be installed via a package manager on Linux. In order to do so, your system needs to be configured to install from one of the MariaDB repositories.

You can configure your package manager to install it from MariaDB Corporation's MariaDB Package Repository by using the [MariaDB Package Repository setup script](#).

You can also configure your package manager to install it from MariaDB Foundation's MariaDB Repository by using the [MariaDB Repository Configuration Tool](#).

Installing with yum/dnf

On RHEL, CentOS, Fedora, and other similar Linux distributions, it is highly recommended to install the relevant [RPM package](#) from MariaDB's repository using `yum` or `dnf`. Starting with RHEL 8 and Fedora 22, `yum` has been replaced by `dnf`, which is the next major version of `yum`. However, `yum` commands still work on many systems that use `dnf`. For example:

```
sudo yum install MariaDB-cracklib-password-check
```

Installing with apt-get

On Debian, Ubuntu, and other similar Linux distributions, it is highly recommended to install the relevant [DEB package](#) from MariaDB's repository using `apt-get`. For example:

```
sudo apt-get install mariadb-plugin-cracklib-password-check
```

Installing with zypper

On SLES, OpenSUSE, and other similar Linux distributions, it is highly recommended to install the relevant [RPM package](#) from MariaDB's repository using `zypper`. For example:

```
sudo zypper install MariaDB-cracklib-password-check
```

Installing the Plugin

Once the shared library is in place, the plugin is not actually installed by MariaDB by default. There are two methods that can be used to install the plugin with MariaDB.

The first method can be used to install the plugin without restarting the server. You can install the plugin dynamically by executing `INSTALL SONAME` or `INSTALL PLUGIN`. For example:

```
INSTALL SONAME 'cracklib_password_check';
```

The second method can be used to tell the server to load the plugin when it starts up. The plugin can be installed this way by providing the `--plugin-load` or the `--plugin-load-add` options. This can be specified as a command-line argument to `mysqld` or it can be specified in a relevant server [option group](#) in an [option file](#). For example:

```
[mariadb]
...
plugin_load_add = cracklib_password_check
```

Uninstalling the Plugin

You can uninstall the plugin dynamically by executing `UNINSTALL SONAME` or `UNINSTALL PLUGIN`. For example:

```
UNINSTALL SONAME 'cracklib_password_check';
```

If you installed the plugin by providing the `--plugin-load` or the `--plugin-load-add` options in a relevant server

[option group](#) in an [option file](#), then those options should be removed to prevent the plugin from being loaded the next time the server is restarted.

Viewing CrackLib Errors

If password validation fails, then the original CrackLib error message can be viewed by executing `SHOW WARNINGS`.

Example

When creating a new password, if the criteria are not met, the following error is returned:

```
SET PASSWORD FOR 'bob'@'%'.loc.gov' = PASSWORD('abc');
ERROR 1819 (HY000): Your password does not satisfy the current policy requirements
```

Known Issues

Issues with PAM Authentication Plugin

Prior to [MariaDB 10.4.0](#), all [password validation plugins](#) are incompatible with the [pam](#) authentication plugin. See [Authentication Plugin - PAM: Conflicts with Password Validation](#) for more information.

SELinux

When using the standard SELinux policy with the `mode` set to `enforcing`, `mysqld` does not have access to `/usr/share/cracklib`, and you may see the following error when attempting to use the `cracklib_password_check` plugin:

```
CREATE USER `user`@`hostname` IDENTIFIED BY 's0mePwD123.';
ERROR 1819 (HY000): Your password does not satisfy the current policy requirements

SHOW WARNINGS;
+-----+-----+-----+
| Level  | Code | Message                                                                 |
+-----+-----+-----+
| Warning| 1819 | cracklib: error loading dictionary                                     |
| Error  | 1819 | Your password does not satisfy the current policy requirements       |
| Error  | 1396 | Operation CREATE USER failed for 'user'@'hostname'                   |
+-----+-----+-----+
```

And the SELinux `audit.log` will contain errors like the following:

```
type=AVC msg=audit(1548371977.821:66): avc: denied { read } for pid=3537 comm="mysqld"
name="pw_dict.pwd" dev="xvda2" ino=564747 scontext=system_u:system_r:mysqld_t:s0
tcontext=system_u:object_r:crack_db_t:s0 tclass=file
type=SYSCALL msg=audit(1548371977.821:66): arch=c000003e syscall=2 success=no exit=-13
a0=7fdd2a674580 a1=0 a2=1b6 a3=1b items=0 ppid=1 pid=3537 auid=4294967295 uid=995 gid=992
euid=995 suid=995 fsuid=995 egid=992 sgid=992 fsgid=992 tty=(none) ses=4294967295 comm="mysqld"
exe="/usr/sbin/mysqld" subj=system_u:system_r:mysqld_t:s0 key=(null)
```

This can be fixed by creating an SELinux policy that allows `mysqld` to load the CrackLib dictionary. For example:

```

cd /usr/share/mysql/policy/selinux/
tee ./mariadb-plugin-cracklib-password-check.te <<EOF

module mariadb-plugin-cracklib-password-check 1.0;

require {
    type mysqld_t;
    type crack_db_t;
    class file { execute setattr read create getattr execute_no_trans write ioctl open
append unlink };
    class dir { write search getattr add_name read remove_name open };
}

allow mysqld_t crack_db_t:dir { search read open };
allow mysqld_t crack_db_t:file { getattr read open };
EOF
sudo yum install selinux-policy-devel
make -f /usr/share/selinux/devel/Makefile mariadb-plugin-cracklib-password-check.pp
sudo semodule -i mariadb-plugin-cracklib-password-check.pp

```

See [MDEV-18374](#) for more information.

Versions

Version	Status	Introduced
1.0	Stable	MariaDB 10.1.18
1.0	Gamma	MariaDB 10.1.13
1.0	Alpha	MariaDB 10.1.2

System Variables

`cracklib_password_check_dictionary`

- **Description:** Sets the path to the CrackLib dictionary. If not set, the default CrackLib dictionary path is used. The parameter expects the base name of a cracklib dictionary (a set of three files with endings `.hwm`, `.pwd`, `.pwi`), not a directory path.
- **Commandline:** `--cracklib-password-check-dictionary=value`
- **Scope:** Global
- **Dynamic:** No
- **Data Type:** `string`
- **Default Value:** Depends on the system. Often `/usr/share/cracklib/pw_dict`

Options

`cracklib_password_check`

- **Description:** Controls how the server should treat the plugin when the server starts up.
 - Valid values are:
 - `OFF` - Disables the plugin without removing it from the `mysql.plugins` table.
 - `ON` - Enables the plugin. If the plugin cannot be initialized, then the server will still continue starting up, but the plugin will be disabled.
 - `FORCE` - Enables the plugin. If the plugin cannot be initialized, then the server will fail to start with an error.
 - `FORCE_PLUS_PERMANENT` - Enables the plugin. If the plugin cannot be initialized, then the server will fail to start with an error. In addition, the plugin cannot be uninstalled with `UNINSTALL SONAME` or `UNINSTALL PLUGIN` while the server is running.
 - See [Plugin Overview: Configuring Plugin Activation at Server Startup](#) for more information.
- **Commandline:** `--cracklib-password-check=value`
- **Data Type:** `enumerated`
- **Default Value:** `ON`
- **Valid Values:** `OFF`, `ON`, `FORCE`, `FORCE_PLUS_PERMANENT`

5.4.7.3 Password Reuse Check Plugin

MariaDB starting with [10.7](#)

`password_reuse_check` is a [password validation](#) plugin introduced in [MariaDB 10.7.0](#).

Contents

1. [Description](#)
 1. [Installing the Plugin](#)
 2. [Uninstalling the Plugin](#)
2. [Example](#)
3. [Versions](#)

Description

The plugin is used to prevent a user from reusing a password, which can be a requirement in some security policies. The `password_reuse_check_interval` system variable determines the retention period, in days, for a password. By default this is zero, meaning unlimited retention. Old passwords are stored in the `mysql.password_reuse_check_history` table.

Note that passwords can be directly set as a hash, bypassing the password validation, if the `strict_password_validation` variable is `OFF` (it is `ON` by default).

Installing the Plugin

Although the plugin's shared library is distributed with MariaDB by default, the plugin is not actually installed by MariaDB by default.

You can install the plugin dynamically, without restarting the server, by executing `INSTALL SONAME` or `INSTALL PLUGIN`. For example:

```
INSTALL SONAME 'password_reuse_check';
```

The second method can be used to tell the server to load the plugin when it starts up. The plugin can be installed this way by providing the `--plugin-load` or the `--plugin-load-add` options. This can be specified as a command-line argument to `mysqld` or it can be specified in a relevant server `option group` in an `option file`. For example:

```
[mariadb]
...
plugin_load_add = password_reuse_check
```

Uninstalling the Plugin

You can uninstall the plugin dynamically by executing `UNINSTALL SONAME` or `UNINSTALL PLUGIN`. For example:

```
UNINSTALL SONAME 'password_reuse_check';
```

If you installed the plugin by providing the `--plugin-load` or the `--plugin-load-add` options in a relevant server `option group` in an `option file`, then those options should be removed to prevent the plugin from being loaded the next time the server is restarted.

Example

```

INSTALL SONAME 'password_reuse_check';

GRANT SELECT ON *.* TO user1@localhost identified by 'pwd1';
Query OK, 0 rows affected (0.038 sec)

GRANT SELECT ON *.* TO user1@localhost identified by 'pwd1';
ERROR 1819 (HY000): Your password does not satisfy the current policy requirements

GRANT SELECT ON *.* TO user1@localhost identified by 'pwd2';
Query OK, 0 rows affected (0.003 sec)

GRANT SELECT ON *.* TO user1@localhost identified by 'pwd1';
ERROR 1819 (HY000): Your password does not satisfy the current policy requirements

```

Versions

Version	Status	Introduced
1.0	Alpha	MariaDB 10.7.0
1.0	Beta	MariaDB 10.7.2
1.0	Gamma	MariaDB 10.7.4
2.0	Stable	MariaDB 10.7.7 , MariaDB 10.8.7 , MariaDB 10.9.5 , MariaDB 10.10.2

The bump to version 2.0 required the change of the stored format to mitigate an implementation weakness ([MDEV-28838](#)) and as such the bump from 1.0 to 2.0 will invalidate previously saved password reuse protections.

5.4.7.4 Password Validation Plugin API

Contents

1. [SQL-Level Extensions](#)
 1. [Password-Changing Statements](#)
 1. [With Plain Text Password](#)
 2. [With Password Hash](#)
 2. [Examples](#)
 3. [Plugin API](#)

“Password validation” means ensuring that user passwords meet certain minimal security requirements. A dedicated plugin API allows the creation of password validation plugins that will check user passwords as they are set (in [SET PASSWORD](#) and [GRANT](#) statements) and either allow or reject them.

SQL-Level Extensions

MariaDB comes with three password validation plugins — the [simple_password_check](#) plugin, the [cracklib_password_check](#) plugin and the [password_reuse_check](#) plugin. They are not enabled by default; use [INSTALL SONAME](#) (or [INSTALL PLUGIN](#)) statement to install them.

When at least one password plugin is loaded, all new passwords will be validated and password-changing statements will fail if the password will not pass validation checks. Several password validation plugin can be loaded at the same time — in this case a password must pass **all** validation checks by **all** plugins.

Password-Changing Statements

One can use various SQL statements to change a user password:

With Plain Text Password

```

SET PASSWORD = PASSWORD('plain-text password');
SET PASSWORD FOR `user`@`host` = PASSWORD('plain-text password');
SET PASSWORD = OLD_PASSWORD('plain-text password');
SET PASSWORD FOR `user`@`host` = OLD_PASSWORD('plain-text password');
CREATE USER `user`@`host` IDENTIFIED BY 'plain-text password';
GRANT privileges TO `user`@`host` IDENTIFIED BY 'plain-text password';

```

These statements are subject to password validation. If at least one password validation plugin is loaded, plain-text passwords specified in these statements will be validated.

With Password Hash

```
SET PASSWORD = 'password hash';
SET PASSWORD FOR `user`@`host` = 'password hash';
CREATE USER `user`@`host` IDENTIFIED BY PASSWORD 'password hash';
CREATE USER `user`@`host` IDENTIFIED VIA mysql_native_password USING 'password hash';
CREATE USER `user`@`host` IDENTIFIED VIA mysql_old_password USING 'password hash';
GRANT privileges TO `user`@`host` IDENTIFIED BY PASSWORD 'password hash';
GRANT privileges TO `user`@`host` IDENTIFIED VIA mysql_native_password USING 'password hash';
GRANT privileges TO `user`@`host` IDENTIFIED VIA mysql_old_password USING 'password hash';
```

These statements can not possibly use password validation — there is nothing to validate, the original plain-text password is not available. MariaDB introduces a **strict password validation** mode — controlled by a [strict_password_validation](#) global server variable. If the strict password validation is enabled and at least one password validation plugin is loaded then these “unvalidatable” passwords will be rejected. Otherwise they will be accepted. By default a strict password validation is enabled (but note that it has no effect if no password validation plugin is loaded).

Examples

Failed password validation:

```
GRANT SELECT ON *.* to foobar IDENTIFIED BY 'raboof';
ERROR HY000: Your password does not satisfy the current policy requirements

SHOW WARNINGS;
+-----+-----+-----+-----+
| Level  | Code | Message                                     |      |
+-----+-----+-----+-----+
| Warning| 1819 | cracklib: it is based on your username     |      |
| Error  | 1819 | Your password does not satisfy the current |      |
|         |      | policy requirements                       |      |
+-----+-----+-----+-----+
```

Strict password validation:

```
GRANT SELECT ON *.* TO foo IDENTIFIED BY PASSWORD '2222222222222222';
ERROR HY000: The MariaDB server is running with the --strict-password-validation option so it cannot execute this statement
```

Plugin API

Password validation plugin API is very simple. A plugin must implement only one method — `validate_password()`. This method takes two arguments — user name and the plain-text password. And it returns 0 when the password has passed the validation and 1 otherwise,

See also `mysql/plugin_password_validation.h` and password validation plugins in `plugin/simple_password_check/` and `plugins/cracklib_password_check/`.

5.4.7.5 password_reuse_check_interval

The `password_reuse_check_interval` system variable is available when the [password_reuse_check](#) plugin is installed. It determines the retention period for the password history in days. Zero, the default, means passwords are never discarded.

- **Commandline:** `--password_reuse_check_interval=#`
- **Scope:** Global
- **Read-only:** No
- **Data Type:** numeric
- **Default Value:** 0
- **Range:** 0 to 36500

 - [Encryption Plugins without Key Rotation Support](#)
- [Encryption Plugin API](#)

MariaDB's [data-at-rest encryption](#) requires the use of a key management and encryption plugin. These plugins are responsible both for the management of encryption keys and for the actual encryption and decryption of data.

MariaDB supports the use of multiple encryption keys. Each encryption key uses a 32-bit integer as a key identifier. If the specific plugin supports key rotation, then encryption keys can also be rotated, which creates a new version of the encryption key.

Choosing an Encryption Key Management Solution

How MariaDB manages encryption keys depends on which encryption key management solution you choose. Currently, MariaDB has three options:

File Key Management Plugin

The File Key Management plugin that ships with MariaDB is a basic key management and encryption plugin that reads keys from a plain-text file. It can also serve as example and as a starting point when developing a key management plugin.

For more information, see [File Key Management Plugin](#).

AWS Key Management Plugin

The AWS Key Management plugin is a key management and encryption plugin that uses the Amazon Web Services (AWS) Key Management Service (KMS). The AWS Key Management plugin depends on the [AWS SDK for C++](#), which uses the [Apache License, Version 2.0](#). This license is not compatible with MariaDB Server's [GPL 2.0 license](#), so we are not able to distribute packages that contain the AWS Key Management plugin. Therefore, the only way to currently obtain the plugin is to install it from source.

For more information, see [AWS Key Management Plugin](#).

Eperi Key Management Plugin

The Eperi Key Management plugin is a key management and encryption plugin that uses the [eperi Gateway for Databases](#). The [eperi Gateway for Databases](#) stores encryption keys on the key server outside of the database server itself, which provides an extra level of security. The [eperi Gateway for Databases](#) also supports performing all data encryption operations on the key server as well, but this is optional.

For more information, see [Eperi Key Management Plugin](#).

Using Multiple Encryption Keys

Key management and encryption plugins support using multiple encryption keys. Each encryption key can be defined with a different 32-bit integer as a key identifier.

The support for multiple keys opens up some potential use cases. For example, let's say that a hypothetical key management and encryption plugin is configured to provide two encryption keys. One encryption key might be intended for "low security" tables. It could use short keys, which might not be rotated, and data could be encrypted with a fast encryption algorithm. Another encryption key might be intended for "high security" tables. It could use long keys, which are rotated often, and data could be encrypted with a slower, but more secure encryption algorithm. The user would specify the identifier of the key that they want to use for different tables, only using high level security where it's needed.

There are two encryption key identifiers that have special meanings in MariaDB. Encryption key `1` is intended for encrypting system data, such as InnoDB redo logs, binary logs, and so on. It must always exist when [data-at-rest encryption](#) is enabled. Encryption key `2` is intended for encrypting temporary data, such as temporary files and temporary tables. It is optional. If it doesn't exist, then MariaDB uses encryption key `1` for these purposes instead.

When [encrypting InnoDB tables](#), the key that is used to encrypt tables [can be changed](#).

When [encrypting Aria tables](#), the key that is used to encrypt tables [cannot currently be changed](#).

Key Rotation

Encryption key rotation is optional in MariaDB Server. Key rotation is only supported if the backend key management service (KMS) supports key rotation, and if the corresponding key management and encryption plugin for MariaDB also supports key rotation. When a key management and encryption plugin supports key rotation, users can opt to rotate one or more encryption keys, which creates a new version of each rotated encryption key.

Key rotation allows users to improve data security in the following ways:

- If the server is configured to automatically re-encrypt table data with the newer version of the encryption key after the key is rotated, then that prevents an encryption key from being used for long periods of time.
- If the server is configured to simultaneously encrypt table data with multiple versions of the encryption key after the key is rotated, then that prevents all data from being leaked if a single encryption key version is compromised.

The [InnoDB storage engine](#) has [background encryption threads](#) that can [automatically re-encrypt pages when key rotations occur](#).

The [Aria storage engine](#) does [not currently have a similar mechanism to re-encrypt pages in the background when key rotations occur](#).

Support for Key Rotation in Encryption Plugins

Encryption Plugins with Key Rotation Support

- The [AWS Key Management Service \(KMS\)](#) supports encryption key rotation, and the corresponding [AWS Key Management Plugin](#) also supports encryption key rotation.
- The [eperi Gateway for Databases](#) supports encryption key rotation, and the corresponding [Eperi Key Management Plugin](#) also supports encryption key rotation.

Encryption Plugins without Key Rotation Support

- The [File Key Management Plugin](#) does not support encryption key rotation, because it does not use a backend key management service (KMS).

Encryption Plugin API

New key management and encryption plugins can be developed using the [encryption plugin API](#).

5.4.8.2 File Key Management Encryption Plugin

MariaDB's [data-at-rest encryption](#) requires the use of a [key management and encryption plugin](#). These plugins are responsible both for the management of encryption keys and for the actual encryption and decryption of data.

MariaDB supports the use of [multiple encryption keys](#). Each encryption key uses a 32-bit integer as a key identifier. If the specific plugin supports [key rotation](#), then encryption keys can also be rotated, which creates a new version of the encryption key.

The File Key Management plugin that ships with MariaDB is a [key management and encryption plugin](#) that reads encryption keys from a plain-text file.

Overview

The File Key Management plugin is the easiest [key management and encryption plugin](#) to set up for users who want to use [data-at-rest encryption](#). Some of the plugin's primary features are:

- It reads encryption keys from a plain-text key file.
- As an extra protection mechanism, the plain-text key file can be encrypted.
- It supports multiple encryption keys.
- It does **not** support key rotation.
- It supports two different algorithms for encrypting data.

It can also serve as an example and as a starting point when developing a key management and encryption plugin with the [encryption plugin API](#).

Installing the File Key Management Plugin's Package

The File Key Management plugin is included in MariaDB packages as the `file_key_management.so` or `file_key_management.dll` shared library. The shared library is in the main server package, so no additional package installations are necessary. The plug-in must be installed into MariaDB however as follows.

Installing the Plugin

Although the plugin's shared library is distributed with MariaDB by default, the plugin is not actually installed by MariaDB by default. The plugin can be installed by providing the `--plugin-load` or the `--plugin-load-add` options. This can be specified as a command-line argument to `mysqld` or it can be specified in a relevant server [option group](#) in an [option file](#). For example:

```
[mariadb]
...
plugin_load_add = file_key_management
```

Uninstalling the Plugin

Before you uninstall the plugin, you should ensure that [data-at-rest encryption](#) is completely disabled, and that MariaDB no longer needs the plugin to decrypt tables or other files.

You can uninstall the plugin dynamically by executing `UNINSTALL SONAME` or `UNINSTALL PLUGIN`. For example:

```
UNINSTALL SONAME 'file_key_management';
```

If you installed the plugin by providing the `--plugin-load` or the `--plugin-load-add` options in a relevant server [option group](#) in an [option file](#), then those options should be removed to prevent the plugin from being loaded the next time the server is restarted.

Creating the Key File

In order to encrypt your tables with encryption keys using the File Key Management plugin, you first need to create the file that contains the encryption keys. The file needs to contain two pieces of information for each encryption key. First, each encryption key needs to be identified with a 32-bit integer as the key identifier. Second, the encryption key itself needs to be provided in hex-encoded form. These two pieces of information need to be separated by a semicolon. For example, the file is formatted in the following way:

```
<encryption_key_id1>;<hex-encoded_encryption_key1>
<encryption_key_id2>;<hex-encoded_encryption_key2>
```

You can also optionally encrypt the key file to make it less accessible from the file system. That is explained further in the section below.

The File Key Management plugin uses [Advanced Encryption Standard \(AES\)](#) to encrypt data, which supports 128-bit, 192-bit, and 256-bit encryption keys. Therefore, the plugin also supports 128-bit, 192-bit, and 256-bit encryption keys.

You can generate random encryption keys using the `openssl rand` command. For example, to create a random 256-bit (32-byte) encryption key, you would run the following command:

```
$ openssl rand -hex 32
a7add9adea9978fda19f21e6be987880e68ac92632ca052e5bb42b1a506939a
```

The key file still needs to have a key identifier for each encryption key added to the beginning of each line. Key identifiers do not need to be contiguous.

For example, to append three new encryption keys to a new key file, you could execute the following:

```
$ (echo -n "1;" ; openssl rand -hex 32 ) | sudo tee -a /etc/mysql/encryption/keyfile
$ (echo -n "2;" ; openssl rand -hex 32 ) | sudo tee -a /etc/mysql/encryption/keyfile
$ (echo -n "100;" ; openssl rand -hex 32 ) | sudo tee -a /etc/mysql/encryption/keyfile
```

The new key file would look something like the following after this step:

```
1;a7add9adea9978fda19f21e6be987880e68ac92632ca052e5bb42b1a506939a
2;49c16acc2df6e616710c9ba9a10b94944a737de1beccb52dc1560abfdd67388b
100;8db1ee74580e7e93ab8cf157f02656d356c2f437d548d5bf16bf2a56932954a3
```

The key identifiers give you a way to reference the encryption keys from MariaDB. In the example above, you could reference these encryption keys using the key identifiers `1`, `2` or `100` with the `ENCRYPTION_KEY_ID` table option or with system variables such as `innodb_default_encryption_key_id`. You do not necessarily need multiple encryption keys--the encryption key with the key identifier `1` is the only mandatory encryption key.

Configuring the Path to an Unencrypted Key File

If the key file is unencrypted, then the File Key Management plugin only requires the `file_key_management_filename` system variable to be configured.

This system variable can be specified as command-line arguments to `mysqld` or it can be specified in a relevant server `option group` in an `option file`. For example:

```
[mariadb]
...
loose_file_key_management_filename = /etc/mysql/encryption/keyfile
```

Note that the `loose` option prefix is specified. This option prefix is used in case the plugin hasn't been installed yet.

Encrypting the Key File

By enabling the File Key Management plugin and setting the appropriate path on the `file_key_management_filename` system variable, you can begin using the plugin to manage your encryption keys. But, there is a security risk in doing so, given that the keys are stored in plain text on your system. You can reduce this exposure using file permissions, but it's better to encrypt the whole key file to further restrict access.

There are some important details to keep in mind about encrypting the key file, such as:

- The only algorithm that MariaDB currently supports to encrypt the key file is [Cipher Block Chaining \(CBC\)](#) mode of [Advanced Encryption Standard \(AES\)](#).
- The encryption key size can be 128-bits, 192-bits, or 256-bits.
- The encryption key is created from the [SHA-1](#) hash of the encryption password.
- The encryption password has a max length of 256 characters.

You can generate a random encryption password using the `openssl rand` command. For example, to create a random 256 character encryption password, you could execute the following:

```
$ sudo openssl rand -hex 128 > /etc/mysql/encryption/keyfile.key
```

You can encrypt the key file using the `openssl enc` command. For example, to encrypt the key file with the encryption password created in the previous step, you could execute the following:

```
$ sudo openssl enc -aes-256-cbc -md sha1 \
-pass file:/etc/mysql/encryption/keyfile.key \
-in /etc/mysql/encryption/keyfile \
-out /etc/mysql/encryption/keyfile.enc
```

Note: some more recent `openssl` versions may complain with

```
*** WARNING : deprecated key derivation used.
Using -iter or -pbkdf2 would be better.
```

Keys generated that way won't work with the current implementation of the plugin though. Also as SHA1 is only used to generate the actual AES encryption key, from a long random string, it's not really an issue here. SHA1 deprecation is mostly related to checksum / signing use cases, not to what we are using it here for.

Running this command reads the unencrypted `keyfile` file created above and creates a new encrypted `keyfile.enc` file, using the encryption password stored in `keyfile.key`. Once you've finished preparing your system, you can delete the unencrypted `keyfile` file, as it's no longer necessary.

Configuring the Path to an Encrypted Key File

If the key file is encrypted, then the File Key Management plugin requires both the `file_key_management_filename` and the `file_key_management_filekey` system variables to be configured.

The `file_key_management_filekey` system variable can be provided in two forms:

- It can be the actual plain-text encryption password. This is not recommended, since the plain-text encryption password would be visible in the output of the `SHOW VARIABLES` statement.
- If it is prefixed with `FILE:`, then it can be a path to a file that contains the plain-text encryption password.

These system variables can be specified as command-line arguments to `mysqld` or they can be specified in a relevant server [option group](#) in an [option file](#). For example:

```
[mariadb]
...
loose_file_key_management_filename = /etc/mysql/encryption/keyfile.enc
loose_file_key_management_filekey = FILE:/etc/mysql/encryption/keyfile.key
```

Note that the `loose` option prefix is specified. This option prefix is used in case the plugin hasn't been installed yet.

Choosing an Encryption Algorithm

The File Key Management plugin currently supports two encryption algorithms for encrypting data: `AES_CBC` and `AES_CTR`. Both of these algorithms use [Advanced Encryption Standard \(AES\)](#) in different modes. AES uses 128-bit blocks, and supports 128-bit, 192-bit, and 256-bit keys. The modes are:

- The `AES_CBC` mode uses AES in the [Cipher Block Chaining \(CBC\)](#) mode.
- The `AES_CTR` mode uses AES in two slightly different modes in different contexts. When encrypting tablespace pages (such as pages in InnoDB, XtraDB, and Aria tables), it uses AES in the [Counter \(CTR\)](#) mode. When encrypting temporary files (where the cipher text is allowed to be larger than the plain text), it uses AES in the authenticated [Galois/Counter Mode \(GCM\)](#).

The recommended algorithm is `AES_CTR`, but this algorithm is only available when MariaDB is built with recent versions of [OpenSSL](#). If the server is built with [wolfSSL](#) or [yaSSL](#), then this algorithm is not available. See [TLS and Cryptography Libraries Used by MariaDB](#) for more information about which libraries are used on which platforms.

Configuring the Encryption Algorithm

The encryption algorithm can be configured by setting the `file_key_management_encryption_algorithm` system variable.

This system variable can be set to one of the following values:

System Variable	Description
<code>AES_CBC</code>	Data is encrypted using AES in the Cipher Block Chaining (CBC) mode. This is the default value.
<code>AES_CTR</code>	Data is encrypted using AES either in the Counter (CTR) mode or in the authenticated Galois/Counter Mode (GCM) mode, depending on context. This is only supported in some builds. See the previous section for more information.

This system variable can be specified as command-line arguments to `mysqld` or it can be specified in a relevant server [option group](#) in an [option file](#). For example:

```
[mariadb]
...
loose_file_key_management_encryption_algorithm = AES_CTR
```

Note that the `loose` option prefix is specified. This option prefix is used in case the plugin hasn't been installed yet.

Note that this variable does not affect the algorithm that MariaDB uses to decrypt the key file. This variable only affects the encryption algorithm that MariaDB uses to encrypt and decrypt data. The only algorithm that MariaDB currently supports to encrypt the key file is [Cipher Block Chaining \(CBC\)](#) mode of [Advanced Encryption Standard \(AES\)](#).

Using the File Key Management Plugin

Once the File Key Management Plugin is enabled, you can use it by creating an encrypted table:

```
CREATE TABLE t (i int) ENGINE=InnoDB ENCRYPTED=YES
```

Now, table `t` will be encrypted using the encryption key from the key file.

For more information on how to use encryption, see [Data at Rest Encryption](#).

Using Multiple Encryption Keys

The File Key Management Plugin supports [using multiple encryption keys](#). Each encryption key can be defined with a different 32-bit integer as a key identifier.

When [encrypting InnoDB tables](#), the key that is used to encrypt tables [can be changed](#).

When [encrypting Aria tables](#), the key that is used to encrypt tables [cannot currently be changed](#).

Key Rotation

The File Key Management plugin does not currently support [key rotation](#). See [MDEV-20713](#) for more information.

Versions

Version	Status	Introduced
1.0	Stable	MariaDB 10.1.18
1.0	Gamma	MariaDB 10.1.13
1.0	Alpha	MariaDB 10.1.3

System Variables

`file_key_management_encryption_algorithm`

- **Description:** This system variable is used to determine which algorithm the plugin will use to encrypt data.
 - The recommended algorithm is `AES_CTR`, but this algorithm is only available when MariaDB is built with recent versions of [OpenSSL](#). If the server is built with [wolfSSL](#) or [yaSSL](#), then this algorithm is not available. See [TLS and Cryptography Libraries Used by MariaDB](#) for more information about which libraries are used on which platforms.
- **Commandline:** `--file-key-management-encryption-algorithm=value`
- **Scope:** Global
- **Dynamic:** No
- **Data Type:** `enumerated`
- **Default Value:** `AES_CBC`
- **Valid Values:** `AES_CBC`, `AES_CTR`

`file_key_management_filekey`

- **Description:** This system variable is used to determine the encryption password that is used to decrypt the key file defined by `file_key_management_filename`.
 - If this system variable's value is prefixed with `FILE:`, then it is interpreted as a path to a file that contains the plain-text encryption password.
 - If this system variable's value is **not** prefixed with `FILE:`, then it is interpreted as the plain-text encryption password. However, this is not recommended.
 - The encryption password has a max length of 256 characters.
 - The only algorithm that MariaDB currently supports when decrypting the key file is [Cipher Block Chaining \(CBC\)](#) mode of [Advanced Encryption Standard \(AES\)](#). The encryption key size can be 128-bits, 192-bits, or 256-bits. The encryption key is calculated by taking a [SHA-1](#) hash of the encryption password.
- **Commandline:** `--file-key-management-filekey=value`
- **Scope:** Global
- **Dynamic:** No
- **Data Type:** `string`
- **Default Value:** (empty)

`file_key_management_filename`

- **Description:** This system variable is used to determine the path to the file that contains the encryption keys. If `file_key_management_filekey` is set, then this file can be encrypted with [Cipher Block Chaining \(CBC\)](#) mode of [Advanced Encryption Standard \(AES\)](#).

- **Commandline:** `--file-key-management-filename=value`
- **Scope:** Global
- **Dynamic:** No
- **Data Type:** `string`
- **Default Value:** (empty)

Options

`file_key_management`

- **Description:** Controls how the server should treat the plugin when the server starts up.
 - Valid values are:
 - `OFF` - Disables the plugin without removing it from the `mysql.plugins` table.
 - `ON` - Enables the plugin. If the plugin cannot be initialized, then the server will still continue starting up, but the plugin will be disabled.
 - `FORCE` - Enables the plugin. If the plugin cannot be initialized, then the server will fail to start with an error.
 - `FORCE_PLUS_PERMANENT` - Enables the plugin. If the plugin cannot be initialized, then the server will fail to start with an error. In addition, the plugin cannot be uninstalled with `UNINSTALL SONAME` or `UNINSTALL PLUGIN` while the server is running.
 - See [Plugin Overview: Configuring Plugin Activation at Server Startup](#) for more information.
- **Commandline:** `--file-key-management=value`
- **Data Type:** `enumerated`
- **Default Value:** `ON`
- **Valid Values:** `OFF`, `ON`, `FORCE`, `FORCE_PLUS_PERMANENT`

5.4.8.3 Hashicorp Key Management Plugin

MariaDB starting with [10.9](#)

The Hashicorp Key Management Plugin is used to implement encryption using keys stored in the Hashicorp Vault KMS. For more information, see [Hashicorp Vault and MariaDB](#), and for how to install Vault, see [Install Vault](#), as well as [MySQL/MariaDB Database Secrets Engine](#).

Contents

1. [Options](#)
 1. [hashicorp-key-management-vault-url](#)
 2. [hashicorp-key-management-token](#)
 3. [hashicorp-key-management-vault-ca](#)
 4. [hashicorp-key-management-timeout](#)
 5. [hashicorp-key-management-retries](#)
 6. [hashicorp-key-management-caching-enabled](#)
 7. [hashicorp-key-management-use-cache-on-timeout](#)
 8. [hashicorp-key-management-cache-timeout](#)
 9. [hashicorp-key-management-cache-version-timeout](#)
 10. [hashicorp-key-management-check-kv-version](#)

The current version of this plugin implements the following features:

- Authentication is done using the Hashicorp Vault's token authentication method;
- If additional client authentication is required, then the path to the CA authentication bundle file may be passed as a plugin parameter;
- The creation of the keys and their management is carried out using the Hashicorp Vault KMS and their tools;
- The plugin uses libcurl (https) as an interface to the HashiCorp Vault server;
- JSON parsing is performed through the JSON service (through the `include/mysql/service_json.h`);
- HashiCorp Vault 1.2.4 was used for development and testing.

Since we require support for key versioning, the key-value storage must be configured in Hashicorp Vault as a key-value storage that uses the interface of the second version. For example, you can create it as follows:

```
~$ vault secrets enable -path /test -version=2 kv
```

Key names must correspond to their numerical identifiers. Key identifiers itself, their possible values and rules of use are described in more detail in the MariaDB main documentation.

From the point of view of the key-value storage (in terms of Hashicorp Vault), the key is a secret containing one key-value pair with the name "data" and a value representing a binary string containing the key value, for example:

```
~$ vault kv get /test/1

===== Metadata =====
Key             Value
----           -
created_time    2019-12-14T14:19:19.42432951Z
deletion_time   n/a
destroyed       false
version         1

==== Data =====
Key             Value
----           -
data            0123456789ABCDEF0123456789ABCDEF
```

Keys values are strings containing binary data. MariaDB currently uses the AES algorithm with 256-bit keys as the default encryption method. In this case, the keys that will be stored in the Hashicorp Vault should be 32-byte strings. Most likely you will use some utilities for creating and administering keys designed to work with Hashicorp Vault. But in the simplest case, keys can be created from the command line through the vault utility, for example, as follows:

```
~$ vault kv put /test/1 data="0123456789ABCDEF0123456789ABCDEF"
```

If you use default encryption (AES), you should ensure that the key length is 32 bytes, otherwise it may fail to use InnoDB as a data storage.

The plugin currently does not unseal Hashicorp Vault on its own, you must do this in advance and on your own.

To use Hashicorp Vault KMS, the plugin must be preloaded and activated on the server. Most of its parameters should not be changed during plugin operation and therefore must be preconfigured as part of the server configuration through configuration file or command line options:

```
--plugin-load-add=hashicorp_key_management.so
--loose-hashicorp-key-management
--loose-hashicorp-key-management-vault-url="$VAULT_ADDR/v1/test"
--loose-hashicorp-key-management-token="$VAULT_TOKEN"
```

Options

The plugin supports the following parameters, which must be set in advance and cannot be changed during server operation:

`hashicorp-key-management-vault-url`

- **Description:** HTTP[s] URL that is used to connect to the Hashicorp Vault server. It must include the name of the scheme (`https://` for a secure connection) and, according to the API rules for storages of the key-value type in Hashicorp Vault, after the server address, the path must begin with the `/v1/` string (as prefix), for example: `https://127.0.0.1:8200/v1/my_secrets`. By default, the path is not set, therefore you must replace with the correct path to your secrets.
- **Commandline:** `--[loose-]hashicorp-key-management-vault-url=<url>`

`hashicorp-key-management-token`

- **Description:** Authentication token that passed to the Hashicorp Vault in the request header. By default, this parameter contains an empty string, so you must specify the correct value for it, otherwise the Hashicorp Vault server will refuse authorization.
- **Commandline:** `--[loose-]hashicorp-key-management-token=<token>`

`hashicorp-key-management-vault-ca`

- **Description:** Path to the Certificate Authority (CA) bundle (is a file that contains root and intermediate certificates). By default, this parameter contains an empty string, which means no CA bundle.
- **Commandline:** `--[loose-]hashicorp-key-management-vault-ca=<path>`

hashicorp-key-management-timeout

- **Description:** Set the duration (in seconds) for the Hashicorp Vault server connection timeout. The default value is 15 seconds. The allowed range is from 1 to 86400 seconds. The user can also specify a zero value, which means the default timeout value set by the libcurl library (currently 300 seconds).
- **Commandline:** `--[loose-]hashicorp-key-management-timeout=<timeout>`

hashicorp-key-management-retries

- **Description:** Number of server request retries in case of timeout. Default is three retries.
- **Commandline:** `----[loose-]hashicorp-key-management-retries=<retries>`

hashicorp-key-management-caching-enabled

- **Description:** Enable key caching (storing key values received from the Hashicorp Vault server in the local memory). By default caching is enabled.
- **Commandline:** `--[loose-]hashicorp-key-management-caching-enabled="on"|"off"`

hashicorp-key-management-use-cache-on-timeout

- **Description:** This parameter instructs the plugin to use the key values or version numbers taken from the cache in the event of a timeout when accessing the vault server. By default this option is disabled. Please note that key values or version numbers will be read from the cache when the timeout expires only after the number of attempts to read them from the storage server that specified by the `--[loose-]hashicorp-key-management-retries` parameter has been exhausted.
- **Commandline:** `--[loose-]hashicorp-key-management-use-cache-on-timeout="on"|"off"`

hashicorp-key-management-cache-timeout

- **Description:** The time (in milliseconds) after which the value of the key stored in the cache becomes invalid and an attempt to read this data causes a new request send to the vault server. By default, cache entries become invalid after 60,000 milliseconds (after one minute). If the value of this parameter is zero, then the keys will always be considered invalid, but they still can be used if the vault server is unavailable and the corresponding cache operating mode (`--[loose-]hashicorp-key-management-use-cache-on-timeout="on"`) is enabled.
- **Commandline:** `--[loose-]hashicorp-key-management-cache-timeout=<timeout>`

hashicorp-key-management-cache-version-timeout

- **Description:** The time (in milliseconds) after which the information about latest version number of the key (which stored in the cache) becomes invalid and an attempt to read this information causes a new request send to the vault server. If the value of this parameter is zero, then information about latest key version numbers always considered invalid, unless there is no communication with the vault server and use of the cache is allowed when the server is unavailable. By default, this parameter is zero, that is, the latest version numbers for the keys stored in the cache are considered always invalid, except when the vault server is unavailable and use of the cache is allowed on server failures.
- **Commandline:** `--[loose-]hashicorp-key-management-cache-version-timeout=<timeout>`

hashicorp-key-management-check-kv-version

- **Description:** This parameter enables ("on", this is the default value) or disables ("off") checking the kv storage version during plugin initialization. The plugin requires storage to be version 2 or older in order for it to work properly.
- **Commandline:** `--[loose-]hashicorp-key-management-check-kv-version="on"|"off"`

5.4.8.4 AWS Key Management Encryption Plugin

 7. [aws_key_management_rotate_key](#)
13. [Options](#)
 1. [aws_key_management](#)

Due to license incompatibilities between the MariaDB server source code and the Amazon AWS C++ SDK we can only distribute the plugin in source code form, and not as ready-to-use binaries. See [Installing the Plugin's Package](#) for details.

MariaDB's [data-at-rest encryption](#) requires the use of a [key management and encryption plugin](#). These plugins are responsible both for the management of encryption keys and for the actual encryption and decryption of data.

MariaDB supports the use of [multiple encryption keys](#). Each encryption key uses a 32-bit integer as a key identifier. If the specific plugin supports [key rotation](#), then encryption keys can also be rotated, which creates a new version of the encryption key.

The AWS Key Management plugin is a [key management and encryption plugin](#) that uses the [Amazon Web Services \(AWS\) Key Management Service \(KMS\)](#) [↗](#).

Overview

The AWS Key Management plugin uses the [Amazon Web Services \(AWS\) Key Management Service \(KMS\)](#) [↗](#) to generate and store AES keys on disk, in encrypted form, using the Customer Master Key (CMK) kept in AWS KMS. When MariaDB Server starts, the plugin will decrypt the encrypted keys, using the AWS KMS "Decrypt" API function. MariaDB data will then be encrypted and decrypted using the AES key. It supports multiple encryption keys. It supports key rotation.

Tutorials

Tutorials related to the AWS Key Management plugin can be found at the following pages:

- [Amazon Web Services \(AWS\) Key Management Service \(KMS\) Encryption Plugin Setup Guide](#)
- [Amazon Web Services \(AWS\) Key Management Service \(KMS\) Encryption Plugin Advanced Usage](#)

Preparation

- Before you use the plugin, you need to create a Customer Master Key (CMK). Create a key using the AWS Console as described in the [AMS KMS developer guide](#) [↗](#).
- The easiest way to give the AWS key management plugin access to the key is to create an IAM Role with access to the key, and to apply that IAM Role to an EC2 instance where MariaDB Server runs.
- Make sure that MariaDB Server runs under the correct AWS identity that has access to the above key. For example, you can store the AWS credentials in a AWS credentials file for the user who runs `mysqld`. More information about the credentials file can be found in [the AWS CLI Getting Started Guide](#) [↗](#).

Installing the Plugin's Package

The AWS Key Management plugin depends on the [AWS SDK for C++](#), which uses the [Apache License, Version 2.0](#). This license is not compatible with MariaDB Server's [GPL 2.0 license](#), so we are not able to distribute packages that contain the AWS Key Management plugin. Therefore, the only way to currently obtain the plugin is to install it from source.

Installing from Source

When [compiling MariaDB from source](#), the AWS Key Management plugin is not built by default in [MariaDB 10.1](#), but it is built by default in [MariaDB 10.2](#) and later, on systems that support it.

Compilation is controlled by the following [cmake](#) arguments:

- `-DPLUGIN_AWS_KEY_MANAGEMENT=DYNAMIC` to build a loadable plugin library
- `-DAWS_SDK_EXTERNAL_PROJECT=ON` to download the AWS C++ SDK code
- `-DNOT_FOR_DISTRIBUTION=ON` to confirm that you know to not distribute the resulting binaries

The plugin uses [AWS C++ SDK](#), which introduces the following restrictions:

- The plugin can only be built on Windows, Linux and macOS.
- The plugin requires that one of the following compilers is used: `gcc` 4.8 or later, `clang` 3.3 or later, Visual Studio 2013 or later.
- On Unix, the `libcurl` development package (e.g. `libcurl3-dev` on Debian Jessie), `uuid` development package and `openssl` need to be installed.
- You may need to use a newer version of [cmake](#) than is provided by default in your OS.

You do not need to download / install the AWS C++ SDK yourself, the correct version of the SDK github repository will be cloned into the build directory at build time, and only the libraries for AWS components actually needed by the key management plugin will be built, which takes much less time than building the full AWS C++ SDK.

Building on Linux

With all prerequisites installed the actual build process pretty much comes down to:

```
# clone the MariaDB Server source code repository
git clone https://github.com/MariaDB/server.git
cd server

# prepare the build
mkdir _build
cd _build
cmake .. -DNOT_FOR_DISTRIBUTION=ON \
-DPLUGIN_AWS_KEY_MANAGEMENT=DYNAMIC \
-DAWS_SDK_EXTERNAL_PROJECT=1

# build the plugin only
cd plugin/aws_key_management
make
```

Cmake will print the following warning as part of its output, please take it serious and do not distribute the `aws_key_management.so` file to any third parties:

You have linked MariaDB with Apache 2.0 libraries! You may not distribute the resulting binary. If you do, you will put yourself into a legal problem with the Free Software Foundation.

After `make` succeeded you can copy the created `aws_key_management.so` plugin library file to the plugin directory of your actual MariaDB Server machines installation, e.g. `/usr/lib64/mysql/plugin` on RedHat/Fedora based systems or `/usr/lib/mysql/plugin` on Debian based systems.

Installing the Plugin

Even after the package that contains the plugin's shared library is installed on the operating system, the plugin is not actually installed by MariaDB by default. There are two methods that can be used to install the plugin with MariaDB.

The first method can be used to install the plugin without restarting the server. You can install the plugin dynamically by executing `INSTALL SONAME` or `INSTALL PLUGIN`. For example:

```
INSTALL SONAME 'aws_key_management';
```

The second method can be used to tell the server to load the plugin when it starts up. The plugin can be installed this way by providing the `--plugin-load` or the `--plugin-load-add` options. This can be specified as a command-line argument to `mysqld` or it can be specified in a relevant server [option group](#) in an [option file](#). For example:

```
[mariadb]
...
plugin_load_add = aws_key_management
```

Uninstalling the Plugin

Before you uninstall the plugin, you should ensure that [data-at-rest encryption](#) is completely disabled, and that MariaDB no longer needs the plugin to decrypt tables or other files.

You can uninstall the plugin dynamically by executing `UNINSTALL SONAME` or `UNINSTALL PLUGIN`. For example:

```
UNINSTALL SONAME 'aws_key_management';
```

If you installed the plugin by providing the `--plugin-load` or the `--plugin-load-add` options in a relevant server [option group](#) in an [option file](#), then those options should be removed to prevent the plugin from being loaded the next time the server is restarted.

Configuring the AWS Key Management Plugin

To enable the AWS Key Management plugin, you also need to set the plugin's system variables. The `aws_key_management_master_key_id` system variable is the primary one to set. These system variables can be specified as command-line arguments to `mysqld` or they can be specified in a relevant server [option group](#) in an [option file](#). For example:

```
[mariadb]
...
aws_key_management_master_key_id=alias/<your key's alias>
```

Once you've updated the configuration file, [restart](#) the MariaDB server to apply the changes and make the key management and encryption plugin available for use.

Using the AWS Key Management Plugin

Once the AWS Key Management Plugin is enabled, you can use it by creating an encrypted table:

```
CREATE TABLE t (i int) ENGINE=InnoDB ENCRYPTED=YES
```

Now, table `t` will be encrypted using the encryption key generated by AWS.

For more information on how to use encryption, see [Data at Rest Encryption](#).

Using Multiple Encryption Keys

The AWS Key Management Plugin supports [using multiple encryption keys](#). Each encryption key can be defined with a different 32-bit integer as a key identifier. If a previously unused identifier is used, then the plugin will automatically generate a new key.

When [encrypting InnoDB tables](#), the key that is used to encrypt tables [can be changed](#).

When [encrypting Aria tables](#), the key that is used to encrypt tables [cannot currently be changed](#).

Key Rotation

The AWS Key Management plugin does support [key rotation](#). To rotate a key, set the `aws_key_management_rotate_key` system variable. For example, to rotate key with ID 2:

```
SET GLOBAL aws_key_management_rotate_key=2;
```

Or to rotate all keys, set the value to -1:

```
SET GLOBAL aws_key_management_rotate_key=-1;
```

Versions

Version	Status	Introduced
1.0	Stable	MariaDB 10.2.6 ↗ , MariaDB 10.1.24 ↗
1.0	Beta	MariaDB 10.1.18 ↗
1.0	Experimental	MariaDB 10.1.13 ↗

System Variables

`aws_key_management_key_spec`

- **Description:** Encryption algorithm used to create new keys
- **Commandline:** `--aws-key-management-key-spec=value`
- **Scope:** Global
- **Dynamic:** No
- **Data Type:** `enumerated`
- **Default Value:** `AES_128`
- **Valid Values:** `AES_128` , `AES_256`

`aws_key_management_log_level`

- **Description:** Dump log of the AWS SDK to MariaDB error log. Permitted values, in increasing verbosity, are **Off** (default), **Fatal**, **Error**, **Warn**, **Info**, **Debug**, and **Trace**.
- **Commandline:** `--aws-key-management-log-level=value`
- **Scope:** Global
- **Dynamic:** No
- **Data Type:** `enumerated`
- **Default Value:** `Off`
- **Valid Values:** `Off` , `Fatal` , `Warn` , `Info` , `Debug` and `Trace`

`aws_key_management_master_key_id`

- **Description:** AWS KMS Customer Master Key ID (ARN or alias prefixed by alias/) for the master encryption key. Used to create new data keys. If not set, no new data keys will be created.
- **Commandline:** `--aws-key-management-master-key-id=value`
- **Scope:** Global
- **Dynamic:** No
- **Data Type:** `string`
- **Default Value:**

`aws_key_management_mock`

- **Description:** Mock AWS KMS calls (for testing). Must be enabled at compile-time.
- **Commandline:** `--aws-key-management-mock`
- **Scope:** Global
- **Dynamic:** No
- **Data Type:** `boolean`
- **Default Value:** `OFF`
- **Valid Values:** `OFF` , `ON`

aws_key_management_region

- **Description:** AWS region name, e.g us-east-1 . Default is SDK default, which is us-east-1.
 - **Commandline:** `--aws-key-management-region=value`
 - **Scope:** Global
 - **Dynamic:** No
 - **Data Type:** `string`
 - **Default Value:** `'us-east-1'`
-

aws_key_management_request_timeout

- **Description:** Timeout in milliseconds for create HTTPS connection or execute AWS request. Specify 0 to use SDK default.
 - **Commandline:** `--aws-key-management-request-timeout=value`
 - **Scope:** Global
 - **Dynamic:** No
 - **Data Type:** `integer`
 - **Default Value:** 0
-

aws_key_management_rotate_key

- **Description:** Set this variable to a data key ID to perform rotation of the key to the master key given in `aws_key_management_master_key_id` . Specify -1 to rotate all keys.
 - **Commandline:** `--aws-key-management-rotate-key=value`
 - **Scope:** Global
 - **Dynamic:** Yes
 - **Data Type:** `integer`
 - **Default Value:**
-

Options

aws_key_management

- **Description:** Controls how the server should treat the plugin when the server starts up.
 - Valid values are:
 - `OFF` - Disables the plugin without removing it from the `mysql.plugins` table.
 - `ON` - Enables the plugin. If the plugin cannot be initialized, then the server will still continue starting up, but the plugin will be disabled.
 - `FORCE` - Enables the plugin. If the plugin cannot be initialized, then the server will fail to start with an error.
 - `FORCE_PLUS_PERMANENT` - Enables the plugin. If the plugin cannot be initialized, then the server will fail to start with an error. In addition, the plugin cannot be uninstalled with `UNINSTALL SONAME` or `UNINSTALL PLUGIN` while the server is running.
 - See [Plugin Overview: Configuring Plugin Activation at Server Startup](#) for more information.
 - **Commandline:** `--aws-key-management=value`
 - **Data Type:** `enumerated`
 - **Default Value:** `ON`
 - **Valid Values:** `OFF` , `ON` , `FORCE` , `FORCE_PLUS_PERMANENT`

Overview

MariaDB contains a robust, full instance, at-rest encryption. This feature uses a flexible plugin interface to allow actual encryption to be done using a key management approach that meets the customer's needs. MariaDB Server, starting with [MariaDB 10.2](#), includes a plugin that uses the Amazon Web Services (AWS) Key Management Service (KMS) to facilitate separation of responsibilities and remote logging & auditing of key access requests.

Rather than storing the encryption key in a local file, this plugin keeps the master key in AWS KMS. When you first start MariaDB, the AWS KMS plugin will connect to the AWS Key Management Service and ask it to generate a new key. MariaDB will store that key on-disk in an encrypted form. The key stored on-disk cannot be used to decrypt the data; rather, on each startup, MariaDB connects to AWS KMS and has the service decrypt the locally-stored key(s). The decrypted key is stored in-memory as long as the MariaDB server process is running, and that in-memory decrypted key is used to encrypt the local data.

This guide is based on CentOS 7, using systemd with SELinux enabled. Some steps will differ if you use other operating systems or configurations.

Installing the Plugin's Package

The AWS Key Management plugin depends on the [AWS SDK for C++](#), which uses the [Apache License, Version 2.0](#). This license is not compatible with MariaDB Server's [GPL 2.0 license](#), so we are not able to distribute packages that contain the AWS Key Management plugin. Therefore, the only way to currently obtain the plugin is to install it from source.

Installing from Source

When [compiling MariaDB from source](#), the AWS Key Management plugin is not built by default in [MariaDB 10.1](#), but it is built by default in [MariaDB 10.2](#) and later, on systems that support it.

Compilation is controlled by the `-DPLUGIN_AWS_KEY_MANAGEMENT=DYNAMIC -DAWS_SDK_EXTERNAL_PROJECT=1` [cmake](#) arguments.

The plugin uses [AWS C++ SDK](#), which introduces the following restrictions:

- The plugin can only be built on Windows, Linux and macOS.
- The plugin requires that one of the following compilers is used: `gcc` 4.8 or later, `clang` 3.3 or later, Visual Studio 2013 or later.
- On Unix, the `libcurl` development package (e.g. `libcurl3-dev` on Debian Jessie), `uuid` development package and `openssl` need to be installed.
- You may need to use a newer version of [cmake](#) than is provided by default in your OS.

Installing the Plugin

Even after the package that contains the plugin's shared library is installed on the operating system, the plugin is not actually installed by MariaDB by default. There are two methods that can be used to install the plugin with MariaDB.

The first method can be used to install the plugin without restarting the server. You can install the plugin dynamically by executing [INSTALL SONAME](#) or [INSTALL PLUGIN](#). For example:

```
INSTALL SONAME 'aws_key_management';
```

The second method can be used to tell the server to load the plugin when it starts up. The plugin can be installed this way by providing the `--plugin-load` or the `--plugin-load-add` options. This can be specified as a command-line argument to `mysqld` or it can be specified in a relevant server `option group` in an `option file`. For example:

```
[mariadb]
...
plugin_load_add = aws_key_management
```

Sign up for Amazon Web Services

If you already have an AWS account, you can skip this section.

1. Load <http://aws.amazon.com/>
2. Click "Create a Free Account" and complete the steps.
3. You'll need to enter credit card information. Charges related only to your use of the AWS KMS service should be limited to about \$1/month for the single master key we will create. If you use other services, additional charges may apply. Consult AWS Cloud Pricing Principles <https://aws.amazon.com/pricing/> for more information about pricing of AWS services.
4. You'll need to complete the AWS identify verification process.

Create an IAM User and/or Role

After creating an account or logging in to an existing account, follow these steps to create an IAM User or Role with restricted privileges that will use (but not administer) your master encryption key.

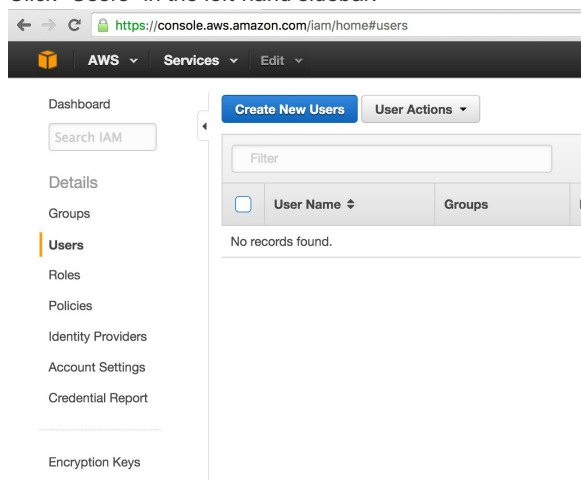

If you intend to run MariaDB Server on an EC2 instance, you should create a Role (or modify an existing Role already attached to your instance). If you intend to run MariaDB Server outside of AWS, you may want to create a User.

Creating an IAM Role

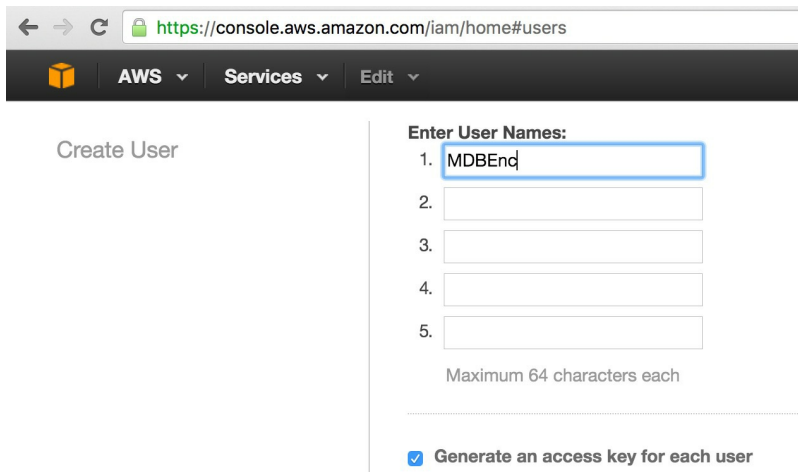

1. Load the Identity and Access Management Console at <https://console.aws.amazon.com/iam/>
2. Click "Roles" in the left-hand sidebar
3. Click "Create new role"
4. Select "AWS Service Role"
5. Click the "Select" button next to "Amazon EC2 / Allows EC2 instances to call AWS services on your behalf."
6. Do not select any policies on the "Attach Policy" screen. Click "Next Step"
7. Click "Next Step"
8. Give your Role a "Role name"
9. Click "Create role"

Creating an IAM User

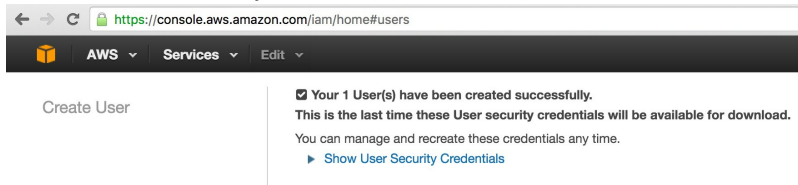

1. Load the Identity and Access Management Console at <https://console.aws.amazon.com/iam/>
2. Click "Users" in the left-hand sidebar.

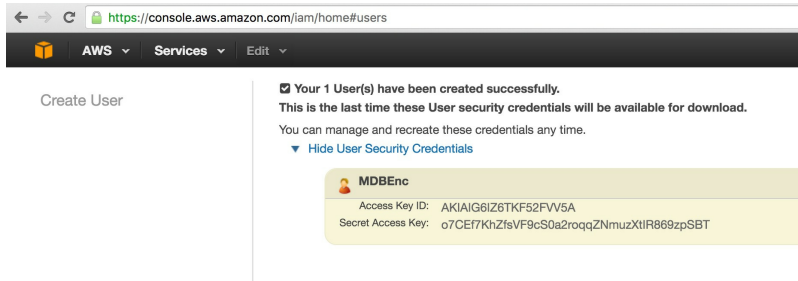

3. Click the "Create New Users" button
4. Enter a single User Name of your choosing. We'll use "MDBEnc" for this demonstration. Keep the "Generate an access key for each user" box checked.

5. Click "Create".
6. Click "Show User Security Credentials".

7. Copy the Access Key ID and Secret Access Key. Optionally, you can click "Download Credentials". We will need these in order for local programs to interact with AWS using its API.

8. Create a file on your computer to hold the credentials for this user. We'll use this file later. It should have this structure:

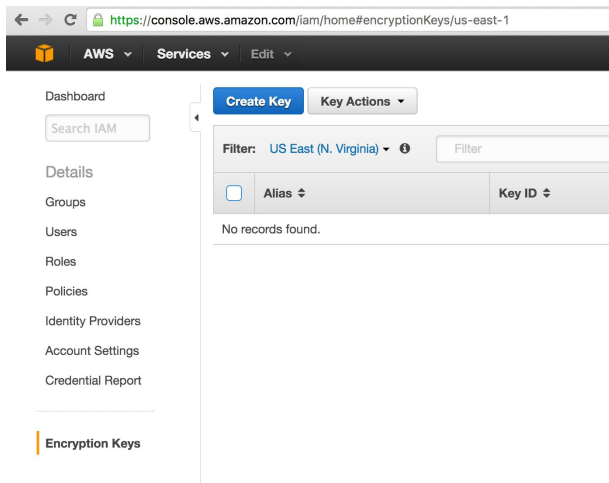

```
[default]
aws_access_key_id = AKIAIG6IZ6TKF52FVV5A
aws_secret_access_key = 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
```

9. Click "Close". If prompted because you did not Download Credentials, ensure that you've saved them somewhere, and click "Close".

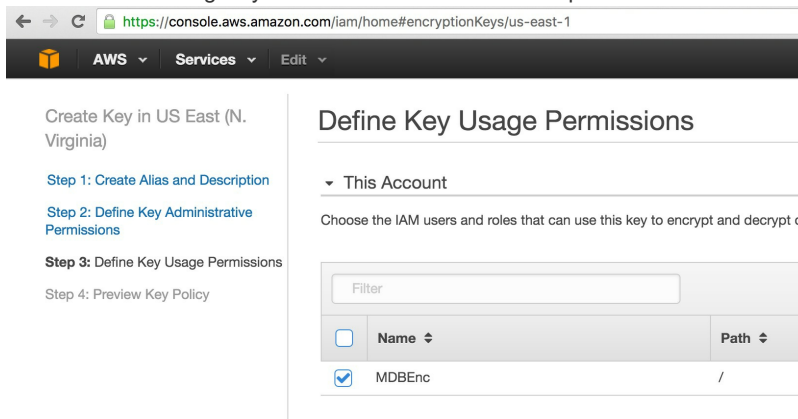

Create a Master Encryption Key

Now, we'll create a master encryption key. This key can *never* be retrieved by *any* application or user. This key is used remotely to encrypt (and decrypt) the actual encryption keys that will be used by MariaDB. If this key is deleted or you lose access to it, you will be unable to use the contents of your MariaDB data directory.

1. Click "Encryption Keys" in the left-hand sidebar.
2. Click the "Get Started Now" button.
3. Use the "Filter" dropdown to choose the region where you'd like to create your master key.
4. Click the "Create Key" button.

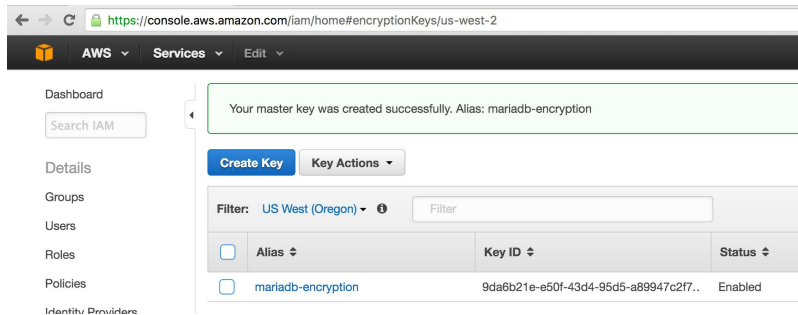

5. Enter an Alias and Description of your choosing.
6. Click "Next Step".
7. Do **not** check the box to make your IAM Role or IAM User user a Key Administrator.
8. Click "Next Step" again.
9. Check the boxes to give your IAM Role and/or IAM User permissions to use this key.

10. Click "Next Step".
11. Click "Finish".

You should now see your key listed in the console:

You'll use the "Alias" you provided when you configure MariaDB later.

We now have a Customer Master Key and an IAM user that has privileges to access it using access credentials. This is enough to begin using the AWS KMS plugin.

Configure AWS Credentials

There are a number of ways to give the IAM credentials to the AWS KMS plugin. The plugin supports reading credentials from all standard locations used across the various AWS API clients.

The easiest approach is to run MariaDB Server in an EC2 instance that has an IAM Role with User access to the CMK you wish to use. You can give key access privileges to a Role already attached to your EC2 instance, or you can create a new IAM Role and attach it to an already-running EC2 instance. If you've done that, no further credentials management is required and you do not need to create a `credentials` file.

If you're not running MariaDB Server on an EC2 instance, you can also place the credentials in the MariaDB data directory. The AWS API client looks for a `credentials` file in the `.aws` subdirectory of the home directory of the user running the client process. In the case of MariaDB, its home directory is its `datadir`.

1. Create a `credentials` file that MariaDB can read. Use the region you selected when creating the key. Master keys cannot be used across regions. For example:

```
$ cat /var/lib/mysql/.aws/credentials
[default]
aws_access_key_id = AKIAIG6IZ6TKF52FVV5A
aws_secret_access_key = o7CEf7KhZfsVF9cS0a2roqqZNmuzXtIR869zpSBT
region = us-east-1
```

2. Change the permissions of the file so that it is owned by, and can only be read by, the `mysql` user:

```
chown mysql /var/lib/mysql/.aws/credentials
chmod 600 /var/lib/mysql/.aws/credentials
```

Configure MariaDB

1. Create a new option file to tell MariaDB to enable encryption functionality and to use the AWS KMS plugin. Create a new file under `/etc/my.cnf.d/` (or wherever your OS may have you create such files) with contents like this:

```
[mariadb]
plugin_load_add = aws_key_management
aws-key-management = FORCE_PLUS_PERMANENT
aws-key-management-master-key-id = alias/mariadb-encryption
aws-key-management-region = us-east-1
!include /etc/my.cnf.d/enable_encryption.preset
```

1. Append the "Alias" value you copied above to `alias/` to use as the value for the `aws-key-management-master-key-id` option.

Note that you **must** include `aws-key-management-region` in your `.cnf` file if you are not using the `us-east-1` region.

Now, you have told MariaDB to use the AWS KMS plugin and you've put credentials for the plugin in a location where the plugin will find them. The `/etc/my.cnf.d/enable_encryption.preset` file contains a set of options that enable all available encryption functionality.

When you start MariaDB, the AWS KMS plugin will connect to the AWS Key Management Service and ask it to generate a new key. MariaDB will store that key on-disk in an encrypted form. The key stored on-disk cannot be used to decrypt the data; rather, on each startup, MariaDB must connect to AWS KMS and have the service decrypt the locally-stored key. The decrypted version is stored in-memory as long as the MariaDB server process is running, and that in-memory decrypted key is used to encrypt the local data.

SELinux and Outbound Connections from MariaDB

Because MariaDB needs to connect to the AWS KMS service, you must ensure that the host has outbound network connectivity over port 443 to AWS and you must ensure that local policies allow the MariaDB server process to make those outbound connections. By default, SELinux restricts MariaDB from making such connections.

The most simple way to cause SELinux to allow outbound HTTPS connections from MariaDB is to enable to `mysql_connect_any` boolean, like this:

```
setsebool -P mysql_connect_any 1
```

There are more complex alternatives that have a more granular effect, but those are beyond the scope of this document.

Start MariaDB

Start MariaDB using the `systemctl` tool:

```
systemctl start mariadb
```

If you do not use `systemd`, you may have to start MariaDB using some other mechanism.

You should see journal output similar to this:

```
# journalctl --no-pager -o cat -u mariadb.service

[Note] /usr/sbin/mysqld (mysqld 10.1.9-MariaDB-enterprise-log) starting as process 19831 ...
[Note] AWS KMS plugin: generated encrypted datakey for key id=1, version=1
[Note] AWS KMS plugin: loaded key 1, version 1, key length 128 bit
[Note] InnoDB: Using mutexes to ref count buffer pool pages
[Note] InnoDB: The InnoDB memory heap is disabled
[Note] InnoDB: Mutexes and rw_locks use GCC atomic builtins
[Note] InnoDB: Memory barrier is not used
[Note] InnoDB: Compressed tables use zlib 1.2.7
[Note] InnoDB: Using CPU crc32 instructions
[Note] InnoDB: Initializing buffer pool, size = 2.0G
[Note] InnoDB: Completed initialization of buffer pool
[Note] InnoDB: Highest supported file format is Barracuda.
[Note] InnoDB: 128 rollback segment(s) are active.
[Note] InnoDB: Waiting for purge to start
[Note] InnoDB:  Percona XtraDB (http://www.percona.com) 5.6.26-74.0 started; log sequence number
[Note] InnoDB: Dumping buffer pool(s) not yet started
[Note] Plugin 'FEEDBACK' is disabled.
[Note] AWS KMS plugin: generated encrypted datakey for key id=2, version=1
[Note] AWS KMS plugin: loaded key 2, version 1, key length 128 bit
[Note] Using encryption key id 2 for temporary files
[Note] Server socket created on IP: '::'.
[Note] Reading of all Master_info entries succeeded
[Note] Added new Master_info '' to hash table
[Note] /usr/sbin/mysqld: ready for connections.
```

Note the several lines of output that refer explicitly to the "AWS KMS plugin". You can see that the plugin generates a "datakey", loads that data key, and then later generates and loads a second data key. The 2nd data key is used to encrypt temporary files and temporary tables.

You can see the encrypted keys stored on-disk in the datadir:

```
# ls -l /var/lib/mysql/aws*
-rw-rw----. 1 mysql mysql 188 Feb 25 18:55 /var/lib/mysql/aws-kms-key.1.1
-rw-rw----. 1 mysql mysql 188 Feb 25 18:55 /var/lib/mysql/aws-kms-key.2.1
```

Note that those keys are not useful alone. They are encrypted. When MariaDB starts up, the AWS KMS plugin decrypts those keys by interacting with AWS KMS.

For maximum security, you should start from an empty datadir and run `mariadb-install-db` after configuring encryption. Then you should re-import your data so that it is fully encrypted. Use `sudo` to run `mariadb-install-db` so that it finds your credentials file:

```
# sudo -u mysql mariadb-install-db
Installing MariaDB/MySQL system tables in '/var/lib/mysql' ...
2016-02-25 23:16:06 139731553998976 [Note] /usr/sbin/mysqld (mysqld 10.1.11-MariaDB-enterprise-
log) starting as process 39551 ...
2016-02-25 23:16:07 139731553998976 [Note] AWS KMS plugin: generated encrypted datakey for key
id=1, version=1
2016-02-25 23:16:07 139731553998976 [Note] AWS KMS plugin: loaded key 1, version 1, key length
128 bit
...
```

Create Encrypted Tables

With `innodb-encrypt-tables=ON`, new InnoDB tables will be encrypted by default, using the key ID set in `innodb_default_encryption_key_id` (default 1). With `innodb-encrypt-tables=FORCE` enabled, it is not possible to manually bypass encryption when creating a table.

You can cause the AWS KMS plugin to create new encryption keys at-will by specifying a new `ENCRYPTION_KEY_ID` when creating a table:

```
MariaDB [test]> create table t1 (id serial, v varchar(32)) ENCRYPTION_KEY_ID=3;
Query OK, 0 rows affected (0.91 sec)
```

```
[Note] AWS KMS plugin: generated encrypted datakey for key id=3, version=1
[Note] AWS KMS plugin: loaded key 3, version 1, key length 128 bit
```

```
# ls -l /var/lib/mysql/aws*
-rw-rw----. 1 mysql mysql 188 Feb 25 18:55 /var/lib/mysql/aws-kms-key.1.1
-rw-rw----. 1 mysql mysql 188 Feb 25 18:55 /var/lib/mysql/aws-kms-key.2.1
-rw-rw----. 1 mysql mysql 188 Feb 25 19:10 /var/lib/mysql/aws-kms-key.3.1
```

Read more about encrypting data in the [Data at Rest Encryption](#) section of the MariaDB Documentation.

AWS KMS Plugin Option Reference

- `aws_key_management_master_key_id`: AWS KMS Customer Master Key ID (ARN or alias prefixed by `alias/`) for master encryption key. Used to create new data keys. If not set, no new data keys will be created.
- `aws_key_management_rotate_key`: Set this variable to a data key ID to perform rotation of the key to the master key given in `aws_key_management_master_key_id`. Specify `-1` to rotate all keys.
- `aws_key_management_key_spec`: Encryption algorithm used to create new keys. Allowed values are `AES_128` (default) or `AES_256`.
- `aws_key_management_log_level`: Logging for AWS API. Allowed values, in increasing verbosity, are "Off" (default), "Fatal", "Error", "Warn", "Info", "Debug", and "Trace".

Next Steps

For more information about advanced usage, including strategies to manage credentials, enforce separation of responsibilities, and even require 2-factor authentication to start your MariaDB server, please review [Amazon Web Services \(AWS\) Key Management Service \(KMS\) Encryption Plugin Advanced Usage](#).

5.4.8.6 Amazon Web Services (AWS) Key Management Service (KMS) Encryption Plugin Advanced Usage

Contents

 2. [CloudWatch](#)

This document assumes you've already set up an Amazon Web Services (AWS) account, created a master key in the Key Management Service (KMS), and have done the basic work to set up the MariaDB AWS KMS plugin. These steps are all described in [Amazon Web Services \(AWS\) Key Management Service \(KMS\) Encryption Plugin Setup Guide](#).

Ultimately, keeping all the credentials required to read the key on a single host means that a user who has gained access to the host has enough information to read the encrypted files in the `datadir`, read the encrypted keys from the `datadir`, interact with AWS KMS to decrypt the encrypted keys, and then used the decrypted keys to decrypt the encrypted data.

Theoretically, a superuser can read the memory of the MariaDB server process to read the decrypted keys or restart MariaDB with password authentication disabled in order to dump data, or add new users to MariaDB in order to allow a user to connect and dump the data. Resolving these issues is beyond the scope of this document. A user who gains root access to your operating system or root access to your MariaDB server will have the ability to decrypt your data. Plan accordingly.

Managing AWS credentials

Putting the AWS credentials in a file inside the MariaDB home directory is not ideal. By default, any user with the `FILE` privilege can read any files that the MariaDB server has permission to read, which would include the credentials file. To

protect against this, you should set `secure_file_priv` to restrict the location the server will allow a user to read from when executing `LOAD DATA INFILE` or the `LOAD_FILE()` function.

But putting them in other locations requires passing additional data to the server, which in the case of CentOS 7 requires customizing the systemd startup procedure. This is most easily done by creating a "drop-in" file in `/etc/systemd/system/mariadb.service.d/`. The file should end in ".conf" but can otherwise be named whatever you like. After making any changes to systemd files, execute `systemctl daemon-reload` and then start (or restart) the service as usual.

You can place the credentials file in a location of your choosing and then refer to that file by setting the `AWS_CREDENTIAL_PROFILES_FILE` environment variable in the drop-in file:

```
[Service]
Environment=AWS_CREDENTIAL_PROFILES_FILE=/etc/aws-kms-credentials
```

The credentials file will need to be readable by the "mysql" user, but it does not need to be readable by any other user.

AWS credentials can also be put directly into a "drop-in" systemd file that will be read when starting the MariaDB service:

```
# cat /etc/systemd/system/mariadb.service.d/aws-kms.conf
[Service]
Environment=AWS_ACCESS_KEY_ID=AKIAIRSG2XYZATCJLZ4A
Environment=AWS_SECRET_ACCESS_KEY=ux91LZIx Cp4ZXabcdefgIViQNTan42QAmJqJVqV
```

However, any OS user can read this information from systemd, which could be considered a security risk. Another solution is to put the credentials in a separate file that is only readable by root and then refer to that file using an `EnvironmentFile` directive in a drop-in systemd file.

```
# cat /etc/systemd/system/mariadb.service.d/aws-kms.env
AWS_ACCESS_KEY_ID=AKIAIRSG2XYZATCJLZ4A
AWS_SECRET_ACCESS_KEY=ux91LZIx Cp4ZXabcdefgIViQNTan42QAmJqJVqV

# chown root /etc/systemd/system/mariadb.service.d/aws-kms.env
# chmod 600 /etc/systemd/system/mariadb.service.d/aws-kms.env

# cat /etc/systemd/system/mariadb.service.d/aws-kms.conf
[Service]
EnvironmentFile=/etc/systemd/system/mariadb.service.d/aws-kms.env
```

That has the advantage the the credentials can only be read directly by root. systemd adds those variables to the environment of the MariaDB server when starting it, and MariaDB can use the credentials to interact with AWS. Note, though, that any process running as the "mysql" user can still read the credentials from the proc filesystem on Linux.

```
$ whoami
mysql
$ cat /proc/$(pgrep mysqld)/environ | tr '\0' '\n' | grep AWS
AWS_ACCESS_KEY_ID=AKIAIRSG2XYZATCJLZ4A
AWS_SECRET_ACCESS_KEY=ux91LZIx Cp4ZXabcdefgIViQNTan42QAmJqJVqV
```

AWS KMS Key Policy

AWS KMS allows flexible, user-editable key policy. This offers fine-grained control over which users can operate on keys. The possibilities range from simply restricting which IP addresses are allowed to perform operations on the key, to requiring a MFA (Multi-Factor Authentication) device to use the key, to enforcing separation of responsibilities by creating an additional user with limited privileges to enable and disable the key. All 3 of these options will be outlined in this section.

For more details about customizing the Key Policy for your master keys, please consult the [AWS Key Management Service Key Policy](#) documentation.

Source IP restrictions

A simple, common-sense restriction to put in place is to restrict the range of IP addresses that are allowed to use your master key. This way, even if someone obtains API credentials, they'll be unable to use them to decrypt your encryptions keys from a different host.

To restrict API access from only a specific IP address or range of IP addresses, you'll need to manually edit the key policy.

1. Load the IAM console at <https://console.aws.amazon.com/iam/>.
2. Click "Encryption Keys" in the left-hand sidebar.
3. Click the name of your encryption key to view its details.

4. Click the link labeled "Switch to policy view", to the right of the heading of the "Key Policy" section.
5. Locate the section that contains "Sid": "Allow use of the key".
6. Add this text below the "Sid" line:

```
"Condition": {
  "IpAddress": {
    "aws:SourceIp": [
      "10.1.2.3/32"
    ]
  }
},
```

... replacing 10.1.2.3/32 above with an IP address or range of IP addresses in CIDR format. For example, a single address would be 192.168.12.34/32, while a range of addresses might be 192.168.0.0/24.

7. Click "Save Changes".
8. Click "Proceed" if prompted with a warning about using the default view in the future.

Access to the API will now be restricted to requests coming from the IP address or range of IP addresses specified in the policy.

Using a Multi-Factor Authentication (MFA) device

One approach is to modify the key policy for the master key so that MFA (Multi-Factor Authentication) is required in order to use the key. This is achieved with a wrapper that handles prompting the user for an MFA token, acquires temporary, limited-privilege credentials from the AWS Security Token Service (STS), and puts those credentials into the environment of the MariaDB server process. The credentials can expire after as little as 15 minutes.

To require an MFA token for users of the key, you'll need to manually edit the key policy.

1. Load the IAM console at <https://console.aws.amazon.com/iam/>.
2. Click "Encryption Keys" in the left-hand sidebar.
3. Click the name of your encryption key to view its details.
4. Click the link labeled "Switch to policy view", to the right of the heading of the "Key Policy" section.
5. Locate the section that contains "Sid": "Allow use of the key".
6. Add this text below the "Sid" line:

```
"Condition": {
  "Bool": {
    "aws:MultiFactorAuthPresent": "True"
  }
},
```

7. Click "Save Changes".
8. Click "Proceed" if prompted with a warning about using the default view in the future.

Now, add an MFA device for your user. You'll need to have a hardware MFA device or an application such as Google Authenticator installed on your smartphone.

1. Click "Users" in the left-hand sidebar.
2. Click the name of your user.
3. Click the "Security Credentials" tab.
4. In the "Sign-In Credentials" section, click the "Manage MFA Device" button.
5. Complete the steps to activate your MFA device.
6. Copy the ARN for your MFA device. You will need to use this when configuring the wrapper program.

Now, set up the wrapper program.

1. Copy the iam-kms-wrapper file to /usr/local/bin/, and ensure that it is executable.
2. Create a drop-in systemd config file in /etc/systemd/system/mariadb.service.d/:

```
[Service]
EnvironmentFile=/etc/systemd/system/mariadb.service.d/aws-kms.env
ExecStart=
ExecStart=/usr/local/bin/iam-kms-wrapper --config=/etc/my.cnf.d/iam-kms-wrapper.config /usr/
```

3. Execute `systemctl daemon-reload`.
4. Create a file at /etc/my.cnf.d/iam-kms-wrapper.config with these contents, using the ARN for your MFA device as the value for kms_mfa_id:

```
[kms]
kms_mfa_id = arn:aws:iam::551888187628:mfa/MDBEnc
kms_mfa_socket = /tmp/kms_mfa_socket
```

When you start the MariaDB service now, the wrapper will temporarily create a socket file at the location given by the `kms_mfa_socket` option. The wrapper will read the MFA code from the socket and will use it to authenticate to KMS. To give the MFA code, simply write the digits to the socket file using `echo: echo 111676 > /tmp/kms_mfa_socket`.

The `systemctl` command will block until MariaDB starts, so you will need to write the code to the socket file via a separate terminal.

Note that the temporary credentials put into the environment of the MariaDB process will expire after a period of time defined by the request to the AWS Security Token Service (STS). In the example below, they will expire after 900 seconds. After that time, MariaDB may be unable to generate new encrypted data keys, which means that, for example, an attempt to create a table with a previously-unused key ID would fail.

Wrapper program example

Here's an example wrapper program written in go. Build this into an executable named `iam-kms-wrapper` and use it as instructed above. This could of course be written in any language for which an appropriate AWS SDK exists, but go has the benefit of compiling to a static binary, which means you do not have to worry about interpreter versions or installing complex dependencies on the host that runs your MariaDB server.

```
package main

import (
    "syscall"
    "os"
    "log"
    "flag"
    "github.com/aws/aws-sdk-go/aws"
    "github.com/aws/aws-sdk-go/aws/session"
    "github.com/aws/aws-sdk-go/aws/awsserr"
    "github.com/aws/aws-sdk-go/service/sts"
    "github.com/robfig/config"
)

func main() {

    config_file_p := flag.String("config", "", "location of the config file")
    flag.Parse()

    if flag.NArg() < 1 {
        log.Fatal("Command to wrap must be given as first command-line argument")
    }

    cmd := flag.Arg(0)
    args := flag.Args()[0:]

    conf, err := config.ReadDefault(*config_file_p)
    if err != nil {
        log.Fatal(err)
    }

    kms_mfa_id, err := conf.String("kms", "kms_mfa_id")
    mfa_socket_file, err := conf.String("kms", "kms_mfa_socket")

    sess := session.New()
    svc := sts.New(sess)

    syscall.Umask(0044)

    log.Printf("Reading MFA token from %s\n", mfa_socket_file)

    if err := syscall.Mknod(mfa_socket_file, syscall.S_IFIFO|uint32(os.FileMode(0622)), 0); err
    != nil {
        log.Fatal(err)
    }

    file, err := os.Open(mfa_socket_file)
    if err != nil {
        log.Fatal(err)
    }
}
```

```

}

token := make([]byte, 6)

if _, err := file.Read(token); err != nil {
    log.Fatal(err)
}

file.Close()

    log.Fatal(err)
}

mfa_token := string(token)

token_params := &sts.GetSessionTokenInput{
    DurationSeconds: aws.Int64(900),
    SerialNumber:    aws.String(kms_mfa_id),
    TokenCode:      aws.String(mfa_token),
}

resp, err := svc.GetSessionToken(token_params)
if err != nil {
    if awsErr, ok := err.(awserr.Error); ok {
        // Prints out full error message, including original error if there was one.
        log.Fatal("Error:", awsErr.Error())
    } else {
        log.Fatal("Error:", err.Error())
    }
}

creds := resp.Credentials

os.Setenv("AWS_ACCESS_KEY_ID", *creds.AccessKeyId)
os.Setenv("AWS_SECRET_ACCESS_KEY", *creds.SecretAccessKey)
os.Setenv("AWS_SESSION_TOKEN", *creds.SessionToken)

execErr := syscall.Exec(cmd, args, os.Environ())
if execErr != nil {
    panic(execErr)
}
}

```

Disabling keys when not needed

Another possibility is to use the API to disable access to the master key and enable it only when a trusted administrator knows that the MariaDB service needs to be started. A specialized tool on a separate host could be used to enable the key for a very short period of time while the service starts and then quickly disable the key.

To do this, you can create an extra IAM User that can only use the kms:EnableKey and kms:DisableKey API endpoints for your key. This user will not be able to encrypt or decrypt any data using the key.

First, create a new user.

1. Load the IAM console at <https://console.aws.amazon.com/iam/>.
2. Click "Users" in the left-hand sidebar.
3. Click "Create New Users".
4. Enter a new user name. (The examples will use "MDBEncAdmin".)
5. Click "Show User Security Credentials".
6. Copy the credentials and put them in a `credentials` file with this structure:

```

[MDBEncAdmin]
aws_access_key_id=AKIAJMPPNO7EBKABCDEF
aws_secret_access_key=pVdGwbuK5/jG64aBK1oEJOXRlkdM0aAylgabCDef

```

7. Click "Close".
8. Click "Close" again if prompted.
9. Click the name of your new user to open the details view.
10. Copy the "User ARN" value for your user (for example "arn:aws:iam::551888181234:user/MDBEncAdmin"). You will need this for the next step.

Now, give the new user permission to perform API operations on your key.

1. Click "Encryption Keys" in the left-hand sidebar.
2. Click the name of your key to open the details view.
3. Click "Switch to policy view" if it is not already open. (The "policy view" is a large text field that contains JSON describing the key policy.)
4. Create a new item in the `Statement` array with this structure:

```
{
  "Sid": "Allow Enable and Disable of the key",
  "Effect": "Allow",
  "Principal": {
    "AWS": "arn:aws:iam::551888181234:user/MDBEncAdmin"
  },
  "Action": [
    "kms:EnableKey",
    "kms:DisableKey"
  ]
},
```

...so that your Key Policy looks like this:

```
{
  "Version": "2012-10-17",
  "Id": "key-consolepolicy-2",
  "Statement": [
    {
      "Sid": "Allow Enable and Disable of the key",
      "Effect": "Allow",
      "Principal": {
        ...
      }
    }
  ]
}
```

5. Click "Save Changes".

You've now added a new IAM user and you've given that user privileges to enable and disable your key. This user will be able to perform those operations using the AWS CLI or via a script of your own design using the AWS API. For example, using the [AWS CLI](#):

```
$ cat ~/.aws/credentials
[MDBEncAdmin]
aws_access_key_id=AKIAJMPNO7EBKABCDEF
aws_secret_access_key=pVdGwbuK5/jG64aBK1oEJOXRlkdM0aAylgabCDef

$ AWS_PROFILE=MDBEncAdmin aws --region us-east-1 kms disable-key --key-id arn:aws:kms:us-east-1:551888181234:key/abcdef8f6-084b-4cff-99ca-abcdef6c7907c
```

In order for MariaDB to start, this new user will have to enable the master key, then the DBA can start MariaDB, and this user can once again disable the master key after the service has started. Note that in this workflow, MariaDB will be unable to create new encryption keys, such as would be done when a user creates a table that refers to a non-existent key ID. The AWS KMS plugin will encounter an error if it tries to generate a new encryption key while the master key is disabled. In that scenario, the key administrator would have to enable the key before the operation could succeed. Here's what you should expect to see in the journal if MariaDB tries to interact with a disabled master key:

```
[ERROR] AWS KMS plugin : GenerateDataKeyWithoutPlaintext failed : DisabledException - Unable to parse ExceptionName: DisabledException Message: arn:aws:kms:us-east-1:551888181234:key/abcdef8f6-084b-4cff-99ca-abcdef6c7907c is disabled.
```

Adding MFA

It's also possible to add MFA to this technique so that the user that enables & disables the master key has to authenticate using an MFA device. Adapt the instructions in the MFA section above to add MFA to the policy section for the user with `EnableKey` and `DisableKeys` privileges, add an MFA device for that user, use Security Token Service (STS) to get temporary security credentials, and then use those credentials to make the API calls. Here's an example Python script that follows that workflow:

```
#!/usr/bin/env python

import boto3
import sys

# Command-line argument processing should be more robust than this...
action= sys.argv[1]
mfa_token= sys.argv[2]

# These should perhaps go into a config file instead of here
mfa_serial= 'arn:aws:iam::551888181234:mfa/MBEncAdmin'
key_id= 'arn:aws:kms:us-east-1:551888181234:key/abcd8f6-084b-4cff-99ca-abcdef6c7907c'

# Make the connection to the Security Token Service to get temporary credentials
token_client= boto3.client('sts')
token_response= token_client.get_session_token(
    DurationSeconds= 900,
    SerialNumber= mfa_serial,
    TokenCode= mfa_token
)

cred= token_response['Credentials']

# Start new session using temporary, MFA-authenticated credentials
kms_session= boto3.session.Session(
    aws_access_key_id= cred['AccessKeyId'],
    aws_secret_access_key= cred['SecretAccessKey'],
    aws_session_token= cred['SessionToken'],
    region_name= key_id.split(':')[3]
)

# Start KMS client and execute operation against key
kms_client= kms_session.client('kms')
if action == 'enable' or action == 'e':
    action_f= kms_client.enable_key
elif action == 'disable' or action == 'd':
    action_f= kms_client.disable_key
else:
    raise Exception('Action must be either "disable" or "enable"')

action_f(KeyId=key_id)
```

```
$ AWS_PROFILE=MBEncAdmin python kms-manage-key disable 575290
$ AWS_PROFILE=MBEncAdmin python kms-manage-key enable 799870
```

Logging and auditing

CloudTrail

Amazon's CloudTrail service creates JSON-formatted text log files for every API interaction. Enabling CloudTrail requires S3, which incurs additional fees.

First, enable CloudTrail and add a trail.

1. Load the CloudTrail console at <https://console.aws.amazon.com/cloudtrail/>.
2. If you've never used CloudTrail before, click "Get Started Now".
3. Enter a value for "trail name". This example uses "mariadb-encryption-key".
4. Create a new S3 bucket, using a globally unique name, or use an existing S3 bucket, according to your needs.
5. Click "Turn On".

If you navigate to the S3 bucket you created, you should find log files that contain JSON-formatted descriptions of your API interactions.

CloudWatch

Amazon's CloudWatch service allows you to create alarms and event rules that monitor log information.

First, send your CloudTrail logs to CloudWatch.

1. Load the CloudTrail console at <https://console.aws.amazon.com/cloudtrail/>.

2. Click "Trails" in the left-hand navigation sidebar.
3. Click the name of your trail to open the Configuration view.
4. In the "CloudWatch Logs" section, click "Configure".
5. Click "Continue".
6. Click "Allow".

Now, set up an SNS topic to facilitate email notifications.

1. Open <https://console.aws.amazon.com/sns/>.
2. *Make sure the region in the console (look in the upper-right corner) is the same as the region where you created your key!*
3. Click "Get Started" is prompted.
4. Click "Events" in the left-hand sidebar.
5. Click "Create new topic".
6. Enter a *Topic name* of your choosing.
7. Enter a *Display name* of your choosing.
8. Click "Create topic".
9. Click the ARN of your new SNS topic.
10. Click "Create Subscription".
11. Select "Email" from the Protocol dropdown.
12. Enter the desired notification email address in the Endpoint field.
13. Wait for the confirmation email to show up and follow the instructions.

Now, configure CloudWatch and create an Event Rule.

1. Open <https://console.aws.amazon.com/cloudwatch/>.
2. *Make sure the region in the console (look in the upper-right corner) is the same as the region where you created your key and your SNS topic!*
3. Click "Events" in the left-hand sidebar.
4. Click "Create rule".
5. Choose "AWS API call" from the "Select event source" dropdown.
6. Choose "KMS" from the "Service name" dropdown.
7. Decide which operations should trigger the event. (You can eep "Any operation" selected for simplicity.)
8. Click "Add target".
9. Select "SNS target" from the dropdown.
10. Select the SNS topic you created in the previous steps.
11. Click "Configure details".
12. Enter a *Name* and *Description* of your choosing.
13. Click "Create rule".

You should now get emails any time someone executes API calls on the KMS service in the region where you've created the CloudWatch Event rule. That means you should get email any time the key is enabled or disabled, and any time the AWS KMS plugin generates new keys or decrypts the keys stored on disk on the MariaDB server.

You may also wish to create an event rule (or an additional event) that matches only when an unauthorized user tries to access the key. You might accomplish that by manually editing the Event selector of the rule to look something like this:

```
{
  "detail-type": [
    "AWS API Call via CloudTrail"
  ],
  "detail": {
    "eventSource": [
      "kms.amazonaws.com"
    ],
    "errorCode": [
      "AccessDenied",
      "UnauthorizedOperation"
    ]
  }
}
```

The emails are formatted as JSON. Further customization of the CloudWatch email workflow is beyond the scope of this document.

There are many other workflows available using CloudWatch, including workflows with alarms and dashboards. Those are beyond the scope of this document.

5.4.8.7 Eperi Key Management Encryption

Plugin

Eperi's Key Management Plugin Package no longer appears to be available.

11. [Options](#)
 1. [eperi_key_management_plugin](#)

MariaDB's [data-at-rest encryption](#) requires the use of a [key management and encryption plugin](#). These plugins are responsible both for the management of encryption keys and for the actual encryption and decryption of data.

MariaDB supports the use of [multiple encryption keys](#). Each encryption key uses a 32-bit integer as a key identifier. If the specific plugin supports [key rotation](#), then encryption keys can also be rotated, which creates a new version of the encryption key.

The Eperi Key Management plugin is a [key management and encryption plugin](#) that integrates with [eperi Gateway for Databases](#).

Overview

The Eperi Key Management plugin is one of the [key management and encryption plugins](#) that can be set up for users who want to use [data-at-rest encryption](#). Some of the plugin's primary features are:

- It reads encryption keys from [eperi Gateway for Databases](#).
- It supports multiple encryption keys.
- It supports key rotation.
- It supports two different algorithms for encrypting data.

The [eperi Gateway for Databases](#) stores encryption keys on the key server outside of the database server itself, which provides an extra level of security. The [eperi Gateway for Databases](#) also supports performing all data encryption operations on the key server as well, but this is optional.

It also provides the following benefits:

- Key management outside the database
- No keys on database server hard disk
- Graphical user interface for configuration
- Encryption and decryption outside the database, supporting HSM's for maximum security.

Support for MariaDB is provided in [eperi Gateway for Databases 3.4](#).

Installing the Eperi Key Management Plugin's Package

For information on how to install the package, see Eperi's documentation at the [Eperi Customer Portal](#).

Installing the Plugin

Even after the package that contains the plugin's shared library is installed on the operating system, the plugin is not actually installed by MariaDB by default. The plugin can be installed by providing the `--plugin-load` or the `--plugin-load-add`

options. This can be specified as a command-line argument to `mysqld` or it can be specified in a relevant server [option group](#) in an [option file](#). For example:

```
[mariadb]
...
plugin_load_add = eperi_key_management_plugin
```

Uninstalling the Plugin

Before you uninstall the plugin, you should ensure that [data-at-rest encryption](#) is completely disabled, and that MariaDB no longer needs the plugin to decrypt tables or other files.

You can uninstall the plugin dynamically by executing `UNINSTALL SONAME` or `UNINSTALL PLUGIN`. For example:

```
UNINSTALL SONAME 'eperi_key_management_plugin';
```

If you installed the plugin by providing the `--plugin-load` or the `--plugin-load-add` options in a relevant server [option group](#) in an [option file](#), then those options should be removed to prevent the plugin from being loaded the next time the server is restarted.

Configuring the Eperi Key Management Plugin

For information on how to configure the plugin, see Eperi's documentation at the [Eperi Customer Portal](#).

Using the Eperi Key Management Plugin

Once the Eperi Key Management Plugin is enabled, you can use it by creating an encrypted table:

```
CREATE TABLE t (i int) ENGINE=InnoDB ENCRYPTED=YES
```

Now, table `t` will be encrypted using the encryption key from the key server.

For more information on how to use encryption, see [Data at Rest Encryption](#).

Using Multiple Encryption Keys

The Eperi Key Management Plugin supports [using multiple encryption keys](#). Each encryption key can be defined with a different 32-bit integer as a key identifier.

When [encrypting InnoDB tables](#), the key that is used to encrypt tables [can be changed](#).

When [encrypting Aria tables](#), the key that is used to encrypt tables [cannot currently be changed](#).

Key Rotation

The Eperi Key Management plugin supports [key rotation](#).

Versions

Version	Status	Introduced
1.0	Unknown	eperi Gateway for Databases 3.4.0

System Variables

`eperi_key_management_plugin_databaseId`

- **Description:** Determines the database ID which is processed in the eperi Gateway.
- **Commandline:** `--eperi-key-management-plugin-databaseid=value`
- **Scope:** Global
- **Dynamic:** No

- **Data Type:** `integer`
 - **Default Value:** `1`
-

`eperi_key_management_plugin_encryption_algorithm`

- **Description:** This system variable is used to determine which algorithm the plugin will use to encrypt data.
 - The recommended algorithm is `AES_CTR`, but this algorithm is only available when MariaDB is built with recent versions of [OpenSSL](#). If the server is built with [wolfSSL](#) or [yaSSL](#), then this algorithm is not available. See [TLS and Cryptography Libraries Used by MariaDB](#) for more information about which libraries are used on which platforms.
 - **Commandline:** `--eperi-key-management-plugin-encryption-algorithm=value`
 - **Scope:** Global
 - **Dynamic:** No
 - **Data Type:** `enumerated`
 - **Default Value:** `AES_CBC`
 - **Valid Values:** `AES_CBC`, `AES_CTR`
-

`eperi_key_management_plugin_encryption_mode`

- **Description:** Encryption mode.
 - **Commandline:** `--eperi-key-management-plugin-encryption-mode=value`
 - **Scope:** Global
 - **Dynamic:** No
 - **Data Type:** `enumerated`
 - **Default Value:** `database`
 - **Valid Values:** `database`, `gateway`
-

`eperi_key_management_plugin_osslmt`

- **Description:** Determines, whether the plugin should register callback functions for OpenSSL thread support.
 - **Commandline:** `--eperi-key-management-plugin-osslmt=value`
 - **Scope:** Global
 - **Dynamic:** No
 - **Data Type:** `boolean`
 - **Default Value:** `0` (Linux), `1` (Windows)
-

`eperi_key_management_plugin_port`

- **Description:** Listener port for plugin.
 - **Commandline:** `--eperi-key-management-plugin-port=value`
 - **Scope:** Global
 - **Dynamic:** No
 - **Data Type:** `integer`
 - **Default Value:** `14332`
-

`eperi_key_management_plugin_url`

- **Description:** URL to key server. The expected format of the URL is `<host>[:<port>]`. The port number is optional, and the port number defaults to `14333` if it is not specified.
 - **Commandline:** `--eperi-key-management-plugin-url=value`
 - **Scope:** Global
 - **Dynamic:** No
 - **Data Type:** `string`
 - **Default Value:** `NULL`
-

`eperi_key_management_plugin_url_check_disabled`

- **Description:** Determines, whether the connection between plugin and eperi Gateway is tested at server startup.
- **Commandline:** `--eperi-key-management-plugin-url-check-disabled=value`
- **Scope:** Global
- **Dynamic:** No
- **Data Type:** `boolean`
- **Default Value:** `1`

Options

`eperi_key_management_plugin`

- **Description:** Controls how the server should treat the plugin when the server starts up.
 - Valid values are:
 - `OFF` - Disables the plugin without removing it from the `mysql.plugins` table.
 - `ON` - Enables the plugin. If the plugin cannot be initialized, then the server will still continue starting up, but the plugin will be disabled.
 - `FORCE` - Enables the plugin. If the plugin cannot be initialized, then the server will fail to start with an error.
 - `FORCE_PLUS_PERMANENT` - Enables the plugin. If the plugin cannot be initialized, then the server will fail to start with an error. In addition, the plugin cannot be uninstalled with `UNINSTALL SONAME` or `UNINSTALL PLUGIN` while the server is running.
 - See [Plugin Overview: Configuring Plugin Activation at Server Startup](#) for more information.
- **Commandline:** `--eperi-key-management-plugin=value`
- **Data Type:** `enumerated`
- **Default Value:** `ON`
- **Valid Values:** `OFF`, `ON`, `FORCE`, `FORCE_PLUS_PERMANENT`

5.4.8.8 Encryption Plugin API

Contents

1. [Encryption Plugin API](#)

MariaDB's [data-at-rest encryption](#) requires the use of a [key management and encryption plugin](#). These plugins are responsible both for the management of encryption keys and for the actual encryption and decryption of data.

MariaDB supports the use of [multiple encryption keys](#). Each encryption key uses a 32-bit integer as a key identifier. If the specific plugin supports [key rotation](#), then encryption keys can also be rotated, which creates a new version of the encryption key.

See [Data at Rest Encryption](#) and [Encryption Key Management](#) for more information.

Encryption Plugin API

The Encryption plugin API was created to allow a plugin to:

- implement key management, provide encryption keys to the server on request and change them according to internal policies.
- implement actual data encryption and decryption with the algorithm defined by the plugin.

This is how the API reflects that:

```
/* Returned from get_latest_key_version() */
#define ENCRYPTION_KEY_VERSION_INVALID (~(unsigned int)0)
```

```

#define ENCRYPTION_KEY_NOT_ENCRYPTED (0)

#define ENCRYPTION_KEY_SYSTEM_DATA 1
#define ENCRYPTION_KEY_TEMPORARY_DATA 2

/* Returned from get_key() */
#define ENCRYPTION_KEY_BUFFER_TOO_SMALL (100)

#define ENCRYPTION_FLAG_DECRYPT 0
#define ENCRYPTION_FLAG_ENCRYPT 1
#define ENCRYPTION_FLAG_NOPAD 2

struct st_mariadb_encryption {
    int interface_version; /**< version plugin uses */

    /***** KEY MANAGEMENT *****/

    /**
     * Function returning latest key version for a given key id.
     *
     * @return A version or ENCRYPTION_KEY_VERSION_INVALID to indicate an error.
     */
    unsigned int (*get_latest_key_version)(unsigned int key_id);

    /**
     * Function returning a key for a key version
     *
     * @param key_id      The requested key id
     * @param version     The requested key version
     * @param key         The key will be stored there. Can be NULL -
                       in which case no key will be returned
     * @param key_length in: key buffer size
                       out: the actual length of the key
     *
     * This method can be used to query the key length - the required
     * buffer size - by passing key==NULL.
     *
     * If the buffer size is less than the key length the content of the
     * key buffer is undefined (the plugin is free to partially fill it with
     * the key data or leave it untouched).
     *
     * @return 0 on success, or
     *         ENCRYPTION_KEY_VERSION_INVALID, ENCRYPTION_KEY_BUFFER_TOO_SMALL
     *         or any other non-zero number for errors
     */
    unsigned int (*get_key)(unsigned int key_id, unsigned int version,
                           unsigned char *key, unsigned int *key_length);

    /***** ENCRYPTION *****/
    /**
     * The caller uses encryption as follows:
     * 1. Create the encryption context object of the crypt_ctx_size() bytes.
     * 2. Initialize it with crypt_ctx_init().
     * 3. Repeat crypt_ctx_update() until there are no more data to encrypt.
     * 4. Write the remaining output bytes and destroy the context object
     *    with crypt_ctx_finish().
     */

    /**
     * Returns the size of the encryption context object in bytes
     */
    unsigned int (*crypt_ctx_size)(unsigned int key_id, unsigned int key_version);

    /**
     * Initializes the encryption context object.
     */
    int (*crypt_ctx_init)(void *ctx, const unsigned char *key, unsigned int klen,
                        const unsigned char *iv, unsigned int ivlen, int flags,
                        unsigned int key_id, unsigned int key_version);

    /**
     * Processes (encrypts or decrypts) a chunk of data
     *
     * Writes the output to th dst buffer. note that it might write
     * more bytes that were in the input. or less. or none at all.
     */
    int (*crypt_ctx_update)(void *ctx, const unsigned char *src,

```

```

        unsigned int slen, unsigned char *dst,
        unsigned int *dlen);

/**
 * Writes the remaining output bytes and destroys the encryption context
 *
 * crypt_ctx_update might've cached part of the output in the context,
 * this method will flush these data out.
 */
int (*crypt_ctx_finish)(void *ctx, unsigned char *dst, unsigned int *dlen);
/**
 * Returns the length of the encrypted data
 *
 * It returns the exact length, given only the source length.
 * Which means, this API only supports encryption algorithms where
 * the length of the encrypted data only depends on the length of the
 * input (a.k.a. compression is not supported).
 */
unsigned int (*encrypted_length)(unsigned int slen, unsigned int key_id,
                                unsigned int key_version);
};

```

The first method is used for key rotation. A plugin that doesn't support key rotation — for example, **file_key_management** — can return a fixed version for any valid key id. Note that it still has to return an error for an invalid key id. The version `ENCRYPTION_KEY_NOT_ENCRYPTED` means that the data should not be encrypted.

The second method is used for key management, the server uses it to retrieve the key corresponding to a specific key identifier and a specific key version.

The last five methods deal with encryption. Note that they take the key to use and key identifier and version. This is needed because the server can derive a session-specific, user-specific, or a tablespace-specific key from the original encryption key as returned by `get_key()`, so the `key` argument doesn't have to match the encryption key as the plugin knows it. On the other hand, the encryption algorithm may depend on the key identifier and version (and in the **example_key_management** plugin it does) so the plugin needs to know them to be able to encrypt the data.

Encryption methods are optional — if unset (as in the **debug_key_management** plugin), the server will fall back to `AES_CBC`.

Current Encryption Plugins

The MariaDB source tree has four encryption plugins. All these plugins are fairly simple and can serve as good examples of the Encryption plugin API.

file_key_management

It reads encryption keys from a plain-text file. It supports two different encryption algorithms. It supports multiple encryption keys. It does not support key rotation. See the [File Key Management Plugin](#) article for more details.

Versions

Version	Status	Introduced
1.0	Stable	MariaDB 10.1.18
1.0	Gamma	MariaDB 10.1.13
1.0	Alpha	MariaDB 10.1.3

aws_key_management

The AWS Key Management plugin uses the [Amazon Web Services \(AWS\) Key Management Service \(KMS\)](#) to generate and store AES keys on disk, in encrypted form, using the Customer Master Key (CMK) kept in AWS KMS. When MariaDB Server starts, the plugin will decrypt the encrypted keys, using the AWS KMS "Decrypt" API function. MariaDB data will then be encrypted and decrypted using the AES key. It supports multiple encryption keys. It supports key rotation.

See the [AWS Key Management Plugin](#) article for more details.

Versions

Version	Status	Introduced
---------	--------	------------

1.0	Stable	MariaDB 10.2.6 , MariaDB 10.1.24
1.0	Beta	MariaDB 10.1.18
1.0	Experimental	MariaDB 10.1.13

example_key_management

Uses random time-based generated keys, ignores key identifiers, supports key versions and key rotation. Uses AES_ECB and AES_CBC as encryption algorithms and changes them automatically together with key versions.

Versions

Version	Status	Introduced
1.0	Experimental	MariaDB 10.1.3

debug_key_management

Key is generated from the version, user manually controls key rotation. Only supports key identifier 1, uses only AES_CBC.

Versions

Version	Status	Introduced
1.0	Experimental	MariaDB 10.1.3

Encryption Service

Encryption is generally needed on the very low level **inside the storage engine**. That is, the storage engine needs to support encryption and have access to the encryption and key management functionality. The usual way for a plugin to access some functionality in the server is via a *service*. In this case the server provides the Encryption Service for storage engines (and other interested plugins) to use. These service functions are directly hooked into encryption plugin methods (described above).

Service functions are declared as follows:

```
unsigned int encryption_key_get_latest_version(unsigned int key_id);
unsigned int encryption_key_get(unsigned int key_id, unsigned int key_version,
                               unsigned char *buffer, unsigned int *length);
unsigned int encryption_ctx_size(unsigned int key_id, unsigned int key_version);
int encryption_ctx_init(void *ctx, const unsigned char *key, unsigned int klen,
                      const unsigned char *iv, unsigned int ivlen, int flags,
                      unsigned int key_id, unsigned int key_version);
int encryption_ctx_update(void *ctx, const unsigned char *src,
                        unsigned int slen, unsigned char *dst,
                        unsigned int *dlen);
int encryption_ctx_finish(void *ctx, unsigned char *dst, unsigned int *dlen);
unsigned int encryption_encrypted_length(unsigned int slen, unsigned int key_id,
                                       unsigned int key_version);
```

There are also convenience helpers to check for a key or key version existence and to encrypt or decrypt a block of data with one function call.

```
unsigned int encryption_key_id_exists(unsigned int id);
unsigned int encryption_key_version_exists(unsigned int id,
                                         unsigned int version);
int encryption_crypt(const unsigned char *src, unsigned int slen,
                   unsigned char *dst, unsigned int *dlen,
                   const unsigned char *key, unsigned int klen,
                   const unsigned char *iv, unsigned int ivlen, int flags,
                   unsigned int key_id, unsigned int key_version);
```

5.4.9 MariaDB Replication & Cluster Plugins

Semisynchronous Replication

Semisynchronous replication.

WSREP_INFO Plugin

Adds two new Information Schema tables, WSREP_MEMBERSHIP and WSREP_STATUS.

3.1.25 Semisynchronous Replication

5.4.9.2 WSREP_INFO Plugin

The `WSREP_INFO` plugin library contains the following plugins:

- `WSREP_MEMBERSHIP`
- `WSREP_STATUS`

The `WSREP_MEMBERSHIP` plugin creates the `WSREP_MEMBERSHIP` table in the `INFORMATION_SCHEMA` database. The plugin also adds the `SHOW WSREP_MEMBERSHIP` statement.

The `WSREP_STATUS` plugin creates the `WSREP_STATUS` table in the `INFORMATION_SCHEMA` database. The plugin also adds the `SHOW WSREP_STATUS` statement.

These tables and statements provide information about Galera. Only users with the `SUPER` privilege can access this information.

Contents

1. [Installing the Plugin](#)
2. [Uninstalling the Plugin](#)
3. [Example](#)
4. [Versions](#)
5. [Options](#)
 1. [wsrep_membership](#)
 2. [wsrep_status](#)

Installing the Plugin

Although the plugin's shared library is distributed with MariaDB by default, the plugin is not actually installed by MariaDB by default. There are two methods that can be used to install the plugin with MariaDB.

The first method can be used to install the plugin without restarting the server. You can install the plugin dynamically by executing `INSTALL SONAME` or `INSTALL PLUGIN`. For example:

```
INSTALL SONAME 'wsrep_info';
```

The second method can be used to tell the server to load the plugin when it starts up. The plugin can be installed this way by providing the `--plugin-load` or the `--plugin-load-add` options. This can be specified as a command-line argument to `mysql` or it can be specified in a relevant server `option group` in an `option file`. For example:

```
[mariadb]
...
plugin_load_add = wsrep_info
```

Uninstalling the Plugin

You can uninstall the plugin dynamically by executing `UNINSTALL SONAME` or `UNINSTALL PLUGIN`. For example:

```
UNINSTALL SONAME 'wsrep_info';
```

If you installed the plugin by providing the `--plugin-load` or the `--plugin-load-add` options in a relevant server `option group` in an `option file`, then those options should be removed to prevent the plugin from being loaded the next time the server is restarted.

Example

```
SHOW TABLES FROM information_schema LIKE 'WSREP%';
```

```
+-----+
| Tables_in_information_schema (WSREP%) |
+-----+
| WSREP_STATUS                          |
| WSREP_MEMBERSHIP                      |
+-----+
```

Versions

Version	Status	Introduced
1.0	Stable	MariaDB 10.1.18 
1.0	Gamma	MariaDB 10.1.13 
1.0	Alpha	MariaDB 10.1.2 

Options

wsrep_membership

- **Description:** Controls how the server should treat the plugin when the server starts up.
 - Valid values are:
 - `OFF` - Disables the plugin without removing it from the [mysql.plugins](#) table.
 - `ON` - Enables the plugin. If the plugin cannot be initialized, then the server will still continue starting up, but the plugin will be disabled.
 - `FORCE` - Enables the plugin. If the plugin cannot be initialized, then the server will fail to start with an error.
 - `FORCE_PLUS_PERMANENT` - Enables the plugin. If the plugin cannot be initialized, then the server will fail to start with an error. In addition, the plugin cannot be uninstalled with [UNINSTALL SONAME](#) or [UNINSTALL PLUGIN](#) while the server is running.
 - See [Plugin Overview: Configuring Plugin Activation at Server Startup](#) for more information.
- **Commandline:** `--wsrep-membership=value`
- **Data Type:** `enumerated`
- **Default Value:** `ON`
- **Valid Values:** `OFF`, `ON`, `FORCE`, `FORCE_PLUS_PERMANENT`

wsrep_status

- **Description:** Controls how the server should treat the plugin when the server starts up.
 - Valid values are:
 - `OFF` - Disables the plugin without removing it from the [mysql.plugins](#) table.
 - `ON` - Enables the plugin. If the plugin cannot be initialized, then the server will still continue starting up, but the plugin will be disabled.
 - `FORCE` - Enables the plugin. If the plugin cannot be initialized, then the server will fail to start with an error.
 - `FORCE_PLUS_PERMANENT` - Enables the plugin. If the plugin cannot be initialized, then the server will fail to start with an error. In addition, the plugin cannot be uninstalled with [UNINSTALL SONAME](#) or [UNINSTALL PLUGIN](#) while the server is running.
 - See [Plugin Overview: Configuring Plugin Activation at Server Startup](#) for more information.
- **Commandline:** `--wsrep-status=value`
- **Data Type:** `enumerated`
- **Default Value:** `ON`
- **Valid Values:** `OFF`, `ON`, `FORCE`, `FORCE_PLUS_PERMANENT`

5.3 Storage Engines

5.4.11 Other Plugins

Compression Plugins

Five MariaDB compression libraries are available as plugins.

Disks Plugin

Shows metadata about disks on the system.

Feedback Plugin

Collect and send user statistics.

Locales Plugin

List compiled-in locales.

METADATA_LOCK_INFO Plugin

Active metadata locks.

MYSQL_JSON

Converting MySQL's JSON data type to MariaDB's format.

Query Cache Information Plugin

Examines the contents of the query cache.

Query Response Time Plugin

Records statistics on the time to execute queries on MariaDB Server.

SQL Error Log Plugin

Records SQL-level errors to a log file.

User Statistics

User Statistics.

User Variables Plugin

User Variables plugin.

There are [1 related questions](#).

5.4.11.1 Feedback Plugin

The `feedback` plugin is designed to collect and, optionally, upload configuration and usage information to MariaDB.org or to any other configured URL.

Contents

1. [Verifying the Plugin's Status](#)
2. [Installing the Plugin](#)
3. [Uninstalling the Plugin](#)
4. [Enabling the Plugin](#)
5. [Collecting Data](#)
6. [Sending Data](#)
7. [Versions](#)
8. [System Variables](#)
 1. [feedback_http_proxy](#)
 2. [feedback_send_retry_wait](#)
 3. [feedback_send_timeout](#)
 4. [feedback_server_uid](#)
 5. [feedback_url](#)
 6. [feedback_user_info](#)
9. [Options](#)
 1. [feedback](#)

The `feedback` plugin exists in all MariaDB versions.

MariaDB is usually distributed with this plugin included, but it is not enabled by default. On Windows, this plugin is part of the server and has a special checkbox in the installer window. Either way, you need to explicitly install and enable it in order for feedback data to be sent.

Verifying the Plugin's Status

To verify whether the `feedback` plugin is installed and enabled, execute the `SHOW PLUGINS` statement or query the `information_schema.plugins` table.

Usually, the plugin is installed in MariaDB by default:

```
SELECT plugin_status FROM information_schema.plugins
WHERE plugin_name = 'feedback';
+-----+
| plugin_status |
+-----+
| DISABLED      |
+-----+
```

See [Enabling the Plugin](#).

If that `SELECT` returns no rows, then you still need to [install the plugin](#).

When the plugin is installed and enabled, you will see:

```
SELECT plugin_status FROM information_schema.plugins
WHERE plugin_name = 'feedback';
+-----+
| plugin_status |
+-----+
| ACTIVE        |
+-----+
```

Installing the Plugin

In some releases, the plugin's shared library is distributed with MariaDB by default, but the plugin is not actually installed by MariaDB. There are two methods that can be used to install the plugin with MariaDB.

The first method can be used to install the plugin without restarting the server. You can install the plugin dynamically by executing `INSTALL SONAME` or `INSTALL PLUGIN`. For example:

```
INSTALL SONAME 'feedback';
```

The second method can be used to tell the server to load the plugin when it starts up. The plugin can be installed this way by providing the `--plugin-load` or the `--plugin-load-add` options. This can be specified as a command-line argument to `mysqld` or it can be specified in a relevant server `option group` in an `option file`. For example:

```
[mariadb]
...
plugin_load_add = feedback
```

Uninstalling the Plugin

You can uninstall the plugin dynamically by executing `UNINSTALL SONAME` or `UNINSTALL PLUGIN`. For example:

```
UNINSTALL SONAME 'feedback';
```

If you installed the plugin by providing the `--plugin-load` or the `--plugin-load-add` options in a relevant server `option group` in an `option file`, then those options should be removed to prevent the plugin from being loaded the next time the server is restarted.

Enabling the Plugin

You can enable the plugin by setting the `feedback` option to `ON` in a relevant server `option group` in an `option file`. For example:

```
[mariadb]
...
feedback=ON
```

In Windows, the plugin can also be enabled during a new [MSI](#) installation. The MSI GUI installation provides the "Enable feedback plugin" checkbox to enable the plugin. The MSI command-line installation provides the `FEEDBACK=1` command-line option to enable the plugin.

See the next section for how to verify the plugin is installed and active and (if needed) install the plugin.

Collecting Data

The `feedback` plugin will collect:

- Certain rows from [SHOW STATUS](#) and [SHOW VARIABLES](#).
- All installed [plugins](#) and their versions.
- System information such as CPU count, memory, architecture, and OS/linux distribution.
- The `feedback_server_uid`, which is a SHA1 hash of the MAC address of the first network interface and the TCP port that the server listens on.

The `feedback` plugin creates the `FEEDBACK` table in the `INFORMATION_SCHEMA` database. To see the data that has been collected by the plugin, you can execute:

```
SELECT * FROM information_schema.feedback;
```

Only the contents of this table are sent to the `feedback_url`.

MariaDB stores collation usage statistics. Each collation that has been used by the server will have a record in "SELECT * FROM information_schema.feedback" output, for example:

```
+-----+-----+
| VARIABLE_NAME                | VARIABLE_VALUE |
+-----+-----+
| Collation used utf8_unicode_ci | 10              |
| Collation used latin1_general_ci | 20              |
+-----+-----+
```

Collations that have not been used will not be included into the result.

Sending Data

The `feedback` plugin sends the data using a `POST` request to any URL or a list of URLs that you specify by setting the `feedback_url` system variable. By default, this is set to the following URL:

- https://mariadb.org/feedback_plugin/post

Both HTTP and HTTPS protocols are supported.

If HTTP traffic requires a proxy in your environment, then you can specify the proxy by setting the `feedback_http_proxy` system variable.

If the `feedback_url` system variable is not set to an empty string, then the plugin will automatically send a report to all URLs in the list a few minutes after the server starts up and then once a week after that.

If the `feedback_url` system variable is set to an empty string, then the plugin will **not** automatically send any data. This may be necessary if outbound HTTP communication from your database server is not permitted. In this case, you can still upload the data manually, if you'd like.

First, generate the report file with the MariaDB command-line `mariadb` client:

```
$ mariadb -e 'select * from information_schema.feedback' > report.txt
```

Then you can upload the generated `report.txt` [here](#) using your web browser.

Or you can do it from the command line with tools such as `curl`. For example:

```
$ curl -F [email protected] https://mariadb.org/feedback_plugin/post
```

Manual uploading allows you to be absolutely sure that we receive only the data shown in the `INFORMATION_SCHEMA.FEEDBACK` table and that no private or sensitive information is being sent.

Versions

Version	Status	Introduced
1.1	Stable	MariaDB 10.0.10
1.1	Beta	MariaDB 5.5.20 , MariaDB 5.3.3

System Variables

`feedback_http_proxy`

- **Description:** Proxy server for use when http calls cannot be made, such as in a firewall environment. The format is `host:port`.
 - **Commandline:** `--feedback-http=proxy=value`
 - **Read-only:** Yes
 - **Data Type:** string
 - **Default Value:** '' (empty)
-

`feedback_send_retry_wait`

- **Description:** Time in seconds before retrying if the plugin failed to send the data for any reason.
 - **Commandline:** `--feedback-send-retry-wait=#`
 - **Scope:** Global
 - **Dynamic:** Yes
 - **Data Type:** numeric
 - **Default Value:** 60
 - **Valid Values:** 1 to 86400
-

`feedback_send_timeout`

- **Description:** An attempt to send the data times out and fails after this many seconds.
 - **Commandline:** `--feedback-send-timeout=#`
 - **Scope:** Global
 - **Dynamic:** Yes
 - **Data Type:** numeric
 - **Default Value:** 60
 - **Valid Values:** 1 to 86400
-

`feedback_server_uid`

- **Description:** Automatically calculated server unique id hash.
 - **Scope:** Global
 - **Dynamic:** No
 - **Data Type:** string
-

`feedback_url`

- **Description:** URL to which the data is sent. More than one URL, separated by spaces, can be specified. Set it to an empty string to disable data sending.
 - **Commandline:** `--feedback-url=url`
 - **Scope:** Global
 - **Dynamic:** No
 - **Data Type:** string
 - **Default Value:** https://mariadb.org/feedback_plugin/post
-

`feedback_user_info`

- **Description:** The value of this option is not used by the plugin, but it is included in the feedback data. It can be used to add any user-specified string to the report. This could be used to help to identify it. For example, a support contract

number, or a computer name (if you collect reports internally by specifying your own `feedback-url`).

- **Commandline:** `--feedback-user-info=string`
- **Scope:** Global
- **Dynamic:** No
- **Data Type:** string
- **Default Value:** Empty string

Options

feedback

- **Description:** Controls how the server should treat the plugin when the server starts up.
 - Valid values are:
 - `OFF` - Disables the plugin without removing it from the [mysql.plugins](#) table.
 - `ON` - Enables the plugin. If the plugin cannot be initialized, then the server will still continue starting up, but the plugin will be disabled.
 - `FORCE` - Enables the plugin. If the plugin cannot be initialized, then the server will fail to start with an error.
 - `FORCE_PLUS_PERMANENT` - Enables the plugin. If the plugin cannot be initialized, then the server will fail to start with an error. In addition, the plugin cannot be uninstalled with [UNINSTALL SONAME](#) or [UNINSTALL PLUGIN](#) while the server is running.
 - See [Plugin Overview: Configuring Plugin Activation at Server Startup](#) for more information.
- **Commandline:** `--feedback=value`
- **Data Type:** `enumerated`
- **Default Value:** `ON`
- **Valid Values:** `OFF`, `ON`, `FORCE`, `FORCE_PLUS_PERMANENT`

5.4.11.2 Locales Plugin

The `LOCALES` plugin creates the `LOCALES` table in the `INFORMATION_SCHEMA` database. The plugin also adds the `SHOW LOCALES` statement. The table and statement can be queried to see all [locales](#) that are compiled into the server.

Contents

1. [Installing the Plugin](#)
2. [Uninstalling the Plugin](#)
3. [Example](#)
4. [Versions](#)
5. [Options](#)
 1. [locales](#)

Installing the Plugin

Although the plugin's shared library is distributed with MariaDB by default, the plugin is not actually installed by MariaDB by default. There are two methods that can be used to install the plugin with MariaDB.

The first method can be used to install the plugin without restarting the server. You can install the plugin dynamically by executing [INSTALL SONAME](#) or [INSTALL PLUGIN](#). For example:

```
INSTALL SONAME 'locales';
```

The second method can be used to tell the server to load the plugin when it starts up. The plugin can be installed this way by providing the `--plugin-load` or the `--plugin-load-add` options. This can be specified as a command-line argument to [mysql](#) or it can be specified in a relevant server [option group](#) in an [option file](#). For example:

```
[mariadb]
...
plugin_load_add = locales
```

Uninstalling the Plugin

You can uninstall the plugin dynamically by executing `UNINSTALL SONAME 'locales'` or `UNINSTALL PLUGIN`. For example:

```
UNINSTALL SONAME 'locales';
```

If you installed the plugin by providing the `--plugin-load` or the `--plugin-load-add` options in a relevant server [option group](#) in an [option file](#), then those options should be removed to prevent the plugin from being loaded the next time the server is restarted.

Example

```
SELECT * FROM INFORMATION_SCHEMA.LOCALES;
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| ID | NAME | DESCRIPTION | MAX_MONTH_NAME_LENGTH |
MAX_DAY_NAME_LENGTH | DECIMAL_POINT | THOUSAND_SEP | ERROR_MESSAGE_LANGUAGE |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| 0 | en_US | English - United States | 9 |
9 | . | | , | | english |
| 1 | en_GB | English - United Kingdom | 9 |
9 | . | | , | | english |
| 2 | ja_JP | Japanese - Japan | 3 |
3 | . | | , | | japanese |
| 3 | sv_SE | Swedish - Sweden | 9 |
7 | , | | | | swedish |
| 4 | de_DE | German - Germany | 9 |
10 | , | | . | | german |
| 5 | fr_FR | French - France | 9 |

| 107 | sv_FI | Swedish - Finland | 9 |
7 | , | | | | swedish |
| 108 | zh_HK | Chinese - Hong Kong SAR | 3 |
3 | . | | , | | english |
| 109 | el_GR | Greek - Greece | 11 |
9 | , | | . | | greek |
| 110 | rm_CH | Romansh - Switzerland | 9 |
9 | , | | . | | english |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
```

Versions

Version	Status	Introduced
1.0	Stable	MariaDB 10.1.13
1.0	Gamma	MariaDB 10.0.10
1.0	Alpha	MariaDB 10.0.4

Options

locales

- **Description:** Controls how the server should treat the plugin when the server starts up.
 - Valid values are:
 - `OFF` - Disables the plugin without removing it from the `mysql.plugins` table.
 - `ON` - Enables the plugin. If the plugin cannot be initialized, then the server will still continue starting up,

but the plugin will be disabled.

- `FORCE` - Enables the plugin. If the plugin cannot be initialized, then the server will fail to start with an error.
 - `FORCE_PLUS_PERMANENT` - Enables the plugin. If the plugin cannot be initialized, then the server will fail to start with an error. In addition, the plugin cannot be uninstalled with `UNINSTALL SONAME` or `UNINSTALL PLUGIN` while the server is running.
 - See [Plugin Overview: Configuring Plugin Activation at Server Startup](#) for more information.
- **Commandline:** `--locales=value`
 - **Data Type:** `enumerated`
 - **Default Value:** `ON`
 - **Valid Values:** `OFF`, `ON`, `FORCE`, `FORCE_PLUS_PERMANENT`

5.4.11.3 METADATA_LOCK_INFO Plugin

The `METADATA_LOCK_INFO` plugin creates the `METADATA_LOCK_INFO` table in the `INFORMATION_SCHEMA` database. This table shows active [metadata locks](#). The table will be empty if there are no active metadata locks.

Contents

1. [Installing the Plugin](#)
2. [Uninstalling the Plugin](#)
3. [Examples](#)
 1. [Viewing all Metadata Locks](#)
 2. [Matching Metadata Locks with Threads and Queries](#)
4. [Versions](#)
5. [Options](#)
 1. [metadata_lock_info](#)

Installing the Plugin

Although the plugin's shared library is distributed with MariaDB by default, the plugin is not actually installed by MariaDB by default. There are two methods that can be used to install the plugin with MariaDB.

The first method can be used to install the plugin without restarting the server. You can install the plugin dynamically by executing `INSTALL SONAME` or `INSTALL PLUGIN`. For example:

```
INSTALL SONAME 'metadata_lock_info';
```

The second method can be used to tell the server to load the plugin when it starts up. The plugin can be installed this way by providing the `--plugin-load` or the `--plugin-load-add` options. This can be specified as a command-line argument to `mysql` or it can be specified in a relevant server [option group](#) in an [option file](#). For example:

```
[mariadb]
...
plugin_load_add = metadata_lock_info
```

Uninstalling the Plugin

You can uninstall the plugin dynamically by executing `UNINSTALL SONAME` or `UNINSTALL PLUGIN`. For example:

```
UNINSTALL SONAME 'metadata_lock_info';
```

If you installed the plugin by providing the `--plugin-load` or the `--plugin-load-add` options in a relevant server [option group](#) in an [option file](#), then those options should be removed to prevent the plugin from being loaded the next time the server is restarted.

Examples

Viewing all Metadata Locks

```

SELECT * FROM information_schema.metadata_lock_info;
+-----+-----+-----+-----+-----+
| THREAD_ID | LOCK_MODE          | LOCK_DURATION | LOCK_TYPE          | TABLE_SCHEMA |
| TABLE_NAME |                     |               |                   |               |
+-----+-----+-----+-----+-----+
|          31 | MDL_INTENTION_EXCLUSIVE | MDL_EXPLICIT | Global read lock  |               |
|          31 | MDL_INTENTION_EXCLUSIVE | MDL_EXPLICIT | Commit lock       |               |
|          31 | MDL_INTENTION_EXCLUSIVE | MDL_EXPLICIT | Schema metadata lock | dbname       |
|          31 | MDL_SHARED_NO_READ_WRITE | MDL_EXPLICIT | Table metadata lock | dbname       |
| exotics    |                       |               |                   |               |
+-----+-----+-----+-----+-----+
4 rows in set (0.00 sec)

```

Matching Metadata Locks with Threads and Queries

```

SELECT
CONCAT('Thread ',P.ID,' executing "',P.INFO,'" IS LOCKED BY Thread ',
M.THREAD_ID) WhoLocksWho
FROM INFORMATION_SCHEMA.PROCESSLIST P,
INFORMATION_SCHEMA.METADATA_LOCK_INFO M
WHERE LOCATE(lcase(LOCK_TYPE), lcase(STATE))>0;
+-----+-----+-----+-----+-----+
| WhoLocksWho |
+-----+-----+-----+-----+
| Thread 3 executing "INSERT INTO foo ( b ) VALUES ( 'FOO' )" IS LOCKED BY Thread 2 |
+-----+-----+-----+-----+
1 row in set (0.00 sec)

SHOW PROCESSLIST;
+-----+-----+-----+-----+-----+

Versions

Version	Status	Introduced
0.1	Stable	MariaDB 10.1.13
0.1	Beta	MariaDB 10.0.10
0.1	Alpha	MariaDB 10.0.7

Options

metadata_lock_info

- **Description:** Controls how the server should treat the plugin when the server starts up.
 - Valid values are:
 - `OFF` - Disables the plugin without removing it from the `mysql.plugins` table.

- `ON` - Enables the plugin. If the plugin cannot be initialized, then the server will still continue starting up, but the plugin will be disabled.
 - `FORCE` - Enables the plugin. If the plugin cannot be initialized, then the server will fail to start with an error.
 - `FORCE_PLUS_PERMANENT` - Enables the plugin. If the plugin cannot be initialized, then the server will fail to start with an error. In addition, the plugin cannot be uninstalled with `UNINSTALL SONAME` or `UNINSTALL PLUGIN` while the server is running.
 - See [Plugin Overview: Configuring Plugin Activation at Server Startup](#) for more information.
- **Commandline:** `--metadata-lock-info=value`
 - **Data Type:** `enumerated`
 - **Default Value:** `ON`
 - **Valid Values:** `OFF`, `ON`, `FORCE`, `FORCE_PLUS_PERMANENT`

5.4.11.4 MYSQL_JSON

MariaDB starting with [10.5.7](#)

The `TYPE_MYSQL_JSON` plugin was first released in [MariaDB 10.5.7](#).

The JSON type in MySQL stores the JSON object in its own native form, while in MariaDB the `JSON` type is a `LONGTEXT`. Opening a table with a JSON type created in MySQL would result in an error:

```
select * from mysql_json_table;
ERROR 4161 (HY000): Unknown data type: 'MYSQL_JSON'
```

The `mysql_json` plugin is used to make it easier to upgrade to MariaDB.

Installing

Installing can be done in a [number of ways](#), for example:

```
install soname 'type_mysql_json';
```

See [Making MariaDB understand MySQL JSON](#) for a full description.

5.4.11.5 Query Cache Information Plugin

The `QUERY_CACHE_INFO` plugin creates the `QUERY_CACHE_INFO` table in the `INFORMATION_SCHEMA` database. This table shows all queries in the `query cache`. Querying this table acquires the query cache lock and will result in lock waits for queries that are using or expiring from the query cache. You must have the `PROCESS` privilege to query this table.

Contents

1. [Installing the Plugin](#)
2. [Uninstalling the Plugin](#)
3. [Example](#)
4. [Versions](#)
5. [Options](#)
 1. [query_cache_info](#)

Installing the Plugin

Although the plugin's shared library is distributed with MariaDB by default, the plugin is not actually installed by MariaDB by default. There are two methods that can be used to install the plugin with MariaDB.

The first method can be used to install the plugin without restarting the server. You can install the plugin dynamically by executing `INSTALL SONAME` or `INSTALL PLUGIN`. For example:

```
INSTALL SONAME 'query_cache_info';
```

The second method can be used to tell the server to load the plugin when it starts up. The plugin can be installed this way by providing the `--plugin-load` or the `--plugin-load-add` options. This can be specified as a command-line argument to `mysqld` or it can be specified in a relevant server `option group` in an `option file`. For example:

```
[mariadb]
...
plugin_load_add = query_cache_info
```

Uninstalling the Plugin

You can uninstall the plugin dynamically by executing [UNINSTALL SONAME](#) or [UNINSTALL PLUGIN](#). For example:

```
UNINSTALL SONAME 'query_cache_info';
```

If you installed the plugin by providing the `--plugin-load` or the `--plugin-load-add` options in a relevant server [option group](#) in an [option file](#), then those options should be removed to prevent the plugin from being loaded the next time the server is restarted.

Example

```
select statement_schema, statement_text, result_blocks_count,
       result_blocks_size from information_schema.query_cache_info;
+-----+-----+-----+-----+
| statement_schema | statement_text | result_blocks_count | result_blocks_size |
+-----+-----+-----+-----+
| test            | select * from t1 | 1 | 512 |
+-----+-----+-----+-----+
```

Versions

- **Data Type:** `enumerated`
- **Default Value:** `ON`
- **Valid Values:** `OFF`, `ON`, `FORCE`, `FORCE_PLUS_PERMANENT`

5.4.11.6 Query Response Time Plugin

The `query_response_time` plugin creates the [QUERY_RESPONSE_TIME](#) table in the [INFORMATION_SCHEMA](#) database. The plugin also adds the [SHOW QUERY_RESPONSE_TIME](#) and [FLUSH QUERY_RESPONSE_TIME*](#)

statements.

The [slow query log](#) provides exact information about queries that take a long time to execute. However, sometimes there are a large number of queries that each take a very short amount of time to execute. This feature provides a tool for analyzing that information by counting and displaying the number of queries according to the the length of time they took to execute.

This feature is based on Percona's [Response Time Distribution](#).

Contents

1. [Installing the Plugin](#)
2. [Uninstalling the Plugin](#)
3. [Response Time Distribution](#)
4. [Using the Plugin](#)
 1. [Using the Information Schema Table](#)
 2. [Using the SHOW Statement](#)
 3. [Flushing Plugin Data](#)
5. [Versions](#)
6. [System Variables](#)
 1. [query_response_time_flush](#)
 2. [query_response_time_range_base](#)
 3. [query_response_time_exec_time_debug](#)
 4. [query_response_time_session_stats](#)
 5. [query_response_time_stats](#)
7. [Options](#)
 1. [query_response_time](#)
 2. [query_response_time_audit](#)

Installing the Plugin

This shared library actually consists of a number of different plugins. Prior to [MariaDB 11.5](#):

- `QUERY_RESPONSE_TIME` - An `INFORMATION_SCHEMA` plugin that exposes statistics.
- `QUERY_RESPONSE_TIME_AUDIT` - audit plugin, collects statistics.

Both plugins need to be installed to get meaningful statistics.

From [MariaDB 11.5](#), there are the following additional plugins:

- `QUERY_RESPONSE_TIME_READ`
- `QUERY_RESPONSE_TIME_READ_WRITE`
- `QUERY_RESPONSE_TIME_WRITE`

Although the plugin's shared library is distributed with MariaDB by default, the plugins are not actually installed by MariaDB by default. There are two methods that can be used to install the plugins with MariaDB.

The first method can be used to install the plugin library without restarting the server. You can install the plugins dynamically by executing [INSTALL SONAME](#) or [INSTALL PLUGIN](#). For example:

```
INSTALL SONAME 'query_response_time';
```

The second method can be used to tell the server to load the plugin library when it starts up. The plugins can be installed this way by providing the `--plugin-load` or the `--plugin-load-add` options. This can be specified as a command-line argument to `mysqld` or it can be specified in a relevant server [option group](#) in an [option file](#). For example:

```
[mariadb]
...
plugin_load_add = query_response_time
```

Note that in both cases you have to activate data collection by changing the `query_response_time_stats` setting to `ON`, it is `OFF` by default even when the plugin library is loaded.

You can change the setting at runtime with

```
SET GLOBAL query_response_time_stats=ON;
```

or in the options file after the plugin has been loaded:

```
[mariadb]
...
plugin_load_add = query_response_time
query_response_time_stats=ON;
```

Uninstalling the Plugin

You can uninstall the plugin dynamically by executing `UNINSTALL SONAME` or `UNINSTALL PLUGIN`. For example:

```
UNINSTALL SONAME 'query_response_time';
```

If you installed the plugin by providing the `--plugin-load` or the `--plugin-load-add` options in a relevant server [option group](#) in an [option file](#), then those options should be removed to prevent the plugin from being loaded the next time the server is restarted.

Response Time Distribution

The user can define time intervals that divide the range 0 to positive infinity into smaller intervals and then collect the number of commands whose execution times fall into each of those intervals.

Each interval is described as:

```
(range_base ^ n; range_base ^ (n+1)]
```

The `range_base` is some positive number (see [Limitations](#)). The interval is defined as the difference between two nearby powers of the range base.

For example, if the range base=10, we have the following intervals:

```
(0; 10 ^ -6], (10 ^ -6; 10 ^ -5], (10 ^ -5; 10 ^ -4], ...,
(10 ^ -1; 10 ^ 1], (10^1; 10^2]...(10^7; positive infinity]
```

or

```
(0; 0.000001], (0.000001; 0.000010], (0.000010; 0.000100], ...,
(0.100000; 1.0]; (1.0; 10.0]...(1000000; positive infinity]
```

For each interval, a count is made of the queries with execution times that fell into that interval.

You can select the range of the intervals by changing the range base. For example, for base range=2 we have the following intervals:

```
(0; 2 ^ -19], (2 ^ -19; 2 ^ -18], (2 ^ -18; 2 ^ -17], ...,
(2 ^ -1; 2 ^ 1], (2 ^ 1; 2 ^ 2]...(2 ^ 25; positive infinity]
```

or

```
(0; 0.000001], (0.000001, 0.000003], ...,
(0.25; 0.5], (0.5; 2], (2; 4]...(8388608; positive infinity]
```

Small numbers look strange (i.e., don't look like powers of 2), because we lose precision on division when the ranges are calculated at runtime. In the resulting table, you look at the high boundary of the range.

For example, you may see:

```
SELECT * FROM INFORMATION_SCHEMA.QUERY_RESPONSE_TIME;
+-----+-----+-----+
| TIME          | COUNT | TOTAL          |
+-----+-----+-----+
| 0.000001     | 0     | 0.000000     |
| 0.000010     | 17    | 0.000094     |
| 0.000100     | 4301  | 0.236555     |
| 0.001000     | 1499  | 0.824450     |
| 0.010000     | 14851 | 81.680502    |
| 0.100000     | 8066  | 443.635693   |
| 1.000000     | 0     | 0.000000     |
| 10.000000    | 0     | 0.000000     |
| 100.000000   | 1     | 55.937094    |
| 1000.000000  | 0     | 0.000000     |
| 10000.000000 | 0     | 0.000000     |
| 100000.000000| 0     | 0.000000     |
| 1000000.000000| 0     | 0.000000     |
| TOO LONG     | 0     | TOO LONG     |
+-----+-----+-----+
```

This means there were:

```
* 17 queries with 0.000001 < query execution time <= 0.000010 seconds; total execution time of
the 17 queries = 0.000094 seconds

* 4301 queries with 0.000010 < query execution time <= 0.000100 seconds; total execution time
of the 4301 queries = 0.236555 seconds

* 1499 queries with 0.000100 < query execution time <= 0.001000 seconds; total execution time
of the 1499 queries = 0.824450 seconds

* 14851 queries with 0.001000 < query execution time <= 0.010000 seconds; total execution time
of the 14851 queries = 81.680502 seconds

* 8066 queries with 0.010000 < query execution time <= 0.100000 seconds; total execution time
of the 8066 queries = 443.635693 seconds

* 1 query with 10.000000 < query execution time <= 100.0000 seconds; total execution time of
the 1 query = 55.937094 seconds
```

Using the Plugin

Using the Information Schema Table

You can get the distribution by querying the the [QUERY_RESPONSE_TIME](#) table in the [INFORMATION_SCHEMA](#) database. For example:

```
SELECT * FROM INFORMATION_SCHEMA.QUERY_RESPONSE_TIME;
```

You can also write more complex queries. For example:

```
SELECT c.count, c.time,
(SELECT SUM(a.count) FROM INFORMATION_SCHEMA.QUERY_RESPONSE_TIME as a
 WHERE a.count != 0) as query_count,
(SELECT COUNT(*) FROM INFORMATION_SCHEMA.QUERY_RESPONSE_TIME as b
 WHERE b.count != 0) as not_zero_region_count,
(SELECT COUNT(*) FROM INFORMATION_SCHEMA.QUERY_RESPONSE_TIME) as region_count
FROM INFORMATION_SCHEMA.QUERY_RESPONSE_TIME as c
WHERE c.count > 0;
```

Note: If [query_response_time_stats](#) is set to `ON`, then the execution times for these two `SELECT` queries will also be collected.

Using the SHOW Statement

As an alternative to the [QUERY_RESPONSE_TIME](#) table in the [INFORMATION_SCHEMA](#) database, you can also use the [SHOW QUERY_RESPONSE_TIME](#) statement. For example:

```
SHOW QUERY_RESPONSE_TIME;
```

Flushing Plugin Data

Flushing the plugin data does two things:

- Clears the collected times from the `QUERY_RESPONSE_TIME` table in the `INFORMATION_SCHEMA` database.
- Reads the value of `query_response_time_range_base` and uses it to set the range base for the table.

Plugin data can be flushed with the `FLUSH QUERY_RESPONSE_TIME` statement. For example:

```
FLUSH QUERY_RESPONSE_TIME;
```

Setting the `query_response_time_flush` system variable has the same effect. For example:

```
SET GLOBAL query_response_time_flush=1;
```

From [MariaDB 11.5](#), it is possible to specify flushing read and/or write statements with the `FLUSH QUERY_RESPONSE_TIME_READ`, `FLUSH QUERY_RESPONSE_TIME_WRITE` and `FLUSH QUERY_RESPONSE_TIME_READ_WRITE` statements.

Versions

Version	Status	Introduced
1.0	Stable	MariaDB 10.1.13 
1.0	Gamma	MariaDB 10.0.10 
1.0	Alpha	MariaDB 10.0.4 

System Variables

`query_response_time_flush`

- **Description:** Updating this variable flushes the statistics and re-reads `query_response_time_range_base`.
- **Commandline:** None
- **Scope:** Global
- **Dynamic:** Yes
- **Data Type:** `boolean`
- **Default Value:** `OFF`

`query_response_time_range_base`

- **Description:** Select base of log for `QUERY_RESPONSE_TIME` ranges. **WARNING:** variable change takes affect only after flush.
- **Commandline:** `--query-response-time-range-base=#`
- **Scope:** Global
- **Dynamic:** Yes
- **Data Type:** `numeric`
- **Default Value:** `10`
- **Range:** `2` to `1000`

`query_response_time_exec_time_debug`

- **Description:** Pretend queries take this many microseconds. When 0 (the default) use the actual execution time.
 - This system variable is only available when the plugin is a [debug build](#).
- **Scope:** Global
- **Dynamic:** Yes
- **Data Type:** `numeric`
- **Default Value:** `0`

- **Range:** 0 to 31536000

query_response_time_session_stats

- **Description:** Controls query response time statistics collection for the current session: ON - enable, OFF - disable, GLOBAL (default) - use [query_response_time_stats](#) value.
- **Commandline:** `query-response-time-session-stats=val`
- **Scope:** Global, Session
- **Dynamic:** Yes
- **Data Type:** `enum`
- **Default Value:** GLOBAL
- **Valid Values:** GLOBAL, ON, OFF
- **Introduced:** [MariaDB 11.5](#)

query_response_time_stats

- **Description:** Enable or disable query response time statistics collecting.
- **Commandline:** `query-response-time-stats[={0|1}]`
- **Scope:** Global
- **Dynamic:** Yes
- **Data Type:** `boolean`
- **Default Value:** OFF

Options

query_response_time

- **Description:** Controls how the server should treat the plugin when the server starts up.
 - Valid values are:
 - OFF - Disables the plugin without removing it from the [mysql.plugins](#) table.
 - ON - Enables the plugin. If the plugin cannot be initialized, then the server will still continue starting up, but the plugin will be disabled.
 - FORCE - Enables the plugin. If the plugin cannot be initialized, then the server will fail to start with an error.
 - FORCE_PLUS_PERMANENT - Enables the plugin. If the plugin cannot be initialized, then the server will fail to start with an error. In addition, the plugin cannot be uninstalled with [UNINSTALL SONAME](#) or [UNINSTALL PLUGIN](#) while the server is running.
 - See [Plugin Overview: Configuring Plugin Activation at Server Startup](#) for more information.
- **Commandline:** `--query-response-time=value`
- **Data Type:** `enumerated`
- **Default Value:** ON
- **Valid Values:** OFF, ON, FORCE, FORCE_PLUS_PERMANENT

query_response_time_audit

- **Description:** Controls how the server should treat the plugin when the server starts up.
 - Valid values are:
 - OFF - Disables the plugin without removing it from the [mysql.plugins](#) table.
 - ON - Enables the plugin. If the plugin cannot be initialized, then the server will still continue starting up, but the plugin will be disabled.
 - FORCE - Enables the plugin. If the plugin cannot be initialized, then the server will fail to start with an error.
 - FORCE_PLUS_PERMANENT - Enables the plugin. If the plugin cannot be initialized, then the server will fail to start with an error. In addition, the plugin cannot be uninstalled with [UNINSTALL SONAME](#) or [UNINSTALL PLUGIN](#) while the server is running.
 - See [Plugin Overview: Configuring Plugin Activation at Server Startup](#) for more information.
- **Commandline:** `--query-response-time-audit=value`
- **Data Type:** `enumerated`
- **Default Value:** ON

- **Valid Values:** OFF, ON, FORCE, FORCE_PLUS_PERMANENT

5.4.11.7 SQL Error Log Plugin

Contents

1. [Installing the Plugin](#)
2. [Uninstalling the Plugin](#)
3. [Logging](#)
4. [Example of Logs](#)
5. [Example Usage](#)
6. [Versions](#)
7. [System Variables and Options](#)

The `SQL_ERROR_LOG` plugin collects errors sent to clients in a log file defined by `sql_error_log_filename`, so that they can later be analyzed. The log file can be rotated if `sql_error_log_rotate` is set.

Errors are logged as they happen and an error will be logged even if it was handled by a `condition handler` and was never technically *sent* to the client.

From [MariaDB 10.11.5](#) warnings can also be logged if `sql_error_log_warnings` is enabled.

Comments are also logged, which can make the log easier to search. But this is only possible if the client does not strip the comments away. For example, the `mariadb` command-line client only leaves comments when started with the `--comments` option.

Installing the Plugin

Although the plugin's shared library is distributed with MariaDB by default, the plugin is not actually installed by MariaDB by default. There are two methods that can be used to install the plugin with MariaDB.

The first method can be used to install the plugin without restarting the server. You can install the plugin dynamically by executing `INSTALL SONAME` or `INSTALL PLUGIN`. For example:

```
INSTALL SONAME 'sql_errlog';
```

The second method can be used to tell the server to load the plugin when it starts up. The plugin can be installed this way by providing the `--plugin-load` or the `--plugin-load-add` options. This can be specified as a command-line argument to `mariadb` or it can be specified in a relevant server `option group` in an `option file`. For example:

```
[mariadb]
...
plugin_load_add = sql_errlog
```

Uninstalling the Plugin

You can uninstall the plugin dynamically by executing `UNINSTALL SONAME` or `UNINSTALL PLUGIN`. For example:

```
UNINSTALL SONAME 'sql_errlog';
```

If you installed the plugin by providing the `--plugin-load` or the `--plugin-load-add` options in a relevant server `option group` in an `option file`, then those options should be removed to prevent the plugin from being loaded the next time the server is restarted.

Logging

The log format until [MariaDB 10.10](#) is:

```
Time User Error_code: Error_message : Query
```

Starting from [MariaDB 10.11](#), the format is:

```
Time User Type Error_code: Error_message : Query
```

Starting from [MariaDB 10.6.17](#), [MariaDB 10.11.7](#), [MariaDB 11.0.5](#), [MariaDB 11.1.4](#), [MariaDB 11.2.3](#), [MariaDB 11.3.2](#), and [MariaDB 11.4.1](#), when the `sql_error_log_with_db_and_thread_info` variable is enabled, the log also contains thread id and database name. If there is no database, `NULL` will be displayed.

```
Time Thread_id User Database_name Type Error_code: Error_message : Query
```

Each separated by a space or `:` as above

Option	Description	Version
Time	Time (YYYY-MM-DD hh-mm-ss)	5.5.22
Thread Id	Thread Id of current thread	10.6.17
User	privilege_user [login_user_name] @ hostname [ip]	5.5.22
Database name	Name of the currently selected database	10.6.17
Type	ERROR or WARNING	10.11.6
Error_code	OS error, MariaDB storage engine code (120-199) or MariaDB internal error code (1000-)	5.5.22
Query	Query text	5.5.22

Example of Logs

```
2023-10-31 15:54:37 root[root] @ localhost [] ERROR 1146: Table 'test.t_doesnt_exist' doesn't exist
2023-10-31 15:54:37 root[root] @ localhost [] ERROR 1064: You have an error in your SQL syntax; check the
2023-10-31 15:54:37 root[root] @ localhost [] ERROR 1146: Table 'testtemptab' doesn't exist : SE
2023-11-01 11:31:15 [monty] @ storm [192.168.0.12] ERROR 1051: Unknown table 'test.t1' : drop tab
```

With `sql_error_log_with_db_and_thread_info` enabled (database `test` and thread id `4`):

```
2023-10-31 15:54:37 4 root[root] @ localhost [] `test` ERROR 1146: Table 'test.t_doesnt_exist' do
```

Example Usage

```
install plugin SQL_ERROR_LOG soname 'sql_errlog';
Query OK, 0 rows affected (0.00 sec)

use test;
Database changed

set sql_mode='STRICT_ALL_TABLES,NO_ENGINE_SUBSTITUTION';
Query OK, 0 rows affected (0.00 sec)

CREATE TABLE foo2 (id int) ENGINE=WHOOOPSIE;
ERROR 1286 (42000): Unknown storage engine 'WHOOOPSIE'
\! cat data/sql_errors.log
2013-03-19 9:38:40 msandbox[msandbox] @ localhost [] ERROR 1286: Unknown storage engine
'WHOOOPSIE' : CREATE TABLE foo2 (id int) ENGINE=WHOOOPSIE
```

Versions

Version	Status	Introduced
1.1	Stable	MariaDB 10.6.17 , MariaDB 10.11.7 , MariaDB 11.0.5 , MariaDB 11.1.4 , MariaDB 11.2.3
1.0	Stable	MariaDB 10.1.13
1.0	Gamma	MariaDB 10.0.10
1.0	Alpha	MariaDB 5.5.22

System Variables and Options

- [sql_error_log](#)
- [sql_error_log_filename](#)
- [sql_error_log_rate](#)
- [sql_error_log_rotate](#)
- [sql_error_log_rotations](#)
- [sql_error_log_size_limit](#)

- [sql_error_log_with_db_and_thread_info](#)

3.3.4.6.6 User Statistics

5.4.11.9 User Variables Plugin

The `user_variables` plugin creates the `USER_VARIABLES` table in the `INFORMATION_SCHEMA` database. This table contains information about [user-defined variables](#).

Contents

1. [Viewing](#)
 1. [Flushing User-Defined Variables](#)
2. [Examples](#)
3. [Installing the Plugin](#)
4. [Uninstalling the Plugin](#)
5. [Versions](#)
6. [Options](#)
 1. [user_variables](#)

Viewing

User-defined variables can be viewed by either querying the `USER_VARIABLES`, or by running `SHOW USER_VARIABLES`.

Flushing User-Defined Variables

User-defined variables are reset and the Information Schema table emptied with the `FLUSH USER_VARIABLES` statement.

Examples

```

SET @v1 = 0;
SET @v2 = 'abc';
SET @v3 = CAST(123 AS CHAR(5));

SHOW USER_VARIABLES;
+-----+-----+
| Variable_name | Value |
+-----+-----+
| v3            | 123   |
| v2            | abc   |
| v1            | 0     |
+-----+-----+

SELECT * FROM information_schema.USER_VARIABLES ORDER BY VARIABLE_NAME;
+-----+-----+-----+-----+-----+
| VARIABLE_NAME | VARIABLE_VALUE | VARIABLE_TYPE | CHARACTER_SET_NAME |
+-----+-----+-----+-----+-----+
| v1            | 0              | INT          | latin1              |
| v2            | abc            | VARCHAR      | utf8                 |
| v3            | 123            | VARCHAR      | utf8                 |
+-----+-----+-----+-----+-----+

FLUSH USER_VARIABLES;

SELECT * FROM information_schema.USER_VARIABLES ORDER BY VARIABLE_NAME;
Empty set (0.000 sec)

```

Installing the Plugin

In current versions, the `user_variables` plugin is statically linked into the server by default, so it does not need to be installed, and the following steps are unnecessary.

Prior to [MariaDB 10.2.6](#), although the plugin's shared library is distributed with MariaDB by default, the plugin was not actually installed by MariaDB by default. There are two methods that can be used to install the plugin with MariaDB.

The first method can be used to install the plugin without restarting the server. You can install the plugin dynamically by executing `INSTALL SONAME` or `INSTALL PLUGIN`. For example:

```
INSTALL SONAME 'user_variables';
```

The second method can be used to tell the server to load the plugin when it starts up. The plugin can be installed this way by providing the `--plugin-load` or the `--plugin-load-add` options. This can be specified as a command-line argument to `mysqld` or it can be specified in a relevant server `option group` in an `option file`. For example:

```
[mariadb]
...
plugin_load_add = user_variables
```

Uninstalling the Plugin

You can uninstall the plugin dynamically by executing `UNINSTALL SONAME` or `UNINSTALL PLUGIN`. For example:

```
UNINSTALL SONAME 'user_variables';
```

If you installed the plugin by providing the `--plugin-load` or the `--plugin-load-add` options in a relevant server `option group` in an `option file`, then those options should be removed to prevent the plugin from being loaded the next time the server is restarted.

Versions

Version	Status	Introduced
1.0	Stable	MariaDB 10.3.13
1.0	Gamma	MariaDB 10.2.6
1.0	Alpha	MariaDB 10.2.0

Options

`user_variables`

- **Description:** Controls how the server should treat the plugin when the server starts up.
 - Valid values are:
 - `OFF` - Disables the plugin without removing it from the `mysql.plugins` table.
 - `ON` - Enables the plugin. If the plugin cannot be initialized, then the server will still continue starting up, but the plugin will be disabled.
 - `FORCE` - Enables the plugin. If the plugin cannot be initialized, then the server will fail to start with an error.
 - `FORCE_PLUS_PERMANENT` - Enables the plugin. If the plugin cannot be initialized, then the server will fail to start with an error. In addition, the plugin cannot be uninstalled with `UNINSTALL SONAME` or `UNINSTALL PLUGIN` while the server is running.
 - See [Plugin Overview: Configuring Plugin Activation at Server Startup](#) for more information.
- **Commandline:** `--user-variables=value`
- **Data Type:** `enumerated`
- **Default Value:** `ON`
- **Valid Values:** `OFF`, `ON`, `FORCE`, `FORCE_PLUS_PERMANENT`

5.4.11.10 Disks Plugin

The `DISKS` plugin creates the `DISKS` table in the `INFORMATION_SCHEMA` database. This table shows metadata about

disks on the system.

Before [MariaDB 10.4.7](#), [MariaDB 10.3.17](#) and [MariaDB 10.2.26](#), this plugin did **not** check [user privileges](#). When it is enabled, **any** user can query the `INFORMATION_SCHEMA.DISKS` table and see all the information it provides.

Since [MariaDB 10.4.7](#), [MariaDB 10.3.17](#) and [MariaDB 10.2.26](#), it required the [FILE privilege](#).

The plugin only works on Linux.

Contents

5.4.11.11 Compression Plugins

MariaDB starting with [10.7.0](#) 
Compressions plugins were added in a [MariaDB 10.7.0](#)  preview release.

Contents

1. [Installing](#)
2. [Upgrading](#)

The various MariaDB storage engines, such as [InnoDB](#), [RocksDB](#), [Mroonga](#), can use different compression libraries.

Before [MariaDB 10.7.0](#) , each separate library would have to be compiled in in order to be available for use, resulting in numerous runtime/rpm/deb dependencies, most of which would never be used by users.

From [MariaDB 10.7.0](#) , five additional MariaDB compression libraries (besides the default `zlib`) are available as plugins (note that these affect `InnoDB` and `Mroonga` only; `RocksDB` still uses the compression algorithms from its own library):

- `bzip2`
- `lzma`
- `lz4`
- `lzo`
- `snappy`

Installing

Depending on how MariaDB was installed, the libraries may already be available for installation, or may first need to be installed as `.deb` or `.rpm` packages, for example:

```
apt-get install mariadb-plugin-provider-lz4
```

Once available, [install as a plugin](#), for example:

```
INSTALL SONAME 'provider_lz4';
```

The compression algorithm can then be used, for example, in [InnoDB compression](#):

```
SET GLOBAL innodb_compression_algorithm = lz4;
```

Upgrading

When upgrading from a release without compression plugins, if a non-`zlib` compression algorithm was used, those tables

will be unreadable until the appropriate compression library is installed. [mariadb-upgrade](#) should be run. The `--force` option (to run [mariadb-check](#)) or `mariadb-check` itself will indicate any problems with compression, for example:

```
Warning : MariaDB tried to use the LZMA compression, but its provider plugin is not loaded
Error   : Table 'test.t' doesn't exist in engine
status  : Operation failed
```

or

```
Error   : Table test/t is compressed with lzma, which is not currently loaded.
        Please load the lzma provider plugin to open the table
error   : Corrupt
```

In this case, the appropriate compression plugin should be installed, and the server restarted.

Useful MariaDB Queries

Quick reference of commonly-used MariaDB queries.

6.1.1 A MariaDB Primer

MariaDB 101: Learning the Basics of MariaDB

Watch the Webinar [↗](#)

Contents

1. [Logging into MariaDB](#)
2. [The Basics of a Database](#)
3. [Inserting Data](#)
4. [Modifying Data](#)

This primer is designed to teach you the basics of getting information into and out of an existing MariaDB database using the `mariadb` command-line client program. It's not a complete reference and will not touch on any advanced topics. It is just a quick jump-start into using MariaDB.

Logging into MariaDB

Log into your MariaDB server from the command-line like so:

```
mariadb -u user_name -p -h ip_address db_name
```

Replace `user_name` with your database username. Replace `ip_address` with the host name or address of your server. If you're accessing MariaDB from the same server you're logged into, then don't include `-h` and the `ip_address`. Replace `db_name` with the name of the database you want to access (such as `test`, which sometimes comes already created for testing purposes - note that Windows does not create this database, and some setups may also have removed the `test` database by running [mariadb-secure-installation](#), in which case you can leave the `db_name` out).

When prompted to enter your password, enter it. If your login is successful you should see something that looks similar to this:

```
MariaDB [test]>
```

This is where you will enter in all of your SQL statements. More about those later. For now, let's look at the components of the prompt: The "MariaDB" part means you that you are connected to a MariaDB database server. The word between the brackets is the name of your default database, the `test` database in this example.

The Basics of a Database

To make changes to a database or to retrieve data, you will need to enter an SQL statement. SQL stands for Structured Query Language. An SQL statement that requests data is called a query. Databases store information in tables. They're are similar to spreadsheets, but much more efficient at managing data.

Note that the `test` database may not contain any data yet. If you want to follow along with the primer, copy and paste the following into the `mariadb` client. This will create the tables we will use and add some data to them. Don't worry about understanding them yet; we'll get to that later.

```
CREATE DATABASE IF NOT EXISTS test;

USE test;

CREATE TABLE IF NOT EXISTS books (
  BookID INT NOT NULL PRIMARY KEY AUTO_INCREMENT,
  Title VARCHAR(100) NOT NULL,
  SeriesID INT, AuthorID INT);

CREATE TABLE IF NOT EXISTS authors
(id INT NOT NULL PRIMARY KEY AUTO_INCREMENT);

CREATE TABLE IF NOT EXISTS series
(id INT NOT NULL PRIMARY KEY AUTO_INCREMENT);

INSERT INTO books (Title, SeriesID, AuthorID)
VALUES ('The Fellowship of the Ring', 1, 1),
       ('The Two Towers', 1, 1), ('The Return of the King', 1, 1),
       ('The Sum of All Men', 2, 2), ('Brotherhood of the Wolf', 2, 2),
       ('Wizardborn', 2, 2), ('The Hobbit', 0, 1);
```

Notice the semi-colons used above. The `mariadb` client lets you enter very complex SQL statements over multiple lines. It won't send an SQL statement until you type a semi-colon and hit [Enter].

Let's look at what you've done so far. Enter the following:

```
SHOW TABLES;

+-----+
| Tables_in_test |
+-----+
| authors        |
| books          |
| series         |
+-----+
3 rows in set (0.00 sec)
```

Notice that this displays a list of the tables in the database. If you didn't already have tables in your `test` database, your results should look the same as above. Let's now enter the following to get information about one of these tables:

```
DESCRIBE books;

+-----+-----+-----+-----+-----+-----+
| Field      | Type          | Null | Key | Default | Extra          |
+-----+-----+-----+-----+-----+-----+
| BookID     | int(11)       | NO   | PRI | NULL    | auto_increment |
| Title      | varchar(100)  | NO   |     | NULL    |                |
| SeriesID   | int(11)       | YES  |     | NULL    |                |
| AuthorID   | int(11)       | YES  |     | NULL    |                |
+-----+-----+-----+-----+-----+-----+

```

The main bit of information of interest to us is the *Field* column. The other columns provide useful information about the structure and type of data in the database, but the *Field* column gives us the names, which is needed to retrieve data from the table.

Let's retrieve data from the `books` table. We'll do so by executing a `SELECT` statement like so:

```
SELECT * FROM books;

+-----+-----+-----+-----+
| BookID | Title                | SeriesID | AuthorID |
+-----+-----+-----+-----+
| 1      | The Fellowship of the Ring | 1        | 1        |
| 2      | The Two Towers         | 1        | 1        |
| 3      | The Return of the King | 1        | 1        |
| 4      | The Sum of All Men     | 2        | 2        |
| 5      | Brotherhood of the Wolf | 2        | 2        |
| 6      | Wizardborn            | 2        | 2        |
| 7      | The Hobbit            | 0        | 1        |
+-----+-----+-----+-----+
7 rows in set (0.00 sec)
```

This SQL statement or query asks the database to show us all of the data in the `books` table. The wildcard ('*') character indicates to select all columns.

Inserting Data

Suppose now that we want to add another book to this table. We'll add the book, *Lair of Bones*. To insert data into a table, you would use the `INSERT` statement. To insert information on a book, we would enter something like this:

```
INSERT INTO books (Title, SeriesID, AuthorID)
VALUES ("Lair of Bones", 2, 2);

Query OK, 1 row affected (0.00 sec)
```

Notice that we put a list of columns in parentheses after the name of the table, then we enter the keyword `VALUES` followed by a list of values in parentheses--in the same order as the columns were listed. We could put the columns in a different order, as long as the values are in the same order as we list the columns. Notice the message that was returned indicates that the execution of the SQL statement went fine and one row was entered.

Execute the following SQL statement again and see what results are returned:

```
SELECT * FROM books;
```

You should see the data you just entered on the last row of the results. In looking at the data for the other books, suppose we notice that the title of the seventh book is spelled wrong. It should be spelled *The Hobbit*, not *The Hobbbit*. We will need to update the data for that row.

Modifying Data

To change data in a table, you will use the `UPDATE` statement. Let's change the spelling of the book mentioned above. To do this, enter the following:

```
UPDATE books
SET Title = "The Hobbit"
WHERE BookID = 7;

Query OK, 1 row affected (0.00 sec)
Rows matched: 1  Changed: 1  Warnings: 0
```

Notice the syntax of this SQL statement. The `SET` clause is where you list the columns and the values to set them. The `WHERE` clause says that you want to update only rows in which the `BookID` column has a value of `7`, of which there are only one. You can see from the message it returned that one row matched the `WHERE` clause and one row was changed. There are no warnings because everything went fine. Execute the `SELECT` from earlier to see that the data changed.

As you can see, using MariaDB isn't very difficult. You just have to understand the syntax of SQL since it doesn't allow for typing mistakes or things in the wrong order or other deviations.

Connecting to MariaDB

MariaDB is a database system, a database server. To interface with the MariaDB server, you can use a client program, or you can write a program or script with one of the popular programming languages (e.g., PHP) using an API (Application Programming Interface) to interface with the MariaDB server. For the purposes of this article, we will focus on using the default client that comes with MariaDB called `mariadb`. With this client, you can either enter queries from the command-line, or you can switch to a terminal, that is to say, monitor mode. To start, we'll use the latter.

From the Linux command-line, you would enter the following to log in as the root user and to enter monitor mode:

```
mariadb -u root -p -h localhost
```

The `-u` option is for specifying the user name. You would replace `root` here if you want to use a different user name. This is the MariaDB user name, not the Linux user name. The password for the MariaDB user `root` will probably be different from the Linux user `root`. Incidentally, it's not a good security practice to use the `root` user unless you have a specific administrative task to perform for which only `root` has the needed privileges.

The `-p` option above instructs the `mariadb` client to prompt you for the password. If the password for the `root` user

hasn't been set yet, then the password is blank and you would just hit [Enter] when prompted. The `-h` option is for specifying the host name or the IP address of the server. This would be necessary if the client is running on a different machine than the server. If you've secure-shelled into the server machine, you probably won't need to use the host option. In fact, if you're logged into Linux as `root`, you won't need the user option—the `-p` is all you'll need. Once you've entered the line above along with the password when prompted, you will be logged into MariaDB through the client. To exit, type `quit` or `exit` and press [Enter].

Creating a Structure

In order to be able to add and to manipulate data, you first have to create a database structure. Creating a database is simple. You would enter something like the following from within the [mariadb client](#):

```
CREATE DATABASE bookstore;

USE bookstore;
```

This very minimal, first SQL statement will create a sub-directory called `bookstore` on the Linux filesystem in the directory which holds your MariaDB data files. It won't create any data, obviously. It'll just set up a place to add tables, which will in turn hold data. The second SQL statement above will set this new database as the default database. It will remain your default until you change it to a different one or until you log out of MariaDB.

The next step is to begin creating tables. This is only a little more complicated. To create a simple table that will hold basic data on books, we could enter something like the following:

```
CREATE TABLE books (
  isbn CHAR(20) PRIMARY KEY,
  title VARCHAR(50),
  author_id INT,
  publisher_id INT,
  year_pub CHAR(4),
  description TEXT );
```

This SQL statement creates the table `books` with six fields, or rather columns. The first column (`isbn`) is an identification number for each row—this name relates to the unique identifier used in the book publishing business. It has a fixed-width character type of 20 characters. It will be the primary key column on which data will be indexed. The column data type for the book title is a variable width character column of fifty characters at most. The third and fourth columns will be used for identification numbers for the author and the publisher. They are integer data types. The fifth column is used for the publication year of each book. The last column is for entering a description of each book. It's a `TEXT` data type, which means that it's a variable width column and it can hold up to 65535 bytes of data for each row. There are several other data types that may be used for columns, but this gives you a good sampling.

To see how the table we created looks, enter the following SQL statement:

```
DESCRIBE books;
+-----+-----+-----+-----+-----+-----+
| Field          | Type          | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+-----+
| isbn           | char(20)      | NO   | PRI | NULL    |       |
| title          | varchar(50)   | YES  |     | NULL    |       |
| author_id      | int(11)       | YES  |     | NULL    |       |
| publisher_id   | int(11)       | YES  |     | NULL    |       |
| year_pub       | char(4)       | YES  |     | NULL    |       |
| description    | text         | YES  |     | NULL    |       |
+-----+-----+-----+-----+-----+-----+
```

To change the settings of a table, you can use the [ALTER TABLE](#) statement. I'll cover that statement in another article. To delete a table completely (including its data), you can use the [DROP TABLE](#) statement, followed by the table name. Be careful with this statement since it's not reversible.

The next table we'll create for our examples is the `authors` table to hold author information. This table will save us from having to enter the author's name and other related data for each book written by each author. It also helps to ensure consistency of data: there's less chance of inadvertent spelling deviations.

```
CREATE TABLE authors
(author_id INT AUTO_INCREMENT PRIMARY KEY,
name_last VARCHAR(50),
name_first VARCHAR(50),
country VARCHAR(50) );
```

We'll join this table to the books table as needed. For instance, we would use it when we want a list of books along with their corresponding authors' names. For a real bookstore's database, both of these tables would probably have more columns. There would also be several more tables. For the examples that follow, these two tables as they are will be enough.

Minor Items

Before moving on to the next step of adding data to the tables, let me point out a few minor items that I've omitted mentioning. SQL statements end with a semi-colon (or a `\G`). You can spread an SQL statement over multiple lines. However, it won't be passed to the server by the client until you terminate it with a semi-colon and hit [Enter]. To cancel an SQL statement once you've started typing it, enter `\c` and press [Enter].

As a basic convention, reserved words are printed in all capital letters. This isn't necessary, though. MariaDB is case-insensitive with regards to reserved words. Database and table names, however, are case-sensitive on Linux. This is because they reference the related directories and files on the filesystem. Column names aren't case sensitive since they're not affected by the filesystem, per se. As another convention, we use lower-case letters for structural names (e.g., table names). It's a matter of preference for deciding on names.

Entering Data

The primary method for entering data into a table is to use the `INSERT` statement. As an example, let's enter some information about an author into the authors table. We'll do that like so:

```
INSERT INTO authors
(name_last, name_first, country)
VALUES ('Kafka', 'Franz', 'Czech Republic');
```

This will add the name and country of the author Franz Kafka to the authors table. We don't need to give a value for the `author_id` since that column was created with the `AUTO_INCREMENT` option. MariaDB will automatically assign an identification number. You can manually assign one, especially if you want to start the count at a higher number than 1 (e.g., 1000). Since we are not providing data for all of the columns in the table, we have to list the columns for which we are giving data and in the order that the data is given in the set following the `VALUES` keyword. This means that we could give the data in a different order.

For an actual database, we would probably enter data for many authors. We'll assume that we've done that and move on to entering data for some books. Below is an entry for one of Kafka's books:

```
INSERT INTO books
(title, author_id, isbn, year_pub)
VALUES ('The Castle', '1', '0805211063', '1998');
```

This adds a record for Kafka's book, *The Castle*. Notice that we mixed up the order of the columns, but it still works because both sets agree. We indicate that the author is Kafka by giving a value of 1 for the `author_id`. This is the value that was assigned by MariaDB when we entered the row for Kafka earlier. Let's enter a few more books for Kafka, but by a different method:

```
INSERT INTO books
(title, author_id, isbn, year_pub)
VALUES ('The Trial', '1', '0805210407', '1995'),
('The Metamorphosis', '1', '0553213695', '1995'),
('America', '1', '0805210644', '1995');
```

In this example, we've added three books in one statement. This allows us to give the list of column names once. We also give the keyword `VALUES` only once, followed by a separate set of values for each book, each contained in parentheses and separated by commas. This cuts down on typing and speeds up the process. Either method is fine and both have their advantages. To be able to continue with our examples, let's assume that data on thousands of books has been entered. With that behind us, let's look at how to retrieve data from tables.

Retrieving Data

The primary method of retrieving data from tables is to use a `SELECT` statement. There are many options available with the `SELECT` statement, but you can start simply. As an example, let's retrieve a list of book titles from the books table:

```
SELECT title
FROM books;
```

This will display all of the rows of books in the table. If the table has thousands of rows, MariaDB will display thousands. To limit the number of rows retrieved, we could add a `LIMIT` clause to the `SELECT` statement like so:

```
SELECT title
FROM books
LIMIT 5;
```

This will limit the number of rows displayed to five. To be able to list the author's name for each book along with the title, you will have to join the books table with the authors table. To do this, we can use the [JOIN](#) clause like so:

```
SELECT title, name_last
FROM books
JOIN authors USING (author_id);
```

Notice that the primary table from which we're drawing data is given in the `FROM` clause. The table to which we're joining is given in the `JOIN` clause along with the commonly named column (i.e., `author_id`) that we're using for the join.

To retrieve the titles of only books written by Kafka based on his name (not the `author_id`), we would use the `WHERE` clause with the `SELECT` statement. This would be entered like the following:

```
SELECT title AS 'Kafka Books'
FROM books
JOIN authors USING (author_id)
WHERE name_last = 'Kafka';
```

```
+-----+
| Kafka Books      |
+-----+
| The Castle      |
| The Trial        |
| The Metamorphosis |
| Amerika          |
+-----+
```

This statement will list the titles of Kafka books stored in the database. Notice that I've added the `AS` parameter next to the column name `title` to change the column heading in the results set to `Kafka Books`. This is known as an alias. Looking at the results here, we can see that the title for one of Kafka's books is incorrect. His book *Amerika* is spelled above with a "c" in the table instead of a "k". This leads to the next section on changing data.

Changing & Deleting Data

In order to change existing data, a common method is to use the `UPDATE` statement. When changing data, though, we need to be sure that we change the correct rows. In our example, there could be another book with the title *America* written by a different author. Since the key column `isbn` has only unique numbers and we know the ISBN number for the book that we want to change, we can use it to specify the row.

```
UPDATE books
SET title = 'Amerika'
WHERE isbn = '0805210644';
```

This will change the value of the title column for the row specified. We could change the value of other columns for the same row by giving the `column = value` for each, separated by commas.

If we want to delete a row of data, we can use the `DELETE` statement. For instance, suppose that our fictitious bookstore has decided no longer to carry books by John Grisham. By first running a `SELECT` statement, we determine the identification number for the author to be 2034. Using this author identification number, we could enter the following:

```
DELETE FROM books
WHERE author_id = '2034';
```

This statement will delete all rows from the table `books` for the `author_id` given. To do a clean job of it, we'll have to do the same for the `authors` table. We would just replace the table name in the statement above; everything else would be the same.

Conclusion

This is a very basic primer for using MariaDB. Hopefully, it gives you the idea of how to get started with MariaDB. Each of the SQL statements mentioned here have several more options and clauses each. We will cover these statements and others in greater detail in other articles. For now, though, you can learn more about them from experimenting and by further reading of the Knowledge Base online documentation. A downloadable PDF of much of the documentation is [available here](#)

6.1.3 Getting Data from MariaDB

MariaDB 101: Learning the Basics of MariaDB

Watch the Webinar [↗](#)

Contents

1. [Creating and Populating the Tables](#)
2. [Basic Elements](#)
3. [Selectivity and Order](#)
4. [Friendlier and More Complicated](#)
5. [Some Flags](#)
6. [Conclusion](#)

The simplest way to retrieve data from MariaDB is to use the [SELECT](#) statement. Since the [SELECT](#) statement is an essential SQL statement, it has many options available with it. It's not necessary to know or use them all—you could execute very basic [SELECT](#) statements if that satisfies your needs. However, as you use MariaDB more, you may need more powerful [SELECT](#) statements. In this article we will go through the basics of [SELECT](#) and will progress to more involved [SELECT](#) statements; we will move from the beginner level to the more intermediate and hopefully you will find some benefit from this article regardless of your skill level. For absolute beginners who are just starting with MariaDB, you may want to read the [MariaDB Basics article](#).

Creating and Populating the Tables

In order to follow the examples that follow, you can create and pre-populate the tables, as follows:

```
CREATE OR REPLACE TABLE books (  
  isbn CHAR(20) PRIMARY KEY,  
  title VARCHAR(50),  
  author_id INT,  
  publisher_id INT,  
  year_pub CHAR(4),  
  description TEXT );  
  
CREATE OR REPLACE TABLE authors  
(author_id INT AUTO_INCREMENT PRIMARY KEY,  
  name_last VARCHAR(50),  
  name_first VARCHAR(50),  
  country VARCHAR(50) );  
  
INSERT INTO authors (name_last, name_first, country) VALUES  
  ('Kafka', 'Franz', 'Czech Republic'),  
  ('Dostoevsky', 'Fyodor', 'Russia');  
  
INSERT INTO books (title, author_id, isbn, year_pub) VALUES  
  ('The Trial', 1, '0805210407', '1995'),  
  ('The Metamorphosis', 1, '0553213695', '1995'),  
  ('America', 2, '0805210644', '1995'),  
  ('Brothers Karamozov', 2, '0553212168', ''),  
  ('Crime & Punishment', 2, '0679420290', ''),  
  ('Crime & Punishment', 2, '0553211757', ''),  
  ('Idiot', 2, '0192834118', ''),  
  ('Notes from Underground', 2, '067973452X', '');
```

If you are unclear what these statements do, review the [MariaDB Primer](#) and [MariaDB Basics](#) tutorials.

Basic Elements

The basic, minimal elements of the [SELECT](#) statement call for the keyword `SELECT`, of course, the columns to select or to retrieve, and the table from which to retrieve rows of data. Actually, for the columns to select, we can use the asterisk as a wildcard to select all columns in a particular table. Using a database from a fictitious bookstore, we might enter the following

SQL statement to get a list of all columns and rows in a table containing information on books:

```
SELECT * FROM books;
+-----+-----+-----+-----+-----+
| isbn      | title                | author_id | publisher_id | year_pub | description |
+-----+-----+-----+-----+-----+
| 0192834118 | Idiot                | 2         | NULL         |          | NULL        |
| 0553211757 | Crime & Punishment  | 2         | NULL         |          | NULL        |
| 0553212168 | Brothers Karamozov  | 2         | NULL         |          | NULL        |
| 0553213695 | The Metamorphosis   | 1         | NULL         | 1995    | NULL        |
| 0679420290 | Crime & Punishment  | 2         | NULL         |          | NULL        |
| 067973452X | Notes from Underground | 2         | NULL         |          | NULL        |
| 0805210407 | The Trial            | 1         | NULL         | 1995    | NULL        |
| 0805210644 | America              | 2         | NULL         | 1995    | NULL        |
+-----+-----+-----+-----+-----+
8 rows in set (0.001 sec)
```

This will retrieve all of the data contained in the `books` table. As you can see, not all values have been populated. If we want to retrieve only certain columns, we would list them in place of the asterisk in a comma-separated list like so:

```
SELECT isbn, title, author_id
FROM books;
+-----+-----+-----+
| isbn      | title                | author_id |
+-----+-----+-----+
| 0192834118 | Idiot                | 2         |
| 0553211757 | Crime & Punishment  | 2         |
| 0553212168 | Brothers Karamozov  | 2         |
| 0553213695 | The Metamorphosis   | 1         |
| 0679420290 | Crime & Punishment  | 2         |
| 067973452X | Notes from Underground | 2         |
| 0805210407 | The Trial            | 1         |
| 0805210644 | America              | 2         |
+-----+-----+-----+
8 rows in set (0.001 sec)
```

This narrows the width of the results set by retrieving only three columns, but it still retrieves all of the rows in the table. If the table contains thousands of rows of data, this may be more data than we want. If we want to limit the results to just a few books, say five, we would include what is known as a `LIMIT` clause:

```
SELECT isbn, title, author_id
FROM books
LIMIT 5;
+-----+-----+-----+
| isbn      | title                | author_id |
+-----+-----+-----+
| 0192834118 | Idiot                | 2         |
| 0553211757 | Crime & Punishment  | 2         |
| 0553212168 | Brothers Karamozov  | 2         |
| 0553213695 | The Metamorphosis   | 1         |
| 0679420290 | Crime & Punishment  | 2         |
+-----+-----+-----+
5 rows in set (0.001 sec)
```

This will give us the first five rows found in the table. If we want to get the next ten found, we would add a starting point parameter just before the number of rows to display, separated by a comma:

```
SELECT isbn, title, author_id
FROM books
LIMIT 5, 10;
+-----+-----+-----+
| isbn      | title                | author_id |
+-----+-----+-----+
| 067973452X | Notes from Underground | 2         |
| 0805210407 | The Trial            | 1         |
| 0805210644 | America              | 2         |
+-----+-----+-----+
3 rows in set (0.001 sec)
```

In this case, there are only three further records.

Selectivity and Order

The previous statements have narrowed the number of columns and rows retrieved, but they haven't been very selective. Suppose that we want only books written by a certain author, say Dostoevsky. Looking in the authors table we find that his author identification number is 2. Using a `WHERE` clause, we can retrieve a list of books from the database for this particular author like so:

```
SELECT isbn, title
FROM books
WHERE author_id = 2
LIMIT 5;
+-----+-----+
| isbn      | title                |
+-----+-----+
| 0192834118 | Idiot                |
| 0553211757 | Crime & Punishment  |
| 0553212168 | Brothers Karamozov  |
| 0679420290 | Crime & Punishment  |
| 067973452X | Notes from Underground |
+-----+-----+
5 rows in set (0.000 sec)
```

I removed the `author_id` from the list of columns to select, but left the basic `LIMIT` clause in because we want to point out that the syntax is fairly strict on ordering of clauses and flags. You can't enter them in any order. You'll get an error in return.

The SQL statements we've looked at thus far will display the titles of books in the order in which they're found in the database. If we want to put the results in alphanumeric order based on the values of the title column, for instance, we would add an `ORDER BY` clause like this:

```
SELECT isbn, title
FROM books
WHERE author_id = 2
ORDER BY title ASC
LIMIT 5;
+-----+-----+
| isbn      | title                |
+-----+-----+
| 0805210644 | America              |
| 0553212168 | Brothers Karamozov  |
| 0553211757 | Crime & Punishment  |
| 0679420290 | Crime & Punishment  |
| 0192834118 | Idiot                |
+-----+-----+
5 rows in set (0.001 sec)
```

Notice that the `ORDER BY` clause goes after the `WHERE` clause and before the `LIMIT` clause. Not only will this statement display the rows in order by book title, but it will retrieve only the first five based on the ordering. That is to say, MariaDB will first retrieve all of the rows based on the `WHERE` clause, order the data based on the `ORDER BY` clause, and then display a limited number of rows based on the `LIMIT` clause. Hence the reason for the order of clauses. You may have noticed that we slipped in the `ASC` flag. It tells MariaDB to order the rows in ascending order for the column name it follows. It's not necessary, though, since ascending order is the default. However, if we want to display data in descending order, we would replace the flag with `DESC`. To order by more than one column, additional columns may be given in the `ORDER BY` clause in a comma separated list, each with the `ASC` or `DESC` flags if preferred.

Friendlier and More Complicated

So far we've been working with one table of data containing information on books for a fictitious bookstore. A database will usually have more than one table, of course. In this particular database, there's also one called authors in which the name and other information on authors is contained. To be able to select data from two tables in one `SELECT` statement, we will have to tell MariaDB that we want to join the tables and will need to provide a join point. This can be done with a `JOIN` clause as shown in the following SQL statement, with the results following it:

```

SELECT isbn, title,
CONCAT(name_first, ' ', name_last) AS author
FROM books
JOIN authors USING (author_id)
WHERE name_last = 'Dostoevsky'
ORDER BY title ASC
LIMIT 5;
+-----+-----+-----+
| isbn      | title                | author                |
+-----+-----+-----+
| 0805210644 | America              | Fyodor Dostoevsky    |
| 0553212168 | Brothers Karamozov  | Fyodor Dostoevsky    |
| 0553211757 | Crime & Punishment | Fyodor Dostoevsky    |
| 0679420290 | Crime & Punishment | Fyodor Dostoevsky    |
| 0192834118 | Idiot                | Fyodor Dostoevsky    |
+-----+-----+-----+
5 rows in set (0.00 sec)

```

Our **SELECT** statement is getting hefty, but it's the same one to which we've been adding. Don't let the clutter fluster you. Looking for the new elements, let's focus on the **JOIN** clause first. There are a few possible ways to construct a join. This method works if both tables contain a column of the same name and value. Otherwise you'll have to redo the **JOIN** clause to look something like this:

```

...
JOIN authors ON author_id = row_id
...

```

This excerpt is based on the assumption that the key field in the authors table is not called `author_id`, but `row_id` instead. There's much more that can be said about joins, but that would make for a much longer article. If you want to learn more on joins, look at MariaDB's documentation page on [JOIN syntax](#).

Looking again at the last full SQL statement above, you must have spotted the **CONCAT()** function that we added to the on-going example statement. This string function takes the values of the columns and strings given and pastes them together, to give one neat field in the results. We also employed the **AS** parameter to change the heading of the results set for the field to `author`. This is much tidier. Since we joined the books and the authors tables together, we were able to search for books based on the author's last name rather than having to look up the author ID first. This is a much friendlier method, albeit more complicated. Incidentally, we can have MariaDB check columns from both tables to narrow our search. We would just add `column = value` pairs, separated by commas in the **WHERE** clause. Notice that the string containing the author's name is wrapped in quotes—otherwise, the string would be considered a column name and we'd get an error.

The name Dostoevsky is sometimes spelled Dostoevskii, as well as a few other ways. If we're not sure how it's spelled in the authors table, we could use the **LIKE** operator instead of the equal sign, along with a wildcard. If we think the author's name is probably spelled either of the two ways mentioned, we could enter something like this:

```

SELECT isbn, title,
CONCAT(name_first, ' ', name_last) AS author
FROM books
JOIN authors USING (author_id)
WHERE name_last LIKE 'Dostoevsk%'
ORDER BY title ASC
LIMIT 5;
+-----+-----+-----+
| isbn      | title                | author                |
+-----+-----+-----+
| 0805210644 | America              | Fyodor Dostoevsky    |
| 0553212168 | Brothers Karamozov  | Fyodor Dostoevsky    |
| 0553211757 | Crime & Punishment | Fyodor Dostoevsky    |
| 0679420290 | Crime & Punishment | Fyodor Dostoevsky    |
| 0192834118 | Idiot                | Fyodor Dostoevsky    |
+-----+-----+-----+
5 rows in set (0.001 sec)

```

This will match any author last name starting with Dostoevsk. Notice that the wildcard here is not an asterisk, but a percent-sign.

Some Flags

There are many flags or parameters that can be used in a **SELECT** statement. To list and explain all of them with examples would make this a very lengthy article. The reality is that most people never use some of them anyway. So, let's take a look at a few that you may find useful as you get more involved with MariaDB or if you work with large tables on very active

servers.

The first flag that may be given, it goes immediately after the `SELECT` keyword, is `ALL`. By default, all rows that meet the requirements of the various clauses given are selected, so this isn't necessary. If instead we would only want the first occurrence of a particular criteria to be displayed, we could add the `DISTINCT` option. For instance, for authors like Dostoevsky there will be several printings of a particular title. In the results shown earlier you may have noticed that there were two copies of *Crime & Punishment* listed, however they have different ISBN numbers and different publishers. Suppose that for our search we only want one row displayed for each title. We could do that like so:

```
SELECT DISTINCT title
FROM books
JOIN authors USING (author_id)
WHERE name_last = 'Dostoevsky'
ORDER BY title;
+-----+
| title          |
+-----+
| America        |
| Brothers Karamozov |
| Crime & Punishment |
| Idiot          |
| Notes from Underground |
+-----+
```

We've thinned out the ongoing SQL statement a bit for clarity. This statement will result in only one row displayed for *Crime & Punishment* and it will be the first one found.

If we're retrieving data from an extremely busy database, by default any other SQL statements entered simultaneously which are changing or updating data will be executed before a `SELECT` statement. `SELECT` statements are considered to be of lower priority. However, if we would like a particular `SELECT` statement to be given a higher priority, we can add the keyword `HIGH_PRIORITY`. Modifying the previous SQL statement for this factor, we would enter it like this:

```
SELECT DISTINCT HIGH_PRIORITY title
FROM books
JOIN authors USING (author_id)
WHERE name_last = 'Dostoevsky'
ORDER BY title;
+-----+
| title          |
+-----+
| America        |
| Brothers Karamozov |
| Crime & Punishment |
| Idiot          |
| Notes from Underground |
+-----+
```

You may have noticed in the one example earlier in which the results are shown, that there's a status line displayed that specifies the number of rows in the results set. This is less than the number of rows that were found in the database that met the statement's criteria. It's less because we used a `LIMIT` clause. If we add the `SQL_CALC_FOUND_ROWS` flag just before the column list, MariaDB will calculate the number of columns found even if there is a `LIMIT` clause.

```
SELECT SQL_CALC_FOUND_ROWS isbn, title
FROM books
JOIN authors USING (author_id)
WHERE name_last = 'Dostoevsky'
LIMIT 5;
+-----+-----+
| isbn      | title          |
+-----+-----+
| 0192834118 | Idiot          |
| 0553211757 | Crime & Punishment |
| 0553212168 | Brothers Karamozov |
| 0679420290 | Crime & Punishment |
| 067973452X | Notes from Underground |
+-----+-----+
5 rows in set (0.001 sec)
```

To retrieve this information, though, we will have to use the `FOUND_ROWS()` function like so:

```
SELECT FOUND_ROWS();
+-----+
| FOUND_ROWS() |
+-----+
|              6 |
+-----+
1 row in set (0.000 sec)
```

This value is temporary and will be lost if the connection is terminated. It cannot be retrieved by any other client session. It relates only to the current session and the value for the variable when it was last calculated.

Conclusion

There are several more parameters and possibilities for the [SELECT](#) statement that we had to skip to keep this article a reasonable length. A popular one that we left out is the [GROUP BY](#) clause for calculating aggregate data for columns (e.g., an average). There are several flags for caching results and a clause for exporting a results set to a text file. If you would like to learn more about [SELECT](#) and all of the options available, look at the on-line documentation for [SELECT](#) statements.

6.1.4 Adding and Changing Data in MariaDB

MariaDB 101: Learning the Basics of MariaDB

Watch the Webinar [↗](#)

Contents

1. [Adding Data](#)
2. [Priority](#)
3. [Contingent Additions](#)
4. [Replacement Data](#)
5. [Updating Data](#)
6. [Conclusion](#)

There are several ways to add and to change data in MariaDB. There are a few SQL statements that you can use, each with a few options. Additionally, there are twists that you can do by mixing SQL statements together with various clauses. In this article, we will explore the ways in which data can be added and changed in MariaDB.

Adding Data

To add data to a table in MariaDB, you will need to use the [INSERT](#) statement. Its basic, minimal syntax is the command [INSERT](#) followed by the table name and then the keyword [VALUES](#) with a comma separated list of values contained in parentheses:

```
INSERT table1
VALUES ('text1', 'text2', 'text3');
```

In this example, text is added to a table called table1, which contains only three columns —the same number of values that we're inserting. The number of columns must match. If you don't want to insert data into all of the columns of a table, though, you could name the columns desired:

```
INSERT INTO table1
(col3, col1)
VALUES ('text3', 'text1');
```

Notice that the keyword `INTO` was added here. This is optional and has no effect on MariaDB. It's only a matter of grammatical preference. In this example we not only name the columns, but we list them in a different order. This is acceptable to MariaDB. Just be sure to list the values in the same order. If you're going to insert data into a table and want to specify all of the values except one (say the key column since it's an auto-incremented one), then you could just give a value of `DEFAULT` to keep from having to list the columns. Incidentally, you can give the column names even if you're naming all of them. It's just unnecessary unless you're going to reorder them as we did in this last example.

When you have many rows of data to insert into the same table, it can be more efficient to insert all of the rows in one SQL

statement. Multiple row insertions can be done like so:

```
INSERT IGNORE
INTO table2
VALUES ('id1', 'text', 'text'),
       ('id2', 'text', 'text'),
       ('id2', 'text', 'text');
```

Notice that the keyword `VALUES` is used only once and each row is contained in its own set of parentheses and each set is separated by commas. We've added an intentional mistake to this example: We are attempting to insert three rows of data into `table2` for which the first column happens to be a `UNIQUE` key field. The third row entered here has the same identification number for the key column as the second row. This would normally result in an error and none of the three rows would be inserted. However, since the statement has an `IGNORE` flag, duplicates will be ignored and not inserted, but the other rows will still be inserted. So, the first and second rows above will be inserted and the third one won't.

Priority

An `INSERT` statement takes priority over read statements (i.e., `SELECT` statements). An `INSERT` will lock the table and force other clients to wait until it's finished. On a busy MariaDB server that has many simultaneous requests for data, this could cause users to experience delays when you run a script that performs a series of `INSERT` statements. If you don't want user requests to be put on hold and you can wait to insert the data, you could use the `LOW_PRIORITY` flag:

```
INSERT LOW_PRIORITY
INTO table1
VALUES ('text1', 'text2', 'text3');
```

The `LOW_PRIORITY` flag will put the `INSERT` statement in queue, waiting for all current and pending requests to be completed before it's performed. If new requests are made while a low priority statement is waiting, then they are put ahead of it in the queue. MariaDB does not begin to execute a low priority statement until there are no other requests waiting. Once the transaction begins, though, the table is locked and any other requests for data from the table that come in after it starts must wait until it's completed. Because it locks the table, low priority statements will prevent simultaneous insertions from other clients even if you're dealing with a MyISAM table. Incidentally, notice that the `LOW_PRIORITY` flag comes before the `INTO`.

One potential inconvenience with an `INSERT LOW_PRIORITY` statement is that the client will be tied up waiting for the statement to be completed successfully. So if you're inserting data into a busy server with a low priority setting using the `mariadb` client, your client could be locked up for minutes, maybe hours depending on how busy your server is at the time. As an alternative either to making other clients with read requests wait or to having your client wait, you can use the `DELAYED` flag instead of the `LOW_PRIORITY` flag:

```
INSERT DELAYED
INTO table1
VALUES ('text1', 'text2', 'text3');
```

MariaDB will take the request as a low priority one and put it on its list of tasks to perform when it has a break. However, it will immediately release the client so that the client can go on to enter other SQL statements or even exit. Another advantage of this method is that multiple `INSERT DELAYED` requests are batched together for block insertion when there is a gap, making the process potentially faster than `INSERT LOW_PRIORITY`. The flaw in this choice, however, is that the client is never told if a delayed insertion is successfully made or not. The client is informed of error messages when the statement is entered—the statement has to be valid before it will be queued—but it's not told of problems that occur after it's accepted. This brings up another flaw: delayed insertions are stored in the server's memory. So if the MariaDB daemon (`mariabdb`) dies or is manually killed, then the transactions are lost and the client is not notified of the failure. So `DELAYED` is not always a good alternative.

Contingent Additions

As an added twist to `INSERT`, you can combine it with a `SELECT` statement. Suppose that you have a table called `employees` which contains employee information for your company. Suppose further that you have a column to indicate whether an employee is on the company's softball team. However, you one day decide to create a separate database and table for the softball team's data that someone else will administer. To get the database ready for the new administrator, you have to copy some data for team members to the new table. Here's one way you can accomplish this task:

```

INSERT INTO softball_team
(last, first, telephone)
SELECT name_last, name_first, tel_home
FROM company.employees
WHERE softball='Y';

```

In this SQL statement the columns in which data is to be inserted into are listed, then the complete SELECT statement follows with the appropriate WHERE clause to determine if an employee is on the softball team. Since we're executing this statement from the new database and since the table employees is in a separate database called company, we have to specify it as you see here. By the way, [INSERT...SELECT](#) statements cannot be performed on the same table.

Replacement Data

When you're adding massive amounts of data to a table that has a key field, as mentioned earlier, you can use the `IGNORE` flag to prevent duplicates from being inserted, but still allow unique rows to be entered. However, there may be times when you actually want to replace the rows with the same key fields with the new ones. In such a situation, instead of using [INSERT](#) you can use a [REPLACE](#) statement:

```

REPLACE LOW_PRIORITY
INTO table2 (id, col1, col2)
VALUES ('id1','text','text'),
('id2','text','text'),
('id3','text','text');

```

Notice that the syntax is the same as an [INSERT](#) statement. The flags all have the same effect, as well. Also, multiple rows may be inserted, but there's no need for the `IGNORE` flag since duplicates won't happen—the originals are just overwritten. Actually, when a row is replaced, it's first deleted completely and the new row is then inserted. Any columns without values in the new row will be given the default values for the columns. None of the values of the old row are kept. Incidentally, [REPLACE](#) will also allow you to combine it with a SELECT statement as we saw with the [INSERT](#) statement earlier.

Updating Data

If you want to change the data contained in existing records, but only for certain columns, then you would need to use an [UPDATE](#) statement. The syntax for [UPDATE](#) is a little bit different from the syntax shown before for [INSERT](#) and [REPLACE](#) statements:

```

UPDATE LOW_PRIORITY table3
SET col1 = 'text-a', col2='text-b'
WHERE id < 100;

```

In the SQL statement here, we are changing the value of the two columns named individually using the `SET` clause. Incidentally, the `SET` clause optionally can be used in [INSERT](#) and [REPLACE](#) statements, but it eliminates the multiple row option. In the statement above, we're also using a `WHERE` clause to determine which records are changed: only rows with an id that has a value less than 100 are updated. Notice that the `LOW_PRIORITY` flag can be used with this statement, too. The `IGNORE` flag can be used, as well.

A useful feature of the [UPDATE](#) statement is that it allows the use of the current value of a column to update the same column. For instance, suppose you want to add one day to the value of a date column where the date is a Sunday. You could do the following:

```

UPDATE table5
SET col_date = DATE_ADD(col_date, INTERVAL 1 DAY)
WHERE DAYOFWEEK(col_date) = 1;

```

For rows where the day of the week is Sunday, the `DATE_ADD()` function will take the value of `col_date` before it's updated and add one day to it. MariaDB will then take this sum and set `col_date` to it.

There are a couple more twists that you can now do with the [UPDATE](#) statement: if you want to update the rows in a specific order, you can add an [ORDER BY](#) clause. You can also limit the number of rows that are updated with a [LIMIT](#) clause. Below is an example of both of these clauses:

```

UPDATE LOW_PRIORITY table3
SET col1='text-a', col2='text-b'
WHERE id < 100
ORDER BY col3 DESC
LIMIT 10;

```

The ordering can be descending as indicated here by the `DESC` flag, or ascending with either the `ASC` flag or by just leaving it out, as ascending is the default. The `LIMIT` clause, of course, limits the number of rows affected to ten here.

If you want to refer to multiple tables in one `UPDATE` statement, you can do so like this:

```
UPDATE table3, table4
SET table3.col1 = table4.col1
WHERE table3.id = table4.id;
```

Here we see a join between the two tables named. In table3, the value of col1 is set to the value of the same column in table4 where the values of id from each match. We're not updating both tables here; we're just accessing both. We must specify the table name for each column to prevent an ambiguity error. Incidentally, `ORDER BY` and `LIMIT` clauses aren't allowed with multiple table updates.

There's another combination that you can do with the `INSERT` statement that we didn't mention earlier. It involves the `UPDATE` statement. When inserting multiple rows of data, if you want to note which rows had potentially duplicate entries and which ones are new, you could add a column called status and change it's value accordingly with a statement like this one:

```
INSERT IGNORE INTO table1
(id, col1, col2, status)
VALUES ('1012', 'text', 'text', 'new'),
('1025', 'text', 'text', 'new'),
('1030', 'text', 'text', 'new')
ON DUPLICATE KEY
UPDATE status = 'old';
```

Because of the `IGNORE` flag, errors will not be generated, duplicates won't be inserted or replaced, but the rest will be added. Because of the `ON DUPLICATE KEY`, the column status of the original row will be set to old when there are duplicate entry attempts. The rest will be inserted and their status set to new.

Conclusion

As you can see from some of these SQL statements, MariaDB offers you quite a few ways to add and to change data. In addition to these methods, there are also some bulk methods of adding and changing data in a table. You could use the `LOAD DATA INFILE` statement and the `mysql-dump` command-line utility. These methods are covered in another article on [Importing Data into MariaDB](#).

6.1.5 Altering Tables in MariaDB

MariaDB 101: Learning the Basics of MariaDB

3. [Changing One's Mind](#)
4. [The Default](#)
5. [Indexes](#)
6. [Renaming & Shifting Tables](#)
7. [Summation](#)

Despite a MariaDB developer's best planning, occasionally one needs to change the structure or other aspects of tables. This is not very difficult, but some developers are unfamiliar with the syntax for the functions used in MariaDB to accomplish this. And some changes can be very frustrating. In this article we'll explore the ways to alter tables in MariaDB and we'll give some precautions about related potential data problems.

Before Beginning

For the examples in this article, we will refer to a database called `db1` containing a table called `clients`. The `clients` table is for keeping track of client names and addresses. To start off, we'll enter a `DESCRIBE` statement to see what the

table looks like:

```
DESCRIBE clients;
```

Field	Type	Null	Key	Default	Extra
cust_id	int(11)		PRI	0	
name	varchar(25)	YES		NULL	
address	varchar(25)	YES		NULL	
city	varchar(25)	YES		NULL	
state	char(2)	YES		NULL	
zip	varchar(10)	YES		NULL	
client_type	varchar(4)	YES		NULL	

This is a very simple table that will hold very little information. However, it's sufficient for the examples here in which we will change several of its columns. Before doing any structural changes to a table in MariaDB, especially if it contains data, one should make a backup of the table to be changed. There are a few ways to do this, but some choices may not be permitted by your web hosting company. Even if your database is on your own server, though, the [mariadb-dump](#) utility is typically the best tool for making and restoring backups in MariaDB, and it's generally permitted by web hosting companies. To backup the clients table with [mariadb-dump](#), we will enter the following from the command-line:

```
mariadb-dump --user='username' --password='password' --add-locks db1 clients > clients.sql
```

As you can see, the username and password are given on the first line. On the next line, the `--add-locks` option is used to lock the table before backing up and to unlock automatically it when the backup is finished. There are many other options in [mariadb-dump](#) that could be used, but for our purposes this one is all that's necessary. Incidentally, this statement can be entered in one line from the shell (i.e., not from the `mariadb` client), or it can be entered on multiple lines as shown here by using the back-slash (i.e., `/`) to let the shell know that more is to follow. On the third line above, the database name is given, followed by the table name. The redirect (i.e., `>`) tells the shell to send the results of the dump to a text file called `clients.sql` in the current directory. A directory path could be put in front of the file name to create the file elsewhere. If the table should need to be restored, the following can be run from the shell:

```
mariadb --user='username' --password='password' db1 < clients.sql
```

Notice that this line does not use the `mariadb-dump` utility. It uses the `mariadb` client from the outside, so to speak. When the dump file (`clients.sql`) is read into the database, it will delete the `clients` table and it's data in MariaDB before restoring the backup copy with its data. So be sure that users haven't added data in the interim. In the examples in this article, we are assuming that there isn't any data in the tables yet.

Basic Addition and More

In order to add a column to an existing MariaDB table, one would use the [ALTER TABLE](#) statement. To demonstrate, suppose that it has been decided that there should be a column for the client's account status (i.e., active or inactive). To make this change, the following is entered:

```
ALTER TABLE clients
ADD COLUMN status CHAR(2);
```

This will add the column `status` to the end with a fixed width of two characters (i.e., `AC` for active and `IA` for inactive). In looking over the table again, it's decided that another field for client apartment numbers or the like needs to be added. That data could be stored in the address column, but it would better for it to be in a separate column. An [ALTER TABLE](#) statement could be entered like above, but it will look tidier if the new column is located right after the address column. To do this, we'll use the `AFTER` option:

```
ALTER TABLE clients
ADD COLUMN address2 varchar(25)
AFTER address;
```

By the way, to add a column to the first position, you would replace the last line of the SQL statement above to read like this:

```
...
FIRST;
```

Before moving on, let's take a look at the table's structure so far:

```
DESCRIBE clients;
```

Field	Type	Null	Key	Default	Extra
cust_id	int(11)		PRI	0	
name	varchar(25)	YES		NULL	
address	varchar(25)	YES		NULL	
address2	varchar(25)	YES		NULL	
city	varchar(25)	YES		NULL	
state	char(2)	YES		NULL	
zip	varchar(10)	YES		NULL	
client_type	varchar(4)	YES		NULL	
status	char(2)	YES		NULL	

Changing One's Mind

After looking over the above table display, it's decided that it might be better if the status column has the choices of 'AC' and 'IA' enumerated. To make this change, we'll enter the following SQL statement:

```
ALTER TABLE clients
CHANGE status status enum('AC','IA');
```

Notice that the column name status is specified twice. Although the column name isn't being changed, it still must be respecified. To change the column name (from status to active), while leaving the enumerated list the same, we specify the new column name in the second position:

```
ALTER TABLE clients
CHANGE status active ENUM('AC','IA');
```

Here we have the current column name and then the new column name, along with the data type specifications (i.e., ENUM), even though the result is only a name change. With the CHANGE clause everything must be stated, even items that are not to be changed.

In checking the table structure again, more changes are decided on: The column address is to be renamed to address1 and changed to forty characters wide. Also, the enumeration of active is to have 'yes' and 'no' choices. The problem with changing enumerations is that data can be clobbered in the change if one isn't careful. We've glossed over this possibility before because we are assuming that clients is empty. Let's take a look at how the modifications suggested could be made with the table containing data:

```
ALTER TABLE clients
CHANGE address address1 varchar(40),
MODIFY active enum('yes','no','AC','IA');

UPDATE clients
SET active = 'yes'
WHERE active = 'AC';

UPDATE clients
SET active = 'no'
WHERE active = 'IA';

ALTER TABLE clients
MODIFY active enum('yes','no');
```

The first SQL statement above changes address and modifies active in preparation for the transition. Notice the use of a MODIFY clause. It works the same as CHANGE, but it is only used for changing data types and not column names. Therefore, the column name isn't respecified. Notice also that there is a comma after the CHANGE clause. You can string several CHANGE and MODIFY clauses together with comma separators. We've enumerated both the new choices and the old ones to be able to migrate the data. The two UPDATE statements are designed to adjust the data accordingly and the last ALTER TABLE statement is to remove the old enumerated choices for the status column.

In talking to the boss, we find out that the client_type column isn't going to be used. So we enter the following in MariaDB:

```
ALTER TABLE clients
DROP client_type;
```

This deletes `client_type` and its data, but not the whole table, obviously. Nevertheless, it is a permanent and non-reversible action; there won't be a confirmation request when using the mariadb client. This is how it is with all MariaDB DROP statements and clauses. So be sure that you want to delete an element and its data before using a DROP. As mentioned earlier, be sure that you have a backup of your tables before doing any structured changes.

The Default

You may have noticed that the results of the DESCRIBE statements shown before have a heading called 'Default' and just about all of the fields have a default value of NULL. This means that there are no default values and a null value is allowed and will be used if a value isn't specified when a row is created. To be able to specify a default value other than NULL, an ALTER TABLE statement can be entered with a SET clause. Suppose we're located in Louisiana and we want a default value of 'LA' for state since that's where our clients are usually located. We would enter the following to set the default:

```
ALTER TABLE clients
ALTER state SET DEFAULT 'LA';
```

Notice that the second line starts with ALTER and not CHANGE. If we change our mind about having a default value for state, we would enter the following to reset it back to NULL (or whatever the initial default value would be based on the data type):

```
ALTER TABLE clients
ALTER state DROP DEFAULT;
```

This particular DROP doesn't delete data, by the way.

Indexes

One of the most irritating tasks in making changes to a table for newcomers is dealing with indexes. If they try to rename a column that is indexed by only using an ALTER TABLE statement like we used earlier, they will get a frustrating and confusing error message:

```
ALTER TABLE clients
CHANGE cust_id client_id INT
PRIMARY KEY;

ERROR 1068: Multiple primary key defined
```

If they're typing this column change from memory, they will wear themselves out trying different deviations thinking that they remembered the syntax wrong. What most newcomers to MariaDB don't seem to realize is that the index is separate from the indexed column. To illustrate, let's take a look at the index for clients by using the SHOW INDEX statement:

```
SHOW INDEX FROM clients \G

***** 1. row *****
      Table: clients
    Non_unique: 0
      Key_name: PRIMARY
    Seq_in_index: 1
     Column_name: cust_id
      Collation: A
   Cardinality: 0
      Sub_part: NULL
         Packed: NULL
         Comment:
 1 row in set (0.00 sec)
```

The text above shows that behind the scenes there is an index associated with `cust_id`. The column `cust_id` is not the index. Incidentally, the G at the end of the SHOW INDEX statement is to display the results in portrait instead of landscape format. Before the name of an indexed column can be changed, the index related to it must be eliminated. The index is not automatically changed or deleted. Therefore, in the example above, MariaDB thinks that the developer is trying to create another primary key index. So, a DROP clause for the index must be entered first and then a CHANGE for the column name can be made along with the establishing of a new index:

```
ALTER TABLE clients
DROP PRIMARY KEY,
CHANGE cust_id
client_id INT PRIMARY KEY;
```

The order of these clauses is necessary. The index must be dropped before the column can be renamed. The syntax here is for a `PRIMARY KEY`. There are other types of indexes, of course. To change a column that has an index type other than a `PRIMARY KEY`. Assuming for a moment that `cust_id` has a `UNIQUE` index, this is what we would enter to change its name:

```
ALTER TABLE clients
DROP UNIQUE cust_id
CHANGE cust_id
client_id INT UNIQUE;
```

Although the index type can be changed easily, MariaDB won't permit you to do so when there are duplicate rows of data and when going from an index that allows duplicates (e.g., `INDEX`) to one that doesn't (e.g., `UNIQUE`). If you actually do want to eliminate the duplicates, though, you can add the `IGNORE` flag to force the duplicates to be deleted:

```
ALTER IGNORE TABLE clients
DROP INDEX cust_id
CHANGE cust_id
client_id INT UNIQUE;
```

In this example, we're not only changing the indexed column's name, but we're also changing the index type from `INDEX` to `UNIQUE`. And, again, the `IGNORE` flag tells MariaDB to ignore any records with duplicate values for `cust_id`.

Renaming & Shifting Tables

The previous sections covered how to make changes to columns in a table. Sometimes you may want to rename a table. To change the name of the `clients` table to `client_addresses` we enter this:

```
RENAME TABLE clients
TO client_addresses;
```

The `RENAME TABLE` statement will also allow a table to be moved to another database just by adding the receiving database's name in front of the new table name, separated by a dot. Of course, you can move a table without renaming it. To move the newly named `client_addresses` table to the database `db2`, we enter this:

```
RENAME TABLE client_addresses
TO db2.client_addresses;
```

Finally, with tables that contain data (excluding `InnoDB` tables), occasionally it's desirable to resort the data within the table. Although the `ORDER BY` clause in a `SELECT` statement can do this on the fly as needed, sometimes developers want to do this somewhat permanently to the data within the table based on a particular column or columns. It can be done by entering the following:

```
ALTER TABLE client_addresses
ORDER BY city, name;
```

Notice that we're sorting by the city first and then by the client's name. Now when the developer enters a `SELECT` statement without an `ORDER BY` clause, the results are already ordered by the default of city and then name, at least until more data is added to the table.

This is not applicable to `InnoDB` tables, the default, which are ordered according to the clustered index, unless the primary key is defined on the specific columns.

Summation

Good planning is certainly important in developing a MariaDB database. However, as you can see, MariaDB is malleable enough that it can be reshaped without much trouble. Just be sure to make a backup before restructuring a table and be sure to check your work and the data when you're finished. With all of this in mind, you should feel comfortable in creating tables since they don't have to be perfect from the beginning.

6.1.6 Changing Times in MariaDB

MariaDB 101: Learning the Basics of MariaDB

1. [The Nature of Time](#)
2. [Around the Clock](#)
3. [Today or Tomorrow?](#)
4. [Around the Calendar](#)
5. [Stepping Back](#)
6. [Conclusion](#)

The article entitled, [Doing Time with MariaDB](#) dealt with time and date columns in MariaDB and how to selectively retrieve and format time and date elements. This article will go a little further by exploring special functions that are available in MariaDB to modify time and date.

The Nature of Time

For most of us, there is a morning and an afternoon in each day. Days are measured in either two twelve-hour blocks or one twenty-four-hour block. There are twelve months in a year, with each month consisting of thirty or thirty-one days. The only exception is the month of February which contains twenty-eight days usually, but once every four years it contains twenty-nine. While this all may be rather natural, putting it into a computer program can make it seem very unnatural and frustrating.

For the scenario in this article we have a MariaDB database in which customers enter work requests through the web. When they enter a trouble ticket, a record is entered into a MariaDB table called, tickets. This record contains several fields, one of which is the date that the ticket was entered called ticket_date. Another contains the time the ticket was entered. It's called simply, entered. Yet another column is called promised; it's the time that the customer was promised that their problem would be resolved. Both the entered and the promised columns are time data type columns. The value of entered is determined from the current time of the server. The value of promised is determined by adding a number of hours to the value of entered, depending on the urgency of the ticket set by the customer. For instance, tickets marked "ASAP" are to be completed within two hours according to our company's policy. This all works nicely in testing, but occasionally customers create tickets at odd times and on odd days.

Around the Clock

Setting aside the potential problems for a moment, let's look at a simple example of how we might add tickets. Suppose we wanted to write a CGI script (in Perl or PHP) that will allow users to create tickets on-line any time. We might use the following SQL statement in our script:

```
INSERT INTO tickets
(client_id, urgency, trouble,
ticket_date, entered, promised)
VALUES ('$client_id', '$urgency', '$trouble',
CURDATE(), CURTIME(),
SEC_TO_TIME(TIME_TO_SEC(CURTIME()) + 7200));
```

If you're unfamiliar with [INSERT](#) statements and the use of script variables (e.g., \$client_id), you may want to go back and read an earlier article ([MariaDB Basics](#)) in this series which explains both. For the purposes of this article, however, let's focus on the minor formula in the SQL statement above for calculating the promised time, the last line. The [TIME_TO_SEC\(\)](#) function converts a time to seconds so that a calculation may be performed. In this case, the current time is converted to seconds. The formula above then adds 7200 seconds (which is two hours) to that. In order to insert the seconds sum into a time column (i.e., promised), it needs to be converted to a time format. Hence, the calculation is wrapped up in the [SEC_TO_TIME\(\)](#) function.

As nice as the SQL statement above is, a problem arises when a customer runs it at 11:00 p.m (or 23:00 in MariaDB time) and the promised time is to be two hours later. The SQL statement above will calculate a promised time of 25:00. What time is that in human or computer terms? As humans, we know that it's meant to be 1:00 a.m., but MariaDB will need this clarified. One solution would be to place the time formula above inside of an IF clause in MariaDB. To do this, the last line of the SQL statement would be replaced with these lines:

```

...
IF((TIME_TO_SEC(CURTIME()) + 7200) < 86400,
SEC_TO_TIME(TIME_TO_SEC(CURTIME()) + 7200),
SEC_TO_TIME((TIME_TO_SEC(CURTIME()) + 7200) - 86400));

```

The first element in the IF clause is the test. The second piece is the value used if the test passes. The third is the value if the test fails. So, if the total seconds is less than 86,400 (i.e., the number of seconds in one day), then the total seconds of the current time, converted to the time format is to be used. Otherwise, the total seconds of the current time minus 86,400 seconds, converted to the time format is to be used. Incidentally, there's an extra closing parenthesis at the end of this SQL statement excerpt because there was an opening one as part of the `VALUES` clause that's not shown here. Although the statement above works, it's a bit excessive and can be accomplished a little more succinctly if one reconsiders the purpose of the IF clause.

What we're trying to determine in the IF clause is the number of seconds into the day in which the work was promised to be done, meaning the excess amount of time of the day (i.e., one hour). For such a calculation, the modulo division operator (i.e., the `%`) can be used. The modulo division operator will give the remainder of a division. For instance, the result of `SELECT 14 % 5;` is 4. That is to say, 5 goes into 14 two complete times with 4 left over. As another example, the result of `SELECT 3 % 5;` is 3; that is to say, 5 goes into 3 zero times with 3 left over. Using this arithmetic operator in the time formula above, we can eliminate the IF clause and use the following to accomplish our task:

```

...
SEC_TO_TIME((TIME_TO_SEC(CURTIME()) + 7200) % 86400);

```

If the current time is 23:00, then the time in seconds will be 82,800. The formula above will add 7200 to 82,800 to make 90,000 seconds. The modulo division operator will divide 86,400 into 90,000 one time, giving a remainder of 3600 seconds. The `SEC_TO_TIME` function will then convert 3600 seconds to one hour or 1:00 a.m.

Today or Tomorrow?

There is a problem with the results from the formula at the end of the previous section. If the customer is promised 1:00 a.m., is that time today or tomorrow? Again, as humans we know that since the promised time must be after the entered time, it must be 1:00 a.m. on the following day. Since computers don't make these assumptions, though, we'll have to make some adjustments to the tickets table and the SQL statement. To be able to record the date and time in each column, we'll first change the column types of entered and promised from time to datetime. We'll do the following SQL statements to migrate the data and to clean up the table:

```

ALTER TABLE tickets,
CHANGE COLUMN entered entered_old TIME,
CHANGE COLUMN promised promised_old TIME,
ADD COLUMN entered DATETIME,
ADD COLUMN promised DATETIME;

UPDATE tickets
SET entered = CONCAT(ticket_date, ' ', entered_old),
    promised = CONCAT(ticket_date, ' ', promised_old);

ALTER TABLE tickets,
DROP COLUMN entered_old,
DROP COLUMN promised_old,
DROP COLUMN ticket_date;

```

The first SQL statement above alters the table to change the names of the time columns temporarily and to add the new columns with datetime types. If we were instead just to change the existing time columns to datetime types without this two step process, the data would be clobbered and reset to all zeros. The next SQL statement copies the values of the `ticket_date` column and pastes it together with the value of one of the old time columns to come up with the new date and time value for the entered and promised dates and times. The flaw in this statement, of course, is that it doesn't deal with the problems with some promised times that the previous layout caused. In fact, it reinforces it by giving a 1:00 a.m. promised time the date of the entered time. This will either have to be fixed manually if it's important to the developer, or with a script that will compare the two time columns. Either way, it's a little out of the scope of this article, so we'll move on. The last SQL statement above deletes the old time columns and the old date column now that the data has been migrated. By the way, it's a good practice to backup the data before altering a table. Also, you probably would run a `SELECT` statement before the last SQL statement above to check the migrated data before dropping the old columns.

Having changed the column types, we can now use the function `DATE_ADD()`, which can deal with times that exceed twenty-four hours so that the problem with times straddling the midnight hour won't reoccur. Therefore, our on-going SQL statement becomes this:

```

INSERT INTO tickets
(client_id, urgency, trouble,
entered, promised)
VALUES ('$client_id', '$urgency', '$trouble',
NOW(),
DATE_ADD(NOW(), INTERVAL 2 HOUR));

```

First notice that the field `ticket_date` was eliminated and `CURTIME()` was replaced with `NOW()`, which provides the date and time in one. In the last line we see `DATE_ADD()`: an interval of two hours is added to the date and time now (or rather when the record is created). If the time rolls into the next day, then the date is advanced by one and the correct hour is set accordingly.

The `DATE_ADD()` function will also allow for the addition of minutes. The directive `HOUR` would be replaced with `MINUTE`. To add both hours and minutes (e.g., two hours and thirty minutes), the last line of the SQL statement above could read like this:

```

...
DATE_ADD(NOW(), INTERVAL '2:30' HOUR_MINUTE));

```

If the time in which the statement is run is 11:00 p.m., the result would be 1:30 a.m. on the next day.

Around the Calendar

The dilemma that can occur with calculations involving hours that wrap around the clock, can similarly occur with calculations involving days that roll into a new month. This problem was fairly easy to resolve with an arithmetic operator when dealing with a constant like the number of seconds in a day. However, a formula to deal with the various number of days in each month would be very lengthy. For instance, if we were simply to add five days to the date February 27, we would get February 32. Imagine trying to create an SQL statement to figure out whether that's supposed to be March 1, 2, 3, or 4--depending on whether the previous month is a regular month with 30 or 31 days, or the one irregular month with 28 or 29 days, depending on the year.

Fortunately (as you probably have already guessed), `DATE_ADD()` will solve the month dilemma, as well. If instead of promising that tickets will be resolved within a couple hours of the time they are entered, we promise resolution within five days, the SQL statement would look like this:

```

INSERT INTO tickets
(client_id, urgency, trouble,
entered, promised)
VALUES ('$client_id', '$urgency', '$trouble',
NOW(),
DATE_ADD(NOW(), INTERVAL 5 DAY));

```

If this statement is run on February 27, then the value of `promised` would be March 3 or 4, depending on whether it is a leap year. Which one will be determined by the `DATE_ADD()` function, requiring no fancy formula.

Just as hours and minutes can be mixed with `DATE_ADD()`, days and hours can be mixed, as well. To make the value of `promised` two days and six hours from now, the last line of the SQL statement above would read like this:

```

...
DATE_ADD(NOW(), INTERVAL '2 6' DAY_HOUR));

```

The function `DATE_ADD()` will also allow the addition of months and of years. For instance, to increase the date by one year and two months, the SQL statement would be adjusted to look like this:

```

...
DATE_ADD(NOW(), INTERVAL '1 2' YEAR_MONTH));

```

This increases the year by one and the month by two. These intervals have no effect on time or day values, though. So, if the value of `NOW()` is `2017-09-15 23:00`, then the value of `promised` would become `2018-11-15 23:00`, regardless of whether next year is a leap year and regardless of the number of days in each intervening month.

Stepping Back

It stands to reason that if one wants to add days to the current date, then one will want to subtract days in an equally agreeable manner. For subtracting days we can still use the `DATE_ADD` function. Just put a negative sign in front of the interval value like this:

```
...  
DATE_ADD(NOW(), INTERVAL -5 DAY);
```

This will give a value five days before the current date. An alternative would be to use the `DATE_SUB()` function which subtracts from the date given. The above amendment (subtracting five days from the current date) could be entered like so:

```
...  
DATE_SUB(NOW(), INTERVAL 5 DAY);
```

Notice that the 5 is not preceded by a negative sign. If it were, it would have the effect of adding five days.

Conclusion

This article along with the previous one on time and date in MariaDB in no way exhaust the topic. There are many more functions and tricks to manipulating temporal values in MariaDB, not to mention what can be done with the extension of a script using a programming language like PHP. Plus, new functions are occasionally being added to MariaDB.

The recording of date and time in a MariaDB database is a very common requirement. For gathering temporal data, one needs to know which type of columns to use in a table. More importantly is knowing how to record chronological data and how to retrieve it in various formats. Although this is a seemingly basic topic, there are many built-in time functions that can be used for more accurate SQL statements and better formatting of data. In this article we will explore these various aspects of how to do time with MariaDB.

About Time

Since date and time are only numeric strings, they can be stored in a regular character column. However, by using temporal data type columns, you can make use of several built-in functions offered by MariaDB. Currently, there are five temporal data types available: `DATE`, `TIME`, `DATETIME`, `TIMESTAMP`, and `YEAR`. The `DATE` column type is for recording the date only and is basically in this format: `yyyy-mm-dd`. The `TIME` column type is for recording time in this format: `hh:mm:ss`. To record a combination of date and time, there is the `DATETIME` column type: `yyyy-mm-dd hh:mm:ss`. The `TIMESTAMP` column is similar to `DATETIME`, but it's a little limited in its range of allowable time. It starts at the Unix epoch time (i.e., 1970-01-01) and ends on 2106-02-07 (from [MariaDB 11.5](#), 64-bit only), or in 2038-01-19 (32-bit, or prior to [MariaDB 11.5](#)). Finally, the `YEAR` data type is for recording only the year in a column: `yy` or `yyyy`. For the examples in this article, `DATE`, `TIME`, and `DATETIME` columns will be used. The database that will be referenced is for a fictitious psychiatry practice that keeps track of its patients and billable hours in MariaDB.

Telling Time

To record the current date and time in a MariaDB table, there are a few built-in functions that may be used. First, to record the date there are the functions `CURRENT_DATE` and `CURDATE()` (depending on your style), which both produce the same results (e.g., 2017-08-01). Notice that `CURDATE()` requires parentheses and the other does not. With many functions a column name or other variables are placed inside of the parentheses to get a result. With functions like `CURDATE()`, there is nothing that may go inside the parenthesis. Since these two functions retrieve the current date in the format of the

DATE column type, they can be used to fill in a DATE column when inserting a row:

```
INSERT INTO billable_work
(doctor_id, patient_id, session_date)
VALUES ('1021', '1256', CURRENT_DATE);
```

The column `session_date` is a DATE column. Notice that there are no quotes around the date function. If there were it would be taken as a literal value rather than a function. Incidentally, I've skipped discussing how the table was set up. If you're not familiar with how to set up a table, you may want to read the [MariaDB Basics](#) article. To see what was just recorded by the INSERT statement above, the following may be entered (results follow):

```
SELECT rec_id, doctor_id,
patient_id, session_date
FROM billable_work
WHERE rec_id=LAST_INSERT_ID();
```

rec_id	doctor_id	patient_id	session_date
2462	1021	1256	2017-08-23

Notice in the `billable_work` table that the primary key column (i.e., `rec_id`) is an automatically generated and incremental number column (i.e., `AUTO_INCREMENT`). As long as another record is not created or the user does not exit from the `mariadb` client or otherwise end the session, the `LAST_INSERT_ID()` function will retrieve the value of the `rec_id` for the last record entered by the user.

To record the time of an appointment for a patient in a time data type column, `CURRENT_TIME` or `CURTIME()` are used in the same way to insert the time. The following is entered to update the row created above to mark the starting time of the appointment—another `SELECT` statement follows with the results:

```
UPDATE billable_work
SET session_time=CURTIME()
WHERE rec_id='2462';
```

```
SELECT patient_id, session_date, session_time
FROM billable_work
WHERE rec_id='2462';
```

patient_id	session_date	session_time
1256	2017-08-23	10:30:23

The column `session_time` is a time column. To record the date and time together in the same column, `CURRENT_TIMESTAMP` or `SYSDATE()` or `NOW()` can be used. All three functions produce the same time format: `yyyy-mm-dd hh:mm:ss`. Therefore, the column's data type would have to be `DATETIME` to use them.

How to get a Date

Although MariaDB records the date in a fairly agreeable format, you may want to present the date when it's retrieved in a different format. Or, you may want to extract part of the date, such as only the day of the month. There are many functions for reformatting and selectively retrieving date and time information. To start off with, let's select a column with a data type of `DATE` and look at the functions available for retrieving each component. To extract the year, there's the `YEAR()` function. For extracting just the month, the `MONTH()` function could be called upon. And to grab the day of the month, `DAYOFMONTH()` will work. Using the record entered above, here's what an SQL statement and its results would look like in which the session date is broken up into separate parts, but in a different order:

```

SELECT MONTH(session_date) AS Month,
DAYOFMONTH(session_date) AS Day,
YEAR(session_date) AS Year
FROM billable_work
WHERE rec_id='2462';

```

```

+-----+-----+-----+
| Month | Day | Year |
+-----+-----+-----+
|      8 |  23 | 2017 |
+-----+-----+-----+

```

For those who aren't familiar with the keyword `AS`, it's used to label a column's output and may be referenced within an SQL statement. Splitting up the elements of a date can be useful in analyzing a particular element. If the bookkeeper of the fictitious psychiatry office needed to determine if the day of the week of each session was on a Saturday because the billing rate would be higher (time and a half), the `DAYOFWEEK()` function could be used. To spice up the examples, let's wrap the date function up in an `IF()` function that tests for the day of the week and sets the billing rate accordingly.

```

SELECT patient_id AS 'Patient ID',
session_date AS 'Date of Session',
IF(DAYOFWEEK(session_date)=6, 1.5, 1.0)
AS 'Billing Rate'
FROM billable_work
WHERE rec_id='2462';

```

```

+-----+-----+-----+
| Patient ID | Date of Session | Billing Rate |
+-----+-----+-----+
|          1256 | 2017-08-23 |          1.5 |
+-----+-----+-----+

```

Since we've slipped in the `IF()` function, we should explain its format. The test condition is listed first within the parentheses. In this case, the test is checking if the session date is the sixth day of the week. Then, what MariaDB should display is given if the test passes, followed by the result if it fails.

Similar to the `DAYOFWEEK()` function, there's also `WEEKDAY()`. The only difference is that for `DAYOFWEEK()` the first day of the week is Sunday—with `WEEKDAY()` the first day is Monday. Both functions represent the first day with 0 and the last with 6. Having *Saturday* and *Sunday* symbolized by 5 and 6 can be handy in constructing an IF statement that has a test component like "`WEEKDAY(session_date) > 4`" to determine if a date is a weekend day. This is cleaner than testing for values of 0 and 6.

There is a function for determining the day of the year: `DAYOFYEAR()`. It's not used often, but it is available if you ever need it. Occasionally, though, knowing the quarter of a year for a date can be useful for financial accounting. Rather than set up a formula in a script to determine the quarter, the `QUARTER()` function can do this easily. For instance, suppose an accountant wants a list of a doctor's sessions for each patient for the previous quarter. These three SQL statements could be entered in sequence to achieve the results that follow:

```

SET @LASTQTR:=IF((QUARTER(CURDATE())-1)=0,
4, QUARTER(CURDATE())-1);

SET @YR:=IF(@LASTQTR=4,
YEAR(NOW())-1, YEAR(NOW()));

SELECT patient_id AS 'Patient ID',
COUNT(session_time)
AS 'Number of Sessions'
FROM billable_work
WHERE QUARTER(session_date) = @LASTQTR
AND YEAR(session_date) = @YR
AND doctor_id='1021'
GROUP BY patient_id
ORDER BY patient_id LIMIT 5;

```

```

+-----+-----+-----+
| Patient ID | Number of Sessions |
+-----+-----+-----+
| 1104      |          10        |
| 1142      |           7        |
| 1203      |          18        |
| 1244      |           6        |
| 1256      |          12        |
+-----+-----+-----+

```

This example is the most complicated so far. But it's not too difficult to understand if we pull it apart. The first SQL statement sets up a user variable containing the previous quarter (i.e., 1, 2, 3, or 4). This variable will be needed in the other two statements. The `IF()` clause in the first statement checks if the quarter of the current date minus one is zero. It will equal zero when it's run during the first quarter of a year. During a first quarter, of course, the previous quarter is the fourth quarter of the previous year. So, if the equation equals zero, then the variable `@LASTQTR` is set to 4. Otherwise, `@LASTQTR` is set to the value of the current quarter minus one. The second statement is necessary to ensure that the records for the correct year are selected. So, if `@LASTQTR` equals four, then `@YR` needs to equal last year. If not, `@YR` is set to the current year. With the user variables set to the correct quarter and year, the `SELECT` statement can be entered. The `COUNT()` function counts the number of appointments that match the `WHERE` clause for each patient based on the `GROUP BY` clause. The `WHERE` clause looks for sessions with a quarter that equals `@LASTQTR` and a year that equals `@YR`, as well as the doctor's identification number. In summary, what we end up with is a set of SQL statements that retrieve the desired information regardless of which quarter or year it's entered.

What is the Time?

The last section covered how to retrieve pieces of a date column. Now let's look at how to do the same with a time column. To extract just the hour of a time saved in MariaDB, the `HOUR()` function could be used. For the minute and second, there's `MINUTE()` and `SECOND()`. Let's put them all together in one straightforward `SELECT` statement:

```

SELECT HOUR(session_time) AS Hour,
MINUTE(session_time) AS Minute,
SECOND(session_time) AS Second
FROM billable_work
WHERE rec_id='2462';

```

```

+-----+-----+-----+
| Hour | Minute | Second |
+-----+-----+-----+
| 10  | 30    | 00     |
+-----+-----+-----+

```

Date & Time Combined

All of the examples given so far have involved separate columns for date and time. The `EXTRACT()` function, however, will allow a particular component to be extracted from a combined column type (i.e., `DATETIME` or `TIMESTAMP`). The format is `EXTRACT(date_type FROM date_column)` where `date_type` is the component to retrieve and `date_column` is the name of the column from which to extract data. To extract the year, the `date_type` would be `YEAR`; for month, `MONTH` is used; and for day, there's `DAY`. To extract time elements, `HOUR` is used for hour, `MINUTE` for minute, and `SECOND` for second. Although that's all pretty simple, let's look at an example. Suppose the table `billable_work` has a column called `appointment` (a `datetime` column) that contains the date and time for which the appointment was scheduled (as opposed to the time it actually started in `session_time`). To get the hour and minute for a particular date, the following SQL statement will suffice:

```

SELECT patient_name AS Patient,
EXTRACT(HOUR FROM appointment) AS Hour,
EXTRACT(MINUTE FROM appointment) AS Minute
FROM billable_work, patients
WHERE doctor_id='1021'
AND EXTRACT(MONTH FROM appointment)='8'
AND EXTRACT(DAY FROM appointment)='30'
AND billable_work.patient_id =
patients.patient_id;

```

This statement calls upon another table (`patients`) which holds patient information such as their names. It requires a connecting point between the tables (i.e., the `patient_id` from each table). If you're confused on how to form relationships between tables in a `SELECT` statement, you may want to go back and read the [Getting Data from MariaDB](#) article. The SQL statement above would be used to retrieve the appointments for one doctor for one day, giving results like this:

```

+-----+-----+
| Patient          | Hour | Minute |
+-----+-----+
| Michael Zabalaoui | 10  | 00  |
| Jerry Neumeyer   | 11  | 00  |
| Richard Stringer | 13  | 30  |
| Janice Sogard    | 14  | 30  |
+-----+-----+

```

In this example, the time elements are separated and they don't include the date. With the `EXTRACT()` function, however, you can also return combined date and time elements. There is `DAY_HOUR` for the day and hour; there's `DAY_MINUTE` for the day, hour, and minute; `DAY_SECOND` for day, hour, minute, and second; and `YEAR_MONTH` for year and month. There are also some time only combinations: `HOUR_MINUTE` for hour and minute; `HOUR_SECOND` for hour, minute, and second; and `MINUTE_SECOND` for minute and second. However, there's not a `MONTH_DAY` to allow the combining of the two extracts in the `WHERE` clause of the last `SELECT` statement above. Nevertheless, we'll modify the example above and use the `HOUR_MINUTE` date_type to retrieve the hour and minute in one resulting column. It would only require the second and third lines to be deleted and replaced with this:

```

...
EXTRACT(HOUR_MINUTE FROM appointment)
AS Appointment
...
+-----+-----+
| Patient          | Appointment |
+-----+-----+
| Michael Zabalaoui | 1000  |
| Jerry Neumeyer   | 1100  |
| Richard Stringer | 1330  |
| Janice Sogard    | 1430  |
+-----+-----+

```

The problem with this output, though, is that the times aren't very pleasing looking. For more natural date and time displays, there are a few simple date formatting functions available and there are the `DATE_FORMAT()` and `TIME_FORMAT()` functions.

Fine Time Pieces

The simple functions that we mentioned are used for reformatting the output of days and months. To get the date of patient sessions for August, but in a more wordier format, `MONTHNAME()` and `DAYNAME()` could be used:

```

SELECT patient_name AS Patient,
CONCAT(DAYNAME(appointment), ' - ',
MONTHNAME(appointment), ' ',
DAYOFMONTH(appointment), ', ',
YEAR(appointment)) AS Appointment
FROM billable_work, patients
WHERE doctor_id='1021'
AND billable_work.patient_id =
patients.patient_id
AND appointment>'2017-08-01'
AND appointment<'2017-08-31'
LIMIT 1;

```

Patient	Appointment
Michael Zabalaoui	Wednesday - August 30, 2017

In this statement the `CONCAT()` splices together the results of several date functions along with spaces and other characters. The `EXTRACT()` function was eliminated from the `WHERE` clause and instead a simple numeric test for sessions in August was given. Although `EXTRACT()` is fairly straightforward, this all can be accomplished with less typing by using the `DATE_FORMAT()` function.

The `DATE_FORMAT()` function has over thirty options for formatting the date to your liking. Plus, you can combine the options and add your own separators and other text. The syntax is `DATE_FORMAT(date_column, 'options & characters')`. As an example, let's reproduce the last SQL statement by using the `DATE_FORMAT()` function for formatting the date of the appointment and for scanning for appointments in July only:

```

SELECT patient_name AS Patient,
DATE_FORMAT(appointment, '%W - %M %e, %Y')
AS Appointment
FROM billable_work, patients
WHERE doctor_id='1021'
AND billable_work.patient_id =
patients.patient_id
AND DATE_FORMAT(appointment, '%c') = 8
LIMIT 1;

```

This produces the exact same output as above, but with a more succinct statement. The option `%W` gives the name of the day of the week. The option `%M` provides the month's name. The option `%e` displays the day of the month (`%d` would work, but it left-pads single-digit dates with zeros). Finally, `%Y` is for the four character year. All other elements within the quotes (i.e., the spaces, the dash, and the comma) are literal characters for a nicer display.

With `DATE_FORMAT()`, time elements of a field also can be formatted. For instance, suppose we also wanted the hour and minute of the appointment. We would only need to change the second line of the SQL statement above (to save space, `patient_name` was eliminated):

```

SELECT
DATE_FORMAT(appointment, '%W - %M %e, %Y at %r')
AS Appointment
...

```

Appointment
Wednesday - August 30, 2017 at 02:11:19 AM

The word `at` was added along with the formatting option `%r` which gives the time with AM or PM at the end.

Although it may be a little confusing at first, once you've learned some of the common formatting options, `DATE_FORMAT()` is much easier to use than `EXTRACT()`. There are many more options to `DATE_FORMAT()` that we haven't mentioned. For a complete list of the options available, see the [DATE_FORMAT\(\) documentation page](#).

Clean up Time

In addition to `DATE_FORMAT()`, MariaDB has a comparable built-in function for formatting only time: `TIME_FORMAT()`. The syntax is the same and uses the same options as `DATE_FORMAT()`, except only the time related formatting options

apply. As an example, here's an SQL statement that a doctor might use at the beginning of each day to get a list of her appointments for the day:

```
SELECT patient_name AS Patient,
TIME_FORMAT(appointment, '%l:%i %p')
  AS Appointment
FROM billable_work, patients
WHERE doctor_id='1021'
  AND billable_work.patient_id =
    patients.patient_id
  AND DATE_FORMAT(appointment, '%Y-%m-%d') =
    CURDATE();
```

Patient	Appointment
Michael Zabalaoui	10:00 AM
Jerry Neumeyer	11:00 AM
Richard Stringer	01:30 PM
Janice Sogard	02:30 PM

The option `%l` provides the hours 01 through 12. The `%p` at the end indicates (with the AM or PM) whether the time is before or after noon. The `%i` option gives the minute. The colon and the space are for additional display appeal. Of course, all of this can be done exactly the same way with the `DATE_FORMAT()` function. As for the `DATE_FORMAT()` component in the WHERE clause here, the date is formatted exactly as it will be with `CURDATE()` (i.e., 2017-08-30) so that they may be compared properly.

Time to End

Many developers use PHP, Perl, or some other scripting language with MariaDB. Sometimes developers will solve retrieval problems with longer scripts rather than learn precisely how to extract temporal data with MariaDB. As you can see in several of the examples here (particularly the one using the `QUARTER()` function), you can accomplish a great deal within MariaDB. When faced with a potentially complicated SQL statement, try creating it in the mariadb client first. Once you get what you need (under various conditions) and in the format desired, then copy the statement into your script. This practice can greatly help you improve your MariaDB statements and scripting code.

6.1.8 Importing Data into MariaDB

MariaDB 101: Learning the Basics of MariaDB

Watch the Webinar [↗](#)

Contents

1. [Foreign Data Basics](#)
2. [Loading Data Basics](#)
3. [Duplicate Rows](#)
4. [Live Data](#)
5. [Being Difficult](#)
6. [mariadb-import](#)
7. [Web Hosting Restraints](#)
8. [Concluding Observations and Admissions](#)

When a MariaDB developer first creates a MariaDB database for a client, often times the client has already accumulated data in other, simpler applications. Being able to convert data easily to MariaDB is critical. In the previous two articles of this MariaDB series, we explored how to set up a database and how to query one. In this third installment, we will introduce some methods and tools for bulk importing of data into MariaDB. This isn't an overly difficult task, but the processing of large amounts of data can be intimidating for a newcomer and as a result it can be a barrier to getting started with MariaDB. Additionally, for intermediate developers, there are many nuances to consider for a clean import, which is especially important for automating regularly scheduled imports. There are also restraints to deal with that may be imposed on a developer when using a web hosting company.

Foreign Data Basics

Clients sometimes give developers raw data in formats created by simple database programs like MS Access ®. Since non-technical clients don't typically understand database concepts, new clients often give me their initial data in Excel spreadsheets. Let's first look at a simple method for importing data. The simplest way to deal with incompatible data in any format is to load it up in its original software and to export it out to a delimited text file. Most applications have the ability to export data to a text format and will allow the user to set the delimiters. We like to use the bar (i.e., |, a.k.a. pipe) to separate fields and the line-feed to separate records.

For the examples in this article, we will assume that a fictitious client's data was in Excel and that the exported text file will be named `prospects.txt`. It contains contact information about prospective customers for the client's sales department, located on the client's intranet site. The data is to be imported into a MariaDB table called `prospect_contact`, in a database called `sales_dept`. To make the process simpler, the order and number of columns in MS Excel ® (the format of the data provided by the client) should be the same as the table into which the data is going to be imported. So if `prospect_contact` has columns that are not included in the spreadsheet, one would make a copy of the spreadsheet and add the missing columns and leave them blank. If there are columns in the spreadsheet that aren't in `prospect_contact`, one would either add them to the MariaDB table, or, if they're not to be imported, one would delete the extra columns from the spreadsheet. One should also delete any headings and footnotes from the spreadsheet. After this is completed then the data can be exported. Since this is Unix Review, we'll skip how one would export data in Excel and assume that the task was accomplished easily enough using its export wizard.

The next step is to upload the data text file to the client's web site by FTP. It should be uploaded in ASCII mode. Binary mode may send binary hard-returns for row-endings. Also, it's a good security habit to upload data files to non-public directories. Many web hosting companies provide virtual domains with a directory like `/public_html`, which is the document root for the Apache web server; it typically contains the site's web pages. In such a situation, `/` is a virtual root containing logs and other files that are inaccessible to the public. We usually create a directory called `tmp` in the virtual root directory to hold data files temporarily for importing into MariaDB. Once that's done, all that's required is to log into MariaDB with the `mysql` client as an administrative user (if not root, then a user with `FILE` privileges), and run the proper SQL statement to import the data.

Loading Data Basics

The `LOAD DATA INFILE` statement is the easiest way to import data from a plain text file into MariaDB. Below is what one would enter in the `mysql` client to load the data in the file called `prospects.txt` into the table `prospect_contact`:

```
LOAD DATA INFILE '/tmp/prospects.txt'
INTO TABLE prospect_contact
FIELDS TERMINATED BY '|';
```

Before entering the statement above, the MariaDB session would, of course, be switched to the `sales_dept` database with a `USE` statement. It is possible, though, to specify the database along with the table name (e.g., `sales_dept.prospect_contact`). If the server is running Windows, the forward slashes are still used for the text file's path, but a drive may need to be specified at the beginning of the path: `'c:/tmp/prospects.txt'`. Notice that the SQL statement above has `|` as the field delimiter. If the delimiter was [TAB]—which is common—then one would replace `|` with `\t` here. A line-feed (`\n`) isn't specified as the record delimiter since it's assumed. If the rows start and end with something else, though, then they will need to be stated. For instance, suppose the rows in the text file start with a double-quote and end with a double-quote and a Windows hard-return (i.e., a return and a line-feed). The statement would need to read like this:

```
LOAD DATA INFILE '/tmp/prospects.txt'
INTO TABLE prospect_contact
FIELDS TERMINATED BY '|'
LINES STARTING BY '"'
TERMINATED BY '"\r\n';
```

Notice that the starting double-quote is inside of single-quotes. If one needs to specify a single-quote as the start of a line, one could either put the one single-quote within double-quotes or one could escape the inner single-quote with a back-slash, thus telling MariaDB that the single-quote that follows is to be taken literally and is not part of the statement, per se:

```
...
LINES STARTING BY '\''
...
```

Duplicate Rows

If the table `prospect_contact` already contains some of the records that are about to be imported from `prospects.txt` (that is

to say, records with the same primary key), then a decision should be made as to what MariaDB is to do about the duplicates. The SQL statement, as it stands above, will cause MariaDB to try to import the duplicate records and to create duplicate rows in `prospect_contact` for them. If the table's properties are set not to allow duplicates, then MariaDB will kick out errors. To get MariaDB to replace the duplicate existing rows with the ones being imported in, one would add the `REPLACE` just before the `INTO TABLE` clause like this:

```
LOAD DATA INFILE '/tmp/prospects.txt'  
REPLACE INTO TABLE prospect_contact  
FIELDS TERMINATED BY '|' '  
LINES STARTING BY ''' '  
TERMINATED BY '''\n';
```

To import only records for prospects that are not already in `prospect_contact`, one would substitute `REPLACE` with the `IGNORE` flag. This instructs MariaDB to ignore records read from the text file that already exist in the table.

Live Data

For importing data into a table while it's in use, table access needs to be addressed. If access to the table by other users may not be interrupted, then a `LOW_PRIORITY` flag can be added to the `LOAD DATA INFILE` statement. This tells MariaDB that the loading of this data is a low priority. One would only need to change the first line of the SQL statement above to set its priority to low:

```
LOAD DATA LOW_PRIORITY INFILE '/tmp/prospects.txt'  
...
```

If the `LOW_PRIORITY` flag isn't included, the table will be locked temporarily during the import and other users will be prevented from accessing it.

Being Difficult

I mentioned earlier that uploading of the text file should not be done in binary mode so as to avoid the difficulties associated with Windows line endings. If this is unavoidable, however, there is an easy way to import binary row-endings with MariaDB. One would just specify the appropriate hexadecimals for a carriage-return combined with a line-feed (i.e., `CRLF`) as the value of `TERMINATED BY`:

```
...  
TERMINATED BY 0x0d0a;
```

Notice that there are intentionally no quotes around the binary value. If there were, MariaDB would take the value for text and not a binary code. The semi-colon is not part of the value; it's the SQL statement terminator.

Earlier we also stated that the first row in the spreadsheet containing the column headings should be deleted before exporting to avoid the difficulty of importing the headings as a record. It's actually pretty easy to tell MariaDB to just skip the top line. One would add the following line to the very end of the `LOAD DATA INFILE` statement:

```
...  
IGNORE 1 LINES;
```

The number of lines for MariaDB to ignore can, of course, be more than one.

Another difficulty arises when some Windows application wizards export data with each field surrounded by double-quotes, as well as around the start and end of records. This can be a problem when a field contains a double-quote. To deal with this, some applications use back-slash (`\`) to escape embedded double-quotes, to indicate that a particular double-quote is not a field ending but part of the field's content. However, some applications will use a different character (like a pound-sign) to escape embedded quotes. This can cause problems if MariaDB isn't prepared for the odd escape-character. MariaDB will think the escape character is actually text and the embedded quote-mark, although it's escaped, is a field ending. The unenclosed text that follows will be imported into the next column and the remaining columns will be one column off, leaving the last column not imported. As maddening as this can be, it's quite manageable in MariaDB by adding an `ENCLOSED BY` and an `ESCAPED BY` clause:

```

LOAD DATA LOW_PRIORITY INFILE '/tmp/prospects.txt'
REPLACE INTO TABLE prospect_contact
FIELDS TERMINATED BY '"'
ENCLOSED BY '"' ESCAPED BY '#'
LINES STARTING BY '"'
TERMINATED BY '"\n'
IGNORE 1 LINES;

```

In the *Foreign Data Basics* section above, we said that the columns in the spreadsheet should be put in the same order and quantity as the receiving table. This really isn't necessary if MariaDB is cued in as to what it should expect. To illustrate, let's assume that `prospect_contact` has four columns in the following order: `row_id`, `name_first`, `name_last`, `telephone`. Whereas, the spreadsheet has only three columns, differently named, in this order: `Last Name`, `First Name`, `Telephone`. If the spreadsheet isn't adjusted, then the SQL statement will need to be changed to tell MariaDB the field order:

```

LOAD DATA LOW_PRIORITY INFILE '/tmp/prospects.txt'
REPLACE INTO TABLE sales_dept.prospect_contact
FIELDS TERMINATED BY 0x09
ENCLOSED BY '"' ESCAPED BY '#'
TERMINATED BY 0x0d0a
IGNORE 1 LINES
(name_last, name_first, telephone);

```

This SQL statement tells MariaDB the name of each table column associated with each spreadsheet column in the order that they appear in the text file. From there it will naturally insert the data into the appropriate columns in the table. As for columns that are missing like `row_id`, MariaDB will fill in those fields with the default value if one has been supplied in the table's properties. If not, it will leave the field as `NULL`. Incidentally, we slipped in the binary `[TAB] (0x09)` as a field delimiter.

mariadb-import

For some clients and for certain situations it may be of value to be able to import data into MariaDB without using the `mariadb` client. This could be necessary when constructing a shell script to import text files on an automated, regular schedule. To accomplish this, the `mariadb-import` (`mysqlimport` before [MariaDB 10.5](#)) utility may be used as it encompasses the `LOAD DATA INFILE` statement and can easily be run from a script. So if one wants to enter the involved SQL statement at the end of the last section above, the following could be entered from the command-line (i.e., not in the `mariadb` client):

```

mariadb-import --user='marie_dyer' --password='angelle1207' \
--fields-terminated-by=0x09 --lines-terminated-by=0x0d0a \
--replace --low-priority --fields-enclosed-by='"' \
--fields-escaped-by='#' --ignore-lines='1' --verbose \
--columns='name_last, name_first, telephone' \
sales_dept '/tmp/prospect_contact.txt'

```

Although this statement is written over several lines here, it either has to be on the same line when entered or a space followed by a back-slash has to be entered at the end of each line (as seen here) to indicate that more follows. Since the above is entered at the command-line prompt, the user isn't logged into MariaDB. Therefore the first line contains the user name and password for `mariadb-import` to give to MariaDB. The password itself is optional, but the directive `--password` (without the equal sign) isn't. If the password value is not given in the statement, then the user will be prompted for it. Notice that the order of directives doesn't matter after the initial command, except that the database and file name go last. Regarding the file name, its prefix must be the same as the table—the dot and the extension are ignored. This requires that `prospects.txt` be renamed to `prospect_contact.txt`. If the file isn't renamed, then MariaDB would create a new table called `prospects` and the `--replace` option would be pointless. After the file name, incidentally, one could list more text files, separated by a space, to process using `mariadb-import`. We've added the `--verbose` directive so as to be able to see what's going on. One probably would leave this out in an automated script. By the way, `--low-priority` and `--ignore-lines` are available.

Web Hosting Restraints

Some web hosting companies do not allow the use of `LOAD DATA INFILE` or `mariadb-import` statements due to security vulnerabilities in these statements for them. To get around this, some extra steps are necessary to avoid having to manually enter the data one row at a time. First, one needs to have MariaDB installed on one's local workstation. For simplicity, we'll assume this is done and is running Linux on the main partition and MS Windows® on an extra partition. Recapping the on-going example of this article based on these new circumstances, one would boot up into Windows and start MS Excel®, load the client's spreadsheet into it and then run the export wizard as before—saving the file `prospects.txt` to the 'My

Documents' directory. Then one would reboot into Linux and mount the Windows partition and copy the data text file to `/tmp` in Linux, locally. Next one would log into the local (not the client's) MariaDB server and import the text file using a [LOAD DATA INFILE](#) as we've extensively outline above. From there one would exit MariaDB and export the data out of MariaDB using the [mariadb-dump](#) utility locally, from the command-line like this:

```
mariadb-dump --user='root' --password='geronimo' sales_dept prospect_contact > /tmp/prospects.sql
```

This creates an interesting text file complete with all of the SQL commands necessary to insert the data back into MariaDB one record, one [INSERT](#) at a time. When you run [mariadb-import](#), it's very educational to open up it in a text editor to see what it generates.

After creating this table dump, one would upload the resulting file (in ASCII mode) to the `/tmp` directory on the client's web server. From the command prompt on the client's server one would enter the following:

```
mariadb --user='marie_dyer' --password='angelle12107' sales_dept < '/tmp/prospects.sql'
```

This line along with the [mariadb-dump](#) line show above are simple approaches. Like the Windows application wizard, with `mariadb-dump` one can specify the format of the output file and several other factors. One important factor related to the scenario used in this article is the [CREATE TABLE](#) statement that will be embedded in the `mariadb-dump` output file. This will fail and kick out an error because of the existing table `prospect_contact` in the client's database. To limit the output to only [INSERT](#) statements and no [CREATE TABLE](#) statements, the `mariadb-dump` line would look like this:

```
mariadb-dump -u marie_dyer -p --no-create-info sales_dept prospect_contact > /tmp/prospects.sql
```

Notice that we've used acceptable abbreviations for the user name and the password directives. Since the password was given here, the user will be prompted for it.

The `mariadb-dump` utility usually works pretty well. However, one feature it's lacking at this time is a `REPLACE` flag as is found in the [LOAD DATA INFILE](#) statement and with the `mariadb-import` tool. So if a record already exists in the `prospect_contact`, it won't be imported. Instead it will kick out an error message and stop at that record, which can be a mess if one has imported several hundred rows and have several hundred more to go. One easy fix for this is to open up `prospects.sql` in a text editor and do a search on the word `INSERT` and replace it with `REPLACE`. The syntax of both of these statements are the same, fortunately. So one would only need to replace the keyword for new records to be inserted and for existing records to be replaced.

Concluding Observations and Admissions

It's always amazing to me how much can be involved in the simplest of statements in MariaDB. MariaDB is deceptively powerful and feature rich. One can keep the statements pretty minimal or one can develop a fairly detailed, single statement to allow for accuracy of action. There are many other aspects of importing data into MariaDB that we did not address—in particular dealing with utilities. We also didn't talk about the Perl modules that could be used to convert data files. These can be useful in scripting imports. There are many ways in which one can handle importing data. Hopefully, this article has presented most of the basics and pertinent advanced details that may be of use to most MariaDB developers.

6.1.9 Making Backups with mariadb-dump

New Whitepaper: The Ultimate Guide to High Availability with MariaDB

Download Now [↗](#)

Contents

1. [Backing Up Everything](#)
2. [Just One Database](#)
3. [Dumping Tables](#)
4. [Conclusion](#)
5. [Other References](#)

One of the best utilities to use to make a backup copy of a server's MariaDB's data is [mariadb-dump](#) (previously called [mysqldump](#), which still works as a symlink). It comes with MariaDB, so it costs you nothing more. Best of all it doesn't require you to shut down MariaDB services to make a backup. It works very simply: it retrieves the data and schema from

each database and table and builds a data text file outside of MariaDB. This data text file (known as a dump file) will contain the SQL statements necessary to reconstruct the databases and data. If you were to open a dump file generated by [mariadb-dump](#), you would see CREATE TABLE statements and a multitude of [INSERT](#) statements, one for each row of data.

Backing Up Everything

To export all of the databases in MariaDB using [mariadb-dump](#), the following would be entered from the filesystem command-line:

```
mariadb-dump -u admin_backup -p -x -A > /data/backup/dbs.sql
```

The first set of options here (`-u admin_backup -p`) tell MariaDB that this utility is to be executed by the user `admin_backup` and that the user needs to be prompted for a password, which will have to be typed in on the next line when asked. Incidentally, although you might be tempted to just use the root user, you should create a special administrative user as we're using here. If the dump is to be executed by cron by way of a shell script, this option can be changed to `-pmypwd` , where `mypwd` is the password—there's no space between the `-p` and the password. The `-x` option has MariaDB lock all of the tables before performing the backup. The lock won't be released until the process is finished. To bundle [INSERT](#) statements together for each table, we've added the `-e` option. This extended insert option will cause the dump file to be smaller and allow any possible future restores to be executed faster. The `-A` option specifies that all databases are to be exported. Finally, the greater-than sign is a shell redirect of the standard output (STDOUT) to the path and file named after it.

The example given for backing up all database is the short hand version. The convention is migrating to longer options, not the single letter options. In fact, some are being deprecated and won't be available in the future. So, the above could and should be entered like this:

```
mariadb-dump --user=admin_backup --password --lock-tables --all-databases > /data/backup/dbs.sql
```

The longer option names are easier to follow and to remember. Again, if the backup is to be executed by a shell script, the user's password should be listed: `--password=mypwd` . Notice that the equal-sign is added when the password is given with the long option name.

Just One Database

Backing up all of the databases at once with [mariadb-dump](#) may result in one large dump file. This could be take longer to complete the backup and make restoration a bit cumbersome later. Therefore, it might be more useful to stagger backups based on databases, making for possibly several smaller files. You could then backup larger databases during slower traffic times. You might also backup critical databases or ones that are changed much during slower times of the day so that you don't diminish user interaction.

To export only one database and not all, enter something like the following from the command-line:

```
mariadb-dump --user=admin_backup --password --lock-tables --databases db1 > /data/backup/db1.sql
```

The only significant difference in this line is that the `-A` option has been replaced with `-B` and the database to be exported has been given. To export multiple databases, just enter them after the `-B` option, separated by spaces (e.g., `-B db1 db2`).

Dumping Tables

For very large databases, you may want to backup the data based on tables rather than the whole database. You could backup weekly an entire database and then only backup daily individual tables for which data changes often. To backup just one table, the following could be entered from the command line:

```
mariadb-dump --user=admin_backup --password --lock-tables db1 table1 > /data/backup/db1_table1.sql
```

First notice that the `--databases` option has not been included in the line above. The utility assumes that the first name given is a database and the second name is a table name and not another database. To backup multiple tables from a database, just list them after the database name, separated by spaces (e.g., `db1 table1 table2`).

Conclusion

As you can see from this article, [mariadb-dump](#) is easy to use and very powerful. In fact, it can clobber your data if you're not careful. Therefore, you should practice using it on a test database—a test server even—a few times until you're comfortable with making backups and restoring them. Don't wait until you've lost your data and in a panic to restore your data to find out that you haven't been backing up your data properly or that you don't know how to fine tune data restoration. Develop some skills in advance and in a safe and controlled way. To learn how to restore dump files, see [Restoring Data From Dump Files](#).

6.1.10 MariaDB String Functions

MariaDB 101: Learning the Basics of MariaDB

Watch the Webinar 

Contents

1. [Formatting](#)
2. [Extracting](#)
3. [Manipulating](#)
4. [Expression Aids](#)
5. [Conclusion](#)

MariaDB has many built-in functions that can be used to manipulate strings of data. With these functions, one can format data, extract certain characters, or use search expressions. Good developers should be aware of the string functions that are available. Therefore, in this article we will go through several string functions, grouping them by similar features, and provide examples of how they might be used.

Formatting

There are several string functions that are used to format text and numbers for nicer display. A popular and very useful function for pasting together the contents of data fields with text is the [CONCAT\(\)](#) function. As an example, suppose that a table called `contacts` has a column for each sales contact's first name and another for the last name. The following SQL statement would put them together:

```
SELECT CONCAT(name_first, ' ', name_last)
AS Name
FROM contacts;
```

This statement will display the first name, a space, and then the last name together in one column. The AS clause will change the column heading of the results to Name.

A less used concatenating function is [CONCAT_WS\(\)](#). It will put together columns with a separator between each. This can be useful when making data available for other programs. For instance, suppose we have a program that will import data, but it requires the fields to be separated by vertical bars. We could just export the data, or we could use a [SELECT](#) statement like the one that follows in conjunction with an interface written with an API language like Perl:

```
SELECT CONCAT_WS('|', col1, col2, col3)
FROM table1;
```

The first element above is the separator. The remaining elements are the columns to be strung together.

If we want to format a long number with commas every three digits and a period for the decimal point (e.g., 100,000.00), we can use the function [FORMAT\(\)](#) like so:

```
SELECT CONCAT('$', FORMAT(col5, 2))
FROM table3;
```

In this statement, the `CONCAT()` will place a dollar sign in front of the numbers found in the `col15` column, which will be formatted with commas by `FORMAT()`. The `2` within the `FORMAT()` stipulates two decimal places.

Occasionally, one will want to convert the text from a column to either all upper-case letters or all lower-case letters. In the example that follows, the output of the first column is converted to upper-case and the second to lower-case:

```
SELECT UCASE(col1),
LCASE(col2)
FROM table4;
```

When displaying data in forms, it's sometimes useful to pad the data displayed with zeros or dots or some other filler. This can be necessary when dealing with `VARCHAR` columns where the width varies to help the user to see the column limits. There are two functions that may be used for padding: `LPAD()` and `RPAD()`.

```
SELECT RPAD(part_nbr, 8, '.') AS 'Part Nbr.',
LPAD(description, 15, '_') AS Description
FROM catalog;
```

In this SQL statement, dots are added to the right end of each part number. So a part number of "H200" will display as "H200...", but without the quotes. Each part's description will have under-scores preceding it. A part with a description of "brass hinge" will display as "brass hinge".

If a column is a `CHAR` data-type, a fixed width column, then it may be necessary to trim any leading or trailing spaces from displays. There are a few functions to accomplish this task. The `LTRIM()` function will eliminate any leading spaces to the left. So " H200 " becomes "H200 ". For columns with trailing spaces, spaces on the right, `RTRIM()` will work: "H500 " becomes "H500 ". A more versatile trimming function, though, is `TRIM()`. With it one can trim left, right or both. Below are a few examples:

```
SELECT TRIM(LEADING '.' FROM col1),
TRIM(TRAILING FROM col2),
TRIM(BOTH '_' FROM col3),
TRIM(col4)
FROM table5;
```

In the first `TRIM()` clause, the padding component is specified; the leading dots are to be trimmed from the output of `col1`. The trailing spaces will be trimmed off of `col2`—space is the default. Both leading and trailing under-scores are trimmed from `col3` above. Unless specified, `BOTH` is the default. So leading and trailing spaces are trimmed from `col4` in the statement here.

Extracting

When there is a need to extract specific elements from a column, MariaDB has a few functions that can help. Suppose a column in the table `contacts` contains the telephone numbers of sales contacts, including the area-codes, but without any dashes or parentheses. The area-code of each could be extracted for sorting with the `LEFT()` and the telephone number with the `RIGHT()` function.

```
SELECT LEFT(telephone, 3) AS area_code,
RIGHT(telephone, 7) AS tel_nbr
FROM contacts
ORDER BY area_code;
```

In the `LEFT()` function above, the column `telephone` is given along with the number of characters to extract, starting from the first character on the left in the column. The `RIGHT()` function is similar, but it starts from the last character on the right, counting left to capture, in this statement, the last seven characters. In the SQL statement above, `area_code` is reused to order the results set. To reformat the telephone number, it will be necessary to use the `SUBSTRING()` function.

```
SELECT CONCAT('(', LEFT(telephone, 3), ') ',
SUBSTRING(telephone, 4, 3), '-',
MID(telephone, 7)) AS 'Telephone Number'
FROM contacts
ORDER BY LEFT(telephone, 3);
```

In this SQL statement, the `CONCAT()` function is employed to assemble some characters and extracted data to produce a common display for telephone numbers (e.g., (504) 555-1234). The first element of the `CONCAT()` is an opening parenthesis. Next, a `LEFT()` is used to get the first three characters of telephone, the area-code. After that a closing parenthesis, along with a space is added to the output. The next element uses the `SUBSTRING()` function to extract the telephone number's prefix, starting at the fourth position, for a total of three characters. Then a dash is inserted into the

display. Finally, the function `MID()` extracts the remainder of the telephone number, starting at the seventh position. The functions `MID()` and `SUBSTRING()` are interchangeable and their syntax are the same. By default, for both functions, if the number of characters to capture isn't specified, then it's assumed that the remaining ones are to be extracted.

Manipulating

There are a few functions in MariaDB that can help in manipulating text. One such function is `REPLACE()`. With it every occurrence of a search parameter in a string can be replaced. For example, suppose we wanted to replace the title *Mrs.* with *Ms.* in a column containing the person's title, but only in the output. The following SQL would do the trick:

```
SELECT CONCAT(REPLACE(title, 'Mrs.', 'Ms.'),
', ', name_first, ' ', name_last) AS Name
FROM contacts;
```

We're using the ever handy `CONCAT()` function to put together the contact's name with spaces. The `REPLACE()` function extracts each title and replaces *Mrs.* with *Ms.*, where applicable. Otherwise, for all other titles, it displays them unchanged.

If we want to insert or replace certain text from a column (but not all of its contents), we could use the `INSERT()` function in conjunction with the `LOCATE()` function. For example, suppose another contacts table has the contact's title and full name in one column. To change the occurrences of *Mrs.* to *Ms.*, we could not use `REPLACE()` since the title is embedded in this example. Instead, we would do the following:

```
SELECT INSERT(name, LOCATE(name, 'Mrs.'), 4, 'Ms.')
FROM contacts;
```

The first element of the `INSERT()` function is the column. The second element which contains the `LOCATE()` is the position in the string that text is to be inserted. The third element is optional; it states the number of characters to overwrite. In this case, *Mrs.* which is four characters is overwritten with *Ms.* (the final element), which is only three. Incidentally, if 0 is specified, then nothing is overwritten, text is inserted only. As for the `LOCATE()` function, the first element is the column and the second the search text. It returns the position within the column where the text is found. If it's not found, then 0 is returned. A value of 0 for the position in the `INSERT()` function negates it and returns the value of name unchanged.

On the odd chance that there is a need to reverse the content of a column, there's the `REVERSE()` function. You would just place the column name within the function. Another minor function is the `REPEAT()` function. With it a string may be repeated in the display:

```
SELECT REPEAT(col1, 2)
FROM table1;
```

The first component of the function above is the string or column to be repeated. The second component states the number of times it's to be repeated.

Expression Aids

The function `CHAR_LENGTH()` is used to determine the number of characters in a string. This could be useful in a situation where a column contains different types of information of specific lengths. For instance, suppose a column in a table for a college contains identification numbers for students, faculty, and staff. If student identification numbers have eight characters while others have less, the following will count the number of student records:

```
SELECT COUNT(school_id)
AS 'Number of Students'
FROM table8
WHERE CHAR_LENGTH(school_id)=8;
```

The `COUNT()` function above counts the number of rows that meet the condition of the `WHERE` clause.

In a `SELECT` statement, an `ORDER BY` clause can be used to sort a results set by a specific column. However, if the column contains IP addresses, a simple sort may not produce the desired results:

```
SELECT ip_address
FROM computers WHERE server='Y'
ORDER BY ip_address LIMIT 3;
```

```
+-----+
| ip_address |
+-----+
| 10.0.1.1   |
| 10.0.11.1  |
| 10.0.2.1   |
+-----+
```

In the limited results above, the IP address 10.0.2.1 should be second. This happens because the column is being sorted lexically and not numerically. The function `INET_ATON()` will solve this sorting problem.

```
SELECT ip_address
FROM computers WHERE server='Y'
ORDER BY INET_ATON(ip_address) LIMIT 3;
```

Basically, the `INET_ATON()` function will convert IP addresses to regular numbers for numeric sorting. For instance, if we were to use the function in the list of columns in a `SELECT` statement, instead of the `WHERE` clause, the address 10.0.1.1 would return 167772417, 10.0.11.1 will return 167774977, and 10.0.2.1 the number 167772673. As a complement to `INET_ATON()`, the function `INET_NTOA()` will translate these numbers back to their original IP addresses.

MariaDB is fairly case insensitive, which usually is fine. However, to be able to check by case, the `STRCMP()` function can be used. It converts the column examined to a string and makes a comparison to the search parameter.

```
SELECT col1, col2
FROM table6
WHERE STRCMP(col3, 'text')=0;
```

If there is an exact match, the function `STRCMP()` returns 0. So if `col3` here contains "Text", it won't match. Incidentally, if `col3` alphabetically is before the string to which it's compared, a `-1` will be returned. If it's after it, a `1` is returned.

When you have list of items in one string, the `SUBSTRING_INDEX()` can be used to pull out a sub-string of data. As an example, suppose we have a column which has five elements, but we want to retrieve just the first two elements. This SQL statement will return them:

```
SELECT SUBSTRING_INDEX(col4, '|', 2)
FROM table7;
```

The first component in the function above is the column or string to be picked apart. The second component is the delimiter. The third is the number of elements to return, counting from the left. If we want to grab the last two elements, we would use a negative two to instruct MariaDB to count from the right end.

Conclusion

There are more string functions available in MariaDB. A few of the functions mentioned here have aliases or close alternatives. There are also functions for converting between ASCII, binary, hexi-decimal, and octal strings. And there are also string functions related to text encryption and decryption that were not mentioned. However, this article has given you a good collection of common string functions that will assist you in building more powerful and accurate SQL statements.

6.1.11 Restoring Data from Dump Files

Contents

1. Restoring One Table

If you lose your data in MariaDB, but have been using `mariadb-dump` (previously called `mysqldump`) to make regular backups of your data in MariaDB, you can use the dump files to restore your data. This is the point of the back-ups, after all. To restore a dump file, it's just a matter of having the `mariadb` client execute all of the SQL statements that the file contains. There are some things to consider before restoring from a dump file, so read this section all of the way through before restoring. One simple and perhaps clumsy method to restore from a dump file is to enter something like the following:

```
mariadb --user admin_restore --password < /data/backup/db1.sql
```

Again, this is not using `mariadb-dump`. The `mariadb-dump` utility is only for making back-up copies, not restoring databases.

Instead, you would use the `mysql` client, which will read the dump file's content in order to batch execute the SQL statements that it contains. Notice that the redirect for `STDOUT` is not used here, but the redirect for the standard input (`STDIN`); the less-than sign is used since the dump file is an input source. Also, notice that in this example a database isn't specified. That's given within the dump file.

Restoring One Table

The problem with restoring from a dump file is that you may overwrite tables or databases that you wish you hadn't. For instance, your dump file might be a few days old and only one table may have been lost. If you restore all of the databases or all of the tables in a database, you would be restoring the data back to its state at the time of the backup, a few days before. This could be quite a disaster. This is why dumping by database and table can be handy. However, that could be cumbersome.

A simple and easy method of limiting a restoration would be to create temporarily a user who only has privileges for the table you want to restore. You would enter a `GRANT` statement like this:

```
GRANT SELECT
ON db1.* TO 'admin_restore_temp'@'localhost'
IDENTIFIED BY 'its_pwd';

GRANT ALL ON db1.table1
TO 'admin_restore_temp'@'localhost';
```

These two SQL statements allow the temporary user to have the needed `SELECT` privileges on all of the tables of `db1` and `ALL` privileges for the `table1` table. Now when you restore the dump file containing the whole `db1` database, only `table1` will be replaced with the back-up copy. Of course, MariaDB will generate errors. To overlook the errors and to proceed with the restoration of data where no errors are generated (i.e., `table1`), use the `--force` option. Here's what you would enter at the command-line for this situation:

```
mysql --user admin_restore_temp --password --force < /data/backup/db1.sql
```

6.1.12 Basic SQL Queries: A Quick SQL Cheat Sheet

MariaDB 101: Learning the Basics of MariaDB

Watch the Webinar [↗](#)

Contents

1. [Defining How Your Data Is Stored](#)
2. [Manipulating Your Data](#)
3. [Transactions](#)
 1. [A Simple Example](#)

This page lists the most important SQL statements and contains links to their documentation pages. If you need a basic tutorial on how to use the MariaDB database server and how to execute simple commands, see [A MariaDB Primer](#).

Also see [Common MariaDB Queries](#) for examples of commonly-used queries.

Defining How Your Data Is Stored

- `CREATE DATABASE` is used to create a new, empty database.
- `DROP DATABASE` is used to completely destroy an existing database.
- `USE` is used to select a default database.
- `CREATE TABLE` is used to create a new table, which is where your data is actually stored.
- `ALTER TABLE` is used to modify an existing table's definition.
- `DROP TABLE` is used to completely destroy an existing table.
- `DESCRIBE` shows the structure of a table.

Manipulating Your Data

- **SELECT** is used when you want to read (or select) your data.
- **INSERT** is used when you want to add (or insert) new data.
- **UPDATE** is used when you want to change (or update) existing data.
- **DELETE** is used when you want to remove (or delete) existing data.
- **REPLACE** is used when you want to add or change (or replace) new or existing data.
- **TRUNCATE** is used when you want to empty (or delete) all data from the table.

Transactions

- **START TRANSACTION** is used to begin a transaction.
- **COMMIT** is used to apply changes and end transaction.
- **ROLLBACK** is used to discard changes and end transaction.

A Simple Example

```
CREATE DATABASE mydb;
USE mydb;
CREATE TABLE mytable ( id INT PRIMARY KEY, name VARCHAR(20) );
INSERT INTO mytable VALUES ( 1, 'Will' );
INSERT INTO mytable VALUES ( 2, 'Marry' );
INSERT INTO mytable VALUES ( 3, 'Dean' );
SELECT id, name FROM mytable WHERE id = 1;
UPDATE mytable SET name = 'Willy' WHERE id = 1;
SELECT id, name FROM mytable;
DELETE FROM mytable WHERE id = 1;
SELECT id, name FROM mytable;
DROP DATABASE mydb;
SELECT count(1) from mytable; gives the number of records in the table
```

The first version of this article was copied, with permission, from http://hashmysql.org/wiki/Basic_SQL_Statements on 2012-10-05.

6.1.13 Connecting to MariaDB

 7. [ssl-crl](#)
 8. [ssl-crlpath](#)
 9. [ssl-verify-server-cert](#)
 9. [user](#)
2. [Option Files](#)

This article covers connecting to MariaDB and the basic connection parameters. If you are completely new to MariaDB, take a look at [A MariaDB Primer](#) first.

In order to connect to the MariaDB server, the client software must provide the correct connection parameters. The client software will most often be the [mariadb client](#), used for entering statements from the command line, but the same concepts apply to any client, such as a [graphical client](#), a client to run backups such as [mariadb-dump](#), etc. The rest of this article assumes that the mariadb command line client is used.

If a connection parameter is not provided, it will revert to a default value.

For example, to connect to MariaDB using only default values with the mariadb client, enter the following from the command line:

```
mariadb
```

In this case, the following defaults apply:

- The host name is `localhost`.
- The user name is either your Unix login name, or `ODBC` on Windows.
- No password is sent.
- The client will connect to the server with the default socket, but not any particular database on the server.

These defaults can be overridden by specifying a particular parameter to use. For example:

```
mariadb -h 166.78.144.191 -u username -ppassword database_name
```

In this case:

- `-h` specifies a host. Instead of using `localhost`, the IP `166.78.144.191` is used.
- `-u` specifies a user name, in this case `username`
- `-p` specifies a password, `password`. Note that for passwords, unlike the other parameters, there cannot be a space between the option (`-p`) and the value (`password`). It is also not secure to use a password in this way, as other users on the system can see it as part of the command that has been run. If you include the `-p` option, but leave out the password, you will be prompted for it, which is more secure.
- The database name is provided as the first argument after all the options, in this case `database_name`.
- It will connect with the default `tcp_ip` port, `3306`

Connection Parameters

host

```
--host=name  
-h name
```

Connect to the MariaDB server on the given host. The default host is `localhost`. By default, MariaDB does not permit remote logins - see [Configuring MariaDB for Remote Client Access](#).

password

```
--password[=passwd]
-p[passwd]
```

The password of the MariaDB account. It is generally not secure to enter the password on the command line, as other users on the system can see it as part of the command that has been run. If you include the `-p` or `--password` option, but leave out the password, you will be prompted for it, which is more secure.

pipe

```
--pipe
-W
```

On Windows systems that have been started with the `--enable-named-pipe` option, use this option to connect to the server using a named pipe.

port

```
--port=num
-P num
```

The TCP/IP port number to use for the connection. The default is `3306`.

protocol

```
--protocol=name
```

Specifies the protocol to be used for the connection for the connection. It can be one of `TCP`, `SOCKET`, `PIPE` or `MEMORY` (case-insensitive). Usually you would not want to change this from the default. For example on Unix, a Unix socket file (`SOCKET`) is the default protocol, and usually results in the quickest connection.

- `TCP`: A TCP/IP connection to a server (either local or remote). Available on all operating systems.
- `SOCKET`: A Unix socket file connection, available to the local server on Unix systems only. If socket is not specified with `--socket`, in a config file or with the environment variable `MYSQL_UNIX_PORT` then the default `/tmp/mysql.sock` will be used.
- `PIPE`: A named-pipe connection (either local or remote). Available on Windows only.
- `MEMORY`: Shared-memory connection to the local server on Windows systems only.

shared-memory-base-name

```
--shared-memory-base-name=name
```

Only available on Windows systems in which the server has been started with the `--shared-memory` option, this specifies the shared-memory name to use for connecting to a local server. The value is case-sensitive, and defaults to `MARIADB`.

socket

```
--socket=name
-S name
```

For connections to localhost, this specifies either the Unix socket file to use (default `/tmp/mysql.sock`), or, on Windows where the server has been started with the `--enable-named-pipe` option, the name (case-insensitive) of the named pipe to use (default `MARIADB`).

TLS Options

A brief listing is provided below. See [Secure Connections Overview](#) and [TLS System Variables](#) for more detail.

ssl

```
--ssl
```

Enable TLS for connection (automatically enabled with other TLS flags). Disable with ' `--skip-ssl` '.

ssl-ca

```
--ssl-ca=name
```

CA file in PEM format (check OpenSSL docs, implies `--ssl`).

ssl-capath

```
--ssl-capath=name
```

CA directory (check OpenSSL docs, implies `--ssl`).

ssl-cert

```
--ssl-cert=name
```

X509 cert in PEM format (implies `--ssl`).

ssl-cipher

```
--ssl-cipher=name
```

TLS cipher to use (implies `--ssl`).

ssl-key

```
--ssl-key=name
```

X509 key in PEM format (implies `--ssl`).

ssl-crl

```
--ssl-crl=name
```

Certificate revocation list (implies `--ssl`).

ssl-crlpath

```
--ssl-crlpath=name
```

Certificate revocation list path (implies `--ssl`).

ssl-verify-server-cert

```
--ssl-verify-server-cert
```

Verify server's "Common Name" in its cert against hostname used when connecting. This option is disabled by default.

user

```
--user=name  
-u name
```

The MariaDB user name to use when connecting to the server. The default is either your Unix login name, or `ODBC` on Windows. See the [GRANT](#) command for details on creating MariaDB user accounts.

Option Files

It's also possible to use option files (or configuration files) to set these options. Most clients read option files. Usually, starting a client with the `--help` option will display which files it looks for as well as which option groups it recognizes.

12. [Calculating Age](#)
13. [Using User-defined Variables](#)
14. [View Tables in Order of Size](#)
15. [Removing Duplicates](#)

This page is intended to be a quick reference of commonly-used and/or useful queries in MariaDB.

Creating a Table

```
CREATE TABLE t1 ( a INT );
CREATE TABLE t2 ( b INT );
CREATE TABLE student_tests (
  name CHAR(10), test CHAR(10),
  score TINYINT, test_date DATE
);
```

See [CREATE TABLE](#) for more.

Inserting Records

```
INSERT INTO t1 VALUES (1), (2), (3);
INSERT INTO t2 VALUES (2), (4);

INSERT INTO student_tests
(name, test, score, test_date) VALUES
('Chun', 'SQL', 75, '2012-11-05'),
('Chun', 'Tuning', 73, '2013-06-14'),
('Esben', 'SQL', 43, '2014-02-11'),
('Esben', 'Tuning', 31, '2014-02-09'),
('Kaolin', 'SQL', 56, '2014-01-01'),
('Kaolin', 'Tuning', 88, '2013-12-29'),
('Tatiana', 'SQL', 87, '2012-04-28'),
('Tatiana', 'Tuning', 83, '2013-09-30');
```

See [INSERT](#) for more.

Using AUTO_INCREMENT

The `AUTO_INCREMENT` attribute is used to automatically generate a unique identity for new rows.

```
CREATE TABLE student_details (
  id INT NOT NULL AUTO_INCREMENT, name CHAR(10),
  date_of_birth DATE, PRIMARY KEY (id)
);
```

When inserting, the id field can be omitted, and is automatically created.

```
INSERT INTO student_details (name,date_of_birth) VALUES
('Chun', '1993-12-31'),
('Esben','1946-01-01'),
('Kaolin','1996-07-16'),
('Tatiana', '1988-04-13');

SELECT * FROM student_details;
+-----+-----+-----+
| id | name   | date_of_birth |
+-----+-----+-----+
| 1  | Chun   | 1993-12-31   |
| 2  | Esben  | 1946-01-01   |
| 3  | Kaolin | 1996-07-16   |
| 4  | Tatiana| 1988-04-13   |
+-----+-----+-----+
```

See [AUTO_INCREMENT](#) for more.

Querying from two tables on a common value

```
SELECT * FROM t1 INNER JOIN t2 ON t1.a = t2.b;
```

This kind of query is called a join - see [JOINS](#) for more.

Finding the Maximum Value

```
SELECT MAX(a) FROM t1;
+-----+
| MAX(a) |
+-----+
|      3 |
+-----+
```

See the [MAX\(\) function](#) for more, as well as [Finding the maximum value and grouping the results](#) below for a more practical example.

Finding the Minimum Value

```
SELECT MIN(a) FROM t1;
+-----+
| MIN(a) |
+-----+
|      1 |
+-----+
```

See the [MIN\(\) function](#) for more.

Finding the Average Value

```
SELECT AVG(a) FROM t1;
+-----+
| AVG(a) |
+-----+
| 2.0000 |
+-----+
```

See the [AVG\(\) function](#) for more.

Finding the Maximum Value and Grouping the Results

```
SELECT name, MAX(score) FROM student_tests GROUP BY name;
+-----+-----+
| name   | MAX(score) |
+-----+-----+
| Chun   |          75 |
| Esben  |          43 |
| Kaolin |          88 |
| Tatiana |          87 |
+-----+-----+
```

See the [MAX\(\) function](#) for more.

Ordering Results

```
SELECT name, test, score FROM student_tests ORDER BY score DESC;
+-----+-----+-----+
| name   | test   | score |
+-----+-----+-----+
| Kaolin | Tuning |    88 |
| Tatiana | SQL    |    87 |
| Tatiana | Tuning |    83 |
| Chun   | SQL    |    75 |
| Chun   | Tuning |    73 |
| Kaolin | SQL    |    56 |
| Esben  | SQL    |    43 |
| Esben  | Tuning |    31 |
+-----+-----+-----+
```

See [ORDER BY](#) for more.

Finding the Row with the Minimum of a Particular Column

In this example, we want to find the lowest test score for any student.

```
SELECT name, test, score FROM student_tests WHERE score=(SELECT MIN(score) FROM student);
+-----+-----+-----+
| name   | test   | score |
+-----+-----+-----+
| Esben  | Tuning |    31 |
+-----+-----+-----+
```

Finding Rows with the Maximum Value of a Column by Group

This example returns the best test results of each student:

```
SELECT name, test, score FROM student_tests st1 WHERE score = (
  SELECT MAX(score) FROM student st2 WHERE st1.name = st2.name
);
+-----+-----+-----+
| name   | test   | score |
+-----+-----+-----+
| Chun   | SQL    |    75 |
| Esben  | SQL    |    43 |
| Kaolin | Tuning |    88 |
| Tatiana | SQL    |    87 |
+-----+-----+-----+
```

Calculating Age

The [TIMESTAMPDIFF](#) function can be used to calculate someone's age:

```

SELECT CURDATE() AS today;
+-----+
| today      |
+-----+
| 2014-02-17 |
+-----+

SELECT name, date_of_birth, TIMESTAMPDIFF(YEAR,date_of_birth,'2014-08-02') AS age
FROM student_details;
+-----+-----+-----+
| name      | date_of_birth | age  |
+-----+-----+-----+
| Chun      | 1993-12-31   | 20   |
| Esben     | 1946-01-01   | 68   |
| Kaolin    | 1996-07-16   | 18   |
| Tatiana   | 1988-04-13   | 26   |
+-----+-----+-----+

```

See [TIMESTAMPDIFF\(\)](#) for more.

Using User-defined Variables

This example sets a [user-defined variable](#) with the average test score, and then uses it in a later query to return all results above the average.

```

SELECT @avg_score:= AVG(score) FROM student_tests;
+-----+
| @avg_score:= AVG(score) |
+-----+
|          67.000000000    |
+-----+

SELECT * FROM student_tests WHERE score > @avg_score;
+-----+-----+-----+-----+
| name      | test  | score | test_date |
+-----+-----+-----+-----+
| Chun      | SQL   | 75    | 2012-11-05 |
| Chun      | Tuning | 73    | 2013-06-14 |
| Kaolin    | Tuning | 88    | 2013-12-29 |
| Tatiana   | SQL   | 87    | 2012-04-28 |
| Tatiana   | Tuning | 83    | 2013-09-30 |
+-----+-----+-----+-----+

```

User-defined variables can also be used to add an incremental counter to a resultset:

```

SET @count = 0;

SELECT @count := @count + 1 AS counter, name, date_of_birth FROM student_details;
+-----+-----+-----+
| counter | name      | date_of_birth |
+-----+-----+-----+
| 1       | Chun      | 1993-12-31   |
| 2       | Esben     | 1946-01-01   |
| 3       | Kaolin    | 1996-07-16   |
| 4       | Tatiana   | 1988-04-13   |
+-----+-----+-----+

```

See [User-defined Variables](#) for more.

View Tables in Order of Size

Returns a list of all tables in the database, ordered by size:

```
SELECT table_schema as `DB`, table_name AS `Table`,
ROUND(((data_length + index_length) / 1024 / 1024), 2) `Size (MB)`
FROM information_schema.TABLES
ORDER BY (data_length + index_length) DESC;
```

DB	Table	Size (MB)
wordpress	wp_simple_history_contexts	7.05
wordpress	wp_posts	6.59
wordpress	wp_simple_history	3.05
wordpress	wp_comments	2.73
wordpress	wp_commentmeta	2.47
wordpress	wp_simple_login_log	2.03
...		

Removing Duplicates

This example assumes there's a unique ID, but that all other fields are identical. In the example below, there are 4 records, 3 of which are duplicates, so two of the three duplicates need to be removed. The intermediate SELECT is not necessary, but demonstrates what is being returned.

```
CREATE TABLE t (id INT, f1 VARCHAR(2));

INSERT INTO t VALUES (1,'a'), (2,'a'), (3,'b'), (4,'a');

SELECT * FROM t t1, t t2 WHERE t1.f1=t2.f1 AND t1.id<>t2.id AND t1.id=(
SELECT MAX(id) FROM t tab WHERE tab.f1=t1.f1
);
```

id	f1	id	f1
4	a	1	a
4	a	2	a

```
DELETE FROM t WHERE id IN (
SELECT t2.id FROM t t1, t t2 WHERE t1.f1=t2.f1 AND t1.id<>t2.id AND t1.id=(
SELECT MAX(id) FROM t tab WHERE tab.f1=t1.f1
)
);
```

Query OK, 2 rows affected (0.120 sec)

```
SELECT * FROM t;
```

id	f1
3	b
4	a

6.2 Basic MariaDB Articles

These articles are at a basic level. They are more advanced than beginners and less advanced than intermediate developers and administrators.

Joining Tables with JOIN Clauses

An introductory tutorial on using the JOIN clause.

The Essentials of an Index

Explains the basics of a table index.

Troubleshooting Connection Issues

Common problems when trying to connect to MariaDB.

6.2.1 Basic SQL Debugging

Contents

1. [Designing Queries](#)
 1. [Using Whitespace](#)
 2. [Table and Field Aliases](#)
 3. [Placing JOIN conditions](#)
2. [Finding Syntax Errors](#)
 1. [Interpreting the Empty Error](#)
 2. [Checking for keywords](#)
 3. [Version specific syntax](#)

Designing Queries

Following a few conventions makes finding errors in queries a lot easier, especially when you ask for help from people who might know SQL, but know nothing about your particular schema. A query easy to read is a query easy to debug. Use whitespace to group clauses within the query. Choose good table and field aliases to add clarity, not confusion. Choose the syntax that supports the query's meaning.

Using Whitespace

A query hard to read is a query hard to debug. White space is free. New lines and indentation make queries easy to read, particularly when constructing a query inside a scripting language, where variables are interspersed throughout the query.

There is a syntax error in the following. How fast can you find it?

```
SELECT u.id, u.name, alliance.ally FROM users u JOIN alliance ON
(u.id=alliance.userId) JOIN team ON (alliance.teamId=team.teamId
WHERE team.teamName='Legionnaires' AND u.online=1 AND ((u.subscription='paid'
AND u.paymentStatus='current') OR u.subscription='free') ORDER BY u.name;
```

Here's the same query, with correct use of whitespace. Can you find the error faster?

```
SELECT
  u.id
  , u.name
  , alliance.ally
FROM
  users u
  JOIN alliance ON (u.id = alliance.userId)
  JOIN team ON (alliance.teamId = team.teamId
WHERE
  team.teamName = 'Legionnaires'
  AND u.online = 1
  AND (
    (u.subscription = 'paid' AND u.paymentStatus = 'current')
    OR
    u.subscription = 'free'
  )
ORDER BY
  u.name;
```

Even if you don't know SQL, you might still have caught the missing ')' following team.teamId.

The exact formatting style you use isn't so important. You might like commas in the select list to follow expressions, rather than precede them. You might indent with tabs or with spaces. Adherence to some particular form is not important. Legibility is the only goal.

Table and Field Aliases

Aliases allow you to rename tables and fields for use within a query. This can be handy when the original names are very long, and is required for self joins and certain subqueries. However, poorly chosen aliases can make a query harder to debug, rather than easier. Aliases should reflect the original table name, not an arbitrary string.

Bad:

```
SELECT *
FROM
    financial_reportQ_1 AS a
    JOIN sales_renderings AS b ON (a.salesGroup = b.groupId)
    JOIN sales_agents AS c ON (b.groupId = c.group)
WHERE
    b.totalSales > 10000
    AND c.id != a.clientId
```

As the list of joined tables and the WHERE clause grow, it becomes necessary to repeatedly look back to the top of the query to see to which table any given alias refers.

Better:

```
SELECT *
FROM
    financial_report_Q_1 AS frq1
    JOIN sales_renderings AS sr ON (frq1.salesGroup = sr.groupId)
    JOIN sales_agents AS sa ON (sr.groupId = sa.group)
WHERE
    sr.totalSales > 10000
    AND sa.id != frq1.clientId
```

Each alias is just a little longer, but the table initials give enough clues that anyone familiar with the database only need see the full table name once, and can generally remember which table goes with which alias while reading the rest of the query.

Placing JOIN conditions

The manual warns against using the JOIN condition (that is, the ON clause) for restricting rows. Some queries, particularly those using implicit joins, take the opposite extreme - all join conditions are moved to the WHERE clause. In consequence, the table relationships are mixed with the business logic.

Bad:

```
SELECT *
FROM
    family,
    relationships
WHERE
    family.personId = relationships.personId
    AND relationships.relation = 'father'
```

Without digging through the WHERE clause, it is impossible to say what links the two tables.

Better:

```
SELECT *
FROM
    family
    JOIN relationships ON (family.personId = relationships.personId)
WHERE
    relationships.relation = 'father'
```

The relation between the tables is immediately obvious. The WHERE clause is left to limit rows in the result set.

Compliance with such a restriction negates the use of the comma operator to join tables. It is a small price to pay. Queries should be written using the explicit JOIN keyword anyway, and the two should never be mixed (unless you like rewriting all your queries every time a new version changes operator precedence).

Finding Syntax Errors

Syntax errors are among the easiest problems to solve. MariaDB provides an error message showing the exact point where the parser became confused. Check the query, including a few words before the phrase shown in the error message. Most syntax and parsing errors are obvious after a second look, but some are more elusive, especially when the error text seems empty, points to a valid keyword, or seems to error on syntax that appears exactly correct.

Interpreting the Empty Error

Most syntax errors are easy to interpret. The error generally details the exact source of the trouble. A careful look at the query, with the error message in mind, often reveals an obvious mistake, such as misspelled field names, a missing 'AND', or an extra closing parenthesis. Sometimes the error is a little less helpful. A frequent, less-than-helpful message:

```
ERROR 1064: You have an error in your SQL syntax; check the manual that corresponds to your MariaDB server version for the right syntax to use near ' ' at line 1
```

The empty '' can be disheartening. Clearly there is an error, but where? A good place to look is at the end of the query. The '' suggests that the parser reached the end of the statement while still expecting some syntax token to appear.

Check for missing closers, such as ' and):

```
SELECT * FROM someTable WHERE field = 'value
```

Look for incomplete clauses, often indicated by an exposed comma:

```
SELECT * FROM someTable WHERE field = 1 GROUP BY id,
```

Checking for keywords

MariaDB allows table and field names and aliases that are also [reserved words](#). To prevent ambiguity, such names must be enclosed in backticks ('):

```
SELECT * FROM actionTable WHERE `DELETE` = 1;
```

If the syntax error is shown near one of your identifiers, check if it appears on the [reserved word list](#).

A text editor with color highlighting for SQL syntax helps to find these errors. When you enter a field name, and it shows up in the same color as the SELECT keyword, you know something is amiss. Some common culprits:

- **DESC** is a common abbreviation for "description" fields. It means "descending" in a MariaDB **ORDER** clause.
- **DATE**, **TIME**, and **TIMESTAMP** are all common field names. They are also field types.
- **ORDER** appears in sales applications. MariaDB uses it to specify sorting for results.

Some keywords are so common that MariaDB makes a special allowance to use them unquoted. My advice: don't. If it's a keyword, quote it.

Version specific syntax

As MariaDB adds new features, the syntax must change to support them. Most of the time, old syntax will work in newer versions of MariaDB. One notable exception is the change in precedence of the comma operator relative to the JOIN keyword in version 5.0. A query that used to work, such as

```
SELECT * FROM a, b JOIN c ON a.x = c.x;
```

will now fail.

More common, however, is an attempt to use new syntax in an old version. Web hosting companies are notoriously slow to upgrade MariaDB, and you may find yourself using a version several years out of date. The result can be very frustrating when a query that executes flawlessly on your own workstation, running a recent installation, fails completely in your production environment.

This query fails in any version of MySQL prior to 4.1, when subqueries were added to the server:

```
SELECT * FROM someTable WHERE someId IN (SELECT id FROM someLookupTable);
```

This query fails in some early versions of MySQL, because the JOIN syntax did not originally allow an ON clause:

```
SELECT * FROM tableA JOIN tableB ON tableA.x = tableB.y;
```

Always check the installed version of MariaDB, and read the section of the manual relevant for that version. The manual usually indicates exactly when particular syntax became available for use.

6.2.2 Configuring MariaDB for Remote Client Access

Contents

1. [Finding the Defaults File](#)
2. [Editing the Defaults File](#)
3. [Granting User Connections From Remote Hosts](#)
4. [Port 3306 is Configured in Firewall](#)
5. [Caveats](#)

Some MariaDB packages bind MariaDB to 127.0.0.1 (the loopback IP address) by default as a security measure using the `bind-address` configuration directive. Old MySQL packages sometimes disabled TCP/IP networking altogether using the `skip-networking` directive. Before going in to how to configure these, let's explain what each of them actually does:

- `skip-networking` is fairly simple. It just tells MariaDB to run without any of the TCP/IP networking options.
- `bind-address` requires a little bit of background information. A given server usually has at least two networking interfaces (although this is not required) and can easily have more. The two most common are a *Loopback* network device and a physical *Network Interface Card* (NIC) which allows you to communicate with the network. MariaDB is bound to the loopback interface by default because it makes it impossible to connect to the TCP port on the server from a remote host (the `bind-address` must refer to a local IP address, or you will receive a fatal error and MariaDB will not start). This of course is not desirable if you want to use the TCP port from a remote host, so you must remove this `bind-address` directive or replace it either 0.0.0.0 to listen on all interfaces, or the address of a specific public interface.

MariaDB starting with 10.11

Multiple comma-separated addresses can now be given to `bind_address` to allow the server to listen on more than one specific interface while not listening on others.

If `bind-address` is bound to 127.0.0.1 (localhost), one can't connect to the MariaDB server from other hosts or from the same host over TCP/IP on a different interface than the loopback (127.0.0.1). This for example will not work (connecting with a hostname that points to a local IP of the host):

```
(/my/maria-10.11) ./client/mariadb --host=myhost --protocol=tcp --port=3306 test
ERROR 2002 (HY000): Can't connect to MySQL server on 'myhost' (115)
(/my/maria-10.11) telnet myhost 3306
Trying 192.168.0.11...
telnet: connect to address 192.168.0.11: Connection refused
```

Using 'localhost' works when binding with `bind_address` :

```
(my/maria-10.11) ./client/mariadb --host=localhost --protocol=tcp --port=3306 test
Reading table information for completion of table and column names
You can turn off this feature to get a quicker startup with -A

Welcome to the MariaDB monitor.  Commands end with ; or \g.
...
```

Finding the Defaults File

To enable MariaDB to listen to remote connections, you need to edit your defaults file. See [Configuring MariaDB with my.cnf](#) for more detail.

Common locations for defaults files:

```
* /etc/my.cnf (*nix/BSD)
* $MYSQL_HOME/my.cnf (*nix/BSD) *Most Notably /etc/mysql/my.cnf
* SYSCONFDIR/my.cnf (*nix/BSD)
* DATADIR\my.ini (Windows)
```

You can see which defaults files are read and in which order by executing:

```
shell> mariadb --help --verbose
mariadb Ver 10.11.5-MariaDB for linux-systemd on x86_64 (MariaDB Server)
Copyright (c) 2000, 2018, Oracle, MariaDB Corporation Ab and others.

Starts the MariaDB database server.

Usage: ./mariadb [OPTIONS]

Default options are read from the following files in the given order:
/etc/my.cnf /etc/mysql/my.cnf ~/.my.cnf
```

The last line shows which defaults files are read.

Editing the Defaults File

Once you have located the defaults file, use a text editor to open the file and try to find lines like this under the [mysqld] section:

```
[mysqld]
...
skip-networking
...
bind-address = <some ip-address>
...
```

(The lines may not be in this order, and the order doesn't matter.)

If you are able to locate these lines, make sure they are both commented out (prefaced with hash (#) characters), so that they look like this:

```
[mysqld]
...
#skip-networking
...
#bind-address = <some ip-address>
...
```

(Again, the order of these lines don't matter)

Alternatively, just add the following lines **at the end** of your .my.cnf (notice that the file name starts with a dot) file in your home directory or alternative **last** in your /etc/my.cnf file.

```
[mysqld]
skip-networking=0
skip-bind-address
```

This works as one can have any number of [mysqld] sections.

Save the file and restart the mariadb daemon or service (see [Starting and Stopping MariaDB](#)).

You can check the options mariadb is using by executing:

```
shell> ./sql/mariadb --print-defaults
./sql/mariadb would have been started with the following arguments:
--bind-address=127.0.0.1 --innodb_file_per_table=ON --server-id=1 --skip-bind-address ...
```

It doesn't matter if you have the original --bind-address left as the later --skip-bind-address will overwrite it.

Granting User Connections From Remote Hosts

Now that your MariaDB server installation is setup to accept connections from remote hosts, we have to add a user that is allowed to connect from something other than 'localhost' (Users in MariaDB are defined as 'user'@'host', so 'chadmaynard'@'localhost' and 'chadmaynard'@'1.1.1.1' (or 'chadmaynard'@'server.domain.local') are different users that can have completely different permissions and/or passwords.

To create a new user:

- log into the [mariadb command line client](#) (or your favorite graphical client if you wish)

```
Welcome to the MariaDB monitor.  Commands end with ; or \g.
Your MariaDB connection id is 36
Server version: 5.5.28-MariaDB-mariadb1~lucid mariadb.org binary distribution

Copyright (c) 2000, 2012, Oracle, Monty Program Ab and others.

Type 'help;' or '\h' for help. Type '\c' to clear the current input statement.

MariaDB [(none)]>
```

- if you are interested in viewing any existing remote users, issue the following SQL statement on the [mysql.user](#) table:

```
SELECT User, Host FROM mysql.user WHERE Host <> 'localhost';
+-----+-----+
| User  | Host      |
+-----+-----+
| daniel | %         |
| root  | 127.0.0.1 |
| root  | :::1      |
| root  | gandalf   |
+-----+-----+
4 rows in set (0.00 sec)
```

(If you have a fresh install, it is normal for no rows to be returned)

Now you have some decisions to make. At the heart of every grant statement you have these things:

- list of allowed privileges
- what database/tables these privileges apply to
- username
- host this user can connect from
- and optionally a password

It is common for people to want to create a "root" user that can connect from anywhere, so as an example, we'll do just that, but to improve on it we'll create a root user that can connect from anywhere on my local area network (LAN), which has addresses in the subnet 192.168.100.0/24. This is an improvement because opening a MariaDB server up to the Internet and granting access to all hosts is bad practice.

```
GRANT ALL PRIVILEGES ON *.* TO 'root'@'192.168.100.%'
  IDENTIFIED BY 'my-new-password' WITH GRANT OPTION;
```

(% is a wildcard)

For more information about how to use GRANT, please see the [GRANT](#) page.

At this point we have accomplished our goal and we have a user 'root' that can connect from anywhere on the 192.168.100.0/24 LAN.

Port 3306 is Configured in Firewall

One more point to consider whether the firewall is configured to allow incoming request from remote clients:

On RHEL and CentOS 7, it may be necessary to configure the firewall to allow TCP access to MariaDB from remote hosts. To do so, execute both of these commands:

```
firewall-cmd --add-port=3306/tcp
firewall-cmd --permanent --add-port=3306/tcp
```

Caveats

- If your system is running a software firewall (or behind a hardware firewall or NAT) you must allow connections

destined to TCP port that MariaDB runs on (by default and almost always 3306).

- To undo this change and not allow remote access anymore, simply remove the `skip-bind-address` line or uncomment the `bind-address` line in your defaults file. The end result should be that you should have in the output from `./sql/mariadb --print-defaults` the option `--bind-address=127.0.0.1` and no `--skip-bind-address`.

The initial version of this article was copied, with permission, from http://hashmysql.org/wiki/Remote_Clients_Cannot_Connect on 2012-10-30.

6.2.3 Creating & Using Views

 3. [Pre-emptive Optimization](#)
 4. [Abstracting Tables](#)
5. [Summary](#)

A Tutorial Introduction

Up-front warning: This is the beginning of a very basic tutorial on views, based on my experimentation with them. This tutorial assumes that you've read the appropriate tutorials up to and including [More Advanced Joins](#) (or that you understand the concepts behind them). This page is intended to give you a general idea of how views work and what they do, as well as some examples of when you could use them.

Requirements for This Tutorial

In order to perform the SQL statements in this tutorial, you will need access to a MariaDB database and you will need the `CREATE TABLE` and `CREATE VIEW` privileges on this table.

The Employee Database

First, we need some data we can perform our optimizations on, so we'll recreate the tables from the [More Advanced Joins](#) tutorial, to provide us with a starting point. If you have already completed that tutorial and have this database already, you can skip ahead.

First, we create the table that will hold all of the employees and their contact information:

```
CREATE TABLE `Employees` (  
  `ID` TINYINT(3) UNSIGNED NOT NULL AUTO_INCREMENT,  
  `First_Name` VARCHAR(25) NOT NULL,  
  `Last_Name` VARCHAR(25) NOT NULL,  
  `Position` VARCHAR(25) NOT NULL,  
  `Home_Address` VARCHAR(50) NOT NULL,  
  `Home_Phone` VARCHAR(12) NOT NULL,  
  PRIMARY KEY (`ID`)  
) ENGINE=MyISAM;
```

Next, we add a few employees to the table:

```

INSERT INTO `Employees` (`First_Name`, `Last_Name`, `Position`, `Home_Address`, `Home_Phone`)
VALUES
('Mustapha', 'Mond', 'Chief Executive Officer', '692 Promiscuous Plaza', '326-555-3492'),
('Henry', 'Foster', 'Store Manager', '314 Savage Circle', '326-555-3847'),
('Bernard', 'Marx', 'Cashier', '1240 Ambient Avenue', '326-555-8456'),
('Lenina', 'Crowne', 'Cashier', '281 Bumblepuppy Boulevard', '328-555-2349'),
('Fanny', 'Crowne', 'Restocker', '1023 Bokanovsky Lane', '326-555-6329'),
('Helmholtz', 'Watson', 'Janitor', '944 Soma Court', '329-555-2478');

```

Now, we create a second table, containing the hours which each employee clocked in and out during the week:

```

CREATE TABLE `Hours` (
  `ID` TINYINT(3) UNSIGNED NOT NULL,
  `Clock_In` DATETIME NOT NULL,
  `Clock_Out` DATETIME NOT NULL
) ENGINE=MyISAM;

```

Finally, although it is a lot of information, we add a full week of hours for each of the employees into the second table that we created:

```

INSERT INTO `Hours`
VALUES ('1', '2005-08-08 07:00:42', '2005-08-08 17:01:36'),
('1', '2005-08-09 07:01:34', '2005-08-09 17:10:11'),
('1', '2005-08-10 06:59:56', '2005-08-10 17:09:29'),
('1', '2005-08-11 07:00:17', '2005-08-11 17:00:47'),
('1', '2005-08-12 07:02:29', '2005-08-12 16:59:12'),
('2', '2005-08-08 07:00:25', '2005-08-08 17:03:13'),
('2', '2005-08-09 07:00:57', '2005-08-09 17:05:09'),
('2', '2005-08-10 06:58:43', '2005-08-10 16:58:24'),
('2', '2005-08-11 07:01:58', '2005-08-11 17:00:45'),
('2', '2005-08-12 07:02:12', '2005-08-12 16:58:57'),
('3', '2005-08-08 07:00:12', '2005-08-08 17:01:32'),
('3', '2005-08-09 07:01:10', '2005-08-09 17:00:26'),
('3', '2005-08-10 06:59:53', '2005-08-10 17:02:53'),
('3', '2005-08-11 07:01:15', '2005-08-11 17:04:23'),
('3', '2005-08-12 07:00:51', '2005-08-12 16:57:52'),
('4', '2005-08-08 06:54:37', '2005-08-08 17:01:23'),
('4', '2005-08-09 06:58:23', '2005-08-09 17:00:54'),
('4', '2005-08-10 06:59:14', '2005-08-10 17:00:12'),
('4', '2005-08-11 07:00:49', '2005-08-11 17:00:34'),
('4', '2005-08-12 07:01:09', '2005-08-12 16:58:29'),
('5', '2005-08-08 07:00:04', '2005-08-08 17:01:43'),
('5', '2005-08-09 07:02:12', '2005-08-09 17:02:13'),
('5', '2005-08-10 06:59:39', '2005-08-10 17:03:37'),
('5', '2005-08-11 07:01:26', '2005-08-11 17:00:03'),
('5', '2005-08-12 07:02:15', '2005-08-12 16:59:02'),
('6', '2005-08-08 07:00:12', '2005-08-08 17:01:02'),
('6', '2005-08-09 07:03:44', '2005-08-09 17:00:00'),
('6', '2005-08-10 06:54:19', '2005-08-10 17:03:31'),
('6', '2005-08-11 07:00:05', '2005-08-11 17:02:57'),
('6', '2005-08-12 07:02:07', '2005-08-12 16:58:23');

```

Working with the Employee Database

In this example, we are going to assist Human Resources by simplifying the queries that their applications need to perform. At the same time, it's going to enable us to abstract their queries from the database, which allows us more flexibility in maintaining it.

Filtering by Name, Date and Time

In the previous tutorial, we looked at a JOIN query that displayed all of the lateness instances for a particular employee. In this tutorial, we are going to abstract that query somewhat to provide us with all lateness occurrences for all employees, and then standardize that query by making it into a view.

Our previous query looked like this:

```

SELECT
  `Employees`.`First_Name`,
  `Employees`.`Last_Name`,
  `Hours`.`Clock_In`,
  `Hours`.`Clock_Out`
FROM `Employees`
INNER JOIN `Hours` ON `Employees`.`ID` = `Hours`.`ID`
WHERE `Employees`.`First_Name` = 'Helmholtz'
AND DATE_FORMAT(`Hours`.`Clock_In`, '%Y-%m-%d') >= '2005-08-08'
AND DATE_FORMAT(`Hours`.`Clock_In`, '%Y-%m-%d') <= '2005-08-12'
AND DATE_FORMAT(`Hours`.`Clock_In`, '%H:%i:%S') > '07:00:59';

```

The result:

```

+-----+-----+-----+-----+
| First_Name | Last_Name | Clock_In          | Clock_Out          |
+-----+-----+-----+-----+
| Helmholtz  | Watson   | 2005-08-09 07:03:44 | 2005-08-09 17:00:00 |
| Helmholtz  | Watson   | 2005-08-12 07:02:07 | 2005-08-12 16:58:23 |
+-----+-----+-----+-----+

```

Refining Our Query

The previous example displays to us all of Helmholtz's punch-in times that were after seven AM. We can see here that Helmholtz has been late twice within this reporting period, and we can also see that in both instances, he either left exactly on time or he left early. Our company policy, however, dictates that late instances must be made up at the end of one's shift, so we want to exclude from our report anyone whose clock-out time was greater than 10 hours and one minute after their clock-in time.

```

SELECT
  `Employees`.`First_Name`,
  `Employees`.`Last_Name`,
  `Hours`.`Clock_In`,
  `Hours`.`Clock_Out`,
  (TIMESTAMPDIFF(MINUTE, `Hours`.`Clock_Out`, `Hours`.`Clock_In`) + 60) as Difference
FROM `Employees`
INNER JOIN `Hours` USING (ID)
WHERE DATE_FORMAT(`Hours`.`Clock_In`, '%Y-%m-%d') >= '2005-08-08'
AND DATE_FORMAT(`Hours`.`Clock_In`, '%Y-%m-%d') <= '2005-08-12'
AND DATE_FORMAT(`Hours`.`Clock_In`, '%H:%i:%S') > '07:00:59'
AND TIMESTAMPDIFF(MINUTE, `Hours`.`Clock_Out`, `Hours`.`Clock_In`) > -60;

```

This gives us the following list of people who have violated our attendance policy:

```

+-----+-----+-----+-----+-----+
| First_Name | Last_Name | Clock_In          | Clock_Out          | Difference |
+-----+-----+-----+-----+-----+
| Mustapha   | Mond     | 2005-08-12 07:02:29 | 2005-08-12 16:59:12 | 4 |
| Henry      | Foster   | 2005-08-11 07:01:58 | 2005-08-11 17:00:45 | 2 |
| Henry      | Foster   | 2005-08-12 07:02:12 | 2005-08-12 16:58:57 | 4 |
| Bernard    | Marx     | 2005-08-09 07:01:10 | 2005-08-09 17:00:26 | 1 |
| Lenina     | Crowne   | 2005-08-12 07:01:09 | 2005-08-12 16:58:29 | 3 |
| Fanny      | Crowne   | 2005-08-11 07:01:26 | 2005-08-11 17:00:03 | 2 |
| Fanny      | Crowne   | 2005-08-12 07:02:15 | 2005-08-12 16:59:02 | 4 |
| Helmholtz  | Watson   | 2005-08-09 07:03:44 | 2005-08-09 17:00:00 | 4 |
| Helmholtz  | Watson   | 2005-08-12 07:02:07 | 2005-08-12 16:58:23 | 4 |
+-----+-----+-----+-----+-----+

```

The Utility of Views

We can see in the previous example that there have been several instances of employees coming in late and leaving early. Unfortunately, we can also see that this query is getting needlessly complex. Having all of this SQL in our application not only creates more complex application code, but also means that if we ever change the structure of this table we're going to have to change what is becoming a somewhat messy query. This is where views begin to show their usefulness.

Creating the Employee Tardiness View

Creating a view is almost exactly the same as creating a SELECT statement, so we can use our previous SELECT statement in the creation of our new view:

```
CREATE SQL SECURITY INVOKER VIEW Employee_Tardiness AS
SELECT
  `Employees`.`First_Name`,
  `Employees`.`Last_Name`,
  `Hours`.`Clock_In`,
  `Hours`.`Clock_Out`,
  (TIMESTAMPDIFF(MINUTE, `Hours`.`Clock_Out`, `Hours`.`Clock_In`) + 60) as Difference
FROM `Employees`
INNER JOIN `Hours` USING (`ID`)
WHERE DATE_FORMAT(`Hours`.`Clock_In`, '%Y-%m-%d') >= '2005-08-08'
AND DATE_FORMAT(`Hours`.`Clock_In`, '%Y-%m-%d') <= '2005-08-12'
AND DATE_FORMAT(`Hours`.`Clock_In`, '%H:%i:%S') > '07:00:59'
AND TIMESTAMPDIFF(MINUTE, `Hours`.`Clock_Out`, `Hours`.`Clock_In`) > -60;
```

Note that the first line of our query contains the statement 'SQL SECURITY INVOKER' - this means that when the view is accessed, it runs with the same privileges that the person accessing the view has. Thus, if someone without access to our Employees table tries to access this view, they will get an error.

Other than the security parameter, the rest of the query is fairly self explanatory. We simply run 'CREATE VIEW <view-name> AS' and then append any valid SELECT statement, and our view is created. Now if we do a SELECT from the view, we can see we get the same results as before, with much less SQL:

```
SELECT * FROM Employee_Tardiness;
```

First_Name	Last_Name	Clock_In	Clock_Out	Difference
Mustapha	Mond	2005-08-12 07:02:29	2005-08-12 16:59:12	5
Henry	Foster	2005-08-11 07:01:58	2005-08-11 17:00:45	3
Henry	Foster	2005-08-12 07:02:12	2005-08-12 16:58:57	5
Bernard	Marx	2005-08-09 07:01:10	2005-08-09 17:00:26	2
Lenina	Crowne	2005-08-12 07:01:09	2005-08-12 16:58:29	4
Fanny	Crowne	2005-08-09 07:02:12	2005-08-09 17:02:13	1
Fanny	Crowne	2005-08-11 07:01:26	2005-08-11 17:00:03	3
Fanny	Crowne	2005-08-12 07:02:15	2005-08-12 16:59:02	5
Helmholtz	Watson	2005-08-09 07:03:44	2005-08-09 17:00:00	5
Helmholtz	Watson	2005-08-12 07:02:07	2005-08-12 16:58:23	5

Now we can even perform operations on the table, such as limiting our results to just those with a Difference of at least five minutes:

```
SELECT * FROM Employee_Tardiness WHERE Difference >=5;
```

First_Name	Last_Name	Clock_In	Clock_Out	Difference
Mustapha	Mond	2005-08-12 07:02:29	2005-08-12 16:59:12	5
Henry	Foster	2005-08-12 07:02:12	2005-08-12 16:58:57	5
Fanny	Crowne	2005-08-12 07:02:15	2005-08-12 16:59:02	5
Helmholtz	Watson	2005-08-09 07:03:44	2005-08-09 17:00:00	5
Helmholtz	Watson	2005-08-12 07:02:07	2005-08-12 16:58:23	5

Other Uses of Views

Aside from just simplifying our application's SQL queries, there are also other benefits that views can provide, some of which are only possible by using views.

Restricting Data Access

For example, even though our Employees database contains fields for Position, Home Address, and Home Phone, our query does not allow for these fields to be shown. This means that in the case of a security issue in the application (for example, an SQL injection attack, or even a malicious programmer), there is no risk of disclosing an employee's personal

information.

Row-level Security

We can also define separate views to include a specific WHERE clause for security; for example, if we wanted to restrict a department head's access to only the staff that report to him, we could specify his identity in the view's CREATE statement, and he would then be unable to see any other department's employees, despite them all being in the same table. If this view is writeable and it is defined with the CASCADE clause, this restriction will also apply to writes. This is actually the only way to implement row-level security in MariaDB, so views play an important part in that area as well.

Pre-emptive Optimization

We can also define our views in such a way as to force the use of indexes, so that other, less-experienced developers don't run the risk of running un-optimized queries or JOINS that result in full-table scans and extended locks. Expensive queries, queries that SELECT *, and poorly thought-out JOINS can not only slow down the database entirely, but can cause inserts to fail, clients to time out, and reports to error out. By creating a view that is already optimized and letting users perform their queries on that, you can ensure that they won't cause a significant performance hit unnecessarily.

Abstracting Tables

When we re-engineer our application, we sometimes need to change the database to optimize or accommodate new or removed features. We may, for example, want to [normalize](#) our tables when they start getting too large and queries start taking too long. Alternately, we may be installing a new application with different requirements alongside a legacy application. Unfortunately, database redesign will tend to break backwards-compatibility with previous applications, which can cause obvious problems.

Using views, we can change the format of the underlying tables while still presenting the same table format to the legacy application. Thus, an application which demands username, hostname, and access time in string format can access the same data as an application which requires firstname, lastname, user@host, and access time in Unix timestamp format.

Summary

Views are an SQL feature that can provide a lot of versatility in larger applications, and can even simplify smaller applications further. Just as stored procedures can help us abstract out our database logic, views can simplify the way we access data in the database, and can help un-complicate our queries to make application debugging easier and more efficient.

3.3.3.2 Getting Started with Indexes

6.2.5 Joining Tables with JOIN Clauses

In the absence of a more tutorial-level document, here is a simple example of three basic JOIN types, which you can experiment with in order to see what the different joins accomplish:

```
CREATE TABLE t1 ( a INT );
CREATE TABLE t2 ( b INT );
INSERT INTO t1 VALUES (1), (2), (3);
INSERT INTO t2 VALUES (2), (4);
SELECT * FROM t1 INNER JOIN t2 ON t1.a = t2.b;
SELECT * FROM t1 CROSS JOIN t2;
SELECT * FROM t1 LEFT JOIN t2 ON t1.a = t2.b;
SELECT * FROM t2 LEFT JOIN t1 ON t1.a = t2.b;
```

The first two SELECTs are (unfortunately) commonly written with an older form:

```
SELECT * FROM t1, t2 WHERE t1.a = t2.b;
SELECT * FROM t1, t2;
```

What you can see from this is that an **INNER JOIN** produces a result set containing only rows that have a match, in both tables (t1 and t2), for the specified join condition(s).

A **CROSS JOIN** produces a result set in which every row in each table is joined to every row in the other table; this is also called a **cartesian product**. In MariaDB the CROSS keyword can be omitted, as it does nothing. Any JOIN without an ON clause is a CROSS JOIN.

The **LEFT JOIN** is an **outer join**, which produces a result set with all rows from the table on the "left" (t1); the values for the columns in the other table (t2) depend on whether or not a match was found. If no match is found, all columns from that table are set to NULL for that row.

The **RIGHT JOIN** is similar to the LEFT JOIN, though its resultset contains all rows from the right table, and the left table's columns will be filled with NULLs when needed.

JOINS can be concatenated to read results from three or more tables.

Here is the output of the various SELECT statements listed above:

```
SELECT * FROM t1 INNER JOIN t2 ON t1.a = t2.b;
```

```
-----  
| a    | b    |  
-----  
|    2 |    2 |  
-----
```

```
1 row in set (0.00 sec)
```

```
SELECT * FROM t1 CROSS JOIN t2;
```

```
-----  
| a    | b    |  
-----  
|    1 |    2 |  
|    2 |    2 |  
|    3 |    2 |  
|    1 |    4 |  
|    2 |    4 |  
|    3 |    4 |  
-----
```

```
6 rows in set (0.00 sec)
```

```
SELECT * FROM t1 LEFT JOIN t2 ON t1.a = t2.b;
```

```
-----  
| a    | b    |  
-----  
|    1 | NULL |  
|    2 |    2 |  
|    3 | NULL |  
-----
```

```
3 rows in set (0.00 sec)
```

```
SELECT * FROM t2 LEFT JOIN t1 ON t1.a = t2.b;
```

```
-----  
| b    | a    |  
-----  
|    2 |    2 |  
|    4 | NULL |  
-----
```

```
2 rows in set (0.00 sec)
```

That should give you a bit more understanding of how JOINS work!

6.2.6 The Essentials of an Index

Imagine you've created a table with the following rows (this is the same table as used in the [More Advanced Joins](#) tutorial).

ID	First_Name	Last_Name	Position	Home_Address	Home_Phone
1	Mustapha	Mond	Chief Executive Officer	692 Promiscuous Plaza	326-555-349
2	Henry	Foster	Store Manager	314 Savage Circle	326-555-384
3	Bernard	Marx	Cashier	1240 Ambient Avenue	326-555-845
4	Lenina	Crowne	Cashier	281 Bumblepuppy Boulevard	328-555-234
5	Fanny	Crowne	Restocker	1023 Bokanovsky Lane	326-555-632
6	Helmholtz	Watson	Janitor	944 Soma Court	329-555-247

Now, imagine you've been asked to return the home phone of Fanny Crowne. Without indexes, the only way to do it is to go through every row until you find the matching first name and surname. Now imagine there are millions of records and you can see that, even for a speedy database server, this is highly inefficient.

The answer is to sort the records. If they were stored in alphabetical order by surname, even a human could quickly find a record amongst a large number. But we can't sort the entire record by surname. What if we want to also look a record by ID, or by first name? The answer is to create separate indexes for each column we wish to sort by. An index simply contains the sorted data (such as surname), and a link to the original record.

For example, an index on Last_Name:

Last_Name	ID
Crowne	4
Crowne	5
Foster	2
Marx	3
Mond	1
Watson	6

and an index on Position

Position	ID
Cashier	3
Cashier	4
Chief Executive Officer	1
Janitor	6
Restocker	5
Store Manager	2

would allow you to quickly find the phone numbers of all the cashiers, or the phone number of the employee with the surname Marx, very quickly.

Where possible, you should create an index for each column that you search for records by, to avoid having the server read every row of a table.

See [CREATE INDEX](#) and [Getting Started with Indexes](#) for more information.

6.2.7 Troubleshooting Connection Issues

Need additional support? We're here to help!

Contents

1. [Server Not Running in Specified Location](#)
2. [Unable to Connect from a Remote Location](#)
3. [Authentication Problems](#)
 1. [Problems Exporting Query Results](#)
 2. [Access to the Server, but not to a Database](#)
 3. [Option Files and Environment Variables](#)
 4. [Unable to Connect to a Running Server / Lost root Password](#)
 5. [localhost and %](#)

If you are completely new to MariaDB and relational databases, you may want to start with the [MariaDB Primer](#). Also, make sure you understand the connection parameters discussed in the [Connecting to MariaDB](#) article.

There are a number of common problems that can occur when connecting to MariaDB.

Server Not Running in Specified Location

If the error you get is something like:

```
mariadb -uname -p -uname -p
ERROR 2002 (HY000): Can't connect to local MySQL server through
socket '/var/run/mysqld/mysqld.sock' (2 "No such file or directory")
```

or

```
mariadb -uname -p --port=3307 --protocol=tcp
ERROR 2003 (HY000): Can't connect to MySQL server on 'localhost'
(111 "Connection refused")
```

the server is either not running, or not running on the specified port, socket or pipe. Make sure you are using the correct [host](#), [port](#), [pipe](#), [socket](#) and [protocol](#) options, or alternatively, see [Getting, Installing and Upgrading MariaDB](#), [Starting and Stopping MariaDB](#) or [Troubleshooting Installation Issues](#).

The socket file can be in a non-standard path. In this case, the `socket` option is probably written in the `my.cnf` file. Check that its value is identical in the `[mysqld]` and `[client]` sections; if not, the client will look for a socket in a wrong place.

If unsure where the Unix socket file is running, it's possible to find this out, for example:

```
netstat -ln | grep mysqld
unix 2      [ ACC ]     STREAM     LISTENING   33209505  /var/run/mysqld/mysqld.sock
```

Unable to Connect from a Remote Location

Usually, the MariaDB server does not by default accept connections from a remote client or connecting with `tcp` and a `hostname` and has to be configured to permit these.

```
(/my/maria-10.4) ./client/mysql --host=myhost --protocol=tcp --port=3306 test
ERROR 2002 (HY000): Can't connect to MySQL server on 'myhost' (115)
(/my/maria-10.4) telnet myhost 3306
Trying 192.168.0.11...
telnet: connect to address 192.168.0.11: Connection refused
(/my/maria-10.4) perror 115
OS error code 115: Operation now in progress
```

To solve this, see [Configuring MariaDB for Remote Client Access](#)

Authentication Problems

Note that from [MariaDB 10.4.3](#), the [unix_socket authentication plugin](#) is enabled by default on Unix-like systems. This uses operating system credentials when connecting to MariaDB via the local Unix socket file. See [unix_socket](#)

[authentication plugin](#) for instructions on connecting and on switching to password-based authentication as well as [Authentication from MariaDB 10.4](#) for an overview of the [MariaDB 10.4](#) changes..

Authentication is granted to a particular username/host combination. `user1'@'localhost'`, for example, is not the same as `user1'@'166.78.144.191'`. See the [GRANT](#) article for details on granting permissions.

Passwords are hashed with [PASSWORD](#) function. If you have set a password with the [SET PASSWORD](#) statement, the [PASSWORD](#) function must be used at the same time. For example, `SET PASSWORD FOR 'bob'@'%.loc.gov' = PASSWORD('newpass')` rather than just `SET PASSWORD FOR 'bob'@'%.loc.gov' = 'newpass'`;

Problems Exporting Query Results

If you can run regular queries, but get an authentication error when running the [SELECT ... INTO OUTFILE](#), [SELECT ... INTO DUMPFILE](#) or [LOAD DATA INFILE](#) statements, you do not have permission to write files to the server. This requires the FILE privilege. See the [GRANT](#) article.

Access to the Server, but not to a Database

If you can connect to the server, but not to a database, for example:

```
USE test;
ERROR 1044 (42000): Access denied for user 'ian'@'localhost' to database 'test'
```

or can connect to a particular database, but not another, for example `mariadb -uname -p -u name db1` works but not `mariadb -uname -p -u name db2`, you have not been granted permission for the particular database. See the [GRANT](#) article.

Option Files and Environment Variables

It's possible that option files or environment variables may be providing incorrect connection parameters. Check the values provided in any option files read by the client you are using (see [mariadb Configuration Files and Groups](#) and the documentation for the particular client you're using - see [Clients and Utilities](#) [↗](#)).

Option files can usually be suppressed with `no-defaults` option, for example:

```
mariadb-import --no-defaults ...
```

Unable to Connect to a Running Server / Lost root Password

If you are unable to connect to a server, for example because you have lost the root password, you can start the server without using the privilege tables by running the `--skip-grant-tables` option, which gives users full access to all tables. You can then run [FLUSH PRIVILEGES](#) to resume using the grant tables, followed by [SET PASSWORD](#) to change the password for an account.

localhost and %

You may have created a user with something like:

```
CREATE USER melisa identified by 'password';
```

This creates a user with the '%' wildcard host.

```
select user,host from mysql.user where user='melisa';
+-----+-----+
| user  | host  |
+-----+-----+
| melisa | %    |
+-----+-----+
```

However, you may still be failing to login from localhost. Some setups create anonymous users, including localhost. So the following records exist in the user table:

```
select user,host from mysql.user where user='melisa' or user='';
+-----+
| user | host |
+-----+
| melisa | % |
| | localhost |
+-----+
```

Since you are connecting from localhost, the anonymous credentials, rather than those for the 'melisa' user, are used. The solution is either to add a new user specific to localhost, or to remove the anonymous localhost user.

Contents

1. [What is a Database?](#)
 1. [Table 1](#)
 2. [Table 2](#)
2. [Database Terminology](#)

What is a Database?

The easiest way to understand a database is as a collection of related files. Imagine a file (either paper or digital) of sales orders in a shop. Then there's another file of products, containing stock records. To fulfil an order, you'd need to look up the product in the order file and then look up and adjust the stock levels for that particular product in the product file. A database and the software that controls the database, called a *database management system* (DBMS), helps with this kind of task.

Most databases today are *relational* databases, named such because they deal with tables of data related by a common field. For example, Table 1 below shows the product table, and Table 2 shows the invoice table. As you can see, the relation between the two tables is based on the common field `product_code`. Any two tables can relate to each other simply by having a field in common.

Table 1

<i>Product_code</i>	<i>Description</i>	<i>Price</i>
A416	Nails, box	\$0.14
C923	Drawing pins, box	\$0.08

Table 2

<i>Invoice_code</i>	<i>Invoice_line</i>	<i>Product_code</i>	<i>Quantity</i>
3804	1	A416	10
3804	2	C923	15

Database Terminology

Let's take a closer look at the previous two tables to see how they are organized:

- Each table consists of many *rows* and *columns*.
- Each new row contains data about one single *entity* (such as one product or one order line). This is called a *record*. For example, the first row in Table 1 is a record; it describes the A416 product, which is a box of nails that costs fourteen cents. The terms *row* and *record* are interchangeable.
- Each column (also called an *attribute*) contains one piece of data that relates to the record, called a *tuple*. Examples of attributes are the quantity of an item sold or the price of a product. An attribute, when referring to a database table, is called a *field*. For example, the data in the *Description* column in Table 1 are fields. The terms *attribute* and *field* are interchangeable.

Given this kind of structure, the database gives you a way to manipulate this data: SQL. SQL (structured query language) is a powerful way to search for records or make changes. Almost all DBMSs use SQL, although many have added their own enhancements to it. This means that when you learn SQL while using MariaDB, almost all of it is not specific to MariaDB and can be used with other relational databases as well, such as PostgreSQL, MySQL, Oracle and SQL Server. MariaDB was originally-created as a drop-in replacement to MySQL, so MariaDB and MySQL are particularly close.

6.3.1.2 Exploring Early Database Models

Before the advent of databases, the only way to store data was from unrelated files. Programmers had to go to great lengths to extract the data, and their programs had to perform complex parsing and relating.

Languages such as Perl, with its powerful regular expressions ideal for processing text, have made the job a lot easier than before; however, accessing the data from files is still a challenging task. Without a standard way to access data, systems are more prone to errors, are slower to develop, and are more difficult to maintain. Data redundancy (where data is duplicated unnecessarily) and poor data integrity (where data is not changed in all locations, leading to wrong or outdated data being supplied) are frequent consequences of the file access method of data storage. For these reasons, database management systems (DBMSs) were developed to provide a standard and reliable way to access and update data. They

provide an intermediary layer between the application and the data, and the programmer is able to concentrate on developing the application, rather than worrying about data access issues.

A *database model* is a logical model concerned with how the data is represented. Instead of database designers worrying about the physical storage of data, the database model allows them to look at a higher, more conceptual level, reducing the gap between the real-world problem for which the application is being developed and the technical implementation.

There are a number of database models. The next two articles cover two common models; the [hierarchical database model](#) and the [network database model](#). After that comes the one MariaDB, along with most modern DBMSs uses, the relational model.

6.3.1.3 Understanding the Hierarchical Database Model

The earliest model was the hierarchical database model, resembling an upside-down tree. Files are related in a parent-child manner, with each parent capable of relating to more than one child, but each child only being related to one parent. Most of you will be familiar with this kind of structure—it's the way most file systems work. There is usually a root, or top-level, directory that contains various other directories and files. Each subdirectory can then contain more files and directories, and so on. Each file or directory can only exist in one directory itself—it only has one parent. As you can see in the image below *A1* is the root directory, and its children are *B1* and *B2*. *B1* is a parent to *C1*, *C2*, and *C3*, which in turn has children of its own.

This model, although being a vast improvement on dealing with unrelated files, has some serious disadvantages. It represents one-to-many relationships well (one parent has many children; for example, one company branch has many employees), but it has problems with many-to-many relationships. Relationships such as that between a product file and an orders file are difficult to implement in a hierarchical model. Specifically, an order can contain many products, and a product can appear in many orders. Also, the hierarchical model is not flexible because adding new relationships can result in wholesale changes to the existing structure, which in turn means all existing applications need to change as well. This is not fun when someone has forgotten a table and wants it added to the system shortly before the project is due to launch! And developing the applications is complex because the programmer needs to know the data structure well in order to traverse the model to access the needed data. As you've seen in the earlier chapters, when accessing data from two related tables, you only need to know the fields you require from those two tables. In the hierarchical model, you'd need to know the entire chain between the two. For example, to relate data from *A1* and *D4*, you'd need to take the route: *A1*, *B1*, *C3* and *D4*.

6.3.1.4 Understanding the Network Database Model

The network database model was a progression from the [hierarchical database model](#) and was designed to solve some of that model's problems, specifically the lack of flexibility. Instead of only allowing each child to have one parent, this model allows each child to have multiple parents (it calls the children *members* and the parents *owners*). It addresses the need to model more complex relationships such as the orders/parts many-to-many relationship mentioned in the [hierarchical article](#). As you can see in the figure below, *A1* has two members, *B1* and *B2*. *B1* is the owner of *C1*, *C2*, *C3* and *C4*. However, in this model, *C4* has two owners, *B1* and *B2*.

Of course, this model has its problems, or everyone would still be using it. It is more difficult to implement and maintain, and, although more flexible than the hierarchical model, it still has flexibility problems. Not all relations can be satisfied by assigning another owner, and the programmer still has to understand the data structure well in order to make the model efficient.

6.3.1.5 Understanding the Relational Database Model

The relational database model was a huge leap forward from the [network database model](#). Instead of relying on a parent-child or owner-member relationship, the relational model allows any file to be related to any other by means of a common field. Suddenly, the complexity of the design was greatly reduced because changes could be made to the database schema without affecting the system's ability to access data. And because access was not by means of paths to and from files, but from a direct relationship between files, new relations between these files could easily be added.

In 1970, when E.F. Codd developed the model, it was thought to be impractical. The increased ease of use comes at a large performance penalty, and the hardware in those days was not able to implement the model. Since then, of course, hardware has taken huge strides to where today, even the simplest computers can run sophisticated relational database management systems.

Relational databases go hand-in-hand with the development of SQL. The simplicity of SQL - where even a novice can learn to perform basic queries in a short period of time - is a large part of the reason for the popularity of the relational model.

The two tables below relate to each other through the *product_code* field. Any two tables can relate to each other simply by creating a field they have in common.

Table 1

<i>Product_code</i>	Description	Price
A416	Nails, box	\$0.14
C923	Drawing pins, box	\$0.08

Table 2

<i>Invoice_code</i>	<i>Invoice_line</i>	<i>Product_code</i>	Quantity
3804	1	A416	10
3804	2	C923	15

6.3.1.6 Relational Databases: Basic Terms

The relational database model uses certain terms to describe its components:

- *Data* are the values kept in the database. On their own, the data means very little. CA 684-213 is an example of data in a DMV (Division of Motor Vehicles) database.
- *Information* is processed data. For example, CA 684-213 is the car registration number of a car belonging to Lyndon Manson, in a DMV database.
- A *database* is a collection of *tables*, also called *entities*.
- Each table is made up of *records* (the horizontal rows in the table, also called *tuples*). Each record should be unique, and can be stored in any order in the table.

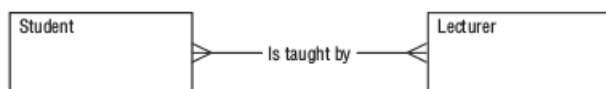

- Each record is made up of *fields* (which are the vertical columns of the table, also called *attributes*). Basically, a record is one fact (for example, one customer or one sale).
- These fields can be of various *types*. MariaDB has many types (see [Data Types](#) for a list), but generally types fall into three kinds: character, numeric, and date. For example, a customer name is a character field, a customer's birthday is a date field, and a customer's number of children is a numeric field.
- The range of allowed values for a field is called the *domain* (also called a *field specification*). For example, a credit card field may be limited to only the values `Mastercard`, `Visa` and `Amex`.
- A field is said to contain a *null* value when it contains nothing at all. Null fields can create complexities in calculations and have consequences for data accuracy. For this reason, many fields are specifically set not to contain null values.
- A *key* accesses specific records in a table.
- An *index* is a mechanism to improve the performance of a database. Indexes are often confused with keys. Indexes are, strictly speaking, part of the physical structure, and keys are part of the logical structure. You'll often see the terms used interchangeably, however, including throughout this Knowledge Base.
- A *view* is a virtual table made up of a subset of the actual tables.
- A *one-to-one* (1:1) relationship is where for each instance of the first table in a relationship, only one instance of the second table exists, An example of this would be a case where a chain of stores carries a vending machine. Each vending machine can only be in one store, and each store carries only one vending machine.

- A *one-to-many* (1:N) relationship is where for each instance of the first table in a relationship, many instances of the second table exist. This is a common kind of relationship. An example is the relationship between a sculptor and their sculptures. Each sculptor may have created many sculptures, but each sculpture has been created by only one

- A *many-to-many* (M:N) relationship occurs where, for each instance of the first table, there are many instances of the second table, and for each instance of the second table, there are many instances of the first. For example, a student can have many lecturers, and a lecturer can have many students.

- A *mandatory* relationship exists where for each instance of the first table in a relationship, one or more instances of the second *must* exist. For example, for a music group to exist, there must exist at least one musician in that group.
- An *optional* relationship is where for each instance of the first table in a relationship, there *may* exist instances of the second. For example, if an author can be listed in the database without having written a book (in other words, a prospective author), that relationship is optional. The reverse isn't necessarily true though. For example, for a book to be listed, it must have an author.
- *Data integrity* refers to the condition where data is accurate, valid, and consistent. An example of poor integrity would be if a customer telephone number is stored differently in two different locations. Another is where a course record contains a reference to a lecturer who is no longer present at the school. [Database normalization](#) is a technique that assists you to minimize the risk of these sorts of problems.

6.3.1.7 Relational Databases: Table Keys

A *key*, or *index*, as the term itself indicates, unlocks access to the tables. If you know the key, you know how to identify specific records and the relationships between the tables.

Each key consists of one or more fields, or field prefix. The order of columns in an index is significant. Each key has a name.

A *candidate key* is a field, or combination of fields, that uniquely identifies a record. It cannot contain a null value, and its value must be unique. (With duplicates, you would no longer be identifying a unique record).

A *primary key* (PK) is a candidate key that has been designated to identify unique records in the table throughout the database structure.

A *surrogate key* is a primary key that contains unique values automatically generated by the database system - usually, integer numbers. A surrogate key has no meaning, except uniquely identifying a record. This is the most common type of primary key.

For example, see the following table:

Customer_code	First_name	Surname	Telephone_number
---------------	------------	---------	------------------

1	Ariane	Edison	448-2143
2	Georgei	Edison	448-2142
3	Abbas	Edison	9231-5312

At first glance, there are two possible candidate keys for this table. Either *customer_code* or a combination of *first_name*, *surname* and *telephone_number* would suffice. It is always better to choose the candidate key with the least number of fields for the primary key, so you would choose *customer_code* in this example (note that it is a surrogate key). Upon reflection, there is also the possibility of the second combination not being unique. The combination of *first_name*, *surname* and *telephone_number* could in theory be duplicated, such as where a father has a son of the same name who is contactable at the same telephone number. This system would have to expressly exclude this possibility for these three fields to be considered for the status of primary key.

There may be many Ariane Edisons, but you avoid confusion by assigning each a unique number. Once a primary key has been created, the remaining candidates are labeled as *alternate keys*.

6.3.1.8 Relational Databases: Foreign Keys

You already know that a relationship between two tables is created by assigning a common field to the two tables (see [Relational Databases: Table Keys](#)). This common field must be a primary key to one table. Consider a relationship between a *customer* table and a *sale* table. The relationship is not much good if instead of using the primary key, *customer_code*, in the *sale* table, you use another field that is not unique, such as the customer's first name. You would be unlikely to know for sure which customer made the sale in that case. So, in the table below, *customer_code* is called the *foreign_key* in the *sale* table; in other words, it is the primary key in a foreign table.

Foreign keys allow for something called *referential integrity*. What this means is that if a foreign key contains a value, this value refers to an existing record in the related table. For example, take a look at the tables below:

Lecturer table

Code	First Name	Surname
1	Anne	Cohen
2	Leonard	Clark
3	Vusi	Cave

Course table

Course Title	Lecturer Code
Introduction to Programming	1
Information Systems	2
Systems Software	3

Referential integrity exists here, as all the lecturers in the *course* table exist in the *lecturer* table. However, let's assume Anne Cohen leaves the institution, and you remove her from the lecturer table. In a situation where referential integrity is not enforced, she would be removed from the lecturer table, but not from the course table, as shown below:

Lecturer table

Code	First Name	Surname
2	Leonard	Clark
3	Vusi	Cave

Course table

Course Title	Lecturer Code
Introduction to Programming	1
Information Systems	2
Systems Software	3

Now, when you look up who lectures *Introduction to Programming*, you are sent to a non-existent record. This is called poor data integrity.

Foreign keys also allow *cascading* deletes and updates. For example, if Anne Cohen leaves, taking the Introduction to Programming Course with her, all trace of her can be removed from both the *lecturer* and *course* table using one statement. The delete *cascades* through the relevant tables, removing all relevant records.

Foreign keys can also contain null values, indicating that no relationship exists.

6.3.1.9 Relational Databases: Views

Views are virtual tables. They are only a structure, and contain no data. Their purpose is to allow a user to see a subset of the actual data. A view can consist of a subset of one table. For example, the *student view*, below, is a subset of the *student table*.

Student View
First name
Surname
Grade

Student Table
Student_id
First name
Surname
Grade
Address
Telephone

This view could be used to allow other students to see their fellow student's marks but not allow them access to personal information.

Alternatively, a view could be a combination of a number of tables, such as the view below:

Student View
First name
Surname
Grade

Student Table
Student_id
First name
Surname
Address
Telephone

Course Table
Course_id
Course description

Grade Table

Student_id
Course_id
Grade

Views are also useful for security. In larger organizations, where many developers may be working on a project, views allow developers to access only the data they need. What they don't need, even if it is in the same table, is hidden from them, safe from being seen or manipulated. It also allows queries to be simplified for developers. For example, without the view, a developer would have to retrieve the fields in the view with the following sort of query

```
SELECT first_name, surname, course_description, grade FROM student, grade, course
WHERE grade.student_id = student.student_id AND grade.course_id = course.course_id
```

With the view, a developer could do the same with the following:

```
SELECT first_name, surname, course_description, grade FROM student_grade_view
```

Much simpler for a junior developer who hasn't yet learned to do joins, and it's just less hassle for a senior developer too!

For more use cases, see the [Views Tutorial](#).

6.3.1.10 Database Design

Articles about the database design process

Database Design: Overview

Databases exist because of the need to change data into information

Database Lifecycle

Like everything else, databases have a finite lifespan

Database Design Phase 1: Analysis

Defining problems, possibilities, constraints, objectives and agreeing on the scope

Database Design Phase 2: Conceptual Design

Requirements identified in the previous phase are used as the basis to develop the new system

Database Design Phase 2: Logical and Physical Design

After conceptual design, it's time to convert to the logical and physical design

Database Design Phase 3: Implementation

Install the DBMS and load the data

Database Design Phase 4: Testing

Testing performance, security, and integrity of the data

Database Design Phase 5: Operation

Rolling out for everyday use

Database Design Phase 6: Maintenance

Maintaining indexes, optimizing tables, adding and removing users, changing passwords

Database Design Example Phase 1: Analysis

Walking through the database design process with a step-by-step example

Database Design Example Phase 2: Design

Poet Circle logical design and identifying the initial entities

Database Design Example Phase 3: Implementation

Creating the Poet's Circle tables

Database Design Example Phases 4-6: Testing, Operation and Maintenance

Testing, rolling out and maintenance of the Poet's Circle database.

6.3.1.10.1 Database Design: Overview

Databases exist because of the need to change data into information. Data are the raw and unprocessed facts. Information is obtained by processing the data into something useful. For example, millions of names and telephone numbers in a phone book are data. Information is the telephone number of the fire department when your house is burning down.

A database is a large repository of facts, designed in such a way that processing the facts into information is easy. If the phone book was structured in a less convenient way, such as with names and numbers placed in chronological order according to when the numbers were issued, converting the data into information would be much more difficult. Not knowing when the fire department was issued their latest number, you could search for days, and by the time you find the number your house would be a charred pile of ash. So, it's a good thing the phone book was designed as it was.

A database is much more flexible; a similar set of data to what's in a phone book could be ordered by MariaDB according to name, telephone number, address as well as chronologically. But databases are of course more complex, containing many different kinds of information. People, job titles and a company's products can all mingle to provide complex information. But this complexity makes the design of databases more complex as well. Poor design could make for slow queries, or it could even make certain kinds of information impossible to reach. This section of the Knowledge Base features articles about good database design, specifically:

- The database lifecycle
- Entity-relationship modeling
- Common mistakes in database design
- Real-world example: creating a publishing tracking system
- Concurrency control with transactions

6.3.1.10.2 Database Lifecycle

This article follows on from [Database Design: Overview](#).

Like everything else, databases have a finite lifespan. They are born in a flush of optimism and make their way through life achieving fame, fortune, and peaceful anonymity, or notoriety as the case may be, before fading out once more. Even the most successful database at some time is replaced by another, more flexible and up-to-date structure, and so begins life anew. Although exact definitions differ, there are generally six stages of the database lifecycle.

Analysis

The analysis phase is where the stakeholders are interviewed and any existing system is examined to identify problems, possibilities and constraints. The objectives and scope of the new system are determined.

Design

The design phase is where a conceptual design is created from the previously determined requirements, and a logical and physical design are created that will ready the database for implementation.

Implementation

The implementation phase is where the database management system (DBMS) is installed, the databases are created, and the data are loaded or imported.

Testing

The testing phase is where the database is tested and fine-tuned, usually in conjunction with the associated applications.

Operation

The operation phase is where the database is working normally, producing information for its users.

Maintenance

The maintenance phase is where changes are made to the database in response to new requirements or changed operating conditions (such as heavier load).

Database development is not independent of systems development, often being one component of the greater systems development process. The stages of systems development basically mirror the stages of a database lifecycle but are a superset. Whereas database design deals with designing the system to store the data, systems design is also concerned with the processes that will impact on the data.

6.3.1.10.3 Database Design Phase 1: Analysis

This article follows on from [Database Lifecycle](#).

Your existing system can no longer cope. It's time to move on. Perhaps the existing paper system is generating too many errors, or the old Perl script based on flat files can no longer handle the load. Or perhaps an existing news database is struggling under its own popularity and needs an upgrade. This is the stage where the existing system is reviewed.

Depending on the size of the project, the designer may be an individual, responsible for the database implementation and coding, or may be a whole team of analysts. For now, the term *designer* will represent all these possibilities.

The following are the steps in the Analysis Phase.

1. Analyze the organization
2. Define any problems, possibilities or constraints
3. Define the objectives
4. Agree on the scope

When reviewing a system, the designer needs to look at the bigger picture - not just the hardware or existing table structures, but the whole situation of the organization calling for the redesign. For example, a large bank with centralized management would have a different structure and a different way of operating from a decentralized media organization, where anyone can post news onto a website. This may seem trivial, but understanding the organization you're building the database for is vital to designing a good database for it. The same demands in the bank and media organizations should lead to different designs because the organizations are different. In other words, a solution that was constructed for the bank cannot be unthinkingly implemented for the media organization, even when the situation seems similar. A culture of central control at the bank may mean that news posted on the bank website has to be moderated and authorized by central management, or may require the designer to keep detailed audit trails of who modified what and when. On the flip-side, the media organization may be more laissez-faire and will be happy with news being modified by any authorized editor.

Understanding an organization's culture helps the designers ask the right questions. The bank may not ask for an audit trail, it may simply expect it; and when the time comes to roll out the implementation, the audit trail would need to be patched on, requiring more time and resources.

Once you understand the organization structure, you can question the users of any existing system as to what their problems and needs are, as well as what constraints will exist then. You need to question different role players, as each can add new understanding as to what the database may need. For example, the media organization's marketing department may need detailed statistics about the times of day certain articles are read. You may also be alerted to possible future requirements. Perhaps the editorial department is planning to expand the website, which will give them the staff to cross-link web articles. Keeping this future requirement in mind could make it easier to add the cross-linking feature when the time comes.

Constraints can include hardware ("We have to use our existing database server") or people ("We only have one data capturer on shift at any one time"). Constraints also refer to the limitations on values. For example, a student's grade in a university database may not be able to go beyond 100 percent, or the three categories of seats in a theatre database are small, medium and large.

It is rarely sufficient to rely on one level of management, or an individual, to supply objectives and current problems, except in the smallest of organizations. Top management may be paying for the database design, but lower levels will need to use it, and their input is probably even more important for a successful design.

Of course, although anything is possible given infinite time and money, this is (usually) never forthcoming. Determining scope, and formalizing it, is an important part of the project. If the budget is for one month's work but the ideal solution requires three, the designer must make clear these constraints and agree with the project owners on which facets are not going to be implemented.

6.3.1.10.4 Database Design Phase 2: Conceptual Design

This article follows on from [Database Design Phase 1: Analysis](#).

Contents

1. Conceptual design
 1. Entities and attributes
 2. Relationships
 1. Mandatory
 2. Optional
 3. One-to-one (1:1)
 4. One-to-many (1:M)
 5. Many-to-many (M:N)
 3. Developing an entity-relationship diagram

The design phase is where the requirements identified in the previous phase are used as the basis to develop the new system. Another way of putting it is that the business understanding of the data structures is converted to a technical understanding. The *what* questions ("What data are required? What are the problems to be solved?") are replaced by the *how* questions ("How will the data be structured? How is the data to be accessed?")

This phase consists of three parts: the conceptual design, the logical design and the physical design. Some methodologies merge the logical design phase into the other two phases. This section is not aimed at being a definitive discussion of database design methodologies (there are whole books written on that!); rather it aims to introduce you to the topic.

Conceptual design

The purpose of the conceptual design phase is to build a conceptual model based upon the previously identified requirements, but closer to the final physical model. A commonly-used conceptual model is called an *entity-relationship* model.

Entities and attributes

Entities are basically people, places, or things you want to keep information about. For example, a library system may have the *book*, *library* and *borrower* entities. Learning to identify what should be an entity, what should be a number of entities, and what should be an *attribute* of an entity takes practice, but there are some good rules of thumb. The following questions can help to identify whether something is an entity:

- Can it vary in number independently of other entities? For example, *person height* is probably not an entity, as it cannot vary in number independently of *person*. It is not fundamental, so it cannot be an entity in this case.
- Is it important enough to warrant the effort of maintaining. For example *customer* may not be important for a small grocery store and will not be an entity in that case, but it will be important for a video store, and will be an entity in that case.
- Is it its own thing that cannot be separated into subcategories? For example, a car-rental agency may have different criteria and storage requirements for different kinds of vehicles. *Vehicle* may not be an entity, as it can be broken up into *car* and *boat*, which are the entities.
- Does it list a type of thing, not an instance? The video game *blow-em-up 6* is not an entity, rather an instance of the *game* entity.
- Does it have many associated facts? If it only contains one attribute, it is unlikely to be an entity. For example, *city* may be an entity in some cases, but if it contains only one attribute, *city name*, it is more likely to be an attribute of another entity, such as *customer*.

The following are examples of entities involving a university with possible attributes in parentheses.

- **Course** (name, code, course prerequisites)
- **Student** (first_name, surname, address, age)
- **Book** (title, ISBN, price, quantity in stock)

An instance of an entity is one particular occurrence of that entity. For example, the student Rudolf Sono is one instance of the student entity. There will probably be many instances. If there is only one instance, consider whether the entity is warranted. The top level usually does not warrant an entity. For example, if the system is being developed for a particular university, *university* will not be an entity because the whole system is for that one university. However, if the system was developed to track legislation at all universities in the country, then *university* would be a valid entity.

Relationships

Entities are related in certain ways. For example, a borrower may belong to a library and can take out books. A book can be found in a particular library. Understanding what you are storing data about, and how the data relate, leads you a large part of the way to a physical implementation in the database.

There are a number of possible relationships:

Mandatory

For each instance of entity A, there must exist one or more instances of entity B. This does not necessarily mean that for each instance of entity B, there must exist one or more instances of entity A. Relationships are optional or mandatory in one direction only, so the A-to-B relationship can be optional, while the B-to-A relationship is mandatory.

Optional

For each instance of entity A, there may or may not exist instances of entity B.

One-to-one (1:1)

This is where for each instance of entity A, there exists one instance of entity B, and vice-versa. If the relationship is optional, there can exist zero or one instances, and if the relationship is mandatory, there exists one and only one instance of the associated entity.

One-to-many (1:M)

For each instance of entity A, many instances of entity B can exist, which for each instance of entity B, only one instance of entity A exists. Again, these can be optional or mandatory relationships.

Many-to-many (M:N)

For each instance of entity A, many instances of entity B can exist, and vice versa. These can be optional or mandatory relationships.

There are numerous ways of showing these relationships. The image below shows *student* and *course* entities. In this case, each student must have registered for at least one course, but a course does not necessarily have to have students registered. The student-to-course relationship is mandatory, and the course-to-student relationship is optional.

The image below shows *invoice_line* and *product* entities. Each invoice line must have at least one product (but no more than one); however each product can appear on many invoice lines, or none at all. The *invoice_line-to-product* relationship is mandatory, while the *product-to-invoice_line* relationship is optional.

The figure below shows husband and wife entities. In this system (others are of course possible), each husband must have one and only one wife, and each wife must have one, and only one, husband. Both relationships are mandatory.

An entity can also have a relationship with itself. Such an entity is called a *recursive entity*. Take a *person* entity. If you're interested in storing data about which people are brothers, you will have an "is brother to" relationship. In this case, the relationship is an M:N relationship.

Conversely, a *weak entity* is an entity that cannot exist without another entity. For example, in a school, the *scholar* entity is related to the weak entity *parent/guardian*. Without the scholar, the parent or guardian cannot exist in the system. Weak entities usually derive their primary key, in part or in totality, from the associated entity. *parent/guardian* could take the primary key from the scholar table as part of its primary key (or the entire key if the system only stored one parent/guardian per scholar).

The term *connectivity* refers to the relationship classification.

The term *cardinality* refers to the specific number of instances possible for a relationship. *Cardinality limits* list the minimum and maximum possible occurrences of the associated entity. In the husband and wife example, the cardinality limit is (1,1),

and in the case of a student who can take between one and eight courses, the cardinality limits would be represented as (1,8).

Developing an entity-relationship diagram

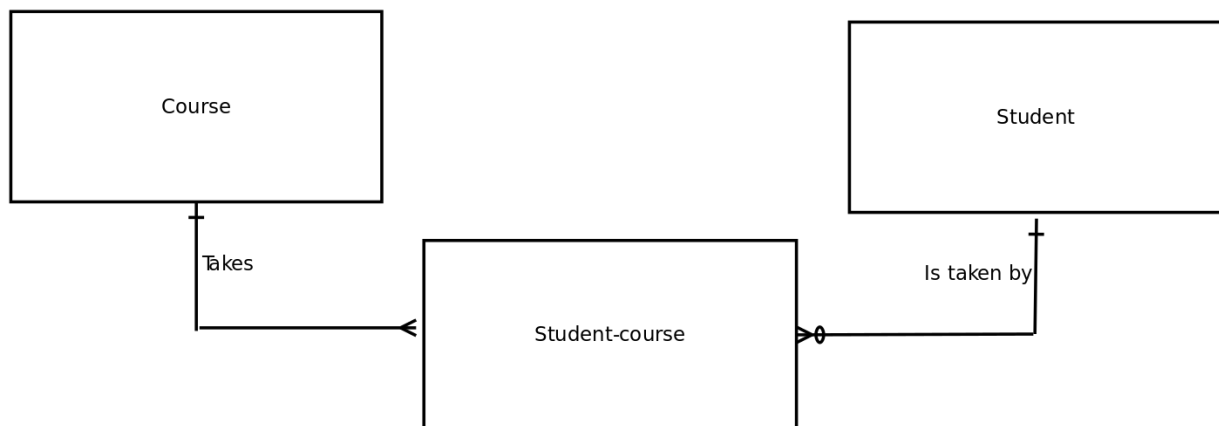

An entity-relationship diagram models how the entities relate to each other. It's made up of multiple relationships, the kind shown in the examples above. In general, these entities go on to become the database tables.

The first step in developing the diagram is to identify all the entities in the system. In the initial stage, it is not necessary to identify the attributes, but this may help to clarify matters if the designer is unsure about some of the entities. Once the entities are listed, relationships between these entities are identified and modeled according to their type: one-to-many, optional and so on. There are many software packages that can assist in drawing an entity-relationship diagram, but any graphical package should suffice.

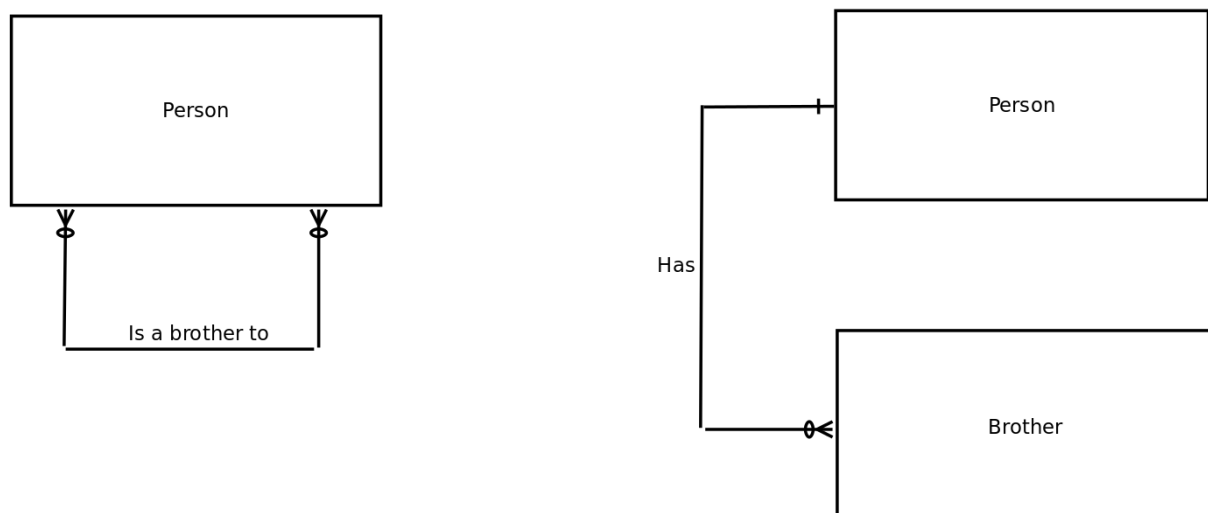

Once the initial entity-relationship diagram has been drawn, it is often shown to the stakeholders. Entity-relationship diagrams are easy for non-technical people to understand, especially when guided through the process. This can help identify any errors that have crept in. Part of the reason for modeling is that models are much easier to understand than pages of text, and they are much more likely to be viewed by stakeholders, which reduces the chances of errors slipping through to the next stage, when they may be more difficult to fix.

It is important to remember that there is no one right or wrong answer. The more complex the situation, the more possible designs that will work. Database design is an acquired skill, though, and more experienced designers will have a good idea of what works and of possible problems at a later stage, having gone through the process before.

Once the diagram has been approved, the next stage is to replace many-to-many relationships with two one-to-many relationships. A DBMS cannot directly implement many-to-many relationships, so they are decomposed into two smaller relationships. To achieve this, you have to create an *intersection*, or *composite* entity type. Because intersection entities are less "real-world" than ordinary entities, they are sometimes difficult to name. In this case, you can name them according to the two entities being intersected. For example, you can intersect the many-to-many relationship between *student* and *course* by a *student-course* entity.

The same applies even if the entity is recursive. The person entity that has an M:N relationship "is brother to" also needs an intersection entity. You can come up with a good name for the intersection entity in this case: *brother*. This entity would contain two fields, one for each person of the brother relationship — in other words, the primary key of the first brother and the primary key of the other brother.

6.3.1.10.5 Database Design Phase 2: Logical and Physical Design

This article follows on from [Database Design Phase 2: Conceptual Design](#).

Contents

1. [Overview](#)
2. [Common errors](#)

Overview

Once the conceptual design is finalized, it's time to convert this to the logical and physical design. Usually, the DBMS is chosen at this stage, depending on the requirements and complexity of the data structures. Strictly speaking, the logical design and the physical design are two separate stages, but are often merged into one. They overlap because most current DBMSs (including MariaDB) match logical records to physical records on disk on a 1:1 basis.

Each entity will become a database table, and each attribute will become a field of this table. Foreign keys can be created if the DBMS supports them and the designer decides to implement them. If the relationship is mandatory, the foreign key must be defined as *NOT NULL*, and if it's optional, the foreign key can allow nulls. For example, because of the invoice line-to-product relationship in the previous example, the product code field is a foreign key in the invoice to line table. Because the invoice line must contain a product, the field must be defined as *NOT NULL*. The default MariaDB storage engine, [XtraDB](#), does support foreign key constraints, but some storage engines, such as [MyISAM](#) do not. The *ON DELETE CASCADE* and *ON DELETE RESTRICT* clauses are used to support foreign keys. *ON DELETE RESTRICT* means that records cannot be deleted unless all records associated with the foreign key are also deleted. In the invoice line-to-product case, *ON DELETE RESTRICT* in the invoice line table means that if a product is deleted, the deletion will not take place unless all associated invoice lines with that product are deleted as well. This avoids the possibility of an invoice line existing that points to a non-existent product. *ON DELETE CASCADE* achieves a similar effect, but more automatically (and more dangerously!). If the foreign key was declared with *ON CASCADE DELETE*, associated invoice lines would automatically be deleted if a product was deleted. *ON UPDATE CASCADE* is similar to *ON DELETE CASCADE* in that all foreign key references to a primary key are updated when the primary key is updated.

[Normalizing](#) your tables is an important step when designing the database. This process helps avoid data redundancy and improves your data integrity.

Novice database designers usually make a number of common errors. If you've carefully identified entities and attributes and you've normalized your data, you'll probably avoid these errors.

Common errors

- Keep unrelated data in different tables. People who are used to using spreadsheets often make this mistake because they are used to seeing all their data in one two-dimensional table. A relational database is much more powerful; don't 'hamstring' it in this way.
- Don't store values you can calculate. Let's say you're interested three numbers: /A, B and the product of A and B (A*B). Don't store the product. It wastes space and can easily be calculated if you need it. And it makes your database more difficult to maintain: If you change A, you also have to change all of the products as well. Why waste your database's efforts on something you can calculate when you need it?
- Does your design cater to all the conditions you've analyzed? In the heady rush of creating an entity-relationship diagram, you can easily overlook a condition. Entity-relationship diagrams are usually better at getting stakeholders to spot an incorrect rule than spot a missing one. The business logic is as important as the database logic and is more likely to be overlooked. For example, it's easy to spot that you cannot have a sale without an associated customer, but have you built in that the customer cannot be approved for a sale of less than \$500 if another approved customer has not recommended them?
- Are your attributes, which are about to become field names, well chosen? Fields should be clearly named. For example, if you use *f1* and *f2* instead of *surname* and *first_name*, the time saved in less typing will be lost in looking up the correct spelling of the field, or in mistakes where a developer thought *f1* was the first name, and *f2* the surname. Similarly, try to avoid the same names for different fields. If six tables have a primary key of *code*, you're making life unnecessarily difficult. Rather, use more descriptive terms, such as *sales_code* or *customer_code*.
- Don't create too many relationships. Almost every table in a system can be related by some stretch of the imagination, but there's no need to do this. For example, a tennis player belongs to a sports club. A sports club belongs to a region. The tennis players then also belong to a region, but this relationship can be derived through the sports club, so there's no need to add another foreign key (except to achieve performance benefits for certain kinds of queries). Normalizing can help you avoid this sort of problem (and even when you're trying to optimize for speed, it's usually better to normalize and then consciously denormalize rather than not normalize at all).
- Conversely, have you catered to all relations? Do all relations from your entity-relationship diagram appear as

common fields in your table structures? Have you covered all relations? Are all many-to-many relationships broken up into two one-to-many relationships, with an intersection entity?

- Have you listed all constraints? Constraints include a gender that can only be *m* or *f*, ages of schoolchildren that cannot exceed twenty, or email addresses that need to have an @ sign and at least one period (. ; don't take these limits for granted. At some stage the system you will need to implement them, and you're either going to forget to do so, or have to go back and gather more data if you don't list these up front.
- Are you planning to store too much data? Should a customer be asked to supply their eye color, favorite kind of fish, and names of their grandparents if they are simply trying to register for an online newsletter? Sometimes stakeholders want too much information from their customers. If the user is outside the organization, they may not have a voice in the design process, but they should always be thought of foremost. Consider also the difficulty and time taken to capture all the data. If a telephone operator needs to take all this information down before making a sale, imagine how much slower they will be. Also consider the impact data has on database speed. Larger tables are generally slower to access, and unnecessary **BLOB**, **TEXT** and **VARCHAR** fields lead to record and table fragmentation.
- Have you combined fields that should be separate? Combining first name and surname into one field is a common beginner mistake. Later you'll realise that sorting names alphabetically is tricky if you've stored them as *John Ellis* and *Alfred Ntombela*. Keep distinct data discrete.
- Has every table got a primary key? There had better be a good reason for leaving out a primary key. How else are you going to identify a unique record quickly? Consider that an index speeds up access time tremendously, and when kept small it adds very little overhead. Also, it's usually better to create a new field for the primary key rather than take existing fields. First name and surname may be unique in your current database, but they may not always be. Creating a system-defined primary key ensures it will always be unique.
- Give some thought to your other indexes. What fields are likely to be used in this condition to access the table? You can always create more fields later when you test the system, but add any you think you need at this stage.
- Are your foreign keys correctly placed? In a one-to-many relationship, the foreign key appears in the *many* table, and the associated primary key in the *one* table. Mixing these up can cause errors.
- Do you ensure referential integrity? Foreign keys should not relate to a primary key in another table that no longer exists.
- Have you covered all character sets you may need? German letters, for example, have an expanded character set, and if the database is to cater for German users it will have to take this into account. Similarly, dates and currency formats should be carefully considered if the system is to be international
- Is your security sufficient? Remember to assign the minimum permissions you can. Do not allow anyone to view a table if they do not need to do so. Allowing malicious users view data, even if they cannot change it, is often the first step in for an attacker.

6.3.1.10.6 Database Design Phase 3: Implementation

This article follows on from [Database Design Phase 2: Logical and Physical Design](#).

The implementation phase is where you install the DBMS on the required hardware, optimize the database to run best on that hardware and software platform, and create the database and load the data. The initial data could be either new data captured directly or existing data imported from a MariaDB database or another DBMS. You also establish database security in this phase and give the various users that you've identified access applicable to their requirements. Finally, you also initiate backup plans in this phase.

The following are steps in the implementation phase:

1. Install the DBMS.
2. Tune the setup variables according to the hardware, software and usage conditions.
3. Create the database and tables.
4. Load the data.
5. Set up the users and security.
6. Implement the backup regime.

6.3.1.10.7 Database Design Phase 4: Testing

This article follows on from [Database Design Phase 3: Implementation](#).

The testing phase is where the performance, security, and integrity of the data are tested. Usually this will occur in conjunctions with the applications that have been developed. You test the performance under various loads conditions to see how the database handles multiple concurrent connections or high volumes of updating and reading. Are the reports generated quickly enough? For example, an application designed with the old **MyISAM** storage engine may prove to be too

slow because the impact of the updates was underestimated. The storage engine may have to be changed to [XtraDB](#) in response.

Data integrity also needs to be tested, as the application may have logical flaws that result in transactions being lost or other inaccuracies. Further, security needs to be tested to ensure that users can access and change only the data they should.

The logical or physical designs may have to be modified. Perhaps new indexes are required (which the tester may discover after careful use of MariaDB's [EXPLAIN](#) statement, for example).

The testing and fine-tuning process is an iterative one, with multiple tests performed and changes implemented.

The following are the steps in the testing phase:

1. Test the performance
2. Test the security
3. Test the data integrity
4. Fine-tune the parameters or modify the logical or physical designs in response to the tests.

6.3.1.10.8 Database Design Phase 5: Operation

This article follows on from [Database Design Phase 4: Testing](#).

The operation phase takes place when the testing is complete and the database is ready to be rolled out for everyday use. The users of the system begin to operate the system, load data, read reports and so on. Inevitably, problems come to light. The designers need to carefully manage the database's scope at this stage, as users may expect all their desires to be pandered to. Poor database designers may find themselves extending the project well beyond their initial time estimate, and the situation may also become unpleasant if the scope has not been clearly defined and agreed upon. Project owners will feel wronged if their needs are not met, and the database designers will feel overworked and underpaid. Even when scope has been well managed, there will always be new requirements, These then lead to the next stage.

There are numerous strategies for implementing a rollout. The low-key approach often works well, where the relatively low number of users in the early stage make bug fixing easy. Hugely publicized rollouts often end with egg on the stakeholder's faces, as the best testers of all, the users, invariably find unforeseen bugs, which is best done away from the spotlight. Alternatively, rollouts can occur in a distributed manner, where a pilot branch or office is selected, and when the system has proven its stability, it's rolled out to the remaining branches.

The following are the steps in the operation phase:

1. Hand over operation of the database to the users.
2. Make any final changes based on the problems discovered by users.

6.3.1.10.9 Database Design Phase 6: Maintenance

This article follows on from [Database Design Phase 5: Operation](#).

The database maintenance phase incorporates general maintenance, such as maintaining the indexes, optimizing the tables, adding and removing users, and changing passwords, as well as backups and restoration of backups in case of a failure. New requirements also start to be requested, and this may result in new fields, or new tables, being created.

As the new system and organization changes, the existing database becomes less and less sufficient to meet the organization's needs. For example, the media organization may be amalgamated with media bodies from other countries, requiring integration of many data sources, or the volumes and staff may expand (or reduce) dramatically. Eventually, there comes a time, whether it's 10 months after completion or 10 years, when the database system needs to be replaced. The maintenance of the existing database begins to drain more and more resources, and the effort to create a new design is matched by the current maintenance effort. As this point, the database is coming to the end of its life, and a new project begins life in the Analysis phase.

The following are the steps in the maintenance phase:

1. Maintain the indexes
2. Maintain the tables
3. Maintain the users
4. Change passwords
5. Backup
6. Restore backups
7. Change the design to meet new requirements

6.3.1.10.10 Database Design Example Phase 1: Analysis

This article follows on from [Database Design Phase 6: Maintenance](#).

Real-world example: creating a publishing tracking system

Now let's walk through the database design process with a step-by-step example. The Poet's Circle is a publisher that publishes poetry and poetry anthologies. It is keen to develop a new system that tracks poets, poems, anthologies and sales. The following sections show the steps taken from the initial analysis to the final, working database.

Poet's circle database phase 1: analysis

The following information is gleaned from speaking to the various stakeholders at Poet's Circle. They want to develop a database system to track the poets they have recorded, the poems they write, the publications they appear in, as well as the sales to customers that these publications make.

The designer asks various questions to get more detailed information, such as "What is a poet, as far as the system goes? Does Poet's Circle keep track of poets even if they haven't written or published poems? Are publications recorded even before there are any associated poems? Does a publication consist of one poem, or many? Are potential customer's details recorded?" The following summarizes the responses in our example:

- Poet's Circle is a publisher that bases its choices of publications on an active poetry community on its website. If enough of the community wants a poem published, Poet's Circle will do so.
- A poet can be anybody who wants to be a poet, not necessarily someone who has a poem captured in the system or someone who has even written a poem.
- Poems can be submitted through a web interface, by email or on paper.
- All captured poems are written by an associated poet, whose details are already in the system. There can be no poems submitted and stored without a full set of details of the poet.
- A publication can be a single poem, a poetry anthology, or a work of literary criticism.
- Customers can sign up through a web interface and may order publications at that point in time, or express interest in receiving updates for possible later purchases.
- Sales of publications are made to customers whose details are stored in the system. There are no anonymous sales.
- A single sale can be for one publication, but many publications can also be purchased at the same time. If more than one customer is involved in this sale, Poet's Circle treats it as more than one sale. Each customer has their own sale.
- Not all publications make sales — some may be special editions, and others simply never sell any copies.

6.3.1.10.11 Database Design Example Phase 2: Design

This article follows on from [Database Design Example Phase 1: Analysis](#).

Based on the provided information, you can begin your logical design and should be able to identify the initial entities:

- Poet
- Poem
- Publication
- Sale
- Customer

The Poet's Circle is not an entity, or even of instance an a *publisher* entity. Only if the system were developed for many publishers would *publisher* be a valid entity.

Neither *website* nor *poetry community* are entities. There is only one website, and anyway, a website is merely a means of producing data to populate the database. There is also only one poetry community as far as this system is concerned, and there is not much you'd want to store about it.

Next, you need to determine the relationship between these entities. You can identify the following:

- A poet can write many poems. The analysis identified the fact that a poet can be stored in the system even if there are

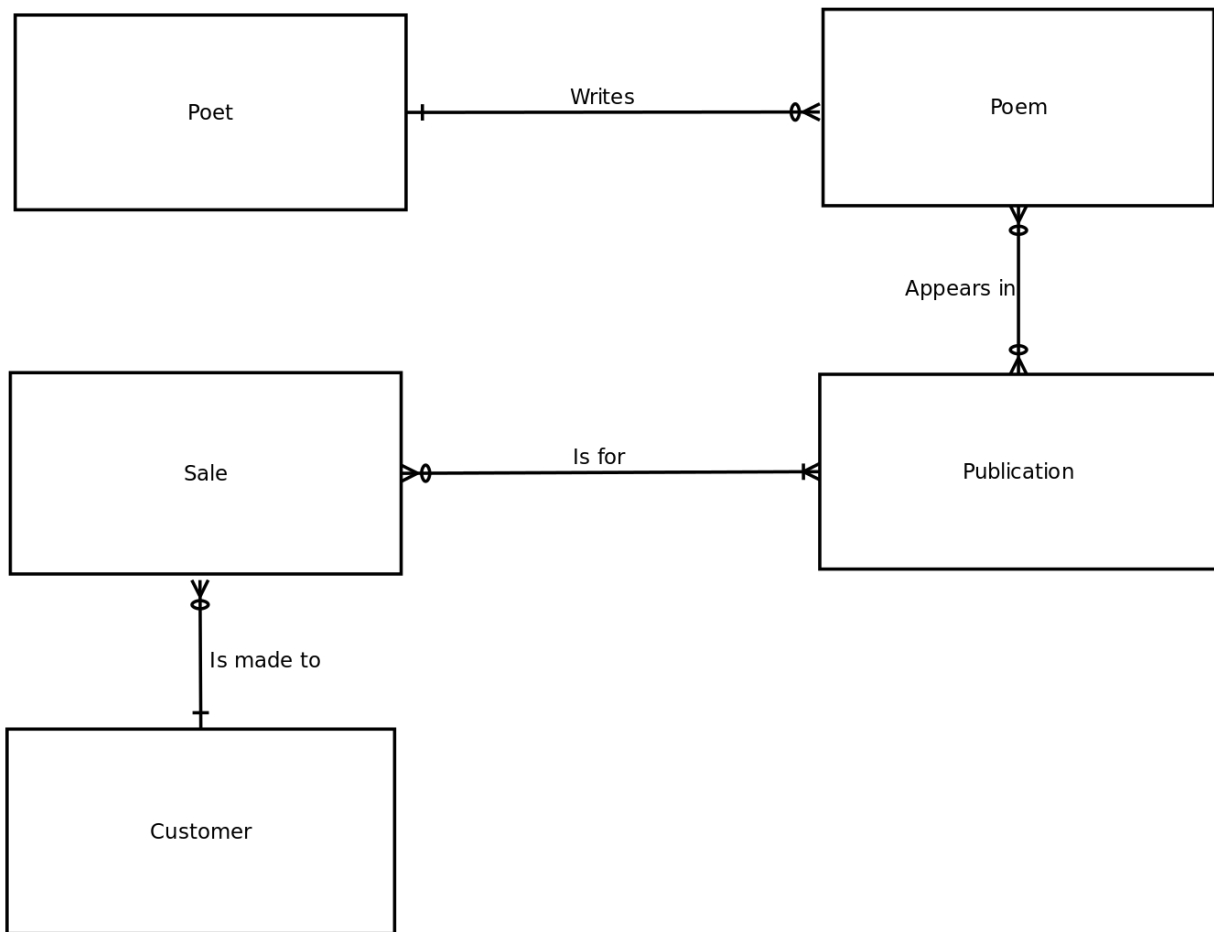

no associated poems. Poems may be captured at a later point in time, or the poet may still be a potential poet. Conversely, many poets could conceivably write a poem, though the poem must have been written by at least one poet.

- A publication may contain many poems (an anthology) or just one. It can also contain no poems (poetry criticism for example). A poem may or may not appear in a publication.
- A sale must be for at least one publication, but it may be for many. A publication may or may not have made any sales.
- A customer may be made for many sales, or none at all. A sale is only made for one and only one customer.

You can identify the following attributes:

- **Poet:** first name, surname, address, email address
- **Poem:** poem title, poem contents
- **Publication:** title, price
- **Sales:** date, amount
- **Customer:** first name, surname, address, email address

Based on these entities and relationships, you can construct the entity-relationship diagram shown below:

There are two many-to-many relationships in the figure above. These need to be converted into one-to-many relationships before you can implement them in a DBMS. After doing so, the intersection entities *poem-publication* and *sale-publication* are created.

Now, to begin the logical and physical design, you need to add attributes that can create the relationship between the entities and specify primary keys. You do what's usually best, and create new, unique, primary keys. The following tables show the structures for the tables created from each of the entities:

Poet table

Field	Definition
poet code	primary key, integer
first name	character (30)
surname	character (40)
address	character (100)
postcode	character (20)
email address	character (254)

Poem table

Field	Definition
poem code	primary key, integer

poem title	character(50)
poem contents	text
poet code	foreign key, integer

Poem-publication table

Field	Definition
poem code	joint primary key, foreign key, integer
publication code	joint primary key, foreign key, integer

Publication table

Field	Definition
publication code	primary key, integer
title	character(100)
price	numeric(5.2)

Sale-publication table

Field	Definition
sale code	joint primary key, foreign key, integer
publication code	joint primary key, foreign key, integer

Sale table

Field	Definition
sale code	primary key, integer
date	date
amount	numeric(10.2)
customer code	foreign key, integer

Customer table

Field	Definition
customer code	primary key, integer
first name	character (30)
surname	character (40)
address	character (100)
postcode	character (20)
email address	character (254)

MariaDB will have no problem with this, and is selected as the DBMS. Existing hardware and operating system platforms are also selected. The following section looks at the implementation and the SQL statements used to create the MariaDB tables.

6.3.1.10.12 Database Design Example Phase 3: Implementation

This article follows on from [Database Design Example Phase 2: Design](#).

With the design complete, it's time to [install MariaDB](#) and run the [CREATE](#) statements, as follows:

```
CREATE DATABASE poets_circle;

CREATE TABLE poet (
  poet_code INT NOT NULL,
  first_name VARCHAR(30),
  surname VARCHAR(40),
  address VARCHAR(100),
  postcode VARCHAR(20),
  email VARCHAR(254),
  PRIMARY KEY(poet_code)
);

CREATE TABLE poem(
  poem_code INT NOT NULL,
  title VARCHAR(50),
  contents TEXT,
  poet_code INT NOT NULL,
  PRIMARY KEY(poem_code),
  INDEX(poet_code),
  FOREIGN KEY(poet_code) REFERENCES poet(poet_code)
);

CREATE TABLE publication(
  publication_code INT NOT NULL,
  title VARCHAR(100),
  price MEDIUMINT UNSIGNED,
  PRIMARY KEY(publication_code)
);

CREATE TABLE poem_publication(
  poem_code INT NOT NULL,
  publication_code INT NOT NULL,
  PRIMARY KEY(poem_code, publication_code),
  INDEX(publication_code),
  FOREIGN KEY(poem_code) REFERENCES poem(poem_code),
  FOREIGN KEY(publication_code) REFERENCES publication(publication_code)
);

CREATE TABLE sales_publication(
  sales_code INT NOT NULL,
  publication_code INT NOT NULL,
  PRIMARY KEY(sales_code, publication_code)
);

CREATE TABLE customer(
  customer_code INT NOT NULL,
  first_name VARCHAR(30),
  surname VARCHAR(40),
  address VARCHAR(100),
  postcode VARCHAR(20),
  email VARCHAR(254),
  PRIMARY KEY(customer_code)
);

CREATE TABLE sale(
  sale_code INT NOT NULL,
  sale_date DATE,
  amount INT UNSIGNED,
  customer_code INT NOT NULL,
  PRIMARY KEY(sale_code),
  INDEX(customer_code),
  FOREIGN KEY(customer_code) REFERENCES customer(customer_code)
);
```

6.3.1.10.13 Database Design Example Phases 4-6: Testing, Operation and Maintenance

Once the database is ready the application programs have been rolled out, it's time for the testing to begin. While the other phases of the database lifecycle can occur reasonably independently of the systems development process, part of the testing phase is how all the components run together.

Load testing may indicate that MariaDB has not been set up to handle the expected 600 concurrent connections, and the configuration file needs to be changed. Other tests may indicate that in certain circumstances, duplicate key errors are received, as the locking mechanism is not uniformly implemented, and the application does not handle locking correctly. The application needs to be fixed. Backups also need to be tested, as well as the ability to smoothly restore from backup with a minimum of downtime.

Testing is one of the most neglected and critical phases. A designer or manager who does not properly account for testing is simply incompetent. No matter how tiny your system, make sure you allocate time for thorough testing, and time for fixing the inevitable bugs.

Once testing is complete, the system can be rolled out. You decide on a low-key rollout and give a few selected poets access to the website to upload their poems. You discover other problems. Some poets upload poems using [character sets](#) you haven't catered for, and you need to make a few tweaks to ensure these are handled correctly.

Soon enough, the system is rolled out completely. Maintenance, though, is a never-ending task, and with the immense popularity of the system, and with large numbers of updates and deletes, the system tends to become fragmented. The administrator regularly needs to take care of this, and, of course, the inevitable disk failure leads to an all-night restore session, and much thankfulness for the ease of use of [mariadb-dump](#).

6.3.1.11 Database Normalization

This section introduces you to a powerful tool for designing databases: normalization.

Database Normalization Overview

A sample system going through the process of normalization

Database Normalization: 1st Normal Form

Moving from unnormalized to 1st normal form

Database Normalization: 2nd Normal Form

From 1st to 2nd normal form

Database Normalization: 3rd Normal Form

From 2nd to 3rd normal form

Database Normalization: Boyce-Codd Normal Form

Beyond 3rd normal form with Boyce-Codd normal form

Database Normalization: 4th Normal Form

Beyond Boyce-Codd normal form with 4th normal form

Database Normalization: 5th Normal Form and Beyond

Normal forms beyond 4th are mainly of academic interest

Understanding Denormalization

Denormalization is the process of reversing the transformations made during...

9. [Plant data after removing the soil description](#)
10. [Creating a new table with the soil description](#)

Developed in the 1970's by E.F. Codd, database normalization is standard requirement of many database designs. Normalization is a technique that can help you avoid data anomalies and other problems with managing your data. It consists of transforming a table through various stages: *1st normal form*, *2nd normal form*, *3rd normal form*, and beyond.

It aims to:

- Eliminate data redundancies (and therefore use less space)
- Make it easier to make changes to data, and avoid anomalies when doing so
- Make referential integrity constraints easier to enforce
- Produce an easily comprehensible structure that closely resembles the situation the data represents, and allows for growth

Let's begin by creating a sample set of data. You'll walk through the process of normalization first without worrying about the theory, to get an understanding of the reasons you'd want to normalize. Once you've done that, we'll introduce the theory and the various stages of normalization, which will make the whole process described below much simpler the next time you do it.

Imagine you are working on a system that records plants placed in certain locations, and the soil descriptions associated with them.

The location:

- Location Code: 11
- Location name: Kirstenbosch Gardens

contains the following three plants:

- Plant code: 431
- Plant name: Leucadendron
- Soil category: A
- Soil description: Sandstone

- Plant code: 446
- Plant name: Protea
- Soil category: B
- Soil description: Sandstone/Limestone

- Plant code: 482
- Plant name: Erica
- Soil category: C
- Soil description: Limestone

The location:

- Location Code: 12
- Location name: Karbonkelberg Mountains

contains the following two plants:

- Plant code: 431
- Plant name: Leucadendron
- Soil category: A
- Soil description: Sandstone

- Plant code: 449
- Plant name: Restio
- Soil category: B
- Soil description: Sandstone/Limestone

Tables in a relational database are in a grid, or table format (MariaDB, like most modern DBMSs is a relational database), so let's rearrange this data in the form of a tabular report:

Plant data displayed as a tabular report

Location code	Location name	Plant code	Plant name	Soil category	Soil description
11	Kirstenbosch Gardens	431	Leucadendron	A	Sandstone
		446	Protea	B	Sandstone/limestone
		482	Erica	C	Limestone
12	Karbonkelberg Mountains	431	Leucadendron	A	Sandstone
		449	Restio	B	Sandstone/limestone

How are you to enter this data into a table in the database? You could try to copy the layout you see above, resulting in a table something like the below. The null fields reflect the fields where no data was entered.

Trying to create a table with plant data

Location code	Location name	Plant code	Plant name	Soil category	Soil description
11	Kirstenbosch Gardens	431	Leucadendron	A	Sandstone
NULL	NULL	446	Protea	B	Sandstone/limestone
NULL	NULL	482	Erica	C	Limestone
1 2	Karbonkelberg Mountains	431	Leucadendron	A	Sandstone
NULL	NULL	449	Restio	B	Sandstone/limestone

This table is not much use, though. The first three rows are actually a group, all belonging to the same location. If you take the third row by itself, the data is incomplete, as you cannot tell the location the Erica is to be found. Also, with the table as it stands, you cannot use the location code, or any other fields, as a primary key (remember, a primary key is a field, or list of fields, that uniquely identify one record). There is not much use in having a table if you can't uniquely identify each record in it.

So, the solution is to make sure each table row can stand alone, and is not part of a group, or set. To achieve this, remove the groups, or sets of data, and make each row a complete record in its own right, which results in the table below.

Each record stands alone

Location code	Location name	Plant code	Plant name	Soil category	Soil description
11	Kirstenbosch Gardens	431	Leucadendron	A	Sandstone
11	Kirstenbosch Gardens	446	Protea	B	Sandstone/limestone
11	Kirstenbosch Gardens	482	Erica	C	Limestone
12	Karbonkelberg Mountains	431	Leucadendron	A	Sandstone
12	Karbonkelberg Mountains	449	Restio	B	Sandstone/limestone

Notice that the location code cannot be a primary key on its own. It does not uniquely identify a row of data. So, the primary key must be a combination of *location code* and *plant code*. Together these two fields uniquely identify a row of data. Think about it. You would never add the same plant type more than once to a particular location. Once you have the fact that it occurs in that location, that's enough. If you want to record quantities of plants at a location - for this example, you're just interested in the spread of plants - you don't need to add an entire new record for each plant; rather, just add a quantity field. If for some reason you would be adding more than one instance of a plant/location combination, you'd need to add something else to the key to make it unique.

So, now the data can go in table format, but there are still problems with it. The table stores the information that code *11* refers to *Kirstenbosch Gardens* three times! Besides the waste of space, there is another serious problem. Look carefully at the data below.

Data anomaly

Location code	Location name	Plant code	Plant name	Soil category	Soil description
11	Kirstenbosch Gardens	431	Leucadendron	A	Sandstone
11	Kirstenbosch Gardens	446	Protea	B	Sandstone/limestone

11	Kirstenbosch Gardens	482	Erica	C	Limestone
12	Karbonkelberg Mountains	431	Leucadendron	A	Sandstone
12	Karbonkelberg Mountains	449	Restio	B	Sandstone/limestone

Did you notice anything strange? Congratulations if you did! *Kirstenbosch* is misspelled in the second record. Now imagine trying to spot this error in a table with thousands of records! By using the structure in the table above, the chances of data anomalies increases dramatically.

The solution is simple. You remove the duplication. What you are doing is looking for partial dependencies - in other words, fields that are dependent on a part of a key and not the entire key. Because both the location code and the plant code make up the key, you look for fields that are dependent only on location code or on plant name.

There are quite a few fields where this is the case. Location name is dependent on location code (plant code is irrelevant in determining project name), and plant name, soil code, and soil name are all dependent on plant number. So, take out all these fields, as shown in the table below:

Removing the fields not dependent on the entire key

Location code	Plant code
11	431
11	446
11	482
12	431
12	449

Clearly you can't remove the data and leave it out of your database completely. You take it out, and put it into a new table, consisting of the fields that have the partial dependency and the fields on which they are dependent. For each of the *key* fields in the partial dependency, you create a new table (in this case, both are already part of the primary key, but this doesn't always have to be the case). So, you identified *plant name*, *soil description* and *soil category* as being dependent on *plant code*. The new table will consist of *plant code*, as a key, as well as plant name, soil category and soil description, as shown below:

Creating a new table with location data

Plant code	Plant name	Soil category	Soil description
431	Leucadendron	A	Sandstone
446	Protea	B	Sandstone/limestone
482	Erica	C	Limestone
431	Leucadendron	A	Sandstone
449	Restio	B	Sandstone/limestone

You do the same process with the location data, shown below:

Creating a new table with location data

Location code	Location name
11	Kirstenbosch Gardens
12	Karbonkelberg Mountains

See how these tables remove the earlier duplication problem? There is only one record that contains *Kirstenbosch Gardens*, so the chances of noticing a misspelling are much higher. And you aren't wasting space storing the name in many different records. Notice that the location code and plant code fields are repeated in two tables. These are the fields that create the relation, allowing you to associate the various plants with the various locations. Obviously there is no way to remove the duplication of these fields without losing the relation altogether, but it is far more efficient storing a small code repeatedly than a large piece of text.

But the table is still not perfect. There is still a chance for anomalies to slip in. Examine the table below carefully:

Another anomaly

Plant code	Plant name	Soil category	Soil description
431	Leucadendron	A	Sandstone
446	Protea	B	Sandstone/limestone
482	Erica	C	Limestone
431	Leucadendron	A	Sandstone
449	Restio	B	Sandstone

The problem in the table above is that the Restio has been associated with Sandstone, when in fact, having a soil category of B, it should be a mix of sandstone and limestone (the soil category determines the soil description in this example). Once again you're storing data redundantly. The *soil category* to *soil description* relationship is being stored in its entirety for each plant. As before, the solution is to take out this excess data and place it in its own table. What you are in fact doing at this stage is looking for transitive relationships, or relationships where a nonkey field is dependent on another nonkey field. *Soil description*, although in one sense dependent on plant code (it did seem to be a partial dependency when we looked at it in the previous step), is actually dependent on *soil category*. So, *soil description* must be removed. Once again, take it out and place it in a new table, along with its actual key (*soil category*) as shown in the tables below:

Plant data after removing the soil description

Plant code	Plant name	Soil category
431	Leucadendron	A
446	Protea	B
482	Erica	C
449	Restio	B

Creating a new table with the soil description

Soil category	Soil description
A	Sandstone
B	Sandstone/limestone
C	Limestone

You've cut down on the chances of anomalies once again. It is now impossible to mistakenly assume soil category B is associated with anything but a mix of sandstone and limestone. The soil description to soil category relationships are stored in only one place - the new *soil* table, where you can be much more certain they are accurate.

Often, when you're designing a system you don't yet have a complete set of test data available, and it's not necessary if you understand how the data relates. This article has used the tables and their data to demonstrate the consequences of storing data in tables that were not normalized, but without them you have to rely on dependencies between fields, which is the key to database normalization.

The following articles will describe the process more formally, starting with moving from unnormalized data (or zero normal form) to first normal form.

6.3.1.11.2 Database Normalization: 1st Normal Form

This article follows on from the [Database Normalization Overview](#).

At first, the data structure was as follows:

- Location code
- Location name
- 1-n plant numbers (1-n is a shorthand for saying there are many occurrences of this field. In other words, it is a repeating group).

- 1-n plant names
- 1-n soil categories
- 1-n soil descriptions

This is a completely unnormalized structure - in other words, it is in *zero normal form*. So, to begin the normalization process, you start by moving from zero normal form to 1st normal form.

Tables are in 1st normal form if they follow these rules:

- There are no repeating groups.
- All the key attributes are defined.
- All attributes are dependent on the primary key.

What this means is that data must be able to fit into a tabular format, where each field contains one value. This is also the stage where the primary key is defined. Some sources claim that defining the primary key is not necessary for a table to be in first normal form, but usually it's done at this stage and is necessary before we can progress to the next stage. Theoretical debates aside, you'll have to define your primary keys at this point.

Although not always seen as part of the definition of 1st normal form, the principle of atomicity is usually applied at this stage as well. This means that all columns must contain their smallest parts, or be indivisible. A common example of this is where someone creates a *name* field, rather than *first name* and *surname* fields. They usually regret it later.

So far, the plant example has no keys, and there are repeating groups. To get it into 1st normal form, you'll need to define a primary key and change the structure so that there are no repeating groups; in other words, each row / column intersection contains one, and only one, value. Without this, you cannot put the data into the ordinary two-dimensional table that most databases require. You define location code and plant code as the primary key together (neither on its own can uniquely identify a record), and replace the repeating groups with a single-value attribute. After doing this, you are left with the structure shown in the table below (the primary key is in italics):

Plant location table
<i>Location code</i>
Location name
<i>Plant code</i>
Plant name
Soil category
Soil description

This table is now in 1st normal form. The process for turning a table into 2nd normal form is continued in the next article.

6.3.1.11.3 Database Normalization: 2nd Normal Form

Contents

1. [Plant location table with partial dependencies removed](#)
2. [Table resulting from fields dependent on plant code](#)
3. [Table resulting from fields dependent on location code](#)

This article follows on from [Database Normalization: 1st Normal Form](#).

After converting to first normal form, the following table structure was achieved:

Plant location table
<i>Location code</i>
Location name
<i>Plant code</i>
Plant name
Soil category

Soil description

Is this in 2nd normal form?

A table is in 2nd normal form if:

- it is in 1st normal form
- it includes no partial dependencies (where an attribute is only dependent on part of a primary key)

For an attribute to be only dependent on part of the primary key, the primary key must consist of more than one field. If the primary key contains only one field, the table is automatically in 2nd normal form if it is in 1st normal form

Let's examine all the fields. *Location name* is only dependent on *location code*. *Plant name*, *soil category*, and *soil description* are only dependent on *plant code* (this assumes that each plant only occurs in one soil type, which is the case in this example). So you remove each of these fields and place them in a separate table, with the key being that part of the original key on which they are dependent. For example, with *plant name*, the key is *plant code*. This leaves you with the tables below:

Plant location table with partial dependencies removed

Plant location table
<i>Plant code</i>
<i>Location code</i>

Table resulting from fields dependent on plant code

Plant table
<i>Plant code</i>
Plant name
Soil category
Soil description

Table resulting from fields dependent on location code

Location table
<i>Location code</i>
Location name

The resulting tables are now in 2nd normal form. The process for turning a table into 3rd normal form is continued in the next article.

6.3.1.11.4 Database Normalization: 3rd Normal Form

This article follows on from [Database Normalization: 2nd Normal Form](#).

After converting to second normal form, the following table structure was achieved:

Plant location table
<i>Plant code</i>
<i>Location code</i>

Plant table
<i>Plant code</i>

Plant name
Soil category
Soil description

Location table

<i>Location code</i>
Location name

Are these tables in 3rd normal form?

A table is in 3rd normal form if:

- it is in 2nd normal form
- it contains no transitive dependencies (where a non-key attribute is dependent on the primary key through another non-key attribute)

If a table only contains one non-key attribute, it is obviously impossible for a non-key attribute to be dependent on another non-key attribute. Any tables where this is the case that are in 2nd normal form are then therefore also in 3rd normal form.

As only the plant table has more than one non-key attribute, you can ignore the others because they are in 3rd normal form already. All fields are dependent on the primary key in some way, since the tables are in second normal form. But is this dependency on another non-key field? *Plant name* is not dependent on either *soil category* or *soil description*. Nor is *soil category* dependent on either *soil description* or *plant name*.

However, *soil description* is dependent on *soil category*. You use the same procedure as before, removing it, and placing it in its own table with the attribute that it was dependent on as the key. You are left with the tables below:

Plant location table remains unchanged

Plant location table
<i>Plant code</i>
<i>Location code</i>

Plant table with soil description removed

Plant table
<i>Plant code</i>
Plant name
Soil category

The new soil table

Soil table
<i>Soil category</i>
Soil description

Location table remains unchanged

Location table
<i>Location code</i>
Location name

All of these tables are now in 3rd normal form. 3rd normal form is usually sufficient for most tables because it avoids the most common kind of data anomalies. It's suggested getting most tables you work with to 3rd normal form before you implement them, as this will achieve the aims of normalization listed in [Database Normalization Overview](#) in the vast majority of cases.

The normal forms beyond this, such as Boyce-Codd normal form and 4th normal form, are rarely useful for business applications. In most cases, tables in 3rd normal form are already in these normal forms anyway. But any skilful database practitioner should know the exceptions, and be able to normalize to the higher levels when required.

The next article covers Boyce-Codd normal form.

6.3.1.11.5 Database Normalization: Boyce-Codd Normal Form

Contents

1. [Table containing data about the student, course, and instructor relationship](#)
2. [Using student and course as the key](#)
3. [More data anomalies](#)
4. [Student Instructor table after removing Course](#)
5. [Resulting Instructor table](#)
6. [Using student and instructor as the key](#)
7. [Removing course](#)
8. [Creating a new table with course](#)

This article follows on from [Database Normalization: 3rd Normal Form](#)

E.F. Codd and R.F. Boyce, two of the people instrumental in the development of the database model, have been honored by the name of this normal form. E.F. Codd developed and expanded the relational model, and also developed normalization for relational models in 1970, while R.F. Boyce was one of the creators of Structured Query Language (then called SEQUEL).

In spite of some resources stating the contrary, Boyce-Codd normal form is not the same as 4th normal form. Let's look at an example of data anomalies, which are presented in 3rd normal form and solved by transforming into Boyce-Codd normal form, before defining it.

Table containing data about the student, course, and instructor relationship

Student Course Instructor table
Student
Course
Instructor

Assume that the following is true for the table above:

- Each instructor takes only one course
- Each course can have one or more instructors
- Each student only has one instructor per course
- Each student can take one or more courses

What would the key be? None of the fields on their own would be sufficient to uniquely identify a records, so you have to use two fields. Which two should you use?

Perhaps *student* and *instructor* seem like the best choice, as that would allow you to determine the *course*. Or you could use *student* and *course*, which would determine the *instructor*. For now, let's use *student* and *course* as the key:

Using student and course as the key

Student Course Instructor table
<i>Student</i>
<i>Course</i>
Instructor

What normal form is this table in? It's in [1st normal form](#), as it has a key and no repeating groups. It's also in [2nd normal form](#), as the instructor is dependent on both other fields (students have many courses, and therefore instructors, and courses have many instructors). Finally, it's also in [3rd normal form](#), as there is only one non-key attribute.

But there are still some data anomalies. Look at the data sample below:

More data anomalies

Student	Course	Instructor
Conrad Pienaar	Biology	Nkosizana Asmal
Dingaan Fortune	Mathematics	Kader Dlamini
Gerrie Jantjies	Science	Helen Ginwala
Mark Thobela	Biology	Nkosizana Asmal
Conrad Pienaar	Science	Peter Leon
Alicia Ncita	Science	Peter Leon
Quinton Andrews	Mathematics	Kader Dlamini

The fact that Peter Leon teaches science is stored redundantly, as are Kader Dlamini with mathematics and Nkosizana Asmal with biology. The problem is that the *instructor* determines the *course*. Or put another, *course* is determined by *instructor*. The table conforms to [3rd normal form](#) rules because no non-key attribute is dependent upon a non-key attribute! Again, you use the familiar method of removing this field and placing it into another table, along with its key:

Student Instructor table after removing Course

Student Course Instructor table
<i>Student</i>
<i>Instructor</i>

After removing the *course* field, the primary key needs to include both remaining fields to uniquely identify a record.

Resulting Instructor table

Student Course Instructor table
<i>Instructor</i>
Course

Although we had chosen *course* as part of the primary key in the original table, the *instructor* determines the *course*, which is why we make it the primary key in this table. As you can see, the redundancy problem has been solved.

Thus, a table is in Boyce-Codd normal form if:

- it is in 3rd normal form
- each determinant is a candidate key

That sounds scary! For most people new to database design, these are new terms. If you followed along with the example above, however, the terms will soon become clear:

- a *determinant* is an attribute that determines the value of another attribute.
- a *candidate key* is either the key or an alternate key (in other words, the attribute could be a key for that table)

In the initial table, *instructor* is not a candidate key (alone it cannot uniquely identify the record), yet it determines the *course*, so the table is not in Boyce-Codd normal form.

Let's look at the example again, and see what happens if you chose *student* and *instructor* as the key. What normal form is the table in this time?

Using student and instructor as the key

Student Course Instructor table
<i>Student</i>
<i>Instructor</i>
Course

Once again it's in 1st normal form because there is a primary key and there are no repeating groups. This time, though, it's

not in 2nd normal form because *course* is determined by only part of the key: the instructor. By removing *course* and its key, instructor, you get the structure shown below:

Removing course

Student Instructor table
Student
Instructor

Creating a new table with course

Student Course Instructor table
Instructor
Course

Either way you do it, by making sure the tables are normalized into Boyce-Codd normal form, you get the same two resulting tables. It's usually the case that when there are alternate fields to choose as a key, it doesn't matter which ones you choose initially because after normalizing you get the same results either way.

6.3.1.11.6 Database Normalization: 4th Normal Form

Contents

1. [Student Course Instructor data, with several instructors per course](#)
2. [More data anomalies](#)
3. [Three attributes as key](#)
4. [Creating a table for the student to instructor relationship](#)
5. [Creating a table for the student to course relationship](#)

This article is intended to be read after the [Boyce-Codd normal form](#) article.

Let's look at the situation where redundancies can creep in even though a table is in [Boyce-Codd normal form](#). Let's take the student / instructor / course example used in that article, but change one of the initial assumptions.

Assume that the following is true for the tables below:

- Each instructor takes only one course
- Each course can have one or more instructors
- Each student can have several instructors per course (this is different to the previous example)
- Each student can take one or more courses

Student Course Instructor data, with several instructors per course

More data anomalies

Student	Course	Instructor
Conrad Pienaar	Biology	Nkosizana Asmal
Dingaane Fortune	Mathematics	Kader Dlamini
Gerrie Jantjies	Science	Helen Ginwala
Mark Thobela	Biology	Nkosizana Asmal
Conrad Pienaar	Science	Peter Leon
Alicia Ncita	Science	Peter Leon
Quinton Andrews	Mathematics	Kader Dlamini
Dingaane Fortune	Mathematics	Helen Ginwala

The data is the same as before, except that Helen Ginwala is teaching science to Gerrie Jantjies as well as mathematics to Dinga Fortune, and Dinga Fortune is being taught by both Helen Ginwala and Kader Dlamini for mathematics.

The only possible key is a combination of all three attributes, as shown below. No other combination will uniquely identify a particular record.

Three attributes as key

Student Course Instructor table
<i>Student</i>
<i>Instructor</i>
<i>Course</i>

But this still has some potentially anomalous behavior. The fact that Kader Dlamini teaches mathematics is still stored more than once, as is the fact that Dinga Thobela takes mathematics. The real problem is that the table stores more than one kind of fact: that of student-to-course relationship, as well as that of a student-to-instructor relationship. You can avoid this, as always, by separating the data into two tables, as shown below:

Creating a table for the student to instructor relationship

Student Instructor table
<i>Student</i>
<i>Instructor</i>

Creating a table for the student to course relationship

Student Instructor table
<i>Student</i>
<i>Course</i>

This situation exists when you have multiple multivalued dependencies. A multivalued dependency exists between two attributes when, for each value of the first attribute, there are one or more associated values of the second attribute. For each value of *student*, there were many values of *course*. This is the first multivalued dependency. Then, for each value of *student*, there are one or more associated values of *instructor*. This is the second multivalued dependency.

Thus, a table is in 4th normal form if:

- it is in Boyce-Codd normal form
- it does not contain more than one multivalued dependency

6.3.1.11.7 Database Normalization: 5th Normal Form and Beyond

Contents

1. [The sales rep example](#)
2. [Looking at a larger set of data](#)
3. [Creating a table with Sales rep and Product](#)
4. [Creating a table with Sales rep and Company](#)
5. [Creating a table with Company and Product](#)

This article follows on from the [4th normal form](#) article.

There are normal forms beyond 4th that are mainly of academic interest, as the problems they exist to solve rarely appear in practice. This series won't discuss them in detail, but for those interested, the following example provides a taste.

The sales rep example

Sales rep	Company	Product
-----------	---------	---------

Felicia Powers	Exclusive	Books
Afzal Ighesund	Wordsworth	Magazines
Felicia Powers	Exclusive	Magazines

Usually you would store this data in one table, as you need all three records to see which combinations are valid. *Afzal Ighesund* sells magazines for *Wordsworth*, but not necessarily books. *Felicia Powers* happens to sell both books and magazines for *Exclusive*. However, let's add another condition. If a sales rep sells a certain product, and they sell it for a particular company, then they must sell that product for that company.

Let's look at a larger data set adhering to this condition:

Looking at a larger set of data

Sales rep	Company	Product
Felicia Powers	Exclusive	Books
Felicia Powers	Exclusive	Magazines
Afzal Ighesund	Wordsworth	Books
Felicia Powers	Wordsworth	Books
Felicia Powers	Wordsworth	Magazines

Now, with this extra dependency, you could normalize the table above into three separate tables without losing any facts, as shown below:

Creating a table with Sales rep and Product

Sales rep	Product
Felicia Powers	Books
Felicia Powers	Magazines
Afzal Ighesund	Books

Creating a table with Sales rep and Company

Sales rep	Company
Felicia Powers	Exclusive
Felicia Powers	Wordsworth
Afzal Ighesund	Wordsworth

Creating a table with Company and Product

Company	Product
Exclusive	Books
Exclusive	Magazines
Wordsworth	Books
Wordsworth	Magazines

Basically, a table is in 5th normal form if it cannot be made into any smaller tables with different keys (most tables can obviously be made into smaller tables with the same key!).

Beyond 5th normal form you enter the heady realms of domain key normal form, a kind of theoretical ideal. Its practical use to a database designer is similar to that of infinity to a bookkeeper - i.e. it exists in theory but is not going to be used in practice. Even the most demanding owner is not going to expect that of the bookkeeper!

For those interested in pursuing this academic and highly theoretical topic further, I suggest obtaining a copy of *An Introduction to Database Systems* by C.J. Date, at the time of writing in its 8th edition, or *Relational Theory for Computer Professionals* by the same author.

6.3.1.11.8 Understanding Denormalization

Denormalization is the process of reversing the transformations made during [normalization](#) for performance reasons. It's a topic that stirs controversy among database experts; there are those who claim the cost is too high and never denormalize, and there are those that tout its benefits and routinely denormalize.

For proponents of denormalization, the thinking is as follows: normalization creates more tables as you proceed towards higher normal forms, but more tables mean there are more joins to be made when data is retrieved, which in turn slows down your queries. For that reason, to improve the performance of certain queries, you can override the advantages to data integrity and return the data structure to a lower normal form.

A practical approach makes sense, taking into account the limitations of SQL and MariaDB in particular, but being cautious not to needless denormalize. Here are some suggestions:

- if your performance with a normalized structure is acceptable, you should not denormalize.
- if your performance is unacceptable, make sure normalizing will cause it to become acceptable. There are very likely to be other alternatives, such as better hardware, load balancing, etc. It's hard to undo structural changes later.
- be sure you are willing to trade decreased data integrity for the increase in performance.
- consider possible future scenario, where applications may place different requirements on the data. Denormalizing to enhance performance of a specific application makes your data structure dependent on that application, when in an ideal situation it will be application-independent.

The table below introduces a common structure where it may not be in your best interests to denormalize. Which normal form is it in?

Customer table
ID
First name
Surname
Address line 1
Address line 2
Town
Zip code

It must be in [1st normal form](#) because it has a primary key and there are no repeating groups. It must be in [2nd normal form](#) because there's only one key, so there cannot be any partial dependencies. And [3rd normal form](#)? Are there any transitive dependencies? It looks like it. *Zip Code* is probably determined by the town attribute. To transform it into [3rd normal form](#), you should take out *Zip code*, putting it in a separate table with town as the key. In most cases, though, this is not worth doing. So although this table is not in 3rd normal form, separating the table is not worth the trouble. The more tables you have, the more joins you need to do, which slows the system down. The reason you normalize at all is to reduce the size of the tables by removing redundant data, and doing so can often speed up the system.

But you also need to look at how your tables are used. *Town* and *Zip code* would almost always be returned together, as part of the address. In most cases, the small amount of space you save by removing the duplicate town/zip code combinations would not offset the slowing down of the system because of the extra joins. In some situations, this may be useful, perhaps where you need to sort addresses according to zip codes or towns for many thousands of customers, and the distribution of data means that a query to the new, smaller table can return the results substantially quicker. In the end, experienced database designers can go beyond rigidly following the steps, as they understand how the data will be used. And that is something only experience can teach you. Normalization is just a helpful set of steps that most often produces an efficient table structure, and not a rule for database design.

There are some scary database designs out there, almost always because of not normalizing rather than too much normalization. So if you're unsure, normalize!

6.3.1.12 ACID: Concurrency Control with Transactions

Database requests happen in linear fashion, one after another. When many users are accessing a database, or one user has a related set of requests to run, it becomes important to ensure that the results remain consistent. To achieve this, you use *transactions*, which are groups of database requests that are processed as a whole. Put another way, they are logical units of work.

To ensure data integrity, transactions need to adhere to four conditions: atomicity, consistency, isolation and durability

(ACID).

Atomicity

Atomicity means the entire transaction must complete. If this is not the case, the entire transaction is aborted. This ensures that the database is never left with partially completed transactions, which would lead to data integrity issues. For example, if money is debited from one bank account but an error occurs before it can be credited to another account, the entire transaction must fail. The money cannot be lost or taken from one account without being successfully deposited into the other.

Consistency

Consistency ensures that data adheres to predefined rules or constraints. For example, a rule might state that each invoice in the invoices table must be linked to a customer in the customers table. During a transaction, these rules can be temporarily violated—such as inserting an invoice before adding the related customer—but only within the transaction itself. These temporary violations are not visible outside the transaction and are always resolved before the transaction is finalized.

Isolation

Isolation ensures that data being used by one transaction is inaccessible to other transactions until the first transaction is complete. For example, if two people deposit \$100 each into an account with a balance of \$900, the first transaction must update the balance to \$1,000, and the second must then update it to \$1,100. If the second transaction reads the \$900 balance before the first transaction finishes, both transactions will appear successful, but \$100 will be lost. The second transaction must wait until the first completes to access the correct balance.

Durability

Durability guarantees that once a transaction is committed, its effects are permanent, even in the event of a system failure. While a transaction is in progress, its changes are not yet permanent. If the database crashes before the transaction is committed, the system can be restored to a consistent state using backups, which reflect the state before the transaction started. A committed transaction cannot be undone by a failure.

6.4.1.1.1.1 Optimizer Trace Overview

MariaDB starting with [10.4.3](#)

Optimizer Trace was introduced in [MariaDB 10.4.3](#).

Contents

1. [Usage](#)
2. [Associated System Variables](#)
3. [INFORMATION_SCHEMA.OPTIMIZER_TRACE](#)
4. [Optimizer Trace Contents](#)
5. [Traceable Queries](#)
6. [Enabling Optimizer Trace](#)
7. [Memory Usage](#)
8. [Privilege Checking](#)
9. [Limitations](#)

Usage

This feature produces a trace as a JSON document for any [SELECT/UPDATE/DELETE](#) containing information about decisions taken by the optimizer during the optimization phase (choice of table access method, various costs, transformations, etc). This feature helps to explain why some decisions were taken by the optimizer and why some were rejected.

Associated System Variables

- [optimizer_trace='enabled=on/off'](#)
 - Default value is off
- [optimizer_trace_max_mem_size= value](#)
 - Default value: 1048576

INFORMATION_SCHEMA.OPTIMIZER_TRACE

Each connection stores a trace from the last executed statement. One can view the trace by reading the [Information Schema OPTIMIZER_TRACE table](#).

Structure of the optimizer trace table:

```
SHOW CREATE TABLE INFORMATION_SCHEMA.OPTIMIZER_TRACE \G
***** 1. row *****
Table: OPTIMIZER_TRACE
Create Table: CREATE TEMPORARY TABLE `OPTIMIZER_TRACE` (
  `QUERY` longtext NOT NULL DEFAULT '',
  `TRACE` longtext NOT NULL DEFAULT '',
  `MISSING_BYTES_BEYOND_MAX_MEM_SIZE` int(20) NOT NULL DEFAULT 0,
  `INSUFFICIENT_PRIVILEGES` tinyint(1) NOT NULL DEFAULT 0
) ENGINE=Aria DEFAULT CHARSET=utf8 PAGE_CHECKSUM=0
```

Optimizer Trace Contents

See [Optimizer Trace Guide](#) for an overview of what one can find in the trace.

Traceable Queries

These include [SELECT](#), [UPDATE](#), [DELETE](#) as well as their multi-table variants and all of the preceding prefixed by [EXPLAIN](#) and [ANALYZE](#).

Enabling Optimizer Trace

To enable optimizer trace run:

```
SET optimizer_trace='enabled=on';
```

Memory Usage

Each trace is stored as a string. It is extended (with `realloc()`) as the optimization progresses and appends data to it. The [optimizer_trace_max_mem_size](#) variable sets a limit on the total amount of memory used by the current trace. If this limit is reached, the current trace isn't extended (so it will be incomplete), and the `MISSING_BYTES_BEYOND_MAX_MEM_SIZE` column will show the number of bytes missing from this trace.

Privilege Checking

In complex scenarios where the query uses SQL SECURITY DEFINER views or stored routines, it may be that a user is denied from seeing the trace of its query because it lacks some extra privileges on those objects. In that case, the trace will be shown as empty and the `INSUFFICIENT_PRIVILEGES` column will show "1".

Limitations

Currently, only one trace is stored. It is not possible to trace the sub-statements of a stored routine; only the statement at the top level is traced.

6.4.1.1.1.2 Optimizer Trace Guide

Contents

1. [A Basic Example](#)
2. [Trace Structure](#)
3. [Extracting Trace Components](#)
4. [Examples of Various Information in the Trace](#)
 1. [Basic Rewrites](#)
 2. [VIEW Processing](#)
 3. [Range Optimizer - What Ranges Will Be Scanned](#)
 4. [Ref Access Options](#)
 5. [Join Optimization](#)

Optimizer trace uses the JSON format. It is basically a structured log file showing what actions were taken by the query optimizer.

A Basic Example

Let's take a simple query:

```
MariaDB> explain select * from t1 where a<10;
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| id    | select_type | table | type  | possible_keys | key  | key_len | ref    | rows | Extra
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| 1     | SIMPLE      | t1    | range | a              | a    | 5        | NULL  | 10   | Using index
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+

```

One can see the full trace [here](#). Taking only the component names, one gets:

```
MariaDB> select * from information_schema.optimizer_trace limit 1\G
***** 1. row *****
          QUERY: select * from t1 where a<10
          TRACE:
{
  "steps": [
    {
      "join_preparation": { ... }
    },
    {
      "join_optimization": {
        "select_id": 1,
        "steps": [
          { "condition_processing": { ... } },
          { "table_dependencies": [ ... ] },
          { "ref_optimizer_key_uses": [ ... ] },
          { "rows_estimation": [
              {
                "range_analysis": {
                  "analyzing_range_alternatives" : { ... },
                  "chosen_range_access_summary": { ... },
                },
                "selectivity_for_indexes" : { ... },
                "selectivity_for_columns" : { ... }
              }
            ]
          },
          { "considered_execution_plans": [ ... ] },
          { "attaching_conditions_to_tables": { ... } }
        ]
      }
    },
    {
      "join_execution": { ... }
    }
  ]
}
```

Trace Structure

For each SELECT, there are two "Steps":

- join_preparation
- join_optimization

Join preparation shows early query rewrites. join_optimization is where most of the query optimizations are done. They are:

- condition_processing - basic rewrites in WHERE/ON conditions.
- ref_optimizer_key_uses - Construction of possible ways to do ref and eq_ref accesses.
- rows_estimation - Consideration of range and index_merge accesses.

- `considered_execution_plans` - Join optimization itself, that is, choice of the join order.
- `attaching_conditions_to_tables` - Once the join order is fixed, parts of the WHERE clause are "attached" to tables to filter out rows as early as possible.

The above steps are for just one SELECT. If the query has subqueries, each SELECT will have these steps, and there will be extra steps/rewrites to handle the subquery construct itself.

Extracting Trace Components

If you are interested in some particular part of the trace, MariaDB has two functions that come in handy:

- `JSON_EXTRACT` extracts a part of JSON document
- `JSON_DETAILED` presents it in a user-readable way.

For example, the contents of the `analyzing_range_alternatives` node can be extracted like so:

```
MariaDB> select JSON_DETAILED(JSON_EXTRACT(trace, '$**.analyzing_range_alternatives'))
-> from INFORMATION_SCHEMA.OPTIMIZER_TRACE\G
***** 1. row *****
JSON_DETAILED(JSON_EXTRACT(trace, '$**.analyzing_range_alternatives')): [
  {
    "range_scan_alternatives":
    [
      {
        "index": "a_b_c",
        "ranges":
        [
          "(1) <= (a,b) < (4,50)"
        ],
        "rowid_ordered": false,
        "using_mrr": false,
        "index_only": false,
        "rows": 4,
        "cost": 6.2509,
        "chosen": true
      }
    ],
    "analyzing_roworder_intersect":
    {
      "cause": "too few roworder scans"
    },
    "analyzing_index_merge_union": []
  }
]
```

Examples of Various Information in the Trace

Basic Rewrites

A lot of applications construct database query text on the fly, which sometimes means that the query has constructs that are repetitive or redundant. In most cases, the optimizer will be able to remove them. One can check the trace to be sure:

```
explain select * from t1 where not (col1 >= 3);
```

Optimizer trace will show:

```
"steps": [
  {
    "join_preparation": {
      "select_id": 1,
      "steps": [
        {
          "expanded_query": "select t1.a AS a,t1.b AS b,t1.col1 AS col1 from t1 where t1.col1 < 3"
        }
      ]
    }
  }
]
```

Here, one can see that `NOT` was removed.

Similarly, one can also see that `IN(...)` with one element is the same as equality:

```
explain select * from t1 where coll in (1);
```

will show

```
"join_preparation": {
  "select_id": 1,
  "steps": [
    {
      "expanded_query": "select t1.a AS a,t1.b AS b,t1.coll AS coll from t1 where t1.coll = 1"
```

On the other hand, converting an UTF-8 column to UTF-8 is not removed:

```
explain select * from t1 where convert(utf8_col using utf8) = 'hello';
```

will show

```
"join_preparation": {
  "select_id": 1,
  "steps": [
    {
      "expanded_query": "select t1.a AS a,t1.b AS b,t1.coll AS coll,t1.utf8_col AS utf8_col from
```

so redundant `CONVERT` calls should be used with caution.

VIEW Processing

MariaDB has two algorithms to handle VIEWS: merging and materialization. If you run a query that uses a VIEW, the trace will have either

```
"view": {
  "table": "view1",
  "select_id": 2,
  "algorithm": "merged"
}
```

or

```
{
  "view": {
    "table": "view2",
    "select_id": 2,
    "algorithm": "materialized"
  }
},
```

depending on which algorithm was used.

Range Optimizer - What Ranges Will Be Scanned

The MariaDB optimizer has a complex part called the Range Optimizer. This is a module that examines WHERE (and ON) clauses and constructs index ranges that need to be scanned to answer the query. The rules for constructing the ranges are quite complex.

An example: Consider a table

```
create table some_events (
  start_date date,
  end_date date,
  ...
  key (start_date, end_date)
);
```

and a query:

```
explain select * from some_events where start_date >= '2019-09-10' and end_date <= '2019-09-14';
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| id   | select_type | table      | type | possible_keys | key   | key_len | ref   | rows | Extra
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| 1    | SIMPLE      | some_events | ALL  | start_date    | NULL  | NULL    | NULL | 1000 | Using
```

One might think that the optimizer would be able to use the restrictions on both *start_date* and *end_date* to construct a narrow range to be scanned. But this is not so, one of the restrictions creates a left-endpoint range and the other one creates a right-endpoint range, hence they cannot be combined.

```
select
  JSON_DETAILED(JSON_EXTRACT(trace, '$**.analyzing_range_alternatives')) as trace
from information_schema.optimizer_trace\G
***** 1. row *****
trace: [
  {
    "range_scan_alternatives":
    [
      {
        "index": "start_date",
        "ranges":
        [
          "(2019-09-10,NULL) < (start_date,end_date)"
        ],
        ...
```

the potential range only uses one of the bounds.

Ref Access Options

Index-based Nested-loops joins are called "ref access" in the MariaDB optimizer.

The optimizer analyzes the WHERE/ON conditions and collects all equality conditions that can be used by ref access using some index.

The list of conditions can be found in the `ref_optimizer_key_uses` node. (TODO example)

Join Optimization

The join optimizer's node is named `considered_execution_plans`.

The optimizer constructs the join orders in a left-to-right fashion. That is, if the query is a join of three tables:

```
select * from t1, t2, t3 where ...
```

then the optimizer will

- Pick the first table (say, it is t1),
- consider adding another table (say, t2), and construct a prefix "t1, t2"
- consider adding the third table (t3), and constructing a prefix "t1, t2, t3", which is a complete join plan Other join orders will be considered as well.

The basic operation here is: "given a join prefix of tables A,B,C ..., try adding table X to it". In JSON, it looks like this:

```
{
  "plan_prefix": ["t1", "t2"],
  "table": "t3",
  "best_access_path": {
    "considered_access_paths": [
      {
        ...
      }
    ]
  }
}
```

(search for `plan_prefix` followed by `table`).

If you are interested in how the join order of #t1,t2,t3# was constructed (or not constructed), you need to search for these patterns:

- "plan_prefix":[], "table":"t1"
- "plan_prefix":["t1"], "table":"t2"
- "plan_prefix":["t1", "t2"], "table":"t3"

6.4.1.1.1.3 Basic Optimizer Trace Example

```
MariaDB> set optimizer_trace='enabled=on';

MariaDB> select * from t1 where a<10;

MariaDB> select * from information_schema.optimizer_trace limit 1\G
***** 1. row *****

6.4.1.1.1.4 How to Collect Large Optimizer Traces

Optimizer traces can be large for some queries.

In order to collect a large trace, you need to perform the following steps (using 128 MB as an example):

```
set global max_allowed_packet=128*1024*1024;
```

Reconnect specifying `--max-allowed-packet=128000000` for the client as well.

```
set optimizer_trace=1;
set optimizer_trace_max_mem_size=127*1024*1024;
```

Now, one can run the query and save the large trace.

6.4.1.1.1.5 Optimizer Trace for Developers

This article describes guidelines for what/how to write to Optimizer Trace when doing server development.

Basic considerations

The trace is a "structured log" of what was done by the optimizer. Prefer to do tracing as soon as a rewrite/decision is made (instead of having a separate `trace_something()` function).

Generally, a function should expect to find the trace in a state where we're writing an array. The rationale is that array elements are ordered, while object members are not (even if they come in a certain order in the JSON text). We're writing a log, so it's natural for different entries to form an array.

Typically you'll want to start an unnamed object, then use member names to show what kind of entry you're about to write:

```
[
  ..., # Something before us
  {
    "my_new_rewrite": {
      "from": "foo",
      "to": "bar",
      ...
    }
  }
  ...
]
```

(TODO other considerations)

Making sure the trace is valid

`Json_writer_object` and `Json_writer_array` classes use RAII idiom and ensure that JSON objects and arrays are "closed" in the reverse order they were started.

However, they do not ensure these constraints:

- JSON objects must have named members.
- JSON arrays must have unnamed members.

Tracing code has runtime checks for these. Attempt to write invalid JSON will cause assertion failure.

Test coverage

It is possible to run `mysql-test-run` with this argument

```
--mysqld=--optimizer_trace=enabled=on
```

This will run all tests with tracing on. As mentioned earlier, debug build will perform checks that we are not producing invalid trace.

The BuildBot instance at <http://buildbot.askmonty.org/> also runs tests with this argument, see `mtr_opttrace` pass in `kvm-fulltest` and `kvm-fulltest2`.

Debugging

See [optimizer-debugging-with-gdb/#printing-the-optimizer-trace](#) for commands to print the trace for the current statement.

6.4.1.1.1.2 Optimizer Development

Notes about Optimizer Development

Contents

1. [mysql-test](#)
 1. [InnoDB Estimates are unstable](#)
 2. [Run mtr with Optimizer Trace enabled](#)

mysql-test

InnoDB Estimates are unstable

This is caused by background statistics update. It may cause the numbers in EXPLAIN output to be off-by-one. It may also cause different query plans to be picked on different runs (See e.g. [MDEV-32901](#) for details)

On a per-table basis, one can use `STATS_AUTO_RECALC=0` as table parameter.

On a per-file basis, one can use this include:

```
--source mysql-test/include/innodb_stable_estimates.inc
```

Run mtr with Optimizer Trace enabled

6.4.1.1.1.3 optimizer_max_sel_arg_weight

Contents

1. Basics
2. Combinatorial number of ranges
3. SEL_ARG graph
4. Weight of SEL_ARG graph
5. Example of effect of limiting weight

Basics

As mentioned in the [Range Optimizer](#), ranges on multiple key parts can create a combinatorial amount of ranges.

`optimizer_max_sel_arg_weight` setting is a limit to reduce the number of ranges generated by dropping restrictions on higher key parts if the number of ranges becomes too high.

(Note that there is also `optimizer_max_sel_args` which limits the number of intermediary SEL_ARG objects that can be created. This is a different limitation)

Combinatorial number of ranges

Let's reuse the example from the [Range Optimizer](#) page.

```
create table t2 (
  keypart1 int,
  keypart2 varchar(100),
  keypart3 int,
  index idx(keypart1, keypart2, keypart3)
);
```

```
select * from t2
where
  keypart1 in (1,2,3,4,5,6,7,8,9,10) and keypart2 in ('a','b', 'c') and keypart3 in (1,2,3,4);
```

Range optimizer will produce $10 * 3 * 4 = 120$ ranges.

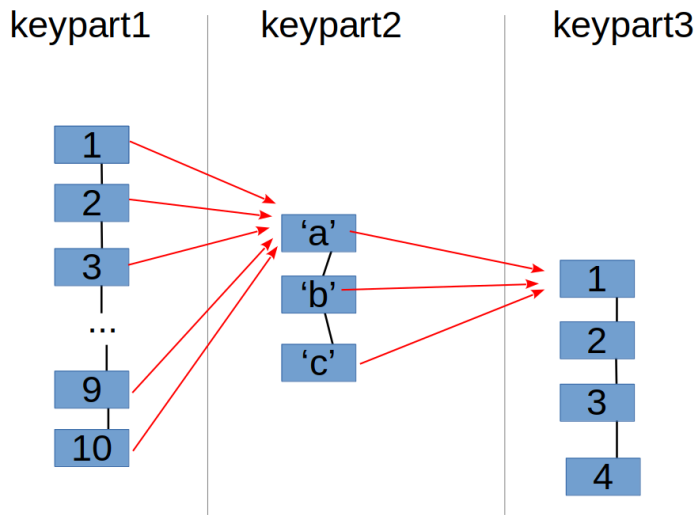

```
select * from information_schema.optimizer_trace
```

```
//...
"range_scan_alternatives": [
  {
    "index": "idx",
    "ranges": [
      "(1,a,1) <= (keypart1,keypart2,keypart3) <= (1,a,1)",
      "(1,a,2) <= (keypart1,keypart2,keypart3) <= (1,a,2)",
      "(1,a,3) <= (keypart1,keypart2,keypart3) <= (1,a,3)",
      "(1,a,4) <= (keypart1,keypart2,keypart3) <= (1,a,4)",
      "(1,b,1) <= (keypart1,keypart2,keypart3) <= (1,b,1)",
      //... # 114 lines omitted ...
      "(3,b,3) <= (keypart1,keypart2,keypart3) <= (3,b,3)",
      "(3,b,4) <= (keypart1,keypart2,keypart3) <= (3,b,4)",
    ],
  },
],
```

This number is fine but if your IN-list are thousands then the number of ranges can in the millions which may cause excessive CPU or memory usage (Note: this however is avoided in some cases when [IN-predicate is converted into subquery](#). But there are cases when that is not done)

SEL_ARG graph

Internally, the Range Optimizer builds this kind of graph:

Vertical black lines connect adjacent "intervals" on the same key part. Red lines connect a key part to a subsequent key part.

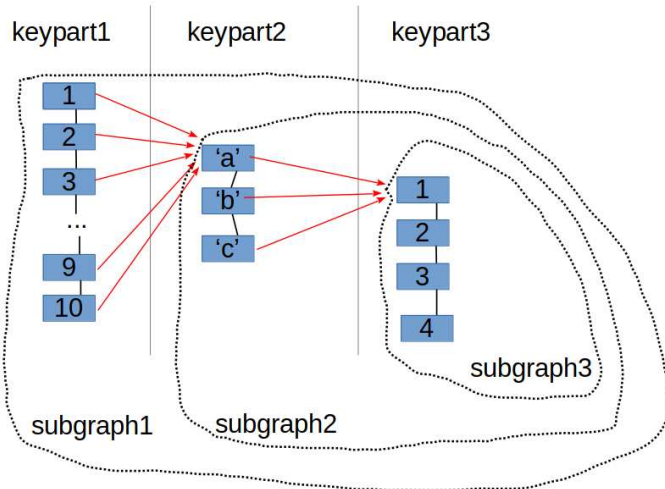

To produce ranges, one walks this graph by starting from left most corner. Walking right "attaches" the ranges on one key part to another to form multi-part ranges. One must mind that [Not all combinations produce multi-part ranges](#), though.

Walking top-to-bottom produces adjacent ranges.

Weight of SEL_ARG graph

How do we limit the number of ranges? We should remove the parts of SEL_ARG graph that describe ranges on big key parts. That way, we can still build ranges, although we will build fewer ranges that may contain more rows.

Due to the way the graph is constructed, we cannot tell how many ranges it would produce, so we introduce a parameter "weight" which is easy to compute and is roughly proportional to the number of ranges we estimate to produce.

Here is how the weight is computed:

- The weight of subgraph3 is just the number of nodes, 4.
- The weight of subgraph2 is the number of nodes for keypart2 (3), and the weight of subgraph1 multiplied by 3 since there are 3 references to it.
- The weight of subgraph1 is the number of nodes for keypart1 (10) plus the weight of subgraph2 multiplied by 10 since there are 10 references to it.

Here the total weight is 160 which has the same order of magnitude as the number of ranges.

SEL_ARG graphs are constructed for all parts of WHERE clause and are AND/ORed according to the AND/OR structure of the WHERE clause (after normalization). If the optimizer notices that it has produced a SEL_ARG graph that exceeds the maximum weight, the parts of the graph describing higher key parts are removed until the weight is within the limit.

Example of effect of limiting weight

Continuing with our example:

```
-- This is very low, don't use in production:
set @@optimizer_max_sel_arg_weight=50;
select * from t2 where keypart1 in (1,2,3,4,5,6,7,8,9,10) and keypart2 in ('a','b','c') and keypart3 in ('a','b','c');
select * from information_schema.optimizer_trace
```

shows

```
"range_scan_alternatives": [
  {
    "index": "idx",
    "ranges": [
      "(1,a) <= (keypart1,keypart2) <= (1,a)",
      "(1,b) <= (keypart1,keypart2) <= (1,b)",
      // (30 lines in total)
      "(10,b) <= (keypart1,keypart2) <= (10,b)",
      "(10,c) <= (keypart1,keypart2) <= (10,c)"
    ]
  }
]
```

One can see that now the range list is much smaller, 30 lines instead of 120. This was achieved by discarding the restrictions on `keypart3`.

6.4.1.1.1.4 Range Optimizer

Contents

1. [Basic example](#)
2. [Ranges are non-overlapping](#)
3. [Ranges for multi-part indexes](#)
 1. [Not all comparisons produce ranges](#)
 2. [Combinatorial blow-ups](#)

Range optimizer is a part of MariaDB (and MySQL) optimizer that takes as input

- the table and index definition(s)
- the WHERE condition (or ON expression if the table is inner in an outer join)

and constructs list of ranges one can scan in an index to read the rows that match the WHERE condition, or a superset of it. It can also construct an "index_merge" plan, where one needs ranges from two or more indexes to compute a union (formed from multiple condition disjunctions) and/or intersection (formed from multiple condition conjunctions).

Basic example

Consider a table

```
create table t1 (
  key1 int,
  key2 varchar(100),
  ...
  index(key1),
  index(key2)
);
```

and query

```
-- Turn on optimizer trace so we can see the ranges:
set optimizer_trace=1;
explain select * from t1 where key1<10 and key2='foo';
select * from information_schema.optimizer_trace
```

This shows the ranges that the optimizer was able to infer:

```

"range_scan_alternatives": [
  {
    "index": "key1",
    "ranges": ["(NULL) < (key1) < (10)"],
    ...
  },
  {
    "index": "key2",
    "ranges": ["(foo) <= (key2) <= (foo)"],
    ...
  }
],

```

Ranges are non-overlapping

Range optimizer produces a list of ranges without overlaps. Consider this WHERE clause where conditions do have overlaps:

```

select * from t1 where (key1 between 10 and 20 and key1 > 14) or key1 in (17, 22, 33);
select * from information_schema.optimizer_trace 

```

We get

```

...
"analyzing_range_alternatives": {
  "range_scan_alternatives": [
    {
      "index": "key1",
      "ranges": [
        "(14) < (key1) <= (20)",
        "(22) <= (key1) <= (22)",
        "(33) <= (key1) <= (33)"
      ]
    },
  ],

```

Ranges for multi-part indexes

Let's consider an index with multiple key parts. (note: due to [Extended Keys](#) optimization, an index may have more key parts than you've explicitly defined)

```

create table t2 (
  keypart1 int,
  keypart2 varchar(100),
  keypart3 int,
  index idx(keypart1, keypart2, keypart3)
);

```

Range optimizer will generate a *finite* set of ranges over lexicographical ordering over (keypart1, keypart2, ...).

Example:

```

select * from t2 where keypart1 in (1,2,3) and keypart2 between 'bar' and 'foo';
select * from information_schema.optimizer_trace 

```

gives

```

"range_scan_alternatives": [
  {
    "index": "idx",
    "ranges": [
      "(1,bar) <= (keypart1,keypart2) <= (1,foo)",
      "(2,bar) <= (keypart1,keypart2) <= (2,foo)",
      "(3,bar) <= (keypart1,keypart2) <= (3,foo)"
    ]
  },

```

Compare with a similar query:

```
select * from t2 where keypart1 between 1 and 3 and keypart2 between 'bar' and 'foo';
select * from information_schema.optimizer_trace
```

this will generate just one bigger range:

```
"range_scan_alternatives": [
  {
    "index": "idx",
    "ranges": ["(1,bar) <= (keypart1,keypart2) <= (3,foo)"],
    ...
  }
]
```

which includes for example rows like $(keypart1, keypart2) = (1, zzz)$. One could argue that the optimizer could be able to figure out that for condition `keypart1 between 1 and 3` the only possible values are 1, 2, 3 but this is not implemented.

Not all comparisons produce ranges

Note that some keypart comparisons produce multi-part ranges while some do not. The governing rule is the same: the conditions together must produce an interval (or a finite number of intervals) in lexicographic order in the index.

Some examples:

```
where keypart1 <= 10 and keypart2 < 'foo'
```

can use the second keypart:

```
"ranges": ["(NULL) < (keypart1, keypart2) < (10, foo)"],
```

but the interval will still include rows like $(keypart1, keypart2) = (8, 'zzzz')$

Non-inclusive bound on keypart1 prevents any use of keypart2. For

```
where keypart1 < 10 keypart2 < 'foo';
```

we get

```
"ranges": ["(NULL) < (keypart1) < (10)"]
```

Non-agreeing comparison (less than and greater than) do not produce a multi-part range:

```
where keypart1 <= 10 and keypart2 > 'foo';
```

gives

```
"ranges": ["(NULL) < (keypart1) <= (10)"],
```

A "Hole" in keyparts means higher keypart cannot be used.

```
where keypart1 = 10 and keypart3 <= 'foo';
```

gives

```
"ranges": ["(10) <= (keypart1) <= (10)"]
```

Combinatorial blow-ups

For multi-part keys, range analyzer can produce ranges that are "tight", that is, they only include rows that will match the WHERE condition. On the other hand, some SQL constructs can produce very large (combinatorial) amounts of ranges. Consider a query

```
select * from t2 where keypart1 in (1,2,3,4) and keypart2 in ('a','b','c')
```

two IN-lists produce $3 \times 4 = 12$ ranges:

```
"range_scan_alternatives": [
  {
    "index": "idx",
    "ranges": [
      "(1,a) <= (keypart1,keypart2) <= (1,a) ",
      "(1,b) <= (keypart1,keypart2) <= (1,b) ",
      "(1,c) <= (keypart1,keypart2) <= (1,c) ",
      "(2,a) <= (keypart1,keypart2) <= (2,a) ",
      "(2,b) <= (keypart1,keypart2) <= (2,b) ",
      "(2,c) <= (keypart1,keypart2) <= (2,c) ",
      "(3,a) <= (keypart1,keypart2) <= (3,a) ",
      "(3,b) <= (keypart1,keypart2) <= (3,b) ",
      "(3,c) <= (keypart1,keypart2) <= (3,c) ",
      "(4,a) <= (keypart1,keypart2) <= (4,a) ",
      "(4,b) <= (keypart1,keypart2) <= (4,b) ",
      "(4,c) <= (keypart1,keypart2) <= (4,c) "
    ]
  },
]
```

if one adds `and keypart3 IN (1,2,3,4,5)`, the amount of ranges will be $3 \times 4 \times 5 = 60$ and so forth. See [optimizer_max_sel_arg_weight](#) on how to combat this.

6.4.1.1.1.5 The Optimizer Cost Model from MariaDB 11.0

Contents

1. [Background](#)

 1. [In Configuration Files \(and Command Line\)](#)
 2. [From SQL](#)
 3. [Examples of Changing Costs](#)
8. [For Storage Engine Developers](#)

Background

Before [MariaDB 11.0](#), the MariaDB Query optimizer used a 'basic cost' of 1 for:

- One disk access
- Fetching a key
- Fetching a row based on the rowid (= unique row identifier) from the key

There were some smaller costs:

- filter lookup: 0.01
- Examining a where clause: 0.20
- Comparing two keys: 0.05
- Fetching a row through an index from a temporary memory table: 0.05

The above costs are reasonable for finding out the best index to use. However, they were not good for finding out if we should use a table scan, index scan or range lookup. The cost for the different engines were not properly calibrated.

New Cost Model

In [MariaDB 11.0](#) we have fixed the above shortcomings by changing the basic cost for 'storage engine operations' to be 1 millisecond. This means that for most queries the query cost (`LAST_QUERY_COST`) should be close (or at least proportional) to the time the server is spending in the storage engine + `join_cache` + sorting.

Note that the user level costs are in **microseconds** (as milliseconds would have so many zero's that it makes it hard to compare values).

The engine costs have also been separated into smaller parts to make things more accurate.

The "disk"-read cost now assumes a mid level SSD disk with 400MB/second. This can be changed by the end user by modifying `OPTIMIZER_DISK_READ_COST`.

All engine specific costs are visible in `information_schema.optimizer_costs`.

For example:

The "default" cost for an engine can be found with:

```
select * from information_schema.optimizer_costs where engine="default"
***** 1. row *****
ENGINE: default
OPTIMIZER_DISK_READ_COST: 10.240000
OPTIMIZER_INDEX_BLOCK_COPY_COST: 0.035600
OPTIMIZER_KEY_COMPARE_COST: 0.011361
OPTIMIZER_KEY_COPY_COST: 0.015685
OPTIMIZER_KEY_LOOKUP_COST: 0.435777
OPTIMIZER_KEY_NEXT_FIND_COST: 0.082347
OPTIMIZER_DISK_READ_RATIO: 0.020000
OPTIMIZER_ROW_COPY_COST: 0.060866
OPTIMIZER_ROW_LOOKUP_COST: 0.130839
OPTIMIZER_ROW_NEXT_FIND_COST: 0.045916
OPTIMIZER_ROWID_COMPARE_COST: 0.002653
OPTIMIZER_ROWID_COPY_COST: 0.002653
```

The above costs are the default (base) for all engines and should be reasonable for engines that does not have a clustered index (like [MyISAM](#), [Aria](#) etc). The default costs can be changed by specifying just the cost as an argument, like `mariadb --optimizer-disk-read-cost=20` or from SQL: `set global optimizer_disk_read_cost=20`. An engine specific cost can be tuned by prefixing the cost with the engine name, like `set global innodb.optimizer_disk_read_cost=20`.

An engine can tune some or all of the above cost in the storage engine interface. Here follows the cost for the [InnoDB storage engine](#).

```
select * from information_schema.optimizer_costs where engine="innodb"
***** 1. row *****
ENGINE: InnoDB
OPTIMIZER_DISK_READ_COST: 10.240000
OPTIMIZER_INDEX_BLOCK_COPY_COST: 0.035600
OPTIMIZER_KEY_COMPARE_COST: 0.011361
OPTIMIZER_KEY_COPY_COST: 0.015685
OPTIMIZER_KEY_LOOKUP_COST: 0.791120
OPTIMIZER_KEY_NEXT_FIND_COST: 0.099000
OPTIMIZER_DISK_READ_RATIO: 0.020000
OPTIMIZER_ROW_COPY_COST: 0.060870
OPTIMIZER_ROW_LOOKUP_COST: 0.765970
OPTIMIZER_ROW_NEXT_FIND_COST: 0.070130
OPTIMIZER_ROWID_COMPARE_COST: 0.002653
OPTIMIZER_ROWID_COPY_COST: 0.002653
```

As can be seen, the `ROW_LOOKUP_COST` is close to the `KEY_LOOKUP_COST`, which is because InnoDB has clustered primary key indexes and is using it to find the row from a secondary index.

Some engines, like `HEAP / MEMORY` implement their own cost functions as different indexes in the same engine can have different costs. This is why some of the cost numbers for these engines are 0.

There are also some SQL level costs that are independent of the storage engine:

```
select * from information_schema.global_variables where variable_name like "%where%cost%" or vari
+-----+
| VARIABLE_NAME          | VARIABLE_VALUE |
+-----+
| OPTIMIZER_SCAN_SETUP_COST | 10.000000      |
| OPTIMIZER_WHERE_COST    | 0.032000      |
+-----+
```

Description of the Different Cost Variables

Time and cost are quite interchangeable in the new cost model. Below we will use cost for most things, except for `OPTIMIZER_DISK_READ_COST` as one should use published/tested timings for the SSD/harddisk if one wants to change the

value..

Variable	Type	Description
OPTIMIZER_DISK_READ_COST	Engine	Time in microseconds to read a 4K block from a disk/SSD. The default is set for a 400MB/second SSD
OPTIMIZER_INDEX_BLOCK_COPY_COST	Engine	Cost to lock and a copy a block from the global cache to a local cache. This cost is added for every block accessed, independent of whether they are cached or not
OPTIMIZER_KEY_COMPARE_COST	Engine	Cost to compare two keys
OPTIMIZER_KEY_COPY_COST	Engine	Cost to copy a key from the index to a local buffer as part of searching for a key
OPTIMIZER_KEY_LOOKUP_COST	Engine	Cost to find a key entry in the index (index read)
OPTIMIZER_KEY_NEXT_FIND_COST	Engine	Cost to find the next key in the index (index next)
OPTIMIZER_DISK_READ_RATIO	Engine	The ratio of BLOCK_NOT_IN_CACHE/CACHE_READS. The cost of disk usage is calculated as $estimated_blocks * OPTIMIZER_DISK_READ_RATIO * OPTIMIZER_DISK_READ_COST$. A value of 0 means that all blocks are always in the cache. A value of 1 means that a block is never in the cache
OPTIMIZER_ROW_COPY_COST	Engine	Cost of copying a row to a local buffer. Should be slightly more than $OPTIMIZER_KEY_COPY_COST$
OPTIMIZER_ROW_LOOKUP_COST	Engine	Cost to find a row based on the rowid (Rowid is stored in the index together with the key)
OPTIMIZER_ROW_NEXT_FIND_COST	Engine	Cost of finding the next row
OPTIMIZER_ROWID_COMPARE_COST	Engine	Cost of comparing two rowids
OPTIMIZER_ROWID_COPY_COST	Engine	Cost of copying a rowid from the index
OPTIMIZER_SCAN_SETUP_COST	Session	Cost of starting a table or index scan. This has a low value to encourage the optimizer to use index lookup also tables with very few rows
OPTIMIZER_WHERE_COST	Session	Cost to execute the <code>WHERE</code> clause for every found row. Increasing this variable will encourage the optimizer to find plans which read fewer rows

More information of the costs and how they were calculated can be found in the `Docs/optimizer_costs.txt` file in the [MariaDB Source distributions](#).

Other Optimizer Cost Changes

- When counting disk accesses, we assume that all rows and index data are cached for the duration of the query. This is to avoid the following problem:
 - table t1 with 1 million_rows is scanned
 - For each row we do a lookup in table t2, which has only 10 rows

If we would count all lookups in t2, there would be 1 million lookups. If this would be the case, the optimizer would choose to use a join cache on the rows in t1 and do a table scan over t2.

- The cost of sorting (filesort) is now more accurate, which allows the optimizer to better choose between index scan and filesort for `ORDER BY/GROUP BY` queries.

A lot of rule-based cost has been changed to be cost-based:

- The decision to use an index (and which index) for resolving `ORDER BY/GROUP BY` were only partly cost-based before.
- The old optimizer would limit the number of 'expected key lookups' to 10% of the number of rows. This would cause the optimizer to use an index to scan a big part of a table when a full table scan would be much faster. This code is now removed.
- InnoDB would limit the number of rows in a range to 50% of the total rows, which would confuse the optimizer for big ranges. The cap is now removed.
- If there was a usable filter for an index, it was sometimes used without checking the complete cost of the filter.
- 'Aggregate distinct optimization with indexes' is now cost-based. This will change many queries from "Using index for group-by (scanning)" to "Using index for group-by".

Other Notable Plan Changes

- Indexes can now be used for `ORDER BY/GROUP BY` in sub queries (instead of filesort)
- Derived tables and queries with `UNION` can now create a distinct key (instead of a key with duplicates) to speed up key accesses.
- Indexes with more used key parts are preferred if the number of resulting rows is the same:
 - `WHERE key_part_1 = 1 and key_part_2 < 10`
 - This will now use a `RANGE` over both key parts instead of using lookups on `key_part_1`.
- For very small tables, index lookup is preferred over table scan.
- `EXPLAIN` does not report "Using index" for scans using a clustered primary key as technically this is a table scan.

When the Optimizer Changes Matter

The new, improved optimizer should be able to find a better plan

- If you are using queries with more than two tables.
- If you have indexes with a lot of identical values.
- If you are using ranges that cover more than 10% of a table.
 - `WHERE key between 1 and 1000 -- Table has values 1-2000`
- If you have complex queries when not all used columns are or can be indexed.
 - In which case you may need to depend on selectivity to get the right plan.
- If you are using queries mixing different storage engines.
 - Like using tables from both InnoDB and Memory in the same query.
- If you have had to use `FORCE INDEX` to get a good plan.
- If using `ANALYZE TABLE` made your plans worse (or not good enough).
- If your queries have lots of derived tables (subselects).
- You are using `ORDER BY / GROUP BY` that could be resolved via indexes.

Changing Costs

All engine and "SQL level" cost variables can be changed via MariaDB startup options, in configuration files or dynamically using SQL.

In Configuration Files (and Command Line)

```
[mariadb]
# Archive is using a hard disk (typical seek is 8-10 ms)
archive.OPTIMIZER_DISK_READ_COST=8000
# All other engines are using an SSD.
OPTIMIZER_DISK_READ_COST=10.240000
```

From SQL

```
# Tell optimizer to find a plan with as few accepted rows as possible
SET SESSION OPTIMIZER_WHERE_COST=1.0;
# Inform the optimizer that InnoDB buffer pool has a 80% hit rate
SET GLOBAL innodb.OPTIMIZER_DISK_READ_RATIO=0.20;
```

- Note engine costs are `GLOBAL` while other costs can also be `SESSION`.
- To keep things fast, engine-specific costs are stored in the table definition (`TABLE_SHARE`). One effect of this is that if one changes the cost for an engine, it will only take effect when new, not previously cached tables are accessed. You can use `FLUSH TABLES` to force the table to use the new costs at next access.

Examples of Changing Costs

- `OPTIMIZER_WHERE_COST` is added as a cost for for all 'accepted rows'. Increasing this variable will cause the optimizer to choose plans with less estimated rows.
- One can specify the kind of disk used by the system by changing `OPTIMIZER_DISK_READ_COST`. This should be the time to do a random read of a 4096 byte block.
- The cost of a potential disk read is calculated as `OPTIMIZER_DISK_READ_COST * OPTIMIZER_DISK_READ_RATIO`. Increasing `OPTIMIZER_DISK_READ_RATIO` will inform the optimizer that not all data is cached.
- `OPTIMIZER_SCAN_SETUP_COST` will increase the cost of a table scan. One can increase this to avoid using table

For Storage Engine Developers

The costs for an engine are set the following way when the engine plugin is loaded/initialized:

- Copy the "default" storage engine costs to the plugin engine costs.
 - `#handler->costs` points to the engine specific cost data.
- Call `handler->update_optimizer_costs()` to let the storage engine update the costs.
- Apply all user specific engine costs (from configuration files/startup) to the engine costs structure.
- When a `TABLE_SHARE` is created, the costs are copied from `handler->costs` to `TABLE_SHARE.optimizer_costs`. `handler::update_optimizer_costs()` is called to allow the engine to tune the cost for this specific table instance. This is done to avoid having to take any "cost" mutex while running queries.
- User changes to engine costs are stored in the data pointed to by `handler->costs`. This is why `FLUSH TABLES` is needed to activate new engine costs.
- To speed up cost access for the optimizer, `handler::set_optimizer_costs()` is called for each query to copy `OPTIMIZER_WHERE_COST` and `OPTIMIZER_SCAN_SETUP_COST` to the engine cost structure.

6.4.1.1.2.1.1 MariaDB Error Code Reference

MariaDB shares error codes with MySQL, as well as adding a number of new error codes specific to MariaDB.

An example of an error code is as follows:

```
SELECT * FROM x;  
ERROR 1046 (3D000): No database selected
```

Contents

- [Shared MariaDB/MySQL error codes](#)
- [MariaDB-specific error codes](#)

There are three pieces of information returned in an error:

- A numeric error code, in this case `1046`. Error codes from 1900 and up are specific to MariaDB, while error codes from 1000 to 1800 are shared by MySQL and MariaDB.
- An `SQLSTATE` value, consisting of five characters, in this case `3D000`. These codes are standard to ODBC and ANSI SQL. When MariaDB cannot allocate a standard `SQLSTATE` code, a generic `HY000`, or general error, is used.
- A string describing the error, in this case `No database selected`.

New error codes are being continually being added as new features are added. For a definitive list, see the file `sql/share/errmsg-utf8.txt`, as well as `include/mysqld_error.h` in the build directory, generated by the `comp_err` tool. Also, the [peror](#) tool can be used to get the error message which is associated with a given error code.

Shared MariaDB/MySQL error codes

Error Code	SQLSTATE	Error	Description
------------	----------	-------	-------------

1000 	HY000	ER_HASHCHK	hashchk
1001 	HY000	ER_NISAMCHK	isamchk
1002 	HY000	ER_NO	NO
1003 	HY000	ER_YES	YES
1004 	HY000	ER_CANT_CREATE_FILE	Can't create file '%s' (errno: %d)
1005 	HY000	ER_CANT_CREATE_TABLE	Can't create table '%s' (errno: %d)
1006 	HY000	ER_CANT_CREATE_DB	Can't create database '%s' (errno: %d)
1007 	HY000	ER_DB_CREATE_EXISTS	Can't create database '%s'; database exists
1008 	HY000	ER_DB_DROP_EXISTS	Can't drop database '%s'; database doesn't exist
1009 	HY000	ER_DB_DROP_DELETE	Error dropping database (can't delete '%s', errno: %d)
1010 	HY000	ER_DB_DROP_RMDIR	Error dropping database (can't rmdir '%s', errno: %d)
1011 	HY000	ER_CANT_DELETE_FILE	Error on delete of '%s' (errno: %d)
1012 	HY000	ER_CANT_FIND_SYSTEM_REC	Can't read record in system table
1013 	HY000	ER_CANT_GET_STAT	Can't get status of '%s' (errno: %d)
1014 	HY000	ER_CANT_GET_WD	Can't get working directory (errno: %d)
1015 	HY000	ER_CANT_LOCK	Can't lock file (errno: %d)
1016 	HY000	ER_CANT_OPEN_FILE	Can't open file: '%s' (errno: %d)
1017 	HY000	ER_FILE_NOT_FOUND	Can't find file: '%s' (errno: %d)
1018 	HY000	ER_CANT_READ_DIR	Can't read dir of '%s' (errno: %d)
1019 	HY000	ER_CANT_SET_WD	Can't change dir to '%s' (errno: %d)
1020 	HY000	ER_CHECKREAD	Record has changed since last read in table '%s'
1021 	HY000	ER_DISK_FULL	Disk full (%s); waiting for someone to free some space...
1022 	23000	ER_DUP_KEY	Can't write; duplicate key in table '%s'
1023 	HY000	ER_ERROR_ON_CLOSE	Error on close of '%s' (errno: %d)
1024 	HY000	ER_ERROR_ON_READ	Error reading file '%s' (errno: %d)
1025 	HY000	ER_ERROR_ON_RENAME	Error on rename of '%s' to '%s' (errno: %d)

1026	HY000	ER_ERROR_ON_WRITE	Error writing file '%s' (errno: %d)
1027	HY000	ER_FILE_USED	'%s' is locked against change
1028	HY000	ER_FILSORT_ABORT	Sort aborted
1029	HY000	ER_FORM_NOT_FOUND	View '%s' doesn't exist for '%s'
1030	HY000	ER_GET_ERRN	Got error %d from storage engine
1031	HY000	ER_ILLEGAL_HA	Table storage engine for '%s' doesn't have this option
1032	HY000	ER_KEY_NOT_FOUND	Can't find record in '%s'
1033	HY000	ER_NOT_FORM_FILE	Incorrect information in file: '%s'
1034	HY000	ER_NOT_KEYFILE	Incorrect key file for table '%s'; try to repair it
1035	HY000	ER_OLD_KEYFILE	Old key file for table '%s'; repair it!
1036	HY000	ER_OPEN_AS_READONLY	Table '%s' is read only
1037	HY001	ER_OUTOFMEMORY	Out of memory; restart server and try again (needed %d bytes)
1038	HY001	ER_OUT_OF_SORTMEMORY	Out of sort memory, consider increasing server sort buffer size
1039	HY000	ER_UNEXPECTED_EOF	Unexpected EOF found when reading file '%s' (Errno: %d)
1040	08004	ER_CON_COUNT_ERROR	Too many connections
1041	HY000	ER_OUT_OF_RESOURCES	Out of memory; check if mysqld or some other process uses all available memory; if not, you may have to use 'ulimit' to allow mysqld to use more memory or you can add more swap space
1042	08S01	ER_BAD_HOST_ERROR	Can't get hostname for your address
1043	08S01	ER_HANDSHAKE_ERROR	Bad handshake
1044	42000	ER_DBACCESS_DENIED_ERROR	Access denied for user '%s'@'%s' to database '%s'
1045	28000	ER_ACCESS_DENIED_ERROR	Access denied for user '%s'@'%s' (using password: %s)
1046	3D000	ER_NO_DB_ERROR	No database selected
1047	08S01	ER_UNKNOWN_COM_ERROR	Unknown command
1048	23000	ER_BAD_NULL_ERROR	Column '%s' cannot be null
1049	42000	ER_BAD_DB_ERROR	Unknown database '%s'
1050	42S01	ER_TABLE_EXISTS_ERROR	Table '%s' already exists
1051	42S02	ER_BAD_TABLE_ERROR	Unknown table '%s'

1052	23000	ER_NON_UNIQ_ERROR	Column '%s' in %s is ambiguous
1053	08S01	ER_SERVER_SHUTDOWN	Server shutdown in progress
1054	42S22	ER_BAD_FIELD_ERROR	Unknown column '%s' in '%s'
1055	42000	ER_WRONG_FIELD_WITH_GROUP	'%s' isn't in GROUP BY
1056	42000	ER_WRONG_GROUP_FIELD	Can't group on '%s'
1057	42000	ER_WRONG_SUM_SELECT	Statement has sum functions and columns in same statement
1058	21S01	ER_WRONG_VALUE_COUNT	Column count doesn't match value count
1059	42000	ER_TOO_LONG_IDENT	Identifier name '%s' is too long
1060	42S21	ER_DUP_FIELDNAME	Duplicate column name '%s'
1061	42000	ER_DUP_KEYNAME	Duplicate key name '%s'
1062	23000	ER_DUP_ENTRY	Duplicate entry '%s' for key %d
1063	42000	ER_WRONG_FIELD_SPEC	Incorrect column specifier for column '%s'
1064	42000	ER_PARSE_ERROR	%s near '%s' at line %d
1065	42000	ER_EMPTY_QUERY	Query was empty
1066	42000	ER_NONUNIQ_TABLE	Not unique table/alias: '%s'
1067	42000	ER_INVALID_DEFAULT	Invalid default value for '%s'
1068	42000	ER_MULTIPLE_PRI_KEY	Multiple primary key defined
1069	42000	ER_TOO_MANY_KEYS	Too many keys specified; max %d keys allowed
1070	42000	ER_TOO_MANY_KEY_PARTS	Too many key parts specified; max %d parts allowed
1071	42000	ER_TOO_LONG_KEY	Specified key was too long; max key length is %d bytes
1072	42000	ER_KEY_COLUMN_DOES_NOT_EXISTS	Key column '%s' doesn't exist in table
1073	42000	ER_BLOB_USED_AS_KEY	BLOB column '%s' can't be used in key specification with the used table type
1074	42000	ER_TOO_BIG_FIELDLENGTH	Column length too big for column '%s' (max = %lu); use BLOB or TEXT instead
1075	42000	ER_WRONG_AUTO_KEY	Incorrect table definition; there can be only one auto column and it must be defined as a key
1076	HY000	ER_READY	%s: ready for connections. Version: '%s' socket: '%s' port: %d
1077	HY000	ER_NORMAL_SHUTDOWN	%s: Normal shutdown

1078	HY000	ER_GOT_SIGNAL	%s: Got signal %d. Aborting!
1079	HY000	ER_SHUTDOWN_COMPLETE	%s: Shutdown complete
1080	08S01	ER_FORCING_CLOSE	%s: Forcing close of thread %ld user: '%s'
1081	08S01	ER_IPSOCK_ERROR	Can't create IP socket
1082	42S12	ER_NO_SUCH_INDEX	Table '%s' has no index like the one used in CREATE INDEX; recreate the table
1083	42000	ER_WRONG_FIELD_TERMINATORS	Field separator argument is not what is expected; check the manual
1084	42000	ER_BLOBS_AND_NO_TERMINATED	You can't use fixed rowlength with BLOBs; please use 'fields terminated by'
1085	HY000	ER_TEXTFILE_NOT_READABLE	The file '%s' must be in the database directory or be readable by all
1086	HY000	ER_FILE_EXISTS_ERROR	File '%s' already exists
1087	HY000	ER_LOAD_INF	Records: %ld Deleted: %ld Skipped: %ld Warnings: %ld
1088	HY000	ER_ALTER_INF	Records: %ld Duplicates: %ld
1089	HY000	ER_WRONG_SUB_KEY	Incorrect prefix key; the used key part isn't a string, the used length is longer than the key part, or the storage engine doesn't support unique prefix keys
1090	42000	ER_CANT_REMOVE_ALL_FIELDS	You can't delete all columns with ALTER TABLE; use DROP TABLE instead
1091	42000	ER_CANT_DROP_FIELD_OR_KEY	Can't DROP '%s'; check that column/key exists
1092	HY000	ER_INSERT_INF	Records: %ld Duplicates: %ld Warnings: %ld
1093	HY000	ER_UPDATE_TABLE_USED	You can't specify target table '%s' for update in FROM clause
1094	HY000	ER_NO_SUCH_THREAD	Unknown thread id: %lu
1095	HY000	ER_KILL_DENIED_ERROR	You are not owner of thread %lu
1096	HY000	ER_NO_TABLES_USED	No tables used
1097	HY000	ER_TOO_BIG_SET	Too many strings for column %s and SET
1098	HY000	ER_NO_UNIQUE_LOGFILE	Can't generate a unique log-filename %s.(1-999)
1099	HY000	ER_TABLE_NOT_LOCKED_FOR_WRITE	Table '%s' was locked with a READ lock and can't be updated

Error Code	SQLSTATE	Error	Description
1100	HY000	ER_TABLE_NOT_LOCKED	Table '%s' was not locked with LOCK TABLES
1101		ER_UNUSED_17	You should never see it

1102 	42000	ER_WRONG_DB_NAME	Incorrect database name '%s'
1103 	42000	ER_WRONG_TABLE_NAME	Incorrect table name '%s'
1104 	42000	ER_TOO_BIG_SELECT	The SELECT would examine more than MAX_JOIN_SIZE rows; check your WHERE and use SET SQL_BIG_SELECTS=1 or SET MAX_JOIN_SIZE=# if the SELECT is okay
1105 	HY000	ER_UNKNOWN_ERROR	Unknown error
1106 	42000	ER_UNKNOWN_PROCEDURE	Unknown procedure '%s'
1107 	42000	ER_WRONG_PARAMCOUNT_TO_PROCEDURE	Incorrect parameter count to procedure '%s'
1108 	HY000	ER_WRONG_PARAMETERS_TO_PROCEDURE	Incorrect parameters to procedure '%s'
1109 	42S02	ER_UNKNOWN_TABLE	Unknown table '%s' in %s
1110 	42000	ER_FIELD_SPECIFIED_TWICE	Column '%s' specified twice
1111 	HY000	ER_INVALID_GROUP_FUNC_USE	Invalid use of group function
1112 	42000	ER_UNSUPPORTED_EXTENSION	Table '%s' uses an extension that doesn't exist in this MariaDB version
1113 	42000	ER_TABLE_MUST_HAVE_COLUMNS	A table must have at least 1 column
1114 	HY000	ER_RECORD_FILE_FULL	The table '%s' is full
1115 	42000	ER_UNKNOWN_CHARACTER_SET	Unknown character set: '%s'
1116 	HY000	ER_TOO_MANY_TABLES	Too many tables; MariaDB can only use %d tables in a join
1117 	HY000	ER_TOO_MANY_FIELDS	Too many columns
1118 	42000	ER_TOO_BIG_ROWSIZE	Row size too large. The maximum row size for the used table type, not counting BLOBs, is %ld. You have to change some columns to TEXT or BLOBs
1119 	HY000	ER_STACK_OVERRUN	Thread stack overrun: Used: %ld of a %ld stack. Use 'mysqld --thread_stack=#' to specify a bigger stack if needed
1120 	42000	ER_WRONG_OUTER_JOIN	Cross dependency found in OUTER JOIN; examine your ON conditions
1121 	42000	ER_NULL_COLUMN_IN_INDEX	Table handler doesn't support NULL in given index. Please change column '%s' to be NOT NULL or use another handler
1122 	HY000	ER_CANT_FIND_UDF	Can't load function '%s'
1123 	HY000	ER_CANT_INITIALIZE_UDF	Can't initialize function '%s'; %s
1124 	HY000	ER_UDF_NO_PATHS	No paths allowed for shared library
1125 	HY000	ER_UDF_EXISTS	Function '%s' already exists

1126	HY000	ER_CANT_OPEN_LIBRARY	Can't open shared library '%s' (Errno: %d %s)
1127	HY000	ER_CANT_FIND_DL_ENTRY	Can't find symbol '%s' in library
1128	HY000	ER_FUNCTION_NOT_DEFINED	Function '%s' is not defined
1129	HY000	ER_HOST_IS_BLOCKED	Host '%s' is blocked because of many connection errors; unblock with 'mysqladmin flush-hosts'
1130	HY000	ER_HOST_NOT_PRIVILEGED	Host '%s' is not allowed to connect to this MariaDB server
1131	42000	ER_PASSWORD_ANONYMOUS_USER	You are using MariaDB as an anonymous user and anonymous users are not allowed to change passwords
1132	42000	ER_PASSWORD_NOT_ALLOWED	You must have privileges to update tables in the mysql database to be able to change passwords for others
1133	42000	ER_PASSWORD_NO_MATCH	Can't find any matching row in the user table
1134	HY000	ER_UPDATE_INF	Rows matched: %ld Changed: %ld Warnings: %ld
1135	HY000	ER_CANT_CREATE_THREAD	Can't create a new thread (Errno %d); if you are not out of available memory, you can consult the manual for a possible OS-dependent bug
1136	21S01	ER_WRONG_VALUE_COUNT_ON_ROW	Column count doesn't match value count at row %ld
1137	HY000	ER_CANT_REOPEN_TABLE	Can't reopen table: '%s'
1138	22004	ER_INVALID_USE_OF_NULL	Invalid use of NULL value
1139	42000	ER_REGEXP_ERROR	Got error '%s' from regexp
1140	42000	ER_MIX_OF_GROUP_FUNC_AND_FIELDS	Mixing of GROUP columns (MIN(),MAX(),COUNT(),...) with no GROUP columns is illegal if there is no GROUP BY clause
1141	42000	ER_NONEXISTING_GRANT	There is no such grant defined for user '%s' on host '%s'
1142	42000	ER_TABLEACCESS_DENIED_ERROR	%s command denied to user '%s'@'%s' for table '%s'
1143	42000	ER_COLUMNACCESS_DENIED_ERROR	%s command denied to user '%s'@'%s' for column '%s' in table '%s'
1144	42000	ER_ILLEGAL_GRANT_FOR_TABLE	Illegal GRANT/REVOKE command; please consult the manual to see which privileges can be used
1145	42000	ER_GRANT_WRONG_HOST_OR_USER	The host or user argument to GRANT is too long
1146	42S02	ER_NO_SUCH_TABLE	Table '%s.%s' doesn't exist
1147	42000	ER_NONEXISTING_TABLE_GRANT	There is no such grant defined for user '%s' on host '%s' on table '%s'

1148	42000	ER_NOT_ALLOWED_COMMAND	The used command is not allowed with this MariaDB version
1149	42000	ER_SYNTAX_ERROR	You have an error in your SQL syntax; check the manual that corresponds to your MariaDB server version for the right syntax to use
1150	HY000	ER_DELAYED_CANT_CHANGE_LOCK	Delayed insert thread couldn't get requested lock for table %s
1151	HY000	ER_TOO_MANY_DELAYED_THREADS	Too many delayed threads in use
1152	08S01	ER_ABORTING_CONNECTION	Aborted connection %ld to db: '%s' user: '%s' (%s)
1153	08S01	ER_NET_PACKET_TOO_LARGE	Got a packet bigger than 'max_allowed_packet' bytes
1154	08S01	ER_NET_READ_ERROR_FROM_PIPE	Got a read error from the connection pipe
1155	08S01	ER_NET_FCNTL_ERROR	Got an error from fcntl()
1156	08S01	ER_NET_PACKETS_OUT_OF_ORDER	Got packets out of order
1157	08S01	ER_NET_UNCOMPRESS_ERROR	Couldn't uncompress communication packet
1158	08S01	ER_NET_READ_ERROR	Got an error reading communication packets
1159	08S01	ER_NET_READ_INTERRUPTED	Got timeout reading communication packets
1160	08S01	ER_NET_ERROR_ON_WRITE	Got an error writing communication packets
1161	08S01	ER_NET_WRITE_INTERRUPTED	Got timeout writing communication packets
1162	42000	ER_TOO_LONG_STRING	Result string is longer than 'max_allowed_packet' bytes
1163	42000	ER_TABLE_CANT_HANDLE_BLOB	The used table type doesn't support BLOB/TEXT columns
1164	42000	ER_TABLE_CANT_HANDLE_AUTO_INCREMENT	The used table type doesn't support AUTO_INCREMENT columns
1165	HY000	ER_DELAYED_INSERT_TABLE_LOCKED	INSERT DELAYED can't be used with table '%s' because it is locked with LOCK TABLES
1166	42000	ER_WRONG_COLUMN_NAME	Incorrect column name '%s'
1167	42000	ER_WRONG_KEY_COLUMN	The used storage engine can't index column '%s'
1168	HY000	ER_WRONG_MRG_TABLE	Unable to open underlying table which is differently defined or of non-MyISAM type or doesn't exist
1169	23000	ER_DUP_UNIQUE	Can't write, because of unique constraint, to table '%s'
1170	42000	ER_BLOB_KEY_WITHOUT_LENGTH	BLOB/TEXT column '%s' used in key specification without a key length
1171	42000	ER_PRIMARY_CANT_HAVE_NULL	All parts of a PRIMARY KEY must be NOT NULL; if you need NULL in a key, use UNIQUE instead
1172	42000	ER_TOO_MANY_ROWS	Result consisted of more than one row

1173	42000	ER_REQUIRES_PRIMARY_KEY	This table type requires a primary key
1174	HY000	ER_NO_RAID_COMPILED	This version of MariaDB is not compiled with RAID support
1175	HY000	ER_UPDATE_WITHOUT_KEY_IN_SAFE_MODE	You are using safe update mode and you tried to update a table without a WHERE that uses a KEY column
1176	42000	ER_KEY_DOES_NOT_EXISTS	Key '%s' doesn't exist in table '%s'
1177	42000	ER_CHECK_NO_SUCH_TABLE	Can't open table
1178	42000	ER_CHECK_NOT_IMPLEMENTED	The storage engine for the table doesn't support %s
1179	25000	ER_CANT_DO_THIS_DURING_AN_TRANSACTION	You are not allowed to execute this command in a transaction
1180	HY000	ER_ERROR_DURING_COMMIT	Got error %d during COMMIT
1181	HY000	ER_ERROR_DURING_ROLLBACK	Got error %d during ROLLBACK
1182	HY000	ER_ERROR_DURING_FLUSH_LOGS	Got error %d during FLUSH_LOGS
1183	HY000	ER_ERROR_DURING_CHECKPOINT	Got error %d during CHECKPOINT
1184	08S01	ER_NEW_ABORTING_CONNECTION	Aborted connection %ld to db: '%s' user: '%s' host: '%s' (%s)
1185		ER_UNUSED_10	You should never see it
1186	HY000	ER_FLUSH_MASTER_BINLOG_CLOSED	Binlog closed, cannot RESET MASTER
1187	HY000	ER_INDEX_REBUILD	Failed rebuilding the index of dumped table '%s'
1188	HY000	ER_MASTER	Error from master: '%s'
1189	08S01	ER_MASTER_NET_READ	Net error reading from master
1190	08S01	ER_MASTER_NET_WRITE	Net error writing to master
1191	HY000	ER_FT_MATCHING_KEY_NOT_FOUND	Can't find FULLTEXT index matching the column list
1192	HY000	ER_LOCK_OR_ACTIVE_TRANSACTION	Can't execute the given command because you have active locked tables or an active transaction
1193	HY000	ER_UNKNOWN_SYSTEM_VARIABLE	Unknown system variable '%s'
1194	HY000	ER_CRASHED_ON_USAGE	Table '%s' is marked as crashed and should be repaired
1195	HY000	ER_CRASHED_ON_REPAIR	Table '%s' is marked as crashed and last (automatic?) repair failed
1196	HY000	ER_WARNING_NOT_COMPLETE_ROLLBACK	Some non-transactional changed tables couldn't be rolled back

1197	HY000	ER_TRANS_CACHE_FULL	Multi-statement transaction required more than 'max_binlog_cache_size' bytes of storage; increase this mysqld variable and try again
1198	HY000	ER_SLAVE_MUST_STOP	This operation cannot be performed with a running slave; run STOP SLAVE first
1199	HY000	ER_SLAVE_NOT_RUNNING	This operation requires a running slave; configure slave and do START SLAVE

Error Code	SQLSTATE	Error	Description
1200	HY000	ER_BAD_SLAVE	The server is not configured as slave; fix in config file or with CHANGE MASTER TO
1201	HY000	ER_MASTER_INFO	Could not initialize master info structure; more error messages can be found in the MariaDB error log
1202	HY000	ER_SLAVE_THREAD	Could not create slave thread; check system resources
1203	42000	ER_TOO_MANY_USER_CONNECTIONS	User %s already has more than 'max_user_connections' active connections
1204	HY000	ER_SET_CONSTANTS_ONLY	You may only use constant expressions with SET
1205	HY000	ER_LOCK_WAIT_TIMEOUT	Lock wait timeout exceeded; try restarting transaction
1206	HY000	ER_LOCK_TABLE_FULL	The total number of locks exceeds the lock table size
1207	25000	ER_READ_ONLY_TRANSACTION	Update locks cannot be acquired during a READ UNCOMMITTED transaction
1208	HY000	ER_DROP_DB_WITH_READ_LOCK	DROP DATABASE not allowed while thread is holding global read lock
1209	HY000	ER_CREATE_DB_WITH_READ_LOCK	CREATE DATABASE not allowed while thread is holding global read lock
1210	HY000	ER_WRONG_ARGUMENTS	Incorrect arguments to %s
1211	42000	ER_NO_PERMISSION_TO_CREATE_USER	'%s'@'%s' is not allowed to create new users
1212	HY000	ER_UNION_TABLES_IN_DIFFERENT_DIR	Incorrect table definition; all MERGE tables must be in the same database
1213	40001	ER_LOCK_DEADLOCK	Deadlock found when trying to get lock; try restarting transaction
1214	HY000	ER_TABLE_CANT_HANDLE_FT	The used table type doesn't support FULLTEXT indexes
1215	HY000	ER_CANNOT_ADD_FOREIGN	Cannot add foreign key constraint
1216	23000	ER_NO_REFERENCED_ROW	Cannot add or update a child row: a foreign key constraint fails
1217	23000	ER_ROW_IS_REFERENCED	Cannot delete or update a parent row: a foreign key constraint fails
1218	08S01	ER_CONNECT_TO_MASTER	Error connecting to master: %s
1219	HY000	ER_QUERY_ON_MASTER	Error running query on master: %s

1220	HY000	ER_ERROR_WHEN_EXECUTING_COMMAND	Error when executing command %s: %s
1221	HY000	ER_WRONG_USAGE	Incorrect usage of %s and %s
1222	21000	ER_WRONG_NUMBER_OF_COLUMNS_IN_SELECT	The used SELECT statements have a different number of columns
1223	HY000	ER_CANT_UPDATE_WITH_READLOCK	Can't execute the query because you have a conflicting read lock
1224	HY000	ER_MIXING_NOT_ALLOWED	Mixing of transactional and non-transactional tables is disabled
1225	HY000	ER_DUP_ARGUMENT	Option '%s' used twice in statement
1226	42000	ER_USER_LIMIT_REACHED	User '%s' has exceeded the '%s' resource (current value: %ld)
1227	42000	ER_SPECIFIC_ACCESS_DENIED_ERROR	Access denied; you need (at least one of) the %s privilege(s) for this operation
1228	HY000	ER_LOCAL_VARIABLE	Variable '%s' is a SESSION variable and can't be used with SET GLOBAL
1229	HY000	ER_GLOBAL_VARIABLE	Variable '%s' is a GLOBAL variable and should be set with SET GLOBAL
1230	42000	ER_NO_DEFAULT	Variable '%s' doesn't have a default value
1231	42000	ER_WRONG_VALUE_FOR_VAR	Variable '%s' can't be set to the value of '%s'
1232	42000	ER_WRONG_TYPE_FOR_VAR	Incorrect argument type to variable '%s'
1233	HY000	ER_VAR_CANT_BE_READ	Variable '%s' can only be set, not read
1234	42000	ER_CANT_USE_OPTION_HERE	Incorrect usage/placement of '%s'
1235	42000	ER_NOT_SUPPORTED_YET	This version of MariaDB doesn't yet support '%s'
1236	HY000	ER_MASTER_FATAL_ERROR_READING_BINLOG	Got fatal error %d from master when reading data from binary log: '%s'
1237	HY000	ER_SLAVE_IGNORED_TABLE	Slave SQL thread ignored the query because of replicate-*table rules
1238	HY000	ER_INCORRECT_GLOBAL_LOCAL_VAR	Variable '%s' is a %s variable
1239	42000	ER_WRONG_FK_DEF	Incorrect foreign key definition for '%s': %s
1240	HY000	ER_KEY_REF_DO_NOT_MATCH_TABLE_REF	Key reference and table reference don't match
1241	21000	ER_OPERAND_COLUMNS	Operand should contain %d column(s)
1242	21000	ER_SUBQUERY_NO_1_ROW	Subquery returns more than 1 row
1243	HY000	ER_UNKNOWN_STMT_HANDLER	Unknown prepared statement handler (%.*s) given to %s
1244	HY000	ER_CORRUPT_HELP_DB	Help database is corrupt or does not exist
1245	HY000	ER_CYCLIC_REFERENCE	Cyclic reference on subqueries

1246	HY000	ER_AUTO_CONVERT	Converting column '%s' from %s to %s
1247	42S22	ER_ILLEGAL_REFERENCE	Reference '%s' not supported (%s)
1248	42000	ER_DERIVED_MUST_HAVE_ALIAS	Every derived table must have its own alias
1249	01000	ER_SELECT_REDUCED	Select %u was reduced during optimization
1250	42000	ER_TABLENAME_NOT_ALLOWED_HERE	Table '%s' from one of the SELECTs cannot be used in %s
1251	08004	ER_NOT_SUPPORTED_AUTH_MODE	Client does not support authentication protocol requested by server; consider upgrading MariaDB client
1252	42000	ER_SPATIAL_CANT_HAVE_NULL	All parts of a SPATIAL index must be NOT NULL
1253	42000	ER_COLLATION_CHARSET_MISMATCH	COLLATION '%s' is not valid for CHARACTER SET '%s'
1254	HY000	ER_SLAVE_WAS_RUNNING	Slave is already running
1255	HY000	ER_SLAVE_WAS_NOT_RUNNING	Slave already has been stopped
1256	HY000	ER_TOO_BIG_FOR_UNCOMPRESS	Uncompressed data size too large; the maximum size is %d (probably, length of uncompressed data was corrupted)
1257	HY000	ER_ZLIB_Z_MEM_ERROR	ZLIB: Not enough memory
1258	HY000	ER_ZLIB_Z_BUF_ERROR	ZLIB: Not enough room in the output buffer (probably, length of uncompressed data was corrupted)
1259	HY000	ER_ZLIB_Z_DATA_ERROR	ZLIB: Input data corrupted
1260	HY000	ER_CUT_VALUE_GROUP_CONCAT	Row %u was cut by GROUP_CONCAT()
1261	01000	ER_WARN_TOO_FEW_RECORDS	Row %ld doesn't contain data for all columns
1262	01000	ER_WARN_TOO_MANY_RECORDS	Row %ld was truncated; it contained more data than there were input columns
1263	22004	ER_WARN_NULL_TO_NOTNULL	Column set to default value; NULL supplied to NOT NULL column '%s' at row %ld
1264	22003	ER_WARN_DATA_OUT_OF_RANGE	Out of range value for column '%s' at row %ld
1265	01000	WARN_DATA_TRUNCATED	Data truncated for column '%s' at row %ld
1266	HY000	ER_WARN_USING_OTHER_HANDLER	Using storage engine %s for table '%s'
1267	HY000	ER_CANT_AGGREGATE_2COLLATIONS	Illegal mix of collations (%s,%s) and (%s,%s) for operation '%s'
1268	HY000	ER_DROP_USER	Cannot drop one or more of the requested users
1269	HY000	ER_REVOKE_GRANTS	Can't revoke all privileges for one or more of the requested users
1270	HY000	ER_CANT_AGGREGATE_3COLLATIONS	Illegal mix of collations (%s,%s), (%s,%s), (%s,%s) for operation '%s'

1271	HY000	ER_CANT_AGGREGATE_NCOLLATIONS	Illegal mix of collations for operation '%s'
1272	HY000	ER_VARIABLE_IS_NOT_STRUCT	Variable '%s' is not a variable component (can't be used as XXXX.variable_name)
1273	HY000	ER_UNKNOWN_COLLATION	Unknown collation: '%s'
1274	HY000	ER_SLAVE_IGNORED_SSL_PARAMS	SSL parameters in CHANGE MASTER are ignored because this MariaDB slave was compiled without SSL support; they can be used later if MariaDB slave with SSL is started
1275	HY000	ER_SERVER_IS_IN_SECURE_AUTH_MODE	Server is running in --secure-auth mode, but '%s'@'%s' has a password in the old format; please change the password to the new format
1276	HY000	ER_WARN_FIELD_RESOLVED	Field or reference '%s%s%s%s%s' of SELECT #d was resolved in SELECT #d
1277	HY000	ER_BAD_SLAVE_UNTIL_COND	Incorrect parameter or combination of parameters for START SLAVE UNTIL
1278	HY000	ER_MISSING_SKIP_SLAVE	It is recommended to use --skip-slave-start when doing step-by-step replication with START SLAVE UNTIL; otherwise, you will get problems if you get an unexpected slave's mysqld restart
1279	HY000	ER_UNTIL_COND_IGNORED	SQL thread is not to be started so UNTIL options are ignored
1280	42000	ER_WRONG_NAME_FOR_INDEX	Incorrect index name '%s'
1281	42000	ER_WRONG_NAME_FOR_CATALOG	Incorrect catalog name '%s'
1282	HY000	ER_WARN_QC_RESIZE	Query cache failed to set size %lu; new query cache size is %lu
1283	HY000	ER_BAD_FT_COLUMN	Column '%s' cannot be part of FULLTEXT index
1284	HY000	ER_UNKNOWN_KEY_CACHE	Unknown key cache '%s'
1285	HY000	ER_WARN_HOSTNAME_WONT_WORK	MariaDB is started in --skip-name-resolve mode; you must restart it without this switch for this grant to work
1286	42000	ER_UNKNOWN_STORAGE_ENGINE	Unknown storage engine '%s'
1287	HY000	ER_WARN_DEPRECATED_SYNTAX	'%s' is deprecated and will be removed in a future release. Please use %s instead
1288	HY000	ER_NON_UPDATABLE_TABLE	The target table %s of the %s is not updatable
1289	HY000	ER_FEATURE_DISABLED	The '%s' feature is disabled; you need MariaDB built with '%s' to have it working
1290	HY000	ER_OPTION_PREVENTS_STATEMENT	The MariaDB server is running with the %s option so it cannot execute this statement
1291	HY000	ER_DUPLICATED_VALUE_IN_TYPE	Column '%s' has duplicated value '%s' in %s
1292	22007	ER_TRUNCATED_WRONG_VALUE	Truncated incorrect %s value: '%s'

1293	HY000	ER_TOO_MUCH_AUTO_TIMESTAMP_COLS	Incorrect table definition; there can be only one TIMESTAMP column with CURRENT_TIMESTAMP in DEFAULT or ON UPDATE clause
1294	HY000	ER_INVALID_ON_UPDATE	Invalid ON UPDATE clause for '%s' column
1295	HY000	ER_UNSUPPORTED_PS	This command is not supported in the prepared statement protocol yet
1296	HY000	ER_GET_ERRMSG	Got error %d '%s' from %s
1297	HY000	ER_GET_TEMPORARY_ERRMSG	Got temporary error %d '%s' from %s
1298	HY000	ER_UNKNOWN_TIME_ZONE	Unknown or incorrect time zone: '%s'
1299	HY000	ER_WARN_INVALID_TIMESTAMP	Invalid TIMESTAMP value in column '%s' at row %ld

Error Code	SQLSTATE	Error	Description
1300	HY000	ER_INVALID_CHARACTER_STRING	Invalid %s character string: '%s'
1301	HY000	ER_WARN_ALLOWED_PACKET_OVERFLOWED	Result of %s() was larger than max_allowed_packet (%ld) - truncated
1302	HY000	ER_CONFLICTING_DECLARATIONS	Conflicting declarations: '%s%s' and '%s%s'
1303	2F003	ER_SP_NO_RECURSIVE_CREATE	Can't create a %s from within another stored routine
1304	42000	ER_SP_ALREADY_EXISTS	%s %s already exists
1305	42000	ER_SP_DOES_NOT_EXIST	%s %s does not exist
1306	HY000	ER_SP_DROP_FAILED	Failed to DROP %s %s
1307	HY000	ER_SP_STORE_FAILED	Failed to CREATE %s %s
1308	42000	ER_SP_LILABEL_MISMATCH	%s with no matching label: %s
1309	42000	ER_SP_LABEL_REDEFINE	Redefining label %s
1310	42000	ER_SP_LABEL_MISMATCH	End-label %s without match
1311	01000	ER_SP_UNINIT_VAR	Referring to uninitialized variable %s
1312	0A000	ER_SP_BADSELECT	PROCEDURE %s can't return a result set in the given context
1313	42000	ER_SP_BADRETURN	RETURN is only allowed in a FUNCTION
1314	0A000	ER_SP_BADSTATEMENT	%s is not allowed in stored procedures
1315	42000	ER_UPDATE_LOG_DEPRECATED_IGNORED	The update log is deprecated and replaced by the binary log; SET SQL_LOG_UPDATE has been ignored. This option will be removed in MariaDB 5.6 .

1316	42000	ER_UPDATE_LOG_DEPRECATED_TRANSLATED	The update log is deprecated and replaced by the binary log; SET SQL_LOG_UPDATE has been translated to SET SQL_LOG_BIN. This option will be removed in MariaDB 5.6 .
1317	70100	ER_QUERY_INTERRUPTED	Query execution was interrupted
1318	42000	ER_SP_WRONG_NO_OF_ARGS	Incorrect number of arguments for %s %s; expected %u, got %u
1319	42000	ER_SP_COND_MISMATCH	Undefined CONDITION: %s
1320	42000	ER_SP_NORETURN	No RETURN found in FUNCTION %s
1321	2F005	ER_SP_NORETURNEND	FUNCTION %s ended without RETURN
1322	42000	ER_SP_BAD_CURSOR_QUERY	Cursor statement must be a SELECT
1323	42000	ER_SP_BAD_CURSOR_SELECT	Cursor SELECT must not have INTO
1324	42000	ER_SP_CURSOR_MISMATCH	Undefined CURSOR: %s
1325	24000	ER_SP_CURSOR_ALREADY_OPEN	Cursor is already open

1334	HY000	ER_SP_CANT ALTER	Failed to ALTER %s %s
1335	0A000	ER_SP_SUBSELECT_NYI	Subquery value not supported
1336	0A000	ER_STMT_NOT_ALLOWED_IN_SF_OR_TRG	%s is not allowed in stored function or trigger
1337	42000	ER_SP_VARCOND_AFTER_CURSHNDLR	Variable or condition declaration after cursor or handler declaration
1338	42000	ER_SP_CURSOR_AFTER_HANDLER	Cursor declaration after handler declaration
1339	20000	ER_SP_CASE_NOT_FOUND	Case not found for CASE statement
1340	HY000	ER_FPARSER_TOO_BIG_FILE	Configuration file '%s' is too big

1341 	HY000	ER_FPARSER_BAD_HEADER	Malformed file type header in file '%s'
1342 	HY000	ER_FPARSER_EOF_IN_COMMENT	Unexpected end of file while parsing comment '%s'
1343 	HY000	ER_FPARSER_ERROR_IN_PARAMETER	Error while parsing parameter '%s' (line: '%s')
1344 	HY000	ER_FPARSER_EOF_IN_UNKNOWN_PARAMETER	Unexpected end of file while skipping unknown parameter '%s'
1345 	HY000	ER_VIEW_NO_EXPLAIN	EXPLAIN/SHOW can not be issued; lacking privileges for underlying table
1346 	HY000	ER_FRM_UNKNOWN_TYPE	File '%s' has unknown type '%s' in its header
1347 	HY000	ER_WRONG_OBJECT	'%s.%s' is not %s
1348 	HY000	ER_NONUPDATEABLE_COLUMN	Column '%s' is not updatable
1349 	HY000	ER_VIEW_SELECT_DERIVED	View's SELECT contains a subquery in the FROM clause
1350 	HY000	ER_VIEW_SELECT_CLAUSE	View's SELECT contains a '%s' clause
1351 	HY000	ER_VIEW_SELECT_VARIABLE	View's SELECT contains a variable or parameter
1352 	HY000	ER_VIEW_SELECT_TMPTABLE	View's SELECT refers to a temporary table '%s'
1353 	HY000	ER_VIEW_WRONG_LIST	View's SELECT and view's field list have different column counts
1354 	HY000	ER_WARN_VIEW_MERGE	View merge algorithm can't be used here for now (assumed undefined algorithm)
1355 	HY000	ER_WARN_VIEW_WITHOUT_KEY	View being updated does not have complete key of underlying table in it
1356 	HY000	ER_VIEW_INVALID	View '%s.%s' references invalid table(s) or column(s) or function(s) or definer/invoke of view lack rights to use them
1357 	HY000	ER_SP_NO_DROP_SP	Can't drop or alter a %s from within another stored routine
1358 	HY000	ER_SP_GOTO_IN_HNDLR	GOTO is not allowed in a stored procedure handler
1359 	HY000	ER_TRG_ALREADY_EXISTS	Trigger already exists
1360 	HY000	ER_TRG_DOES_NOT_EXIST	Trigger does not exist
1361 	HY000	ER_TRG_ON_VIEW_OR_TEMP_TABLE	Trigger's '%s' is view or temporary table
1362 	HY000	ER_TRG_CANT_CHANGE_ROW	Updating of %s row is not allowed in %strigger
1363 	HY000	ER_TRG_NO_SUCH_ROW_IN_TRG	There is no %s row in %s trigger
1364 	HY000	ER_NO_DEFAULT_FOR_FIELD	Field '%s' doesn't have a default value
1365 	22012	ER_DIVISION_BY_ZER	Division by 0

1366	HY000	ER_TRUNCATED_WRONG_VALUE_FOR_FIELD	Incorrect %s value: '%s' for column '%s' at row %ld
1367	22007	ER_ILLEGAL_VALUE_FOR_TYPE	Illegal %s '%s' value found during parsing
1368	HY000	ER_VIEW_NONUPD_CHECK	CHECK OPTION on non-updatable view '%s.%s'
1369	HY000	ER_VIEW_CHECK_FAILED	CHECK OPTION failed '%s.%s'
1370	42000	ER_PROCAccess_DENIED_Error	%s command denied to user '%s'@'%s' for routine '%s'
1371	HY000	ER_RELAY_LOG_FAIL	Failed purging old relay logs: %s
1372	HY000	ER_PASSWD_LENGTH	Password hash should be a %d-digit hexadecimal number
1373	HY000	ER_UNKNOWN_TARGET_BINLOG	Target log not found in binlog index
1374	HY000	ER_IO_ERR_LOG_INDEX_READ	I/O error reading log index file
1375	HY000	ER_BINLOG_PURGE_PROHIBITED	Server configuration does not permit binlog purge
1376	HY000	ER_FSEEK_FAIL	Failed on fseek()
1377	HY000	ER_BINLOG_PURGE_FATAL_ERR	Fatal error during log purge
1378	HY000	ER_LOG_IN_USE	A purgeable log is in use, will not purge
1379	HY000	ER_LOG_PURGE_UNKNOWN_ERR	Unknown error during log purge
1380	HY000	ER_RELAY_LOG_INIT	Failed initializing relay log position: %s
1381	HY000	ER_NO_BINARY_LOGGING	You are not using binary logging
1382	HY000	ER_RESERVED_SYNTAX	The '%s' syntax is reserved for purposes internal to the MariaDB server
1383	HY000	ER_WSAS_FAILED	WSAStartup Failed
1384	HY000	ER_DIFF_GROUPS_PROC	Can't handle procedures with different groups yet
1385	HY000	ER_NO_GROUP_FOR_PROC	Select must have a group with this procedure
1386	HY000	ER_ORDER_WITH_PROC	Can't use ORDER clause with this procedure
1387	HY000	ER_LOGGING_PROHIBIT_CHANGING_OF	Binary logging and replication forbid changing the global server %s
1388	HY000	ER_NO_FILE_MAPPING	Can't map file: %s, errno: %d
1389	HY000	ER_WRONG_MAGIC	Wrong magic in %s
1390	HY000	ER_PS_MANY_PARAM	Prepared statement contains too many placeholders
1391	HY000	ER_KEY_PART_0	Key part '%s' length cannot be 0

1392 	HY000	ER_VIEW_CHECKSUM	View text checksum failed
1393 	HY000	ER_VIEW_MULTIUPDATE	Can not modify more than one base table through a join view '%s.%s'
1394 	HY000	ER_VIEW_NO_INSERT_FIELD_LIST	Can not insert into join view '%s.%s' without fields list
1395 	HY000	ER_VIEW_DELETE_MERGE_VIEW	Can not delete from join view '%s.%s'
1396 	HY000	ER_CANNOT_USER	Operation %s failed for %s
1397 	XAE04	ER_XAER_NOTA	XAER_NOTA: Unknown XID
1398 	XAE05	ER_XAER_INVAL	XAER_INVAL: Invalid arguments (or unsupported command)
1399 	XAE07	ER_XAER_RMFAIL	XAER_RMFAIL: The command cannot be executed when global transaction is in the %s state

Error Code	SQLSTATE	Error	Description
1400 	XAE09	ER_XAER_OUTSIDE	XAER_OUTSIDE: Some work is done outside global transaction
1401 	XAE03	ER_XAER_RMERR	XAER_RMERR: Fatal error occurred in the transaction branch - check your data for consistency
1402 	XA100	ER_XA_RBROLLBACK	XA_RBROLLBACK: Transaction branch was rolled back
1403 	42000	ER_NONEXISTING_PROC_GRANT	There is no such grant defined for user '%s' on host '%s' on routine '%s'
1404 	HY000	ER_PROC_AUTO_GRANT_FAIL	Failed to grant EXECUTE and ALTER ROUTINE privileges
1405 	HY000	ER_PROC_AUTO_REVOKE_FAIL	Failed to revoke all privileges to dropped routine
1406 	22001	ER_DATA_TOO_LONG	Data too long for column '%s' at row %ld
1407 	42000	ER_SP_BAD_SQLSTATE	Bad SQLSTATE: '%s'
1408 	HY000	ER_STARTUP	%s: ready for connections. Version: '%s' socket: '%s' port: %d %s
1409 	HY000	ER_LOAD_FROM_FIXED_SIZE_ROWS_TO_VAR	Can't load value from file with fixed size rows to variable
1410 	42000	ER_CANT_CREATE_USER_WITH_GRANT	You are not allowed to create a user with GRANT
1411 	HY000	ER_WRONG_VALUE_FOR_TYPE	Incorrect %s value: '%s' for function %s
1412 	HY000	ER_TABLE_DEF_CHANGED	Table definition has changed, please retry transaction
1413 	42000	ER_SP_DUP_HANDLER	Duplicate handler declared in the same block
1414 	42000	ER_SP_NOT_VAR_ARG	OUT or INOUT argument %d for routine %s is not a variable or NEW pseudo-variable in BEFORE trigger

1415	0A000	ER_SP_NO_RESET	Not allowed to return a result set from a %s
1416	22003	ER_CANT_CREATE_GEOMETRY_OBJECT	Cannot get geometry object from data you send to the GEOMETRY field
1417	HY000	ER_FAILED_ROUTINE_BREAK_BINLOG	A routine failed and has neither NO SQL nor READS SQL DATA in its declaration and binary logging is enabled; if non-transactional tables were updated, the binary log will miss their changes
1418	HY000	ER_BINLOG_UNSAFE_ROUTINE	This function has none of DETERMINISTIC, NO SQL, or READS SQL DATA in its declaration and binary logging is enabled (you *might* want to use the less safe log_bin_trust_function_creators variable)
1419	HY000	ER_BINLOG_CREATE_ROUTINE_NEED_SUPER	You do not have the SUPER privilege and binary logging is enabled (you *might* want to use the less safe log_bin_trust_function_creators variable)
1420	HY000	ER_EXEC_STMT_WITH_OPEN_CURSOR	You can't execute a prepared statement which has an open cursor associated with it. Reset the statement to re-execute it.
1421	HY000	ER_STMT_HAS_NO_OPEN_CURSOR	The statement (%lu) has no open cursor.
1422	HY000	ER_COMMIT_NOT_ALLOWED_IN_SF_OR_TRG	Explicit or implicit commit is not allowed in stored function or trigger.
1423	HY000	ER_NO_DEFAULT_FOR_VIEW_FIELD	Field of view '%s.%s' underlying table doesn't have a default value
1424	HY000	ER_SP_NO_RECURSION	Recursive stored functions and triggers are not allowed.
1425	42000	ER_TOO_BIG_SCALE	Too big scale %d specified for column '%s'. Maximum is %lu.
1426	42000	ER_TOO_BIG_PRECISION	Too big precision %d specified for column '%s'. Maximum is %lu.
1427	42000	ER_M_BIGGER_THAN_D	For float(M,D, double(M,D or decimal(M,D, M must be >= D (column '%s').
1428	HY000	ER_WRONG_LOCK_OF_SYSTEM_TABLE	You can't combine write-locking of system tables with other tables or lock types
1429	HY000	ER_CONNECT_TO_FOREIGN_DATA_SOURCE	Unable to connect to foreign data source: %s
1430	HY000	ER_QUERY_ON_FOREIGN_DATA_SOURCE	There was a problem processing the query on the foreign data source. Data source error: %s
1431	HY000	ER_FOREIGN_DATA_SOURCE_DOESNT_EXIST	The foreign data source you are trying to reference does not exist. Data source error: %s
1432	HY000	ER_FOREIGN_DATA_STRING_INVALID_CANT_CREATE	Can't create federated table. The data source connection string '%s' is not in the correct format

1433	HY000	ER_FOREIGN_DATA_STRING_INVALID	The data source connection string '%s' is not in the correct format
1434	HY000	ER_CANT_CREATE_FEDERATED_TABLE	Can't create federated table. Foreign data src error: %s
1435	HY000	ER_TRG_IN_WRONG_SCHEMA	Trigger in wrong schema
1436	HY000	ER_STACK_OVERRUN_NEED_MORE	Thread stack overrun: %ld bytes used of a %ld byte stack, and %ld bytes needed. Use 'mysqld --thread_stack=#' to specify a bigger stack.
1437	42000	ER_TOO_LONG_BODY	Routine body for '%s' is too long
1438	HY000	ER_WARN_CANT_DROP_DEFAULT_KEYCACHE	Cannot drop default keycache
1439	42000	ER_TOO_BIG_DISPLAYWIDTH	Display width out of range for column '%s' (max = %lu)
1440	XAE08	ER_XAER_DUPID	XAER_DUPID: The XID already exists
1441	22008	ER_DATETIME_FUNCTION_OVERFLOW	Datetime function: %s field overflow
1442	HY000	ER_CANT_UPDATE_USED_TABLE_IN_SF_OR_TRG	Can't update table '%s' in stored function/trigger because it is already used by statement which invoked this stored function/trigger.
1443	HY000	ER_VIEW_PREVENT_UPDATE	The definition of table '%s' prevents operation %s on table '%s'.
1444	HY000	ER_PS_NO_RECURSION	The prepared statement contains a stored routine call that refers to that same statement. It's not allowed to execute a prepared statement in such a recursive manner
1445	HY000	ER_SP_CANT_SET_AUTOCOMMIT	Not allowed to set autocommit from a stored function or trigger
1446	HY000	ER_MALFORMED_DEFINER	Definer is not fully qualified
1447	HY000	ER_VIEW_FRM_NO_USER	View '%s'.'%s' has no definer information (old table format). Current user is used as definer. Please recreate the view!
1448	HY000	ER_VIEW_OTHER_USER	You need the SUPER privilege for creation view with '%s'@'%s' definer
1449	HY000	ER_NO_SUCH_USER	The user specified as a definer ('%s'@'%s') does not exist
1450	HY000	ER_FORBID_SCHEMA_CHANGE	Changing schema from '%s' to '%s' is not allowed.
1451	23000	ER_ROW_IS_REFERENCED_2	Cannot delete or update a parent row: a foreign key constraint fails (%s)
1452	23000	ER_NO_REFERENCED_ROW_2	Cannot add or update a child row: a foreign key constraint fails (%s)
1453	42000	ER_SP_BAD_VAR_SHADOW	Variable '%s' must be quoted with `...`, or renamed

1454 🔗	HY000	ER_TRG_NO_DEFINER	No definer attribute for trigger '%s'.%s'. The trigger will be activated under the authorization of the invoker, which may have insufficient privileges. Please recreate the trigger.
1455 🔗	HY000	ER_OLD_FILE_FORMAT	'%s' has an old format, you should re-create the '%s' object(s)
1456 🔗	HY000	ER_SP_RECURSION_LIMIT	Recursive limit %d (as set by the max_sp_recursion_depth variable) has exceeded for routine %s
1457 🔗	HY000	ER_SP_PROC_TABLE_CORRUPT	Failed to load routine %s. The table mysql.proc is missing, corrupt, or contains bad data (internal code %d)
1458 🔗	42000	ER_SP_WRONG_NAME	Incorrect routine name '%s'
1459 🔗	HY000	ER_TABLE_NEEDS_UPGRADE	Table upgrade required. Please do "REPAIR TABLE '%s'" or dump/reload to fix it!
1460 🔗	42000	ER_SP_NO_AGGREGATE	AGGREGATE is not supported for stored functions
1461 🔗	42000	ER_MAX_PREPARED_STMT_COUNT_REACHED	Can't create more than max_prepared_stmt_count statements (current value: %lu)
1462 🔗	HY000	ER_VIEW_RECURSIVE	'%s'.%s' contains view recursion
1463 🔗	42000	ER_NON_GROUPING_FIELD_USED	Non-grouping field '%s' is used in %s clause
1464 🔗	HY000	ER_TABLE_CANT_HANDLE_SPKEYS	The used table type doesn't support SPATIAL indexes
1465 🔗	HY000	ER_NO_TRIGGERS_ON_SYSTEM_SCHEMA	Triggers can not be created on system tables
1466 🔗	HY000	ER_REMOVED_SPACES	Leading spaces are removed from name '%s'
1467 🔗	HY000	ER_AUTOINC_READ_FAILED	Failed to read auto-increment value from storage engine
1468 🔗	HY000	ER_USERNAME	user name
1469 🔗	HY000	ER_HOSTNAME	host name
1470 🔗	HY000	ER_WRONG_STRING_LENGTH	String '%s' is too long for %s (should be no longer than %d)
1471 🔗	HY000	ER_NON_INSERTABLE_TABLE	The target table %s of the %s is not insertable-into
1472 🔗	HY000	ER_ADMIN_WRONG_MRG_TABLE	Table '%s' is differently defined or of non-MyISAM type or doesn't exist
1473 🔗	HY000	ER_TOO_HIGH_LEVEL_OF_NESTING_FOR_SELECT	Too high level of nesting for select
1474 🔗	HY000	ER_NAME_BECOMES_EMPTY	Name '%s' has become "
1475 🔗	HY000	ER_AMBIGUOUS_FIELD_TERM	First character of the FIELDS TERMINATED string is ambiguous; please use non-optional and non-empty FIELDS ENCLOSED BY

1476	HY000	ER_FOREIGN_SERVER_EXISTS	The foreign server, %s, you are trying to create already exists.
1477	HY000	ER_FOREIGN_SERVER_DOESNT_EXIST	The foreign server name you are trying to reference does not exist. Data source error: %s
1478	HY000	ER_ILLEGAL_HA_CREATE_OPTION	Table storage engine '%s' does not support the create option '%s'
1479	HY000	ER_PARTITION_REQUIRES_VALUES_ERROR	Syntax error: %s PARTITIONING requires definition of VALUES %s for each partition
1480	HY000	ER_PARTITION_WRONG_VALUES_ERROR	Only %s PARTITIONING can use VALUES %s in partition definition
1481	HY000	ER_PARTITION_MAXVALUE_ERROR	MAXVALUE can only be used in last partition definition
1482	HY000	ER_PARTITION_SUBPARTITION_ERROR	Subpartitions can only be hash partitions and by key
1483	HY000	ER_PARTITION_SUBPART_MIX_ERROR	Must define subpartitions on all partitions if on one partition
1484	HY000	ER_PARTITION_WRONG_NO_PART_ERROR	Wrong number of partitions defined, mismatch with previous setting
1485	HY000	ER_PARTITION_WRONG_NO_SUBPART_ERROR	Wrong number of subpartitions defined, mismatch with previous setting
1486	HY000	ER_CONST_EXPR_IN_PARTITION_FUNC_ERROR	Constant/Random expression in (sub)partitioning function is not allowed
1486	HY000	ER_WRONG_EXPR_IN_PARTITION_FUNC_ERROR	Constant, random or timezone-dependent expressions in (sub)partitioning function are not allowed
1487	HY000	ER_NO_CONST_EXPR_IN_RANGE_OR_LIST_ERROR	Expression in RANGE/LIST VALUES must be constant
1488	HY000	ER_FIELD_NOT_FOUND_PART_ERROR	Field in list of fields for partition function not found in table
1489	HY000	ER_LIST_OF_FIELDS_ONLY_IN_HASH_ERROR	List of fields is only allowed in KEY partitions
1490	HY000	ER_INCONSISTENT_PARTITION_INFO_ERROR	The partition info in the frm file is not consistent with what can be written into the frm file
1491	HY000	ER_PARTITION_FUNC_NOT_ALLOWED_ERROR	The %s function returns the wrong type
1492	HY000	ER_PARTITIONS_MUST_BE_DEFINED_ERROR	For %s partitions each partition must be defined
1493	HY000	ER_RANGE_NOT_INCREASING_ERROR	VALUES LESS THAN value must be strictly increasing for each partition
1494	HY000	ER_INCONSISTENT_TYPE_OF_FUNCTIONS_ERROR	VALUES value must be of same type as partition function
1495	HY000	ER_MULTIPLE_DEF_CONST_IN_LIST_PART_ERROR	Multiple definition of same constant in list partitioning
1496	HY000	ER_PARTITION_ENTRY_ERROR	Partitioning can not be used stand-alone in query
1497	HY000	ER_MIX_HANDLER_ERROR	The mix of handlers in the partitions is not allowed in this version of MariaDB
1498	HY000	ER_PARTITION_NOT_DEFINED_ERROR	For the partitioned engine it is necessary to define all %s

1499 	HY000	ER_TOO_MANY_PARTITIONS_ERROR	Too many partitions (including subpartitions) were defined
--	-------	------------------------------	--

Error Code	SQLSTATE	Error	Description
1500 	HY000	ER_SUBPARTITION_ERROR	It is only possible to mix RANGE/LIST partitioning with HASH/KEY partitioning for subpartitioning
1501 	HY000	ER_CANT_CREATE_HANDLER_FILE	Failed to create specific handler file
1502 	HY000	ER_BLOB_FIELD_IN_PART_FUNC_ERROR	A BLOB field is not allowed in partition function
1503 	HY000	ER_UNIQUE_KEY_NEED_ALL_FIELDS_IN_PF	A %s must include all columns in the table's partitioning function
1504 	HY000	ER_NO_PARTS_ERROR	Number of %s = 0 is not an allowed value
1505 	HY000	ER_PARTITION_MGMT_ON_NONPARTITIONED	Partition management on a not partitioned table is not possible
1506 	HY000	ER_FOREIGN_KEY_ON_PARTITIONED	Foreign key clause is not yet supported in conjunction with partitioning
1507 	HY000	ER_DROP_PARTITION_NON_EXISTENT	Error in list of partitions to %s
1508 	HY000	ER_DROP_LAST_PARTITION	Cannot remove all partitions, use DROP TABLE instead
1509 	HY000	ER_COALESCE_ONLY_ON_HASH_PARTITION	COALESCE PARTITION can only be used on HASH/KEY partitions
1510 	HY000	ER_REORG_HASH_ONLY_ON_SAME_N	REORGANIZE PARTITION can only be used to reorganize partitions not to change their numbers
1511 	HY000	ER_REORG_NO_PARAM_ERROR	REORGANIZE PARTITION without parameters can only be used on auto-partitioned tables using HASH PARTITIONS
1512 	HY000	ER_ONLY_ON_RANGE_LIST_PARTITION	%s PARTITION can only be used on RANGE/LIST partitions
1513 	HY000	ER_ADD_PARTITION_SUBPART_ERROR	Trying to Add partition(s) with wrong number of subpartitions

1713	HY000	ER_UNDO_RECORD_TOO_BIG	Undo log record is too big.
1714	HY000	ER_BINLOG_UNSAFE_INSERT_IGNORE_SELECT	INSERT IGNORE... SELECT is unsafe because the order in which rows are retrieved by the SELECT determines which (if any) rows are ignored. This order cannot be predicted and may differ on master and the slave.
1715	HY000	ER_BINLOG_UNSAFE_INSERT_SELECT_UPDATE	INSERT... SELECT... ON DUPLICATE KEY UPDATE is unsafe because the order in which rows are retrieved by the SELECT determines which (if any) rows are updated. This order cannot be predicted and may differ on master and the slave.
1716	HY000	ER_BINLOG_UNSAFE_REPLACE_SELECT	REPLACE... SELECT is unsafe because the order in which rows are retrieved by the SELECT determines which (if any) rows are replaced. This order cannot be predicted and may differ on master and the slave.

1717	HY000	ER_BINLOG_UNSAFE_CREATE_IGNORE_SELECT	CREATE... IGNORE SELECT is unsafe because the order in which rows are retrieved by the SELECT determines which (if any) rows are ignored. This order cannot be predicted and may differ on master and the slave.
1718	HY000	ER_BINLOG_UNSAFE_CREATE_REPLACE_SELECT	CREATE... REPLACE SELECT is unsafe because the order in which rows are retrieved by the SELECT determines which (if any) row is replaced. This order cannot be predicted and may differ on master and the slave.
1719	HY000	ER_BINLOG_UNSAFE_UPDATE_IGNORE	UPDATE IGNORE is unsafe because the order in which rows are updated determines which (if any) rows are ignored. This order cannot be predicted and may differ on master and the slave.
1720		ER_UNUSED_15	You should never see it
1721		ER_UNUSED_16	You should never see it
1722	HY000	ER_BINLOG_UNSAFE_WRITE_AUTOINC_SELECT	Statements writing to a table with an auto-increment column after selecting from another table are unsafe because the order in which rows are retrieved determines what (if any) rows are written. This order cannot be predicted and may differ on master and the slave.
1723	HY000	ER_BINLOG_UNSAFE_CREATE_SELECT_AUTOINC	CREATE TABLE... SELECT... on a table with an auto-increment column is unsafe because the order in which rows are retrieved by the SELECT determines which (if any) rows are inserted. This order cannot be predicted and may differ on master and the slave.
1724	HY000	ER_BINLOG_UNSAFE_INSERT_TWO_KEYS	INSERT... ON DUPLICATE KEY UPDATE on a table with more than one UNIQUE KEY is unsafe.
1725	HY000	ER_TABLE_IN_FK_CHECK	Table is being used in foreign key check.
1726	HY000	ER_UNSUPPORTED_ENGINE	Storage engine '%s' does not support system tables. [%s.%s]
1727	HY000	ER_BINLOG_UNSAFE_AUTOINC_NOT_FIRST	INSERT into autoincrement field which is not the first part in the composed primary key is unsafe.
1728	HY000	ER_CANNOT_LOAD_FROM_TABLE_V2	Cannot load from %s.%s. The table is probably corrupted
1729	HY000	ER_MASTER_DELAY_VALUE_OUT_OF_RANGE	The requested value %s for the master delay exceeds the maximum %u
1730	HY000	ER_ONLY_FD_AND_RBR_EVENTS_ALLOWED_IN_BINLOG_STATEMENT	Only Format_description_log_event and row events are allowed in BINLOG statements. %s was provided
1731	HY000	ER_PARTITION_EXCHANGE_DIFFERENT_OPTION	Non matching attribute '%s' between partition and table
1732	HY000	ER_PARTITION_EXCHANGE_PART_TABLE	Table to exchange with partition is partition '%s'
1733	HY000	ER_PARTITION_EXCHANGE_TEMP_TABLE	Table to exchange with partition is temporary '%s'
1734	HY000	ER_PARTITION_INSTEAD_OF_SUBPARTITION	Subpartitioned table, use subpartition instead of partition
1735	HY000	ER_UNKNOWN_PARTITION	Unknown partition '%s' in table '%s'
1736	HY000	ER_TABLES_DIFFERENT_METADATA	Tables have different definitions
1737	HY000	ER_ROW_DOES_NOT_MATCH_PARTITION	Found a row that does not match the partition
1738	HY000	ER_BINLOG_CACHE_SIZE_GREATER_THAN_MAX	Option binlog_cache_size (%lu) is greater than max_binlog_cache_size (%lu); setting binlog_cache_size equal to max_binlog_cache_size.
1739	HY000	ER_WARN_INDEX_NOT_APPLICABLE	Cannot use %s access on index '%s' due to collation conversion on field '%s'
1740	HY000	ER_PARTITION_EXCHANGE_FOREIGN_KEY	Table to exchange with partition has foreign key references: '%s'
1741	HY000	ER_NO_SUCH_KEY_VALUE	Key value '%s' was not found in table '%s'.
1742	HY000	ER_RPL_INFO_DATA_TOO_LONG	Data for column '%s' too long
1743	HY000	ER_NETWORK_READ_EVENT_CHECKSUM_FAILURE	Replication event checksum verification failed while reading from network.

1744	HY000	ER_BINLOG_READ_EVENT_CHECKSUM_FAILURE	Replication event checksum verification failed while reading from a log file.
1745	HY000	ER_BINLOG_STMT_CACHE_SIZE_GREATER_THAN_MAX	Option binlog_stmt_cache_size (%lu) is greater than max_binlog_stmt_cache_size (%lu); set binlog_stmt_cache_size equal to max_binlog_stmt_cache_size.
1746	HY000	ER_CANT_UPDATE_TABLE_IN_CREATE_TABLE_SELECT	Can't update table '%s' while '%s' is being created.
1747	HY000	ER_PARTITION_CLAUSE_ON_NONPARTITIONED	PARTITION () clause on non partitioned table
1748	HY000	ER_ROW_DOES_NOT_MATCH_GIVEN_PARTITION_SET	Found a row not matching the given partition
1749	HY000	ER_NO_SUCH_PARTITION_UNUSED	partition '%s' doesn't exist
1750	HY000	ER_CHANGE_RPL_INFO_REPOSITORY_FAILURE	Failure while changing the type of replication repository: %s.
1751	HY000	ER_WARNING_NOT_COMPLETE_ROLLBACK_WITH_CREATED_TEMP_TABLE	The creation of some temporary tables could not be rolled back.
1752	HY000	ER_WARNING_NOT_COMPLETE_ROLLBACK_WITH_DROPPED_TEMP_TABLE	Some temporary tables were dropped, but operations could not be rolled back.
1753	HY000	ER_MTS_FEATURE_IS_NOT_SUPPORTED	%s is not supported in multi-threaded slave mode. %s
1754	HY000	ER_MTS_UPDATED_DBS_GREATER_MAX	The number of modified databases exceeded maximum %d; the database names will not be included in the replication event metadata.
1755	HY000	ER_MTS_CANT_PARALLEL	Cannot execute the current event group in parallel mode. Encountered event %s, relay log name %s, position %s which prevents execution of this event group in parallel mode. Reason: %s
1756	HY000	ER_MTS_INCONSISTENT_DATA	%s
1757	HY000	ER_FULLTEXT_NOT_SUPPORTED_WITH_PARTITIONING	FULLTEXT index is not supported for partitioned tables.
1758	35000	ER_DA_INVALID_CONDITION_NUMBER	Invalid condition number
1759	HY000	ER_INSECURE_PLAIN_TEXT	Sending passwords in plain text without SSL is extremely insecure.
1760	HY000	ER_INSECURE_CHANGE_MASTER	Storing MariaDB user name or password information in the master.info repository is insecure and is therefore not recommended. Please see the MariaDB Manual for more details on this issue and possible alternatives
1761	23000	ER_FOREIGN_DUPLICATE_KEY_WITH_CHILD_INFO	Foreign key constraint for table '%s', record %d would lead to a duplicate entry in table '%s' '%s'
1762	23000	ER_FOREIGN_DUPLICATE_KEY_WITHOUT_CHILD_INFO	Foreign key constraint for table '%s', record %d would lead to a duplicate entry in a child table
1763	HY000	ER_SQLTHREAD_WITH_SECURE_SLAVE	Setting authentication options is not possible when only the Slave SQL Thread is being started.
1764	HY000	ER_TABLE_HAS_NO_FT	The table does not have FULLTEXT index support this query
1765	HY000	ER_VARIABLE_NOT_SETTABLE_IN_SF_OR_TRIGGER	The system variable %s cannot be set in stored functions or triggers.
1766	HY000	ER_VARIABLE_NOT_SETTABLE_IN_TRANSACTION	The system variable %s cannot be set when there is an ongoing transaction.
1767	HY000	ER_GTID_NEXT_IS_NOT_IN_GTID_NEXT_LIST	The system variable @@SESSION.GTID_NEXT has the value %s, which is not listed in @@SESSION.GTID_NEXT_LIST.
1768	HY000	ER_CANT_CHANGE_GTID_NEXT_IN_TRANSACTION_WHEN_GTID_NEXT_LIST_IS_NULL	The system variable @@SESSION.GTID_NEXT cannot change inside a transaction.
1769	HY000	ER_SET_STATEMENT_CANNOT_INVOKE_FUNCTION	The statement 'SET %s' cannot invoke a stored function.
1770	HY000	ER_GTID_NEXT_CANT_BE_AUTOMATIC_IF_GTID_NEXT_LIST_IS_NON_NULL	The system variable @@SESSION.GTID_NEXT cannot be 'AUTOMATIC' when @@SESSION.GTID_NEXT_LIST is non-NULL
1771	HY000	ER_SKIPPING_LOGGED_TRANSACTION	Skipping transaction %s because it has already been executed and logged.
1772	HY000	ER_MALFORMED_GTID_SET_SPECIFICATION	Malformed GTID set specification '%s'.

1773	HY000	ER_MALFORMED_GTID_SET_ENCODING	Malformed GTID set encoding.
1774	HY000	ER_MALFORMED_GTID_SPECIFICATION	Malformed GTID specification '%s'.
1775	HY000	ER_GNO_EXHAUSTED	Impossible to generate Global Transaction Identifier: the integer component reached the maximal value. Restart the server with a new server_uuid.
1776	HY000	ER_BAD_SLAVE_AUTO_POSITION	Parameters MASTER_LOG_FILE, MASTER_LOG_POS, RELAY_LOG_FILE, RELAY_LOG_POS cannot be set when MASTER_AUTO_POSITION is active.
1777	HY000	ER_AUTO_POSITION_REQUIRES_GTID_MODE_ON	CHANGE MASTER TO MASTER_AUTO_POSITION = 1 can only be executed when @@GLOBAL.GTID_MODE = ON.
1778	HY000	ER_CANT_DO_IMPLICIT_COMMIT_IN_TRX_WHEN_GTID_NEXT_IS_SET	Cannot execute statements with implicit commit inside a transaction when @@SESSION.GTID_NEXT != AUTOMATIC.
1779	HY000	ER_GTID_MODE_2_OR_3_REQUIRES_DISABLE_GTID_UNSAFE_STATEMENTS_ON	GTID_MODE = ON or GTID_MODE = ON_WITH_ANNOTATIONS requires UPGRADE_STEP_2 requires DISABLE_GTID_UNSAFE_STATEMENTS = ON.
1779	HY000	ER_GTID_MODE_2_OR_3_REQUIRES_ENFORCE_GTID_CONSISTENCY_ON	@@GLOBAL.GTID_MODE = ON or UPGRADE_STEP_2 requires @@GLOBAL.ENFORCE_GTID_CONSISTENCY = 1.
1780	HY000	ER_GTID_MODE_REQUIRES_BINLOG	@@GLOBAL.GTID_MODE = ON or UPGRADE_STEP_1 or UPGRADE_STEP_2 requires --log-bin and --log-slave-updates.
1781	HY000	ER_CANT_SET_GTID_NEXT_TO_GTID_WHEN_GTID_MODE_IS_OFF	@@SESSION.GTID_NEXT cannot be set to a GTID when @@GLOBAL.GTID_MODE = OFF.
1782	HY000	ER_CANT_SET_GTID_NEXT_TO_ANONYMOUS_WHEN_GTID_MODE_IS_ON	@@SESSION.GTID_NEXT cannot be set to ANONYMOUS when @@GLOBAL.GTID_MODE = ON.
1783	HY000	ER_CANT_SET_GTID_NEXT_LIST_TO_NON_NULL_WHEN_GTID_MODE_IS_OFF	@@SESSION.GTID_NEXT_LIST cannot be set to a non-NULL value when @@GLOBAL.GTID_MODE = OFF.
1784	HY000	ER_FOUND_GTID_EVENT_WHEN_GTID_MODE_IS_OFF	Found a Gtid_log_event or Previous_gtid_log_event when @@GLOBAL.GTID_MODE = OFF.
1785	HY000	ER_GTID_UNSAFE_NON_TRANSACTIONAL_TABLE	When @@GLOBAL.ENFORCE_GTID_CONSISTENCY = 1, updates to non-transactional tables can be done in either autocommitted statement, single-statement transactions, and never in the same statement as updates to transactional tables.
1786	HY000	ER_GTID_UNSAFE_CREATE_SELECT	CREATE TABLE ... SELECT is forbidden when @@GLOBAL.ENFORCE_GTID_CONSISTENCY = 1.
1787	HY000	ER_GTID_UNSAFE_CREATE_DROP_TEMPORARY_TABLE_IN_TRANSACTION	When @@GLOBAL.ENFORCE_GTID_CONSISTENCY = 1, the statements CREATE TEMPORARY TABLE and DROP TEMPORARY TABLE cannot be executed in a non-transactional context and must require that AUTOCOMMIT = 1.
1788	HY000	ER_GTID_MODE_CAN_ONLY_CHANGE_ONE_STEP_AT_A_TIME	The value of @@GLOBAL.GTID_MODE can only change one step at a time: OFF <-> OFF_WITH_ANNOTATIONS <-> UPGRADE_STEP_1 <-> UPGRADE_STEP_2 <-> ON. Also note that this value must be set up or down simultaneously on all servers; see Manual for instructions.
1789	HY000	ER_MASTER_HAS_PURGED_REQUIRED_GTIDS	The slave is connecting using CHANGE MASTER TO MASTER_AUTO_POSITION = 1 but the master has purged binary logs containing GTIDs that the slave requires.
1790	HY000	ER_CANT_SET_GTID_NEXT_WHEN_OWNING_GTID	@@SESSION.GTID_NEXT cannot be changed by a client that owns a GTID. The client owns the GTID. Ownership is released on COMMIT or ROLLBACK.
1791	HY000	ER_UNKNOWN_EXPLAIN_FORMAT	Unknown EXPLAIN format name: '%s'
1792	25006	ER_CANT_EXECUTE_IN_READ_ONLY_TRANSACTION	Cannot execute statement in a READ ONLY transaction.

1793	HY000	ER_TOO_LONG_TABLE_PARTITION_COMMENT	Comment for table partition '%s' is too long = %lu
1794	HY000	ER_SLAVE_CONFIGURATION	Slave is not configured or failed to initialize properly. You must at least set --server-id to enable either a master or a slave. Additional messages can be found in the MariaDB error log
1795	HY000	ER_INNOODB_FT_LIMIT	InnoDB presently supports one FULLTEXT creation at a time
1796	HY000	ER_INNOODB_NO_FT_TEMP_TABLE	Cannot create FULLTEXT index on temporary InnoDB table
1797	HY000	ER_INNOODB_FT_WRONG_DOCID_COLUMN	Column '%s' is of wrong type for an InnoDB FULLTEXT index
1798	HY000	ER_INNOODB_FT_WRONG_DOCID_INDEX	Index '%s' is of wrong type for an InnoDB FULLTEXT index
1799	HY000	ER_INNOODB_ONLINE_LOG_TOO_BIG	Creating index '%s' required more than 'innodb_online_alter_log_max_size' bytes of modification log. Please try again.

Error Code	SQLSTATE	Error	Description
1800	HY000	ER_UNKNOWN_ALTER_ALGORITHM	Unknown ALGORITHM
1801	HY000	ER_UNKNOWN_ALTER_LOCK	Unknown LOCK type '%s'
1802	HY000	ER_MTS_CHANGE_MASTER_CANT_RUN_WITH_GAPS	CHANGE MASTER cannot be executed when the slave is stopped with an error in MTS mode. Consider using RESET SLAVE or START SLAVE UNTIL.
1803	HY000	ER_MTS_RECOVERY_FAILURE	Cannot recover after Slave errored out in parallel replication mode. Additional error messages can be found in the MariaDB error log
1804	HY000	ER_MTS_RESET_WORKERS	Cannot clean up worker tables. Additional error messages can be found in the MariaDB error log
1805	HY000	ER_COL_COUNT_DoesNT_MATCH_CORRUPTED_V2	Column count of %s.%s is wrong. Expected %d, found %d. The table is probably corrupted
1806	HY000	ER_SLAVE_SILENT_RETRY_TRANSACTION	Slave must silently retry transaction
1807	HY000	ER_DISCARD_FK_CHECKS_RUNNING	There is a foreign key check running on table '%s'. Please discard the table.
1808	HY000	ER_TABLE_SCHEMA_MISMATCH	Schema mismatch (%s.%s vs %s.%s)
1809	HY000	ER_TABLE_IN_SYSTEM_TABLESPACE	Table '%s' in system tablespace
1810	HY000	ER_IO_READ_ERROR	IO Read error: (%lu, %s)
1811	HY000	ER_IO_WRITE_ERROR	IO Write error: (%lu, %s)
1812	HY000	ER_TABLESPACE_MISSING	Tablespace is missing '%s'
1813	HY000	ER_TABLESPACE_EXISTS	Tablespace for table '%s' already exists. Please DISCARD the table before IMPORT.

1814 	HY000	ER_TABLESPACE_DISCARDED	Tablespace has been discarded for table '%s'
1815 	HY000	ER_INTERNAL_ERROR	Internal error: %s
1816 	HY000	ER_INNODB_IMPORT_ERROR	ALTER TABLE '%s' IMPORT TABLESPACE failed with error %lu : '%s'
1817 	HY000	ER_INNODB_INDEX_CORRUPT	Index corrupt: %s
1818 	HY000	ER_INVALID_YEAR_COLUMN_LENGTH	YEAR(%lu) column type is deprecated. Creating YEAR(4) column instead.
1819 	HY000	ER_NOT_VALID_PASSWORD	Your password does not meet the current policy requirements.
1820 	HY000	ER_MUST_CHANGE_PASSWORD	You must SET PASSWORD before executing this statement.
1821 	HY000	ER_FK_NO_INDEX_CHILD	Failed to add the foreign key constraint. Missing index on constraint '%s' in the child table '%s'.
1822 	HY000	ER_FK_NO_INDEX_PARENT	Failed to add the foreign key constraint. Missing index on constraint '%s' in the parent table '%s'.
1823 	HY000	ER_FK_FAIL_ADD_SYSTEM	Failed to add the foreign key constraint '%s' to system.
1824 	HY000	ER_FK_CANNOT_OPEN_PARENT	Failed to open the referenced table '%s'.
1825 	HY000	ER_FK_INCORRECT_OPTION	Failed to add the foreign key constraint on table '%s'. Invalid options in FOREIGN KEY constraint '%s'.
1826 	HY000	ER_FK_DUP_NAME	Duplicate foreign key constraint name '%s'.
1827 	HY000	ER_PASSWORD_FORMAT	The password hash does not match the expected format. Consider using a correct password algorithm being used with the PASSWORD() function.
1828 	HY000	ER_FK_COLUMN_CANNOT_DROP	Cannot drop column '%s': needed in a foreign key constraint '%s'.
1829 	HY000	ER_FK_COLUMN_CANNOT_DROP_CHILD	Cannot drop column '%s': needed in a foreign key constraint '%s' of table '%s'.
1830 	HY000	ER_FK_COLUMN_NOT_NULL	Column '%s' cannot be NULL: needed in a foreign key constraint '%s' SET NULL.
1831 	HY000	ER_DUP_INDEX	Duplicate index '%s' defined on the table '%s.%s'. This is deprecated and will be disallowed in a future release.
1832 	HY000	ER_FK_COLUMN_CANNOT_CHANGE	Cannot change column '%s' used in a foreign key constraint '%s'.

1833 	HY000	ER_FK_COLUMN_CANNOT_CHANGE_CHILD	Cannot change column used in a foreign key constraint '%s' of table '%s'
1834 	HY000	ER_FK_CANNOT_DELETE_PARENT	Cannot delete rows from which is parent in a foreign key constraint '%s' of table '%s'
1835 	HY000	ER_MALFORMED_PACKET	Malformed communication packet.
1836 	HY000	ER_READ_ONLY_MODE	Running in read-only mode
1837 	HY000	ER_GTID_NEXT_TYPE_UNDEFINED_GROUP	When GTID_NEXT is set to a GTID, you must explicitly set it again after a COMMIT or ROLLBACK. If you see this message in the slave SQL thread, it means that a transaction is running on the master that is non-transactional on the slave. On a client connection, it means you executed SET GTID_NEXT before a transaction started. To set GTID_NEXT to a specific GTID identifier or to 'AUTOMATIC' after COMMIT or ROLLBACK, the current GTID_NEXT is NULL.
1838 	HY000	ER_VARIABLE_NOT_SETTABLE_IN_SP	The system variable '%s' cannot be set in stored procedure.
1839 	HY000	ER_CANT_SET_GTID_PURGED_WHEN_GTID_MODE_IS_OFF	@@GLOBAL.GTID_PURGED can only be set when @@GLOBAL.GTID_MODE is ON.
1840 	HY000	ER_CANT_SET_GTID_PURGED_WHEN_GTID_EXECUTED_IS_NOT_EMPTY	@@GLOBAL.GTID_PURGED can only be set when @@GLOBAL.GTID_EXECUTED is empty.
1841 	HY000	ER_CANT_SET_GTID_PURGED_WHEN_OWNED_GTIDS_IS_NOT_EMPTY	@@GLOBAL.GTID_PURGED can only be set when there are no ongoing transactions (even in other clients).
1842 	HY000	ER_GTID_PURGED_WAS_CHANGED	@@GLOBAL.GTID_PURGED was changed from '%s' to '%s'.
1843 	HY000	ER_GTID_EXECUTED_WAS_CHANGED	@@GLOBAL.GTID_EXECUTED was changed from '%s' to '%s'.
1844 	HY000	ER_BINLOG_STMT_MODE_AND_NO_REPL_TABLES	Cannot execute statement since BINLOG forms (STATEMENT, and both replicated and non replicated tables are written to).
1845 	0A000	ER_ALTER_OPERATION_NOT_SUPPORTED	'%s' is not supported for operation. Try '%s'.
1846 	0A000	ER_ALTER_OPERATION_NOT_SUPPORTED_REASON	'%s' is not supported. Reason: '%s'. Try '%s'.
1847 	HY000	ER_ALTER_OPERATION_NOT_SUPPORTED_REASON_COPY	COPY algorithm required.

1848 	HY000	ER_ALTER_OPERATION_NOT_SUPPORTED_REASON_PARTITION	Partition specific operation not yet support LOCK/ALGORITHM
1849 	HY000	ER_ALTER_OPERATION_NOT_SUPPORTED_REASON_FK_RENAME	Columns participating in foreign key are renamed
1850 	HY000	ER_ALTER_OPERATION_NOT_SUPPORTED_REASON_COLUMN_TYPE	Cannot change column INPLACE
1851 	HY000	ER_ALTER_OPERATION_NOT_SUPPORTED_REASON_FK_CHECK	Adding foreign keys need foreign_key_checks=C
1852 	HY000	ER_ALTER_OPERATION_NOT_SUPPORTED_REASON_IGNORE	Creating unique index IGNORE requires COF algorithm to remove duplicate rows
1853 	HY000	ER_ALTER_OPERATION_NOT_SUPPORTED_REASON_NOPK	Dropping a primary key allowed without also adding new primary key
1854 	HY000	ER_ALTER_OPERATION_NOT_SUPPORTED_REASON_AUTOINC	Adding an auto-increment column requires a lock
1855 	HY000	ER_ALTER_OPERATION_NOT_SUPPORTED_REASON_HIDDEN_FTS	Cannot replace hidden FTS_DOC_ID with a unique one
1856 	HY000	ER_ALTER_OPERATION_NOT_SUPPORTED_REASON_CHANGE_FTS	Cannot drop or rename FTS_DOC_ID
1857 	HY000	ER_ALTER_OPERATION_NOT_SUPPORTED_REASON_FTS	Fulltext index creation lock
1858 	HY000	ER_SQL_SLAVE_SKIP_COUNTER_NOT_SETTABLE_IN_GTID_MODE	sql_slave_skip_counter can be set when the server running with @@GLOBAL.GTID_MODE=ON. Instead, for each transaction that you want to skip, create an empty transaction with same GTID as the transaction
1859 	23000	ER_DUP_UNKNOWN_IN_INDEX	Duplicate entry for key
1860 	HY000	ER_IDENT_CAUSES_TOO_LONG_PATH	Long database name or identifier for object results in path length exceeding 255 characters. Path: '%s'.
1861 	HY000	ER_ALTER_OPERATION_NOT_SUPPORTED_REASON_NOT_NULL	cannot silently convert values, as required in TRANSACTION SQL_MODE
1862 	HY000	ER_MUST_CHANGE_PASSWORD_LOGIN	Your password has expired, log in you must change password. client that supports explicit passwords.
1863 	HY000	ER_ROW_IN_WRONG_PARTITION	Found a row in wrong partition %s
1864 	HY000	ER_MTS_EVENT_BIGGER_PENDING_JOBS_SIZE_MAX	Cannot schedule event relay-log name %s, position %lu to Worker thread because size %lu exceeds %lu slave_pending_jobs_size_max
1865 	HY000	ER_INNODB_NO_FT_USES_PARSER	Cannot CREATE FULLTEXT INDEX WITH PARSEF on InnoDB table

1866 	HY000	ER_BINLOG_LOGICAL_CORRUPTION	The binary log file '%s' logically corrupted: %s
1867 	HY000	ER_WARN_PURGE_LOG_IN_USE	file %s was not purged it was being read by % thread(s), purged only %d files.
1868 	HY000	ER_WARN_PURGE_LOG_IS_ACTIVE	file %s was not purged it is the active log file.
1869 	HY000	ER_AUTO_INCREMENT_CONFLICT	Auto-increment value i UPDATE conflicts with generated values
1870 	HY000	WARN_ON_BLOCKHOLE_IN_RBR	Row events are not log %s statements that mc BLACKHOLE tables in format. Table(s): '%s'
1871 	HY000	ER_SLAVE_MI_INIT_REPOSITORY	Slave failed to initialize info structure from the
1872 	HY000	ER_SLAVE_RLI_INIT_REPOSITORY	Slave failed to initialize info structure from the

1932		ER_NO_SUCH_TABLE_IN_ENGINE 42S02	Table '%-.192s'.%-.192s' doesn't exist in engine
1933		ER_TARGET_NOT_EXPLAINABLE	Target is not running an EXPLAINable command
1934		ER_CONNECTION_ALREADY_EXISTS	Connection '%.*s' conflicts with existing connection '%.*s'
1935		ER_MASTER_LOG_PREFIX	Master '%.*s':
1936		ER_CANT_START_STOP_SLAVE	Can't %s SLAVE '%.*s'

1937		ER_SLAVE_STARTED	SLAVE '%.*s' started
1938		ER_SLAVE_STOPPED	SLAVE '%.*s' stopped
1939		ER_SQL_DISCOVER_ERROR	Engine %s failed to discover table %'-%.192s.%'-%.192s with '%s'
1940		ER_FAILED_GTID_STATE_INIT	Failed initializing replication GTID state
1941		ER_INCORRECT_GTID_STATE	Could not parse GTID list
1942		ER_CANNOT_UPDATE_GTID_STATE	Could not update replication slave gtid state
1943		ER_DUPLICATE_GTID_DOMAIN	GTID %u-%u-%llu and %u-%u-%llu conflict (duplicate domain id %u)
1944		ER_GTID_OPEN_TABLE_FAILED	Failed to open %s.%s
1945		ER_GTID_POSITION_NOT_FOUND_IN_BINLOG	Connecting slave requested to start from GTID %u-%u-%llu, which is not in the master's binlog
1946		ER_CANNOT_LOAD_SLAVE_GTID_STATE	Failed to load replication slave GTID position from table %s.%s
1947		ER_MASTER_GTID_POS_CONFLICTS_WITH_BINLOG	Specified GTID %u-%u-%llu conflicts with the binary log which contains a more recent GTID %u-%u-%llu. If MASTER_GTID_POS=CURRENT_POS is used, the binlog position will override the new value of @@gtid_slave_pos.
1948		ER_MASTER_GTID_POS_MISSING_DOMAIN	Specified value for @@gtid_slave_pos contains no value for replication domain %u. This conflicts with the binary log which contains GTID %u-%u-%llu. If MASTER_GTID_POS=CURRENT_POS is used, the binlog position will override the new value of @@gtid_slave_pos.
1949		ER_UNTIL_REQUIRES_USING_GTID	START SLAVE UNTIL master_gtid_pos requires that slave is using GTID
1950		ER_GTID_STRICT_OUT_OF_ORDER	An attempt was made to binlog GTID %u-%u-%llu which would create an out-of-order sequence number with existing GTID %u-%u-%llu, and gtid strict mode is enabled.
1951		ER_GTID_START_FROM_BINLOG_HOLE	The binlog on the master is missing the GTID %u-%u-%llu requested by the slave (even though a subsequent sequence number does exist), and GTID strict mode is enabled
1952		ER_SLAVE_UNEXPECTED_MASTER_SWITCH	Unexpected GTID received from master after reconnect. This normally indicates that the master server was replaced without restarting the slave threads. %s
1953		ER_INSIDE_TRANSACTION_PREVENTS_SWITCH_GTID_DOMAIN_ID_SEQ_NO	Cannot modify @@session.gtid_domain_id or @@session.gtid_seq_no inside a transaction
1954		ER_STORED_FUNCTION_PREVENTS_SWITCH_GTID_DOMAIN_ID_SEQ_NO	Cannot modify @@session.gtid_domain_id or @@session.gtid_seq_no inside a stored function or trigger
1955		ER_GTID_POSITION_NOT_FOUND_IN_BINLOG2	Connecting slave requested to start from GTID %u-%u-%llu, which is not in the master's binlog. Since the master's binlog contains GTIDs with higher sequence numbers, it probably means that the slave has diverged due to executing extra erroneous transactions
1956		ER_BINLOG_MUST_BE_EMPTY	This operation is not allowed if any GTID has been logged to the binary log. Run RESET MASTER first to erase the log
1957		ER_NO_SUCH_QUERY	Unknown query id: %ld
1958		ER_BAD_BASE64_DATA	Bad base64 data as position %u
1959		ER_INVALID_ROLE	Invalid role specification '%s'.
1960		ER_INVALID_CURRENT_USER	The current user is invalid.
1961		ER_CANNOT_GRANT_ROLE	Cannot grant role '%s' to: %s.
1962		ER_CANNOT_REVOKE_ROLE	Cannot revoke role '%s' from: %s.

1963		ER_CHANGE_SLAVE_PARALLEL_THREADS_ACTIVE	Cannot change @@slave_parallel_threads while another change is in progress
1964		ER_PRIOR_COMMIT_FAILED	Commit failed due to failure of an earlier commit on which this one depends
1965		ER_IT_IS_A_VIEW	'%-.192s' is a view
1966		ER_SLAVE_SKIP_NOT_IN_GTID	When using GTID, @@sql_slave_skip_counter can not be used. Instead, setting @@gtid_slave_pos explicitly can be used to skip to after a given GTID position.
1967		ER_TABLE_DEFINITION_TOO_BIG	The definition for table %s is too big
1968		ER_PLUGIN_INSTALLED	Plugin '%-.192s' already installed
1969		ER_STATEMENT_TIMEOUT	Query execution was interrupted (max_statement_time exceeded)
1970		ER_SUBQUERIES_NOT_SUPPORTED	%s does not support subqueries or stored functions.
1971		ER_SET_STATEMENT_NOT_SUPPORTED	The system variable %s cannot be set in SET STATEMENT.
1972		ER_UNUSED_9	You should never see it
1973		ER_USER_CREATE_EXISTS	Can't create user '%-.64s'@'%-.64s'; it already exists
1974		ER_USER_DROP_EXISTS	Can't drop user '%-.64s'@'%-.64s'; it doesn't exist
1975		ER_ROLE_CREATE_EXISTS	Can't create role '%-.64s'; it already exists
1976		ER_ROLE_DROP_EXISTS	Can't drop role '%-.64s'; it doesn't exist
1977		ER_CANNOT_CONVERT_CHARACTER	Cannot convert '%s' character 0x%-.64s to '%s'
1978		ER_INVALID_DEFAULT_VALUE_FOR_FIELD	Incorrect default value '%-.128s' for column '%.192s'
1979		ER_KILL_QUERY_DENIED_ERROR	You are not owner of query %lu
1980		ER_NO_EIS_FOR_FIELD	Engine-independent statistics are not collected for column '%s'
1981		ER_WARN_AGGFUNC_DEPENDENCE	Aggregate function '%-.192s' of SELECT #%d belongs to SELECT #%d
1982		WARN_INNOODB_PARTITION_OPTION_IGNORED	<%-.64s> option ignored for InnoDB partition

Error Code	SQLSTATE	Error	Description
3000		ER_FILE_CORRUPT	File %s is corrupted
3001		ER_ERROR_ON_MASTER	Query partially completed on the master (on master: %d) and was aborted. There is a chance that your master is inconsistent at this point. If you are sure that your master is consistent, you can restart this query manually on the slave and then restart the slave with SET GLOBAL SQL_SLAVE_SKIP_COUNTER=1; START SLAVE;. Query:'%s'
3002		ER_INCONSISTENT_ERROR	Query caused different errors on master and slave. Error on master: message (format: '%s', error code=%d); Error on slave: actual message='%s', error code=%d. Default database:'%s'. Query:'%s'
3003		ER_STORAGE_ENGINE_NOT_LOADED	Storage engine for table '%s'.'%s' is not loaded
3004		ER_GET_STACKED_DIAGNOSTICS_WITHOUT_ACTIVE_HANDLER 0Z002	GET STACKED DIAGNOSTICS when no active handler
3005		ER_WARN_LEGACY_SYNTAX_CONVERTED	%s is no longer supported. The statement was converted to %s.

3006 🔗		ER_BINLOG_UNSAFE_FULLTEXT_PLUGIN	Statement is unsafe because it uses a parser plugin which may not return the value on the slave.
3007 🔗		ER_CANNOT_DISCARD_TEMPORARY_TABLE	Cannot DISCARD/IMPORT tablespace associated with temporary table
3008 🔗		ER_FK_DEPTH_EXCEEDED	Foreign key cascade delete/update exceeded max depth of %d.
3009 🔗		ER_COL_COUNT_DOESNT_MATCH_PLEASE_UPDATE_V2	Column count of %s.%s is wrong. Expected %d, found %d. Created with MariaDB % running %d. Please use mysql_upgrade this error.
3010 🔗		ER_WARN_TRIGGER_DOESNT_HAVE_CREATED	Trigger %s.%s.%s does not have CREATE attribute.
3011 🔗		ER_REFERENCED_TRG_DOES_NOT_EXIST_MYSQL	Referenced trigger '%s' for the given action and event type does not exist.
3012 🔗		ER_EXPLAIN_NOT_SUPPORTED	EXPLAIN FOR CONNECTION command supported only for SELECT/UPDATE/INSERT/DELETE/REPLACE
3013 🔗		ER_INVALID_FIELD_SIZE	Invalid size for column '%-.192s'.
3014 🔗		ER_MISSING_HA_CREATE_OPTION	Table storage engine '%-.64s' found re-create option missing
3015 🔗		ER_ENGINE_OUT_OF_MEMORY	Out of memory in storage engine '%-.64s'.
3016 🔗		ER_PASSWORD_EXPIRE_ANONYMOUS_USER	The password for anonymous user can expire.
3017 🔗		ER_SLAVE_SQL_THREAD_MUST_STOP	This operation cannot be performed while running slave sql thread; run STOP SLAVE SQL_THREAD first
3018 🔗		ER_NO_FT_MATERIALIZED_SUBQUERY	Cannot create FULLTEXT index on materialized subquery
3019 🔗		ER_INNODB_UNDO_LOG_FULL	Undo Log error: %s
3020 🔗		ER_INVALID_ARGUMENT_FOR_LOGARITHM	Invalid argument for logarithm
3021 🔗		ER_SLAVE_CHANNEL_IO_THREAD_MUST_STOP	This operation cannot be performed while running slave io thread; run STOP SLAVE IO_THREAD FOR CHANNEL '%s' first
3022 🔗		ER_WARN_OPEN_TEMP_TABLES_MUST_BE_ZERO	This operation may not be safe when there are temporary tables. The tables will be open until the server restarts or until they are deleted by any replicated DROP statement. Suggest to wait until slave_open_temp_tables = 0.
3023 🔗		ER_WARN_ONLY_MASTER_LOG_FILE_NO_POS	CHANGE MASTER TO with a MASTER_LOG_FILE clause but no MASTER_LOG_POS clause may not be valid. The old position value may not be valid for the new binary log file.
3024		ER_QUERY_TIMEOUT	Query execution was interrupted, maximum statement execution time exceeded
3025 🔗		ER_NON_RO_SELECT_DISABLE_TIMER	Select is not a read only statement, disable timer
3026 🔗		ER_DUP_LIST_ENTRY	Duplicate entry '%-.192s'.
3027 🔗		ER_SQL_MODE_NO_EFFECT	'%s' mode no longer has any effect. Use STRICT_ALL_TABLES or STRICT_TRANS_TABLES instead.
3028 🔗		ER_AGGREGATE_ORDER_FOR_UNION	Expression #%u of ORDER BY contains aggregate function and applies to a UNION

3029 🔗		ER_AGGREGATE_ORDER_NON_AGG_QUERY	Expression #%u of ORDER BY contain aggregate function and applies to the non-aggregated query
3030 🔗		ER_SLAVE_WORKER_STOPPED_PREVIOUS_THD_ERROR	Slave worker has stopped after at least previous worker encountered an error \ slave-preserve-commit-order was enabled preserve commit order, the last transaction executed by this thread has not been committed. When restarting the slave and fixing any failed threads, you should fix worker as well.
3031 🔗		ER_DONT_SUPPORT_SLAVE_PRESERVE_COMMIT_ORDER	slave_preserve_commit_order is not supported %s.
3032 🔗		ER_SERVER_OFFLINE_MODE	The server is currently in offline mode
3033 🔗		ER_GIS_DIFFERENT_SRIDS	Binary geometry function %s given two geometries of different srids: %u and % should have been identical.
3034 🔗		ER_GIS_UNSUPPORTED_ARGUMENT	Calling geometry function %s with unsupported types of arguments.

4114 🔗		WARN_VERS_PART_FULL	Versioned table %`s.%`s: last HISTORY partition (%`s) is out of %s, need more HISTORY partitions
4115 🔗		WARN_VERS_PARAMETERS	Maybe missing parameters: %s
4116 🔗		ER_VERS_DROP_PARTITION_INTERVAL	Can only drop oldest partitions when rotating by INTERVAL

4117 		ER_UNUSED_25	You should never see it
4118 		WARN_VERS_PART_NON_HISTORICAL	Partition %`s contains non-historical data
4119 		ER_VERS_ALTER_NOT_ALLOWED	Not allowed for system-versioned %`s.%`s. Change @@system_versioning_alter_history to proceed with ALTER.
4120 		ER_VERS_ALTER_ENGINE_PROHIBITED	Not allowed for system-versioned %`s.%`s. Change to/from native system versioning engine is not supported.
4121 		ER_VERS_RANGE_PROHIBITED	SYSTEM_TIME range selector is not allowed
4122 		ER_CONFLICTING_FOR_SYSTEM_TIME	Conflicting FOR SYSTEM_TIME clauses in WITH RECURSIVE
4123 		ER_VERS_TABLE_MUST_HAVE_COLUMNS	Table %`s must have at least one versioned column
4124 		ER_VERS_NOT_VERSIONED	Table %`s is not system-versioned
4125 		ER_MISSING	Wrong parameters for %`s: missing '%s'
4126 		ER_VERS_PERIOD_COLUMNS	PERIOD FOR SYSTEM_TIME must use columns %`s and %`s
4127 		ER_PART_WRONG_VALUE	Wrong parameters for partitioned %`s: wrong value for '%s'
4128 		ER_VERS_WRONG_PARTS	Wrong partitions for %`s: must have at least one HISTORY and exactly one last CURRENT
4129 		ER_VERS_NO_TRX_ID	TRX_ID %llu not found in `mysql.transaction_registry`
4130 		ER_VERS_ALTER_SYSTEM_FIELD	Can not change system versioning field %`s
4131 		ER_DROP_VERSIONING_SYSTEM_TIME_PARTITION	Can not DROP SYSTEM VERSIONING for table %`s partitioned BY SYSTEM_TIME
4132 		ER_VERS_DB_NOT_SUPPORTED	System-versioned tables in the %`s database are not supported
4133 		ER_VERS_TRT_IS_DISABLED	Transaction registry is disabled
4134 		ER_VERS_DUPLICATE_ROW_START_END	Duplicate ROW %s column %`s
4135 		ER_VERS_ALREADY_VERSIONED	Table %`s is already system-versioned
4136 		ER_UNUSED_24	You should never see it
4137 		ER_VERS_NOT_SUPPORTED	System-versioned tables do not support %s
4138 		ER_VERS_TRX_PART_HISTORIC_ROW_NOT_SUPPORTED	Transaction-precise system-versioned tables do not support partitioning by ROW START or ROW END
4139 		ER_INDEX_FILE_FULL	The index file for table '%-.192s' is full
4140 		ER_UPDATED_COLUMN_ONLY_ONCE	The column %`s.%`s cannot be changed more than once in a single UPDATE statement

4141 🔗		ER_EMPTY_ROW_IN_TVC	Row with no elements is not allowed in table value constructor in this context
4142 🔗		ER_VERS_QUERY_IN_PARTITION	SYSTEM_TIME partitions in table %`s does not support historical query
4143 🔗		ER_KEY_DOESNT_SUPPORT	%s index %`s does not support this operation
4144 🔗		ER_ALTER_OPERATION_TABLE_OPTIONS_NEED_REBUILD	Changing table options requires the table to be rebuilt
4145 🔗		ER_BACKUP_LOCK_IS_ACTIVE	Can't execute the command as you have a BACKUP STAGE active
4146 🔗		ER_BACKUP_NOT_RUNNING	You must start backup with "BACKUP STAGE START"
4147 🔗		ER_BACKUP_WRONG_STAGE	Backup stage %`s' is same or before current backup stage %`s'
4148 🔗		ER_BACKUP_STAGE_FAILED	Backup stage %`s' failed
4149 🔗		ER_BACKUP_UNKNOWN_STAGE	Unknown backup stage: %`s'. Stage should be one of START, FLUSH, BLOCK_DDL, BLOCK_COMMIT or END
4150 🔗		ER_USER_IS_BLOCKED	User is blocked because of too many credential errors; unblock with 'FLUSH PRIVILEGES'
4151 🔗		ER_ACCOUNT_HAS_BEEN_LOCKED	Access denied, this account is locked
4152 🔗		ER_PERIOD_TEMPORARY_NOT_ALLOWED	Application-time period table cannot be temporary
4153 🔗		ER_PERIOD_TYPES_MISMATCH	Fields of PERIOD FOR %`s have different types
4154 🔗		ER_MORE_THAN_ONE_PERIOD	Cannot specify more than one application-time period
4155 🔗		ER_PERIOD_FIELD_WRONG_ATTRIBUTES	Period field %`s cannot be %s
4156 🔗		ER_PERIOD_NOT_FOUND	Period %`s is not found in table
4157 🔗		ER_PERIOD_COLUMNS_UPDATED	Column %`s used in period %`s specified in update SET list
4158 🔗		ER_PERIOD_CONSTRAINT_DROP	Can't DROP CONSTRAINT %`s`. Use DROP PERIOD %`s` for this
4159 🔗	42000 S1009	ER_TOO_LONG_KEYPART	Specified key part was too long; max key part length is %u bytes
4160 🔗		ER_TOO_LONG_DATABASE_COMMENT	Comment for database %`s is too long (max = %u)
4161 🔗		ER_UNKNOWN_DATA_TYPE	Unknown data type: %`s'
4162 🔗		ER_UNKNOWN_OPERATOR	Operator does not exists: %`s'
4163 🔗		ER_WARN_HISTORY_ROW_START_TIME	Table %`s.%`s` history row start %`s' is later than row end %`s'
4164 🔗		ER_PART_STARTS_BEYOND_INTERVAL	%`s: STARTS is later than query time, first history partition may exceed INTERVAL value
4165 🔗		ER_GALERA_REPLICATION_NOT_SUPPORTED	DDL-statement is forbidden as table storage engine does not support Galera replication

4166 	HY000	ER_LOAD_INFILE_CAPABILITY_DISABLED	The used command is not allowed because the MariaDB server or client has disabled the local infile capability
4167 		ER_NO_SECURE_TRANSPORTS_CONFIGURED	No secure transports are configured, unable to set --require_secure_transport=ON
4168 		ER_SLAVE_IGNORED_SHARED_TABLE	Slave SQL thread ignored the '%s' because table is shared
4169 		ER_NO_AUTOINCREMENT_WITH_UNIQUE	AUTO_INCREMENT column %s cannot be used in the UNIQUE index %s
4170 		ER_KEY_CONTAINS_PERIOD_FIELDS	Key %s cannot explicitly include column %s
4171 		ER_KEY_CANT_HAVE_WITHOUT_OVERLAPS	Key %s cannot have WITHOUT OVERLAPS
4172 		ER_NOT_ALLOWED_IN_THIS_CONTEXT	'%-.128s' is not allowed in this context
4173 		ER_DATA_WAS_COMMITTED_UNDER_ROLLBACK	Engine %s does not support rollback. Changes were committed during rollback call
4174 		ER_PK_INDEX_CANT_BE_IGNORED	A primary key cannot be marked as IGNORE
4175 		ER_BINLOG_UNSAFE_SKIP_LOCKED	SKIP LOCKED makes this statement unsafe
4176 		ER_JSON_TABLE_ERROR_ON_FIELD	Field '%s' can't be set for JSON_TABLE '%s'.
4177 		ER_JSON_TABLE_ALIAS_REQUIRED	Every table function must have an alias.
4178 		ER_JSON_TABLE_SCALAR_EXPECTED	Can't store an array or an object in the scalar column '%s' of JSON_TABLE '%s'.
4179 		ER_JSON_TABLE_MULTIPLE_MATCHES	Can't store multiple matches of the path in the column '%s' of JSON_TABLE '%s'.
4180 		ER_WITH_TIES_NEEDS_ORDER	FETCH ... WITH TIES requires ORDER BY clause to be present
4181 		ER_REMOVED_ORPHAN_TRIGGER	Dropped orphan trigger '%-.64s', originally created for table: '%-.192s'
4182 		ER_STORAGE_ENGINE_DISABLED	Storage engine %s is disabled
4183 		WARN_SFORMAT_ERROR	SFORMAT error: %s
4184 		ER_PARTITION_CONVERT_SUBPARTITIONED	Convert partition is not supported for subpartitioned table.
4185 		ER_PROVIDER_NOT_LOADED	MariaDB tried to use the %s, but its provider plugin is not loaded
4186 		ER_JSON_HISTOGRAM_PARSE_FAILED	Failed to parse histogram for table %s.%s: %s at offset %d.
4187 		ER_SF_OUT_INOUT_ARG_NOT_ALLOWED	OUT or INOUT argument %d for function %s is not allowed here
4188 		ER_INCONSISTENT_SLAVE_TEMP_TABLE	Replicated query '%s' table '%s.%s' can not be temporary
4189 		ER_VERS_HIST_PART_FAILED	Versioned table %s.%s: adding HISTORY partition(s) failed
4190 		WARN_OPTION_CHANGING	%s is implicitly changing the value of '%s' from '%s' to '%s'
4191 		ER_CM_OPTION_MISSING_REQUIREMENT	CHANGE MASTER TO option '%s=%s' is missing requirement %s

4192		ER_SLAVE_STATEMENT_TIMEOUT	Slave log event execution was interrupted (slave_max_statement_time exceeded)
4193		ER_JSON_INVALID_VALUE_FOR_KEYWORD	Invalid value for keyword %s
4194		ER_JSON_SCHEMA_KEYWORD_UNSUPPORTED	%s keyword is not supported
4195		ER_JSON_NO_VARIABLE_SCHEMA	Variable schema is not supported.
4196		ER_PSEUDO_THREAD_ID_OVERWRITE	Pseudo thread id should not be modified by the client as it will be overwritten
4197		ER_SEQUENCE_TABLE_HAS_WRONG_NUMBER_OF_COLUMNS	Wrong number of columns
4198		ER_SEQUENCE_TABLE_CANNOT_HAVE_ANY_KEYS	Sequence tables cannot have any keys
4199		ER_SEQUENCE_TABLE_CANNOT_HAVE_ANY_CONSTRAINTS	Sequence tables cannot have any constraints

Error Code	SQLSTATE	Error	Description
4200		ER_SEQUENCE_TABLE_ORDER_BY	ORDER BY
4201		ER_VARIABLE_IGNORED	The variable '%s' is ignored. It only exists for compatibility with old installations and will be removed in a future release
4202		ER_INCORRECT_COLUMN_NAME_COUNT	Incorrect column name count for derived table.
4203		WARN_SORTING_ON_TRUNCATED_LENGTH	Values were longer than max_sort_length. Sorting used only the first bytes.
4204		ER_VECTOR_BINARY_FORMAT_INVALID	Invalid binary vector format. Must use IEEE standard float representation in little-endian format. Use VEC_FromText() to generate it.
4205		ER_VECTOR_FORMAT_INVALID	Invalid vector format at offset: %d for '%-.100s'. Must be a valid JSON array of numbers.
4206		ER_VEC_DISTANCE_TYPE	Cannot determine distance type for VEC_DISTANCE, index is not found

6.4.1.1.2.1.2 Operating System Error Codes

Need additional support? We're here to help!

[Contact Us](#)

Contents

- [Linux Error Codes](#)
- [Windows Error Codes](#)

Below is a partial list of more common Linux and Windows operating system error codes.

Linux Error Codes

The [perror](#) tool can be used to find the error message which is associated with a given error code.

Number	Error Code	Description
--------	------------	-------------

1	EPERM	Operation not permitted
2	ENOENT	No such file or directory
3	ESRCH	No such process
4	EINTR	Interrupted system call
5	EIO	I/O error
6	ENXIO	No such device or address
7	E2BIG	Argument list too long
8	ENOEXEC	Exec format error
9	EBADF	Bad file number
10	ECHILD	No child processes
11	EAGAIN	Try again
12	ENOMEM	Out of memory
13	EACCES	Permission denied
14	EFAULT	Bad address
15	ENOTBLK	Block device required
16	EBUSY	Device or resource busy
17	EEXIST	File exists
18	EXDEV	Cross-device link
19	ENODEV	No such device
20	ENOTDIR	Not a directory
21	EISDIR	Is a directory
22	EINVAL	Invalid argument
23	ENFILE	File table overflow
24	EMFILE	Too many open files
25	ENOTTY	Not a typewriter
26	ETXTBSY	Text file busy
27	EFBIG	File too large
28	ENOSPC	No space left on device
29	ESPIPE	Illegal seek
30	EROFS	Read-only file system
31	EMLINK	Too many links
32	EPIPE	Broken pipe
33	EDOM	Math argument out of domain of func
34	ERANGE	Math result not representable
35	EDEADLK	Resource deadlock would occur
36	ENAMETOOLONG	File name too long
37	ENOLCK	No record locks available
38	ENOSYS	Function not implemented
39	ENOTEMPTY	Directory not empty
40	ELOOP	Too many symbolic links encountered
42	ENOMSG	No message of desired type
43	EIDRM	Identifier removed
44	ECHRNG	Channel number out of range

45	EL2NSYNC	Level 2 not synchronized
46	EL3HLT	Level 3 halted
47	EL3RST	Level 3 reset
48	ELNRNG	Link number out of range
49	EUNATCH	Protocol driver not attached
50	ENOC SI	No CSI structure available
51	EL2HLT	Level 2 halted
52	EBADE	Invalid exchange
53	EBADR	Invalid request descriptor
54	EXFULL	Exchange full
55	ENOANO	No anode
56	EBADRQC	Invalid request code
57	EBADSLT	Invalid slot
59	EBFONT	Bad font file format
60	ENOSTR	Device not a stream
61	ENODATA	No data available
62	ETIME	Timer expired
63	ENOSR	Out of streams resources
64	ENONET	Machine is not on the network
65	ENOPKG	Package not installed
66	EREMOTE	Object is remote
67	ENOLINK	Link has been severed
68	EADV	Advertise error
69	ESRMNT	Srmount error
70	ECOMM	Communication error on send
71	EPROTO	Protocol error
72	EMULTIHOP	Multihop attempted
73	EDOTDOT	RFS specific error
74	EBADMSG	Not a data message
75	E_OVERFLOW	Value too large for defined data type
76	ENOTUNIQ	Name not unique on network
77	EBADFD	File descriptor in bad state
78	EREMCHG	Remote address changed
79	ELIBACC	Can not access a needed shared library
80	ELIBBAD	Accessing a corrupted shared library
81	ELIBSCN	.lib section in a.out corrupted
82	ELIBMAX	Attempting to link in too many shared libraries
83	ELIBEXEC	Cannot exec a shared library directly
84	EILSEQ	Illegal byte sequence
85	ERESTART	Interrupted system call should be restarted
86	ESTRPIPE	Streams pipe error
87	EUSERS	Too many users
88	ENOTSOCK	Socket operation on non-socket

89	EDESTADDRREQ	Destination address required
90	EMSGSIZE	Message too long
91	EPROTOTYPE	Protocol wrong type for socket
92	ENOPROTOOPT	Protocol not available
93	EPROTONOSUPPORT	Protocol not supported
94	ESOCKTNOSUPPORT	Socket type not supported
95	EOPNOTSUPP	Operation not supported on transport endpoint
96	EPFNOSUPPORT	Protocol family not supported
97	EAFNOSUPPORT	Address family not supported by protocol
98	EADDRINUSE	Address already in use
99	EADDRNOTAVAIL	Cannot assign requested address
100	ENETDOWN	Network is down
101	ENETUNREACH	Network is unreachable
102	ENETRESET	Network dropped connection because of reset
103	ECONNABORTED	Software caused connection abort
104	ECONNRESET	Connection reset by peer
105	ENOBUFS	No buffer space available
106	EISCONN	Transport endpoint is already connected
107	ENOTCONN	Transport endpoint is not connected
108	ESHUTDOWN	Cannot send after transport endpoint shutdown
109	ETOOMANYREFS	Too many references: cannot splice
110	ETIMEDOUT	Connection timed out
111	ECONNREFUSED	Connection refused
112	EHOSTDOWN	Host is down
113	EHOSTUNREACH	No route to host
114	EALREADY	Operation already in progress
115	EINPROGRESS	Operation now in progress
116	ESTALE	Stale NFS file handle
117	EUCLEAN	Structure needs cleaning
118	ENOTNAM	Not a XENIX named type file
119	ENAVAIL	No XENIX semaphores available
120	EISNAM	Is a named type file
121	EREMOTEIO	Remote I/O error
122	EDQUOT	Quota exceeded
123	ENOMEDIUM	No medium found
124	EMEDIUMTYPE	Wrong medium type
125	ECANCELED	Operation Canceled
126	ENOKEY	Required key not available
127	EKEYEXPIRED	Key has expired
128	EKEYREVOKED	Key has been revoked
129	EKEYREJECTED	Key was rejected by service
130	EOWNERDEAD	Owner died
131	ENOTRECOVERABLE	State not recoverable

Windows Error Codes

For a complete list, see <https://msdn.microsoft.com/en-us/library/ms681381.aspx>

Number	Error Code	Description
1	ERROR_INVALID_FUNCTION	Incorrect function.
2	ERROR_FILE_NOT_FOUND	The system cannot find the file specified.
3	ERROR_PATH_NOT_FOUND	The system cannot find the path specified.
4	ERROR_TOO_MANY_OPEN_FILES	The system cannot open the file.
5	ERROR_ACCESS_DENIED	Access is denied.
6	ERROR_INVALID_HANDLE	The handle is invalid.
7	ERROR_ARENA_TRASHED	The storage control blocks were destroyed.
8	ERROR_NOT_ENOUGH_MEMORY	Not enough storage is available to process this command.
9	ERROR_INVALID_BLOCK	The storage control block address is invalid.
10	ERROR_BAD_ENVIRONMENT	The environment is incorrect.
11	ERROR_BAD_FORMAT	An attempt was made to load a program with an incorrect format.
12	ERROR_INVALID_ACCESS	The access code is invalid.
13	ERROR_INVALID_DATA	The data is invalid.
14	ERROR_OUTOFMEMORY	Not enough storage is available to complete this operation.
15	ERROR_INVALID_DRIVE	The system cannot find the drive specified.
16	ERROR_CURRENT_DIRECTORY	The directory cannot be removed.
17	ERROR_NOT_SAME_DEVICE	The system cannot move the file to a different disk drive.
18	ERROR_NO_MORE_FILES	There are no more files.
19	ERROR_WRITE_PROTECT	The media is write protected.
20	ERROR_BAD_UNIT	The system cannot find the device specified.
21	ERROR_NOT_READY	The device is not ready.
22	ERROR_BAD_COMMAND	The device does not recognize the command.
23	ERROR_CRC	Data error (cyclic redundancy check).
24	ERROR_BAD_LENGTH	The program issued a command but the command length is incorrect.
25	ERROR_SEEK	The drive cannot locate a specific area or track on the disk.
26	ERROR_NOT_DOS_DISK	The specified disk or diskette cannot be accessed.
27	ERROR_SECTOR_NOT_FOUND	The drive cannot find the sector requested.
28	ERROR_OUT_OF_PAPER	The printer is out of paper.
29	ERROR_WRITE_FAULT	The system cannot write to the specified device.
30	ERROR_READ_FAULT	The system cannot read from the specified device.
31	ERROR_GEN_FAILURE	A device attached to the system is not functioning.
32	ERROR_SHARING_VIOLATION	The process cannot access the file because it is being used by another process.
33	ERROR_LOCK_VIOLATION	The process cannot access the file because another process has locked a portion of the file.
34	ERROR_WRONG_DISK	The wrong diskette is in the drive. Insert %2 (Volume Serial Number: %3) into drive %1.
36	ERROR_SHARING_BUFFER_EXCEEDED	Too many files opened for sharing.
38	ERROR_HANDLE_EOF	Reached the end of the file.
39	ERROR_HANDLE_DISK_FULL	The disk is full.

87	ERROR_INVALID_PARAMETER	The parameter is incorrect.
112	ERROR_DISK_FULL	The disk is full.
123	ERROR_INVALID_NAME	The file name, directory name, or volume label syntax is incorrect.
1450	ERROR_NO_SYSTEM_RESOURCES	Insufficient system resources exist to complete the requested service.

6.4.1.1.2.1.3 SQLSTATE

SQLSTATE is a code which identifies SQL error conditions. It composed by five characters, which can be numbers or uppercase ASCII letters. An SQLSTATE value consists of a class (first two characters) and a subclass (last three characters).

There are three important standard classes. They all indicate in which logical group of errors the condition falls. They match to a particular keyword which can be used with [DECLARE HANDLER](#). Also, the SQLSTATE class determines the default value for the `MYSQL_ERRNO` and `MESSAGE_TEXT` condition properties.

- '00' means 'success'. It can not be set in any way, and can only be read via the API.
- '01' contains all warnings, and matches to the `SQLWARNING` keyword. The default `MYSQL_ERRNO` is 1642 and default `MESSAGE_TEXT` is 'Unhandled user-defined warning condition'.
- '02' is the NOT FOUND class. The default `MYSQL_ERRNO` is 1643 and default `MESSAGE_TEXT` is 'Unhandled user-defined not found condition'.
- All other classes match the `SQLEXCEPTION` keyword. The default `MYSQL_ERRNO` is 1644 and default `MESSAGE_TEXT` is 'Unhandled user-defined exception condition'.

The subclass, if it is set, indicates a particular condition, or a particular group of conditions within the class. However the '000' sequence means 'no subclass'.

For example, if you try to [SELECT](#) from a table which does not exist, a 1109 error is produced, with a '42S02' SQLSTATE. '42' is the class and 'S02' is the subclass. This value matches to the `SQLEXCEPTION` keyword. When `FETCH` is called for a [cursor](#) which has already reached the end, a 1329 error is produced, with a '02000' SQLSTATE. The class is '02' and there is no subclass (because '000' means 'no subclass'). It can be handled by a NOT FOUND handlers.

The standard SQL specification says that classes beginning with 0, 1, 2, 3, 4, A, B, C, D, E, F and G are reserved for standard-defined classes, while other classes are vendor-specific. It also says that, when the class is standard-defined, subclasses starting with those characters (except for '000') are standard-defined subclasses, while other subclasses are vendor-defined. However, MariaDB and MySQL do not strictly obey this rule.

To read the SQLSTATE of a particular condition which is in the [diagnostics area](#), the [GET DIAGNOSTICS](#) statement can be used: the property is called `RETURNED_SQLSTATE`. For user-defined conditions ([SIGNAL](#) and [RESIGNAL](#) statements), a SQLSTATE value must be set via the `SQLSTATE` clause. However, [SHOW WARNINGS](#) and [SHOW ERRORS](#) do not display the SQLSTATE.

For user-defined conditions, MariaDB and MySQL recommend the '45000' SQLSTATE class.

'HY000' is called the "general error": it is the class used for builtin conditions which do not have a specific SQLSTATE class.

A partial list of error codes and matching SQLSTATE values can be found in the page [MariaDB Error Codes](#).

6.4.1.1.2.1.4 MariaDB Error Codes 1000 to 1099

Error 1000: hashchk

[Error 1000: hashchk](#)

Error 1001: isamchk

[Error 1001: isamchk](#)

Error 1002: NO

[Error 1002: NO](#)

Error 1003: YES

[Error 1003: YES](#)

Error 1004: Can't create file

[Error 1004: Can't create file '%s' \(errno: %d\)](#)

**Error 1005: Can't create table**

Error 1005: Can't create table '%s' (errno: %d) [↗](#)

**Error 1006: Can't create database**

Error 1006: Can't create database '%s' (errno: %d) [↗](#)

**Error 1007: Can't create database, database exists**

Error 1007: Can't create database '%s'; database exists [↗](#)

**Error 1008: Can't drop database; database doesn't exist**

Error 1008: Can't drop database '%s'; database doesn't exist [↗](#)

**Error 1009: Error dropping database (can't delete)**

Error 1009: Error dropping database (can't delete '%s', errno: %d) [↗](#)

**Error 1010: Error dropping database (can't rmdir)**

Error 1010: Error dropping database (can't rmdir '%s', errno: %d) [↗](#)

**Error 1011: Error on delete of**

Error 1011: Error on delete of '%s' (errno: %d) [↗](#)

**Error 1012: Can't read record in system table**

Error 1012: Can't read record in system table [↗](#)

**Error 1013: Can't get status of**

Error 1013: Can't get status of '%s' (errno: %d) [↗](#)

**Error 1014: Can't get working directory**

Error 1014: Can't get working directory (errno: %d) [↗](#)

**Error 1015: Can't lock file**

Error 1015: Can't lock file (errno: %d) [↗](#)

**Error 1016: Can't open file**

Error 1016: Can't open file: '%s' (errno: %d) [↗](#)

**Error 1017: Can't find file**

Error 1017: Can't find file: '%s' (errno: %d) [↗](#)

**Error 1018: Can't read dir of**

Error 1018: Can't read dir of '%s' (errno: %d) [↗](#)

**Error 1019: Can't change dir to**

Error 1019: Can't change dir to '%s' (errno: %d) [↗](#)

**Error 1020: Record has changed since last read in table**

Error 1020: Record has changed since last read in table '%s' [↗](#)

**Error 1021: Disk full (%s); waiting for someone to free some space**

Error 1021: Disk full (%s); waiting for someone to free some space... [↗](#)

**Error 1022: Can't write; duplicate key in table**

Error 1022: Can't write; duplicate key in table '%s' [↗](#)

**Error 1023: Error on close of**

Error 1023: Error on close of '%s' (errno: %d) [↗](#)

**Error 1024: Error reading file**

Error 1024: Error reading file '%s' (errno: %d) [↗](#)

**Error 1025: Error on rename of**

Error 1025: Error on rename of '%s' to '%s' (errno: %d) [↗](#)

**Error 1026: Error writing file**

Error 1026: Error writing file '%s' (errno: %d) [↗](#)

**Error 1027: is locked against change**

Error 1027: '%s' is locked against change [↗](#)

**Error 1028: Sort aborted**

Error 1028: Sort aborted [↗](#)

**Error 1029: View doesn't exist for**

Error 1029: View '%s' doesn't exist for '%s' [↗](#)

**Error 1030: Got error from storage engine**

Error 1030: Got error %d from storage engine [↗](#)

**Error 1031: Table storage engine doesn't have this option**

Error 1031: Table storage engine for '%s' doesn't have this option [↗](#)

**Error 1032: Can't find record in**

Error 1032: Can't find record in '%s' [↗](#)

**Error 1033: Incorrect information in file**

Error 1033: Incorrect information in file: '%s' [↗](#)

**Error 1034: Incorrect key file for table; try to repair it**

6.4.1.1.2.1.4.1 Error 1044: Access denied for user

Error Code	SQLSTATE	Error	Description
1044	42000	ER_DBACCESS_DENIED_ERROR	Access denied for user '%s'@'%s' to database '%s'

Possible Causes and Solutions

The user is trying to access a database/schema they do not have access to. See [Troubleshooting Connection Issues](#) for more, as well as [GRANT](#) for details on setting permissions.

6.4.1.1.2.1.4.2 Error 1045: Access denied for user (using password)

Error Code	SQLSTATE	Error	Description
1045	28000	ER_ACCESS_DENIED_ERROR	Access denied for user '%s'@'%s' (using password: %s)

Possible Causes and Solutions

The user/password combination does not exist or the user does not have privileges to the given database. See [Troubleshooting Connection Issues](#) for more, as well as [GRANT](#) for details on setting permissions.

6.4.1.1.2.1.4.3 Error 1068: Multiple primary key defined

Error Code	SQLSTATE	Error	Description
1068	42000	ER_MULTIPLE_PRI_KEY	Multiple primary key defined

Contents

- [Possible Causes and Solutions](#)

Possible Causes and Solutions

No more than one [primary key](#) can be defined per table. Attempting to define more in a single table will result in this error. For example:

```
CREATE TABLE t1 (  
  c1 INT NOT NULL AUTO_INCREMENT,  
  c2 INT NOT NULL,  
  PRIMARY KEY(c1),  
  PRIMARY KEY(c2)  
);  
ERROR 1068 (42000): Multiple primary key defined  
  
CREATE TABLE t1 (  
  c1 INT NOT NULL AUTO_INCREMENT,  
  c2 INT NOT NULL,  
  PRIMARY KEY(c1)  
);
```

It's also possible that this error results from a mistaken attempt to define a multi-part primary key. This is an example of the correct definition for such a key.

```
CREATE TABLE t1 (  
  c1 INT NOT NULL AUTO_INCREMENT,  
  c2 INT NOT NULL,  
  PRIMARY KEY(c1, c2)  
);
```

6.4.1.1.2.1.4.4 Error 1075: Incorrect table definition; there can be only one auto column and it must be defined as a key

Error Code	SQLSTATE	Error	Description
1075	42000	ER_WRONG_AUTO_KEY	Incorrect table definition; there can be only one auto column and it must be defined as a key

Contents

- [Possible Causes and Solutions](#)

Possible Causes and Solutions

There can only be one [AUTO_INCREMENT](#) column per table, and the column must be defined as a [key](#). Not adhering to either of these restrictions will result in this error. For example:

```
CREATE OR REPLACE TABLE animals (  
  id1 MEDIUMINT NOT NULL AUTO_INCREMENT,  
  id2 TINYINT NOT NULL AUTO_INCREMENT,  
  name CHAR(30) NOT NULL,  
  PRIMARY KEY (id1),  
  KEY (id2)  
);  
ERROR 1075 (42000): Incorrect table definition; there can be only one auto column and it must be  
  
CREATE OR REPLACE TABLE animals (  
  id1 MEDIUMINT NOT NULL AUTO_INCREMENT,  
  name CHAR(30) NOT NULL  
);  
ERROR 1075 (42000): Incorrect table definition; there can be only one auto column and it must be  
  
CREATE OR REPLACE TABLE animals (  
  id MEDIUMINT NOT NULL AUTO_INCREMENT,  
  name CHAR(30) NOT NULL,  
  PRIMARY KEY (id)  
);  
Query OK, 0 rows affected (0.017 sec)
```

Possible Causes and Solutions

The user is trying to access a table or a column from a table they do not have access to. See [GRANT](#) for details on setting permissions.

6.4.1.1.2.1.5.2 Error 1149: You have an error in your SQL syntax

Error Code	SQLSTATE	Error	Description
1149	42000	ER_SYNTAX_ERROR	You have an error in your SQL syntax; check the manual that corresponds to your MariaDB server version for the right syntax to use

Contents

- [Possible Causes and Solutions](#)
 - [Delimiters](#)
 - [Delimiters in Stored Programs](#)
 - [Reserved Words](#)
 - [Syntax Doesn't Match SQL_MODE](#)
 - [Oracle Mode](#)

Possible Causes and Solutions

This is one of the most common errors to see. It's caused by an SQL syntax error. The error message will give you a clue as to where the error could be, as MariaDB displays the text following where it picked up an error. There are a huge number of possible causes (and in most cases they're simple typos), but here are a few common ones;

Delimiters

Delimiters need to be present at the end of each statement. See [Delimiters](#). For example:

```

SELECT 1
SELECT 2;
ERROR 1064 (42000): You have an error in your SQL syntax; check the manual that corresponds
to your MariaDB server version for the right syntax to use near 'SELECT 2' at line 2

```

Here, there was no delimiter separating the first and the second line. MariaDB picked up the error at the start of the second line, pointing one to the end of the first line. The correct syntax is:

```
SELECT 1;
SELECT 2;
```

Delimiters in Stored Programs

When creating [stored programs](#) from the command-line, it is likely you will need to differentiate between the regular delimiter and a delimiter inside a [BEGIN END](#) block. See [Delimiters](#).

For example, take the following, seemingly-valid declaration:

```
CREATE FUNCTION FortyTwo() RETURNS TINYINT DETERMINISTIC
BEGIN
  DECLARE x TINYINT;
  SET x = 42;
  RETURN x;
END;
```

Attempting to run will result in an error:

```
CREATE FUNCTION FortyTwo() RETURNS TINYINT DETERMINISTIC
-> BEGIN
-> DECLARE x TINYINT;
ERROR 1064 (42000): You have an error in your SQL syntax; check the manual that corresponds
to your MariaDB server version for the right syntax to use near '' at line 3
```

The error was picked up at the end of the `DECLARE x TINYINT;` line, guiding one to the delimiter found there. The solution is to specify a distinct delimiter for the duration of the process, using the `DELIMITER` command, for example:

```
DELIMITER //

CREATE FUNCTION FortyTwo() RETURNS TINYINT DETERMINISTIC
BEGIN
  DECLARE x TINYINT;
  SET x = 42;
  RETURN x;
END

//

DELIMITER ;
```

Reserved Words

[Reserved words](#) cannot be used as [identifiers](#) unless they are quoted. For example:

```
CREATE TABLE accessible(id INT);
ERROR 1064 (42000): You have an error in your SQL syntax; check the manual that corresponds
to your MariaDB server version for the right syntax to use near 'accessible(id INT)' at line 1
```

The error was picked up after the `accessible` identifier, leading one to suspect that it's causing the problem. And indeed, it's a [reserved word](#). There are a number of possible solutions.

Use a new, non-reserved, identifier:

```
CREATE TABLE accessible_status(id INT);
```

or quote the identifier:

```
CREATE TABLE `accessible`(id INT);
```

or [fully qualify](#) the identifier:

```
CREATE TABLE test.accessible(id INT);
```

Syntax Doesn't Match SQL_MODE

Some syntax may be valid in a particular [SQL_MODE](#), but not in others. There are too many to list here, but the [SQL_MODE](#) page provides a full list. For example:

```
CREATE TABLE "t" (id INT);
ERROR 1064 (42000): You have an error in your SQL syntax; check the manual that corresponds
to your MariaDB server version for the right syntax to use near '"t" (id INT)' at line 1
```

The error message directs one to the identifier `t`. Double quotes cannot be used to [quote identifiers](#) unless `ANSI_MODE` is set, which in this case it isn't:

```
select @@sql_mode;
+-----+
| @@sql_mode |
+-----+
| STRICT_TRANS_TABLES,ERROR_FOR_DIVISION_BY_ZERO,NO_AUTO_CREATE_USER,NO_ENGINE_SUBSTITUTION |
+-----+
```

Either quote with the standard quote character, the backtick, or set the appropriate `SQL_MODE`:

```
SET @@SQL_MODE = CONCAT(@@SQL_MODE, ',ANSI_QUOTES');
CREATE TABLE "t" (id INT);
```

Oracle Mode

[Oracle mode](#) in particular has a large number of differences to the default `SQL_MODE`, for example:

```
CREATE TABLE t (id VARCHAR2(10));
ERROR 1064 (42000): You have an error in your SQL syntax; check the manual that corresponds
to your MariaDB server version for the right syntax to use near '(10))' at line 1
```

The error is identified just after the `VARCHAR2` type is specified, and this type is not valid in the default mode:

```
SELECT @@sql_mode;
+-----+
| @@sql_mode |
+-----+
| STRICT_TRANS_TABLES,ERROR_FOR_DIVISION_BY_ZERO,NO_AUTO_CREATE_USER |
+-----+
SET SQL_MODE='ORACLE';
CREATE TABLE t (id VARCHAR2(10));
```

See [Oracle mode](#) for a full list of syntax differences.

6.4.1.1.2.1.7.1 Error 1305: does not exist

Error Code	SQLSTATE	Error	Description
1305	42000	ER_SP_DOES_NOT_EXIST	%s %s does not exist

Contents

- [Possible Causes and Solutions](#)

Possible Causes and Solutions

This error is returned when what is being called called does not exist. For example:

```
CALL Reset_animal_count();
ERROR 1305 (42000): PROCEDURE test.Reset_animal_count does not exist

SELECT Reset_animal_count();
ERROR 1305 (42000): FUNCTION test.Reset_animal_count does not exist
```

There are a number of possible causes:

- The [stored procedure](#) or [stored function](#) has not yet been created. See [CREATE PROCEDURE](#) or [CREATE FUNCTION](#). For example:

```
DELIMITER //
CREATE PROCEDURE Reset_animal_count()
    MODIFIES SQL DATA
    UPDATE animal_count SET animals = 0;
//
Query OK, 0 rows affected (0.032 sec)

DELIMITER ;

CALL Reset_animal_count();
Query OK, 0 rows affected (0.001 sec)
```

- There was a typo in the name. Check also that the case is correct. See [Identifier Case-sensitivity](#). For example:

```
CALL reset_animal_count();
ERROR 1305 (42000): PROCEDURE test.Reset_animal_count does not exist

CALL Reset_animal_count();
Query OK, 0 rows affected (0.001 sec)
```

- The database specified is not the same as the the database containing the stored procedure or function. For example:

```
use test2
CALL Reset_animal_count();
ERROR 1305 (42000): PROCEDURE test2.Reset_animal_count does not exist
```

Either change the default (current) database with the [USE statement](#), or specify the database in the call, for example:

```
CALL test.Reset_animal_count();
Query OK, 0 rows affected (0.001 sec)
```

or

```
use test
CALL Reset_animal_count();
Query OK, 0 rows affected (0.001 sec)
```

- One is trying to access a stored procedure instead of a stored function, or vice-versa. For example:

```
SELECT Reset_animal_count();
ERROR 1305 (42000): FUNCTION test.Reset_animal_count does not exist

CALL Reset_animal_count();
Query OK, 0 rows affected (0.001 sec)
```

6.4.1.1.2.1.14.1 Error 3024: Query execution was interrupted, maximum statement execution time exceeded

Error Code	SQLSTATE	Error	Description
3024		ER_QUERY_TIMEOUT	Query execution was interrupted, maximum statement execution time exceeded

Contents

- [Possible Causes and Solutions](#)

Possible Causes and Solutions

The cause is that the executing statement took more than [max_statement_time](#) (primary) or [slave_max_statement_time](#) (replica) to execute.

To fix this, you have to either increase the value of [max_statement_time](#) or find out [why the query is slow](#). Start by doing an [EXPLAIN](#) or [ANALYZE](#) on the query to find out how the query is executed.

6.4.1.1.2.1.14.2 Error 3048: Out of range error

Error Code	SQLSTATE	Error	Description
3048		ER_STD_OUT_OF_RANGE_ERROR	Out of range error: %-.256s in function %s.

Contents

1. Possible Causes and Solutions
 1. Function Arguments Outside the Expected Bounds

Possible Causes and Solutions

Function Arguments Outside the Expected Bounds

Functions arguments have an expected range, and this error is returned if this range is exceeded. Follow the documentation for the specific function indicated in the error message. For example, the [ST_GeoHash](#) function expects the longitude and latitude parameters to be between -180 and 180. In this case, the longitude argument is invalid:

```
SELECT ST_GeoHash(181,30,15);
ERROR 3048 (HY000): Out of range error: Longitude should be [-180,180] in function ST_GeoHash.
```

By providing a longitude argument within the expected range, the error is no longer returned:

```
SELECT ST_GeoHash(180,30,15);
+-----+
| ST_GeoHash(180,30,15) |
+-----+
| xvrfxvrfxvrfxvr     |
+-----+
```

7. [How to Add Support for Progress Reporting to a Storage Engine](#)
8. [Examples to Look at in the MariaDB Source:](#)
9. [Format of Progress Packets](#)

MariaDB supports progress reporting for some long running commands.

What is Progress Reporting?

Progress reporting means that:

- There is a `Progress` column in `SHOW PROCESSLIST` which shows the total progress (0-100%)
- `INFORMATION_SCHEMA.PROCESSLIST` has three columns which allow you to see in which process stage we are and how much of that stage is completed:
 - `STAGE`
 - `MAX_STAGE`
 - `PROGRESS` (within current stage).
- The client receives progress messages which it can display to the user to indicate how long the command will take.

We have separate progress reporting for stages because different stages take different amounts of time.

Supported Commands

Currently, the following commands can send progress report messages to the client:

- `ALTER TABLE`
- `CREATE INDEX`
- `DROP INDEX`
- `LOAD DATA INFILE` (not `LOAD DATA LOCAL INFILE`, as in that case we don't know the size of the file).

Some Aria storage engine operations also support progress messages:

- `CHECK TABLE`
- `REPAIR TABLE`
- `ANALYZE TABLE`
- `OPTIMIZE TABLE`

Limitations

Although the above commands support progress reporting, there are some limitations to what progress is reported. To be specific, when executing one of these commands against an InnoDB table with `ALGORITHM=INPLACE` (which is the default in `MariaDB 10.0+`), progress is only reported during the merge sort phase while reconstructing indexes.

Enabling and Disabling Progress Reporting

`mysqld` (the MariaDB server) automatically sends progress report messages to clients that support the new protocol, using the value of the `progress_report_time` variable. They are sent every `max(global.progress_report_time, progress_report_time)` seconds (by default 5). You can disable the sending of progress report messages to the client by setting either the local variable (affects only the current connection) or the global variable (affects all connections) to `0`.

If the extra column in `SHOW PROCESSLIST` gives you a compatibility problem, you can disable it by starting `mysqld` with the `--old` flag.

Clients Which Support Progress Reporting

- The `mariadb` [command line client](#)
- The `mytop` that comes with MariaDB has a `'%`' column which shows the progress.

Progress Reporting in the mysql Command Line Client

Progress reporting is enabled by default in the `mariadb` client. You can disable it with `--disable-progress-reports`. It is automatically disabled in batch mode.

When enabled, for every supported command you get a progress report like:

```
ALTER TABLE my_mail ENGINE=aria;
Stage: 1 of 2 'copy to tmp table' 5.37% of stage done
```

This is updated every `progress_report_time` seconds (the default is 5). If the global `progress_report_time` is higher, this will be used. You can also disable error reporting by setting the variable to `0`.

How to Add Support for Progress Reporting to a Client

You need to use the [MariaDB 5.3](#) or later client library. You can check that the library supports progress reporting by doing:

```
#ifdef CLIENT_PROGRESS
```

To enable progress reporting to the client you need to add `CLIENT_PROGRESS` to the `connect_flag` in `mysql_real_connect()`:

```
mysql_real_connect(mysql, host, user, password,  
                  database, opt_mysql_port, opt_mysql_unix_port,  
                  connect_flag | CLIENT_PROGRESS);
```

Then you need to provide a callback function for progress reports:

```
static void report_progress(const MYSQL *mysql, uint stage, uint max_stage,  
                           double progress, const char *proc_info,  
                           uint proc_info_length);  
  
mysql_options(&mysql, MYSQL_PROGRESS_CALLBACK, (void*) report_progress);
```

The above `report_progress` function will be called for each progress message.

This is the implementation used by `mysql.cc`:

```
uint last_progress_report_length;  
  
static void report_progress(const MYSQL *mysql, uint stage, uint max_stage,  
                           double progress, const char *proc_info,  
                           uint proc_info_length)  
{  
    uint length= printf("Stage: %d of %d '%.*s' %6.3g%% of stage done",  
                      stage, max_stage, proc_info_length, proc_info,  
                      progress);  
    if (length < last_progress_report_length)  
        printf("%*s", last_progress_report_length - length, "");  
    putchar('\r', stdout);  
    fflush(stdout);  
    last_progress_report_length= length;  
}
```

If you want only one number for the total progress, you can calculate it with:

```
double total_progress=  
    ((stage - 1) / (double) max_stage * 100.00 + progress / max_stage);
```

Note: `proc_info` is totally independent of stage. You can have many different `proc_info` values within a stage. The idea behind `proc_info` is to give the user more information about what the server is doing.

How to Add Support for Progress Reporting to a Storage Engine

The functions to use for progress reporting are:

```
void thd_progress_init(MYSQL_THD thd, unsigned int max_stage);
```

Initialize progress reporting with stages. This is mainly used for commands that are totally executed within the engine, like `CHECK TABLE`. You should not use this for operations that could be called by, for example, `ALTER TABLE` as this has already called the function.

`max_stage` is the number of stages your storage engine will have.

```
void thd_progress_report(MYSQL_THD thd, unsigned long long progress,
                        unsigned long long max_progress);
```

The above is used for reporting progress.

- `progress` is how much of the file/rows/keys you have gone through.
- `max_progress` is the max number of rows you will go through.

You can call this with varying numbers, but normally the ratio `progress/max_progress` should be increasing.

This function can be called even if you are not using stages, for example when enabling keys as part of `ALTER TABLE` or `ADD INDEX`.

```
void thd_progress_next_stage(MYSQL_THD thd);
```

To go to the next stage in a multi-stage process initiated by `thd_progress_init()`:

```
void thd_progress_end(MYSQL_THD thd);
```

End progress reporting; Sets 'Progress' back to 0 in `SHOW PROCESSLIST`.

```
const char *thd_proc_info(thd, [ ]stage name[ ]);
```

This sets the name of the current status/stage that is displayed in `SHOW PROCESSLIST` and in the client. It's recommended that you call this between stages and thus before `thd_progress_report()` and `thd_progress_next_stage()`.

This functions returns the last used `proc_info`. It's recommended that you restore `proc_info` to its original value when you are done processing.

Note: `thd_proc_info()` is totally independent of stage. You can have many different `proc_info` values within a stage to give the user more information about what is going on.

Examples to Look at in the MariaDB Source:

- `client/mysql.cc` for an example of how to use reporting.
- `libmysql/client.c:cli_safe_read()` to see how progress packets are handled in client
- `sql/protocol.cc::net_send_progress_packet()` for how progress packets are handled in server.

Format of Progress Packets

The progress packet is sent as an error packet with error number 65535.

It contains the following data (in addition to the error header):

Option	Number of bytes	Other info
1	1	Number of strings. For future
Stage	1	Stage from 1 - Max_stage
Max_stage	1	Max number of stages
Progress	3	Progress in % * 1000
Status_length	1-2	Packet length of string in <code>net_field_length()</code> format
Status	Status_length	Status / Stage name

6.4.1.2 EXPLAIN FORMAT=JSON in MySQL

Contents

1. [Higher priority](#)
2. [Nice to have](#)
 1. [Show ranges being scanned](#)
3. [Low priority](#)
 1. [Filesort/priority queue](#)

There are some things that we in MariaDB are not happy with in MySQL/Oracle's implementation of EXPLAIN FORMAT=JSON.

The most important issues are already fixed in MariaDB's [EXPLAIN FORMAT=JSON](#) implementation. See [EXPLAIN FORMAT=JSON Differences From MySQL](#) for details.

This page lists things are are not fixed yet.

Higher priority

- Better display for ORDER/GROUP BY ([MDEV-6995](#))
- Better display for Batched Key Access plans (Plain join buffering is fixed already)

Nice to have

Show ranges being scanned

Currently, one can only find the ranges produced by the range optimizer by looking into optimizer_trace. It would be nice if EXPLAIN showed them, too

```
MySQL [dbt3sf1]> explain format=json select * from customer where c_acctbal < -1000 \G
***** 1. row *****
EXPLAIN: {
  "query_block": {
    "select_id": 1,
    "table": {
      "table_name": "customer",
      "access_type": "range",
      "possible_keys": [
        "c_acctbal",
        "i_c_acctbal_nationkey"
      ],
      "key": "c_acctbal",
      "used_key_parts": [
        "c_acctbal"
      ],
      "key_length": "9",
      "rows": 1,
      "filtered": 100,
      "index_condition": "(`dbt3sf1`.`customer`.`c_acctbal` < -(1000))"
    }
  }
}
```

Low priority

Filesort/priority queue

Neither version of EXPLAIN in 5.6 shows the "filesort with small limit" optimization. See [MDEV-6430](#).

7 MariaDB Server Releases

You can find the release dates for all upcoming MariaDB Server releases [on Jira](#).

MariaDB Server 12.0

[An upcoming release series](#)

MariaDB Server 11.8

A long-term development release series.

MariaDB Server 11.7

The current stable rolling release.

MariaDB Server 11.6

A previous rolling release, no longer maintained.

MariaDB Server 11.5

A previous rolling release, no longer maintained.

MariaDB Server 11.4

The current long-term release series, maintained until May 2029.

MariaDB Server 11.3

A previous rolling release, no longer maintained.

MariaDB Server 11.2

A previous short-term stable series, no longer maintained.

MariaDB Server 11.1

A previous short-term MariaDB stable release series, no longer maintained.

MariaDB Server 11.0

A previous short-term MariaDB stable release series, no longer maintained.

MariaDB Server 10.11

A previous long-term MariaDB stable release series, maintained until February 2028.

MariaDB Server 10.10

A previous short-term MariaDB stable release series, no longer maintained.

MariaDB Server 10.9

A previous short-term MariaDB stable release series, no longer maintained.

MariaDB Server 10.8

A previous short-term MariaDB stable release series, no longer maintained.

MariaDB Server 10.7

A previous short-term MariaDB stable release series, no longer maintained.

MariaDB Server 10.6

A previous long-term MariaDB stable release series, maintained until July 2026.

MariaDB Server 10.5

A previous MariaDB stable release series, maintained until 24 June 2025.

MariaDB Server 10.4

A previous MariaDB stable release series, no longer maintained.

MariaDB Server 10.3

A previous MariaDB stable release series, no longer maintained.

MariaDB Server 10.2

A previous MariaDB stable release series, no longer maintained.

MariaDB Server 10.1

A previous stable MariaDB release series, no longer maintained.

MariaDB Server 10.0

A previous stable MariaDB release series, no longer maintained.

MariaDB Server 5.5

A previous stable MariaDB release series, no longer maintained.

MariaDB Server 5.3

A previous stable MariaDB release series, no longer maintained.

MariaDB Server 5.2

A previous stable MariaDB release series, no longer maintained.

MariaDB Server 5.1

A previous stable MariaDB release series, no longer maintained.

New Features

Catalogs

- MariaDB [catalogs](#) are a multi-tenancy feature where a single instance MariaDB server handles multiple independent tenants (customers), who have their own users, schemas etc. See [MDEV-31542](#) "Add multi-tenancy catalogs to MariaDB" for details.

mariadb Client

- Can set an alternative directory path for searching scripts invoked via the source command, with the `--script-dir` mariadb client option ([MDEV-23818](#))

 25. [Variables](#)
3. [Removed Features](#)
4. [Security Vulnerabilities Fixed in MariaDB 11.8](#)
5. [List of All MariaDB 11.8 Releases](#)

[MariaDB 11.8](#) will be a long-term release, and is currently in development.

This list includes all features since the previous long-term release, [MariaDB 11.4](#) (those introduced in the [MariaDB 11.5](#), [MariaDB 11.6](#) and [MariaDB 11.7](#) rolling releases).

New Features

Vectors

- New function [VEC_DISTANCE](#) for calculating either a Euclidean or Cosine distance between two vectors, depending on the underlying index type ([MDEV-35450](#))
- aarch64 SIMD instructions now supported ([MDEV-34699](#))

Character Sets

- The default [character set](#) has been changed from `latin1` to `utf8mb4` ([MDEV-19123](#), [MariaDB 11.6](#))
- Change [default Unicode collation](#) to `uca1400_ai_ci`, a modern Unicode collation with proper support for SMP characters (including emoji) ([MDEV-25829](#), [MariaDB 11.5](#))

Optimizer

- Optimizer can now take advantage of queries of the format `SUBSTR(col, 1, n) = const_str` ([MDEV-34911](#))
- Add basic optimizer support for [virtual columns](#) - see [Virtual Column Support in the Optimizer](#) ([MDEV-35616](#))
- Improve selectivity computations for multi-part keys ([MDEV-33697](#), [MariaDB 11.6](#))
- [Index condition pushdown](#) is now supported for partitioned tables ([MDEV-12404](#), [MariaDB 11.5](#))
- ANALYZE for statement should show selectivity of pushed index condition ([MDEV-18478](#), [MariaDB 11.5](#))

Temporary files and tables

- [Limit size of created disk temporary files and tables](#) ([MDEV-9101](#), [MariaDB 11.5](#))
- There are two system variables used for controlling this feature ([MariaDB 11.5](#)):
 - [max_tmp_session_space_usage](#): Limits the the temporary space allowance per user
 - [max_tmp_total_space_usage](#): Limits the temporary space allowance for all users.

Data Types

- The [TIMESTAMP](#) range of values was extended. The maximal allowed value for timestamps was '2038-01-19 03:14:07 UTC', and is now '2106-02-07 06:28:15 UTC'. This does not change the storage format, and new tables can be read by old MariaDB servers as long as timestamp values are within the old timestamp range. At the moment this is only supported on 64-bit platforms ([MDEV-32188](#), [MariaDB 11.5](#))

Authentication

- [New authentication plugin](#) ([MDEV-32618](#), [MariaDB 11.6](#))
- Extend [Unix socket authentication](#) to support authentication_string ([MDEV-33479](#), [MariaDB 11.6](#))

InnoDB

- Fix [innodb-adaptive-hash-index](#) scalability with multiple threads ([MDEV-35049](#))

Backup and Restore

- Added the `--dir` option to [mariadb-import](#), allowing one to restore all tables from a backup directory created using [mariadb-dump --dir](#) ([MDEV-33627](#), [MariaDB 11.6](#))
 - Added the related `--database`, `--ignore-database`, `--table` and `--ignore-table` options.
 - Refactor [mariadb-import](#) threading
- Automatic SST user account management ([MDEV-31809](#), [MariaDB 11.6](#))
- The [mariadb-dump --no-autocommit](#) option is now set by default to allow faster data loading by InnoDB, writing only one undo log for the whole operation ([MDEV-32250](#))
- [mariadb-import](#) has a new option, `--innodb-optimize-keys` to delay creation of secondary indexes until after data load, resulting in faster loads. On by default. ([MDEV-34740](#))
- Parallel dump of multiple databases via [mariadb-dump](#) with the `--dir` option ([MDEV-33625](#), [MariaDB 11.5](#))

Replication

- When [binlogging](#) is enabled, committing a large transaction no longer freezes all other transactions until completed ([MDEV-32014](#), [MariaDB 11.7](#))
- [binlog_optimize_thread_scheduling](#) has been deprecated ([MDEV-33756](#), [MariaDB 11.7](#))
- Async rollback prepared transactions during binlog crash recovery ([MDEV-33853](#), [MariaDB 11.7](#))
- New variable, [slave_abort_blocking_timeout](#), for aborting long-running queries on a replica ([MDEV-34857](#), [MariaDB 11.7](#))
- New variable, [binlog_large_commit_threshold](#), for increasing transaction concurrency for large transactions ([MDEV-32014](#), [MariaDB 11.7](#))
- [binlog_optimize_thread_scheduling](#) deprecated ([MDEV-33756](#), [MariaDB 11.7](#))
- New definition for Seconds_Behind_Master ([MDEV-33856](#), [MariaDB 11.6](#))
 - Added three variables to [SHOW ALL REPLICAS STATUS](#)
 - New [Information Schema SLAVE_STATUS](#) Table

UUID

- New function for generating version 4 UUIDs [UUID_v4](#) ([MDEV-11339](#), [MariaDB 11.7](#))
- New function for generating version 7 UUIDs [UUID_v7](#) ([MDEV-32637](#), [MariaDB 11.7](#))

GIS

New GIS functions. These functions improve compatibility with MySQL 8.

- [ST_Validate](#) ([MDEV-34137](#))
- [MBRCoveredBy](#) ([MDEV-34138](#))
- [ST_Simplify](#) ([MDEV-34141](#))
- [ST_GeoHash](#) ([MDEV-34158](#))
- [ST_LatFromGeoHash](#) ([MDEV-34159](#))
- [ST_LongFromGeoHash](#) ([MDEV-34160](#))
- [ST_PointFromGeoHash](#) ([MDEV-34277](#))
- [ST_IsValid](#) ([MDEV-34276](#))
- [ST_Collect](#) ([MDEV-34278](#))

Other Functions

- New [FORMAT_BYTES](#) function. Given a byte count, returns a string consisting of a value and the units in a human-readable format ([MDEV-31736](#))

Referential Integrity

- [CHECK TABLE ... EXTENDED](#) now also checks for referential integrity ([MDEV-34309](#))

Protocol

- Permit bulk implementation to return ALL individual results ([MDEV-30366](#), [MariaDB 11.5](#))
- Send initial values of system variables in first OK packet ([MDEV-31609](#), [MariaDB 11.5](#))

Observability

- New [USERS](#) table in the Information Schema for storing information about users, [password expiry](#), and the limits set by [max_password_errors](#) ([MDEV-23729](#), [MDEV-32218](#), [MariaDB 11.5](#))
- Add more columns to Information Schema [TABLE_STATISTICS](#), [CLIENT_STATISTICS](#) and [USER_STATISTICS](#) tables ([MDEV-33151](#), [MariaDB 11.5](#))
- Add [QUERIES](#) column to Information Schema [INDEX_STATISTICS](#) table ([MDEV-33152](#), [MariaDB 11.5](#))
- Add [FLUSH GLOBAL STATUS](#) ([MDEV-33145](#), [MariaDB 11.5](#))
- Provide InnoDB async IO statistics ([MDEV-32841](#), [MariaDB 11.5](#))
- Show variable deprecation for `mariadb --help` output ([MDEV-28671](#), [MariaDB 11.5](#))
- Extend [Query Response Time plugin](#) to be compatible with Percona server ([MDEV-33501](#), [MariaDB 11.5](#))

Sequences

- Additional features for Sequences ([MDEV-28152](#), [MariaDB 11.5](#))
 - [CREATE SEQUENCE ... AS](#) permits creating as any [INT](#) type (including [BIGINT UNSIGNED](#)), extending the range
 - [Information Schema Sequences table](#)
 - Parser accepts larger and smaller values for [MINVALUE](#) and [MAXVALUE](#)
- [ANALYZE TABLE](#) on [sequences](#) no longer attempts to collect statistics ([MDEV-33938](#))

System-Versioned Tables

- Allow a [system-versioned table](#) to be converted from implicit to explicit `row_start/row_end` columns ([MDEV-27293](#), [MariaDB 11.7](#))

Stored Routines

- ROW data type for stored function return values ([MDEV-12252](#), [MariaDB 11.7](#))

Derived Tables

- Add optional correlation column list for [derived tables](#) ([MDEV-31466](#), [MariaDB 11.7](#))

[SHOW] CREATE SERVER

- Implement [SHOW CREATE SERVER](#) ([MDEV-15696](#), [MariaDB 11.7](#))
- Allow arbitrary options in [CREATE SERVER](#) ([MDEV-34716](#), [MariaDB 11.7](#))

Slow Query Log

- New variable, [log_slow_always_query_time](#), for specifying that all queries longer than this time are logged to the [slow query log](#), regardless of [log_slow_min_examined_row_limit](#) and [log_slow_rate_limit](#) ([MDEV-33144](#), [MariaDB 11.7](#))

Information Schema

- When querying the [information Schema](#), [stored functions](#) that have the same name as a native function no longer generate a warning ([MDEV-35437](#))

Spider

- The Spider variables [spider_table_crd_thread_count](#) and [spider_table_sts_thread_count](#) have been deprecated ([MDEV-28009](#), [MariaDB 11.7](#))
- Deprecate [spider_casual_read](#) ([MDEV-31789](#), [MariaDB 11.5](#))

General

- [SESSION_USER\(\)](#), which used to be an alias for [USER\(\)](#) now shows the value of [CURRENT_USER\(\)](#) when the session was created ([MDEV-30908](#), [MariaDB 11.7](#))
- [CURRENT_TIMESTAMP](#) should return a [TIMESTAMP \(WITH TIME ZONE?\)](#) ([MDEV-15751](#), [MariaDB 11.7](#))
- A warning has been added when [max_sort_length](#) is exceeded. ([MDEV-27277](#), [MariaDB 11.7](#))
- Single-table [DELETES](#) now support table aliases ([MDEV-33988](#), [MariaDB 11.6](#))
- Set thread names for MariaDB Server threads ([MDEV-32537](#), [MariaDB 11.6](#))
- [REPAIR TABLE ... FORCE](#) ([MDEV-33449](#), [MariaDB 11.5](#))
- Deprecate and ignore the [alter_algorithm](#) system variable ([MDEV-33655](#), [MariaDB 11.5](#))

Variables

- For a list of all new variables, see [System Variables Added in MariaDB 11.8](#) and [Status Variables Added in MariaDB 11.8](#).

Removed Features

The following deprecated features have been removed:

- `<data type> <character set clause> ... COMPRESSED...` ([MariaDB 11.5](#))
 - the correct syntax is `<data type> COMPRESSED... <character set clause> ...`
- [wsrep_load_data_splitting](#) ([MariaDB 11.5](#))
- [integer latches in OQGraph](#) (and the related [oqgraph_allow_create_integer_latch](#) variable). ([MariaDB 11.5](#))

[Overview of 11.8](#)

[Alternate download from mariadb.org](#)

Release date: 13 Feb 2025

Do not use non-stable (non-GA) releases in production!

MariaDB 11.8 is a current long-term development series of MariaDB. It is an evolution of [MariaDB 11.7](#) with several entirely new features.

For an overview of MariaDB 11.8 see the [What is MariaDB 11.8?](#) page.

Thanks, and enjoy MariaDB!

Notable Items

Storage Engines

InnoDB

- Fix assertion failure on cascading foreign key update of table with vcol index in parent ([MDEV-29182](#))

Optimizer

- Fix possibly wrong result using a degenerated subquery (SELECT <expr>) with window function ([MDEV-35869](#))
- Conditions with SP local variables are now pushed into derived table. Previous behaviour caused slow performance and table scans instead of using the pushed down condition ([MDEV-35910](#))
- Support ORDER BY and LIMIT for multi-table DELETE, index hints for single-table DELETE. ([MDEV-30469](#))
- Optimizer can now use indexed virtual columns in WHERE/ON clauses for improved query performance. ([MDEV-35616](#))
- Make SUBSTR(col, 1, n) = const_str sargable ([MDEV-34911](#))

PL/SQL

- It is now possible to define default values (or expressions) for parameters to stored procedures, stored functions and UDFs ([MDEV-10862](#))
- New DECLARE TYPE type_name IS RECORD (..) with scalar members in stored routines ([MDEV-34317](#))
- It was not possible to use a package body variable as a fetch target, instead error "Undeclared variable" was returned. ([MDEV-36047](#))

Triggers

- Fix trigger created with "CREATE TRIGGER `table1_after_insert` AFTER INSERT" which is adding rows to another table using "FOR EACH ROW insert into table2(`id`, `name`) values (NEW.`id`, NEW.`name`);" that did not work correctly when if bulk inserts are used by the application. Only the first row of the bulk insert would be added to the table ([MDEV-34958](#))
- A Trigger definition can now include column names for specifying the columns for which a trigger should be called ([MDEV-34551](#))
- Triggers can now use SIGNAL SQLSTATE '02TRG' to skip row operations (insert, update, delete) in BEFORE triggers, affecting data modification. ([MDEV-34724](#))

Data types

- Fix possible hang or crash where zero offset applied to null pointer ([MDEV-35864](#))
- Comparison of UUID v1 and V6 could return incorrect results ([MDEV-35468](#))

Character Sets

- Fix possible runtime error caused by XA RECOVER applying a zero offset to a null pointer ([MDEV-35549](#))
- Fix issue where functions in default values in tables with certain character sets could break SHOW CREATE and mariadb-dump ([MDEV-29968](#))
- OS character sets "utf8" and "utf-8" now map to MariaDB character set "utf8mb4" for full UTF-8 support. ([MDEV-22217](#))

Stored routines

- Calling a stored routine that executes a join on three or more tables and referencing not-existent column name in the USING clause could previously result in a crash on its second invocation. ([MDEV-24935](#))

Scripts & Clients

- When using [mariadb-import](#) with `--innodb-optimize-keys`, secondary index creation is delayed until after data load, potentially improving load speed. ([MDEV-34740](#))

Changelog

For a complete list of changes made in [MariaDB 11.8.1](#), with links to detailed information on each push, see the [changelog](#).

Contributors

For a full list of contributors to [MariaDB 11.8.1](#), see the [MariaDB Foundation release announcement](#).

Be notified of new MariaDB Server releases automatically by [subscribing](#) to the MariaDB Foundation community announce 'at' lists.mariadb.org announcement list (this is a low traffic, announce-only list). MariaDB plc customers will be notified for all new releases, security issues and critical bug fixes for all MariaDB plc products thanks to the Notification Services.

MariaDB may already be included in your favorite OS distribution. More information can be found on the [Distributions which Include MariaDB](#) page.

7.0.0.5.2 MariaDB 11.8.0 Release Notes

The most recent release of [MariaDB 11.8](#) is:

MariaDB 11.8.1 RC [Download Now](#)

Alternate download from [mariadb.org](#)

[Download](#)

[Release Notes](#)

[Overview of 11.8](#)

Release date: 18 Dec 2024

Do not use *alpha* releases in production!

[MariaDB 11.8.0](#) is a single preview release. Features are to be considered preview, and none are guaranteed to make it into [MariaDB 11.8](#).

For an overview of [MariaDB 11.8](#) see the [What is MariaDB 11.8?](#) page.

Thanks, and enjoy MariaDB!

Notable Items

Vectors

- New function [VEC_DISTANCE](#) for calculating either a Euclidean or Cosine distance between two vectors, depending on the underlying index type ([MDEV-35450](#))
- aarch64 SIMD instructions now supported ([MDEV-34699](#))

Optimizer

- Expanded [Optimizer hints](#) ([MDEV-35504](#))
 - Implement [subquery optimizer hints](#) ([MDEV-34888](#))
 - Implement [MAX_EXECUTION_TIME](#) hint ([MDEV-34860](#))
 - **Optimizer hints did not make it into the final [MariaDB 11.8](#) release.**

- Optimizer can now take advantage of queries of the format `SUBSTR(col, 1, n) = const_str` (MDEV-34911 [↗](#))
- Add basic optimizer support for [virtual columns](#) - see [Virtual Column Support in the Optimizer](#) (MDEV-35616 [↗](#))

InnoDB

- Fix [innodb-adaptive-hash-index](#) scalability with multiple threads (MDEV-35049 [↗](#))

Importing

- The `mariadb-dump --no-autocommit` option is now set by default to allow faster data loading by InnoDB, writing only one undo log for the whole operation (MDEV-32250 [↗](#))
- `mariadb-import` has a new option, `--innodb-optimize-keys` to delay creation of secondary indexes until after data load, resulting in faster loads. On by default. (MDEV-34740 [↗](#))

GIS

New GIS functions. These functions improve compatibility with MySQL 8.

- `ST_Validate` (MDEV-34137 [↗](#))
- `MBRCoveredBy` (MDEV-34138 [↗](#))
- `ST_Simplify` (MDEV-34141 [↗](#))
- `ST_GeoHash` (MDEV-34158 [↗](#))
- `ST_LatFromGeoHash` (MDEV-34159 [↗](#))
- `ST_LongFromGeoHash` (MDEV-34160 [↗](#))
- `ST_PointFromGeoHash` (MDEV-34277 [↗](#))
- `ST_IsValid` (MDEV-34276 [↗](#))
- `ST_Collect` (MDEV-34278 [↗](#))

Functions

- New `FORMAT_BYTES` function. Given a byte count, returns a string consisting of a value and the units in a human-readable format (MDEV-31736 [↗](#))

Referential Integrity

- `CHECK TABLE ... EXTENDED` now also checks for referential integrity (MDEV-34309 [↗](#))

Information Schema

- When querying the [information Schema](#), [stored functions](#) that have the same name as a native function no longer generate a warning (MDEV-35437 [↗](#))

Be notified of new MariaDB Server releases automatically by [subscribing](#) [↗](#) to the MariaDB Foundation community announce 'at' lists.mariadb.org announcement list (this is a low traffic, announce-only list). MariaDB plc customers will be notified for all new releases, security issues and critical bug fixes for all MariaDB plc products thanks to the Notification Services.

MariaDB may already be included in your favorite OS distribution. More information can be found on the [Distributions which Include MariaDB](#) page.

7.0.0.6 MariaDB Server 11.7

Changes and Improvements in MariaDB 11.7

Current Version: 11.7.1 | Status: RC | Release Date: 21 Nov 2024

Release Notes - MariaDB 11.7 Rolling Releases

Release notes for MariaDB 11.7 rolling releases.

Changelogs - MariaDB 11.7 Series

MariaDB 11.7 changelogs [↗](#)

7.0.0.7 Changes and Improvements in MariaDB 11.7

The most recent release of MariaDB 11.7 is:

MariaDB 11.7.2 [Download Now](#)

[Alternate download from mariadb.org](#)

Contents

1. [Upgrading](#)
2. [New Features](#)
 1. [Vectors](#)
 2. [Replication and Binary Log](#)
 3. [UUID](#)
 4. [Optimization](#)
 5. [System-Versioned Tables](#)
 6. [Slow Query Log](#)
 7. [Stored Routines](#)
 8. [Derived Tables](#)
 9. [\[SHOW\] CREATE SERVER](#)
 10. [General](#)
 11. [Deprecated Variables](#)
 1. [Spider](#)
3. [Security Vulnerabilities Fixed in MariaDB 11.7](#)
4. [List of All MariaDB 11.7 Releases](#)

MariaDB 11.7 is a [rolling release](#).

New Features

Vectors

- [Vectors](#) are now included in the binaries
- Numerous [vector search](#) improvements ([MDEV-34939](#))

Replication and Binary Log

- When [binlogging](#) is enabled, committing a large transaction no longer freezes all other transactions until completed ([MDEV-32014](#))
- [binlog_optimize_thread_scheduling](#) has been deprecated ([MDEV-33756](#))
- Async rollback prepared transactions during binlog crash recovery ([MDEV-33853](#))
- New variable, [slave_abort_blocking_timeout](#), for aborting long-running queries on a replica ([MDEV-34857](#))
- New variable, [binlog_large_commit_threshold](#), for increasing transaction concurrency for large transactions ([MDEV-32014](#))

UUID

- New function for generating version 4 UUIDs [UUID_v4](#) ([MDEV-11339](#))
- New function for generating version 7 UUIDs [UUID_v7](#) ([MDEV-32637](#))

Optimization

- Optimization improvement for single-table UPDATE/DELETE: make cost-based choice between subquery strategies ([MDEV-25008](#))
- The [Charset Narrowing Optimization](#) is now on by default ([MDEV-34380](#))

System-Versioned Tables

- Allow a [system-versioned table](#) to be converted from implicit to explicit [row_start/row_end](#) columns ([MDEV-27293](#))

Slow Query Log

- New variable, [log_slow_always_query_time](#), for specifying that all queries longer than this time are logged to the [slow query log](#), regardless of [log_slow_min_examined_row_limit](#) and [log_slow_rate_limit](#) (MDEV-33144 [↗](#))

Stored Routines

- ROW data type for stored function return values (MDEV-12252 [↗](#))

Derived Tables

- Add optional correlation column list for [derived tables](#) (MDEV-31466 [↗](#))

[SHOW] CREATE SERVER

- Implement [SHOW CREATE SERVER](#) (MDEV-15696 [↗](#))
- Allow arbitrary options in [CREATE SERVER](#) (MDEV-34716 [↗](#))

General

- [SESSION_USER\(\)](#), which used to be an alias for [USER\(\)](#) now shows the value of [CURRENT_USER\(\)](#) when the session was created (MDEV-30908 [↗](#))
- [CURRENT_TIMESTAMP](#) should return a [TIMESTAMP \(WITH TIME ZONE?\)](#) (MDEV-15751 [↗](#))
- A warning has been added when [max_sort_length](#) is exceeded. (MDEV-27277 [↗](#))

Deprecated Variables

- [binlog_optimize_thread_scheduling](#) (MDEV-33756 [↗](#))

Spider

- The Spider variables [spider_table_crd_thread_count](#) and [spider_table_sts_thread_count](#) have been deprecated (MDEV-28009 [↗](#))

[Release Notes](#)

[Changelog](#) [↗](#)

[Overview of 11.7](#)

[Alternate download from mariadb.org](#) [↗](#)

Release date: 13 Feb 2025

MariaDB 11.7.2 is a [Stable \(GA\)](#) release. It is an evolution of [MariaDB 11.6](#) with several entirely new features.

MariaDB 11.7 is a [rolling release](#). One is expected to upgrade to [MariaDB 11.8.2](#), there will be no 11.7.3.

For an overview of [MariaDB 11.7](#) see the [What is MariaDB 11.7?](#) page.

Thanks, and enjoy MariaDB!

Notable Items

Storage Engines

InnoDB

- Fix possible InnoDB hang while running out of buffer pool ([MDEV-35409](#))
- Fix assertion failure on cascading foreign key update of table with vcol index in parent ([MDEV-29182](#))
- Fix potential issue in secondary Index with ROW_FORMAT=COMPRESSED and Change buffering enabled ([MDEV-35679](#))
- Fix issue where ON UPDATE SET NULL could not be specified on a NOT NULL column ([MDEV-35445](#))
- New parameter `--skip-freed-pages` for [InnoDBchecksum](#). Use this parameter to not get freed undo logs reported as existing undo log pages. ([MDEV-35394](#))
- Cloning of table statistics while saving the InnoDB table stats is now avoided ([MDEV-35363](#))
- InnoDB deadlock output query length increased to improve visibility of deadlocked statements. ([MDEV-32576](#))
- [ALTER TABLE...IMPORT TABLESPACE](#) now works with INDEX DESC ([MDEV-35169](#))
- Fix occasional failure of recovery of a multi-batch operation with InnoDB on startup ([MDEV-35699](#))

Memory

- Fix possible crash on DELETE from a HEAP table ([MDEV-22695](#))

Spider

- Fix possible Spider thread hang in 'Update' state on 2nd INSERT ([MDEV-35064](#))
- Fix possible crash on bootup in spider_sys_open_table «ext-issue»[MDEV-32822](#), «ext-issue»[MDEV-34302](#) ([MDEV-34925](#))

Character Sets and Collations

- 44 new [collations](#) added. These are aliases for MySQL collations to make it easier to replicate from MySQL to MariaDB ([MDEV-35256](#))
 - The [Information Schema Collations table](#) includes a new column, `COMMENT` which contains information about which collation the alias refers to.
- Fix assertion failure and possible index corruption with unique key and nopad collation without DESC or HASH keys ([MDEV-30111](#))
- Fix client crash the command after client sets character set to utf32 ([MDEV-34090](#))
- Fix possible runtime error caused by XA RECOVER applying a zero offset to a null pointer ([MDEV-35549](#))
- Fix issue where functions in default values in tables with certain character sets could break SHOW CREATE and mariadb-dump ([MDEV-29968](#))

Replication

- Fix incorrect formatting of timestamp during [mariadb-binlog](#) parsing of a binary log, causing point in time recovery discrepancies ([MDEV-31761](#))
- [mariadb-binlog](#) can now correctly process more than one logfile when `--stop-datetime` is specified ([MDEV-35528](#))
- Setting ``pseudo_thread_id`` to a value exceeding 4 bytes previously resulted in truncation when written to the binary log ([MDEV-35646](#))
- MariaDB now supports MySQL 8.0 binlog events, including PARTIAL_UPDATE_ROWS_EVENT, TRANSACTION_PAYLOAD_EVENT, and HEARTBEAT_LOG_EVENT_V2. ([MDEV-35643](#))
- [mariadb-binlog](#) no longer ignores binary log events written with system timestamp 4294967295 and possibly all following events, avoiding potential data loss during recovery from binlogs ([MDEV-33239](#))
- Table flags, preserved from the old storage engine after changing the storage engine of a table, can no longer break replication ([MDEV-31794](#))

- Fix issue where [START/STOP ALL REPLICAS](#) errors without returning an error if the command could be executed due to wrong privileges. ([MDEV-21858](#))

Optimizer

- Fix server crash in `get_sort_by_table/make_join_statistics` after INSERT into a view with ORDER BY ([MDEV-29935](#))
- Fix failing assertion causing disruption and replication failure ([MDEV-24035](#))
- Conditions with SP local variables are now pushed into derived table. Previous behaviour caused slow performance and table scans instead of using the pushed down condition ([MDEV-35910](#))
- NULL-aware materialization with IN predicate and single column no longer skips building sorted Ordered_key structures ([MDEV-34665](#))
- Fix possibly wrong result using a degenerated subquery (`SELECT <expr>`) with window function ([MDEV-35869](#))

Partitioning

- History is now stored on the same partitions on different Galera nodes when system versioning is enabled ([MDEV-35096](#))
- Fix possible hang or crash during InnoDB purge with HASH indexes during ALTER TABLE ([MDEV-25654](#))
- EXCHANGE PARTITION now works for tables with unique blobs ([MDEV-35612](#))
- algorithm = instant can now correctly be used if a table has partitions and one tries to change a column with an index which is not the partitions key. This previously gave the error "ERROR 1846 (0A000): ALGORITHM=INSTANT is not supported. Reason: ADD INDEX. Try ALGORITHM=NOCOPY". ([MDEV-34813](#))

Galera

- [Galera](#) updated to 26.4.21
 - **NOTE:** Includes increasing the GCS protocol version, which prevents downgrades of individual nodes in the cluster as soon as all nodes have been updated
- Fix streaming replication transaction crash with `innodb_snapshot_isolation` ([MDEV-35281](#))
- Fix sporadic failure of async replication on Galera async replica nodes with parallel replication enabled ([MDEV-35465](#))
- Fix possible failure of `wsrep_sst_rsnc` SST script if user specified `aria_log_dir_path` different from default data directory ([MDEV-35387](#))
- Fix cluster node hang during shutdown if threadpool is used ([MDEV-35710](#))
- MariaDB Cluster and ALTER INPLACE running in Total Order Isolation (`wsrep_OSU_method=TOI`) now correctly abort a DML INSERT operation in InnoDB ([MDEV-33064](#))
- Fix possible crash in `wsrep_check_sequence` ([MDEV-33245](#))
- Fix sporadic reporting of success when a deadlock error occurs under `--ps-protocol BF` aborted transaction ([MDEV-35446](#))
- Rows in table `mysql.gtid_slave_pos` are now correctly deleted on Galera nodes when `wsrep_gtid_mode = 1` is used, which previously lead to wrong information about replica delays ([MDEV-34924](#))
- Undefined behavior could occur when attempting to perform INSERT DELAYED on a Galera cluster node. ([MDEV-35852](#))
- Fix issue where DROP TABLE on child and UPDATE of parent table can cause a metadata lock BF-BF conflict when applied concurrently. ([MDEV-35018](#))
- Galera protocol versions are now shown by `show status` - change available with installation of galera library 26.4.21+ ([MDEV-35505](#))
- Fix possible crash in `wsrep_sst_mariabackup` script when upgrading node in cluster from 10.11.9 to 10.11.10. ([MDEV-35526](#))
- `wsrep_sst_mariabackup.sh` no longer uses `--use-memory` default (100MB) resulting in prepare stage which could take hours ([MDEV-35749](#))

Audit Plugin

- For an authentication with the [ed25519 authentication plugin](#) the password of the CREATE USER statement is now masked in the audit log ([MDEV-35507](#))
- MariaDB Audit now detects all DCLs forms for masking a password ([MDEV-35522](#))

Vector search

- Adding a regular index on a vector column leads to invalid table structure ([MDEV-35792](#))
- Vector values become zero after `mariadb-dump` / restore, impacting data integrity for vector columns. ([MDEV-35221](#))
- Server can crash when a SELECT query is including a DISTINCT and ORDER BY, and a vector index is used

General

- Fix possible crash where server could not construct a geometry object from the input ([MDEV-33987](#))
- Fix trigger created with "CREATE TRIGGER `table1_after_insert` AFTER INSERT" which is adding rows to another table using "FOR EACH ROW insert into table2(`id`, `name`) values (NEW.`id`, NEW.`name`);" that did not work correctly when if bulk inserts are used by the application. Only the first row of the bulk insert would be added to the table ([MDEV-34958](#))
- After changing the table definition for the system table 'mysql.servers', a following execution of CREATE SERVER would previously lead to a server crash.
 - NOTE: System tables should never be modified by a user anyhow ([MDEV-33783](#))
- Fix connection hang after query on a partitioned table with UNION and LIMIT ROWS EXAMINED ([MDEV-35571](#))
- Fix possible crash during index traversal using `tree_search_next`. ([MDEV-28130](#))
- Fix assertion failure where CURRENT_USER was not correctly copied during condition pushdown ([MDEV-35090](#))
- START TRANSACTION, when triggering an implicit commit as a COMMIT or ROLLBACK has not been executed before, now resets optional characteristics added to the last START TRANSACTION command ([MDEV-35335](#))
- sql_mode='NO_UNSIGNED_SUBTRACTION' now works for multiple unsigned integers ([MDEV-35651](#))
- The "Failed to write to mysql.slow_log" error no longer shown without a detailed reason for the error ([MDEV-20281](#))
- Fix doublewrite recovery of innodb_checksum_algorithm=full_crc32 encrypted pages ([MDEV-34898](#))
- Can now correctly add a foreign key on a table with a long UNIQUE multi-column index that contains a foreign key as a prefix ([MDEV-33658](#))
- During an online table rebuild of an InnoDB statistics table, opt_search_plan_for_table() no longer sometimes degrades to full table scan ([MDEV-35443](#))
- Fix debian-start script failure when using non-standard socket path ([MDEV-35907](#))
- Fix possible hang or crash where zero offset applied to null pointer ([MDEV-35864](#))
- Fixed issue where ST_PointFromWKB ignored SRID parameter and returned 0 ([MDEV-32619](#))
- Fix possible hang during CREATE TABLE...SELECT error handling, especially with innodb_snapshot_isolation enabled ([MDEV-35647](#))
- Fix incorrect locking order of LOCK_log/LOCK_commit_ordered and LOCK_global_system_variables ([MDEV-29744](#))
- Fix rare cases where binlog entries could receive incorrect timestamps on secondary nodes of a Galera cluster, potentially impacting replication accuracy ([MDEV-35157](#))
- Fix possible memory leak on SHUTDOWN ([MDEV-35326](#))
- Fix possible memory leak while shutting down server after installing the auth_gssapi plugin ([MDEV-35575](#))
- Fix possible server crash when using INSERT DELAYED on tables with virtual columns. ([MDEV-26891](#))
- Fix possible Spider crash or hang when the first byte of a connection key is changed ([MDEV-34849](#))
- A BEFORE INSERT Trigger previously returned with error "'Field 'xxx' doesn't have a default value", if a NULL value is added for a column defined NOT NULL without explicit value and no DEFAULT specified ([MDEV-19761](#))
- Calling a stored routine that executes a join on three or more tables and referencing not-existent column name in the USING clause could previously result in a crash on its second invocation. ([MDEV-24935](#))
- Fix rare cases where binlog entries could receive incorrect timestamps on secondary nodes of a Galera cluster, potentially impacting replication accuracy ([MDEV-35157](#))
- Comparison of UUID v1 and V6 could return incorrect results ([MDEV-35468](#))
- INSERT SELECT on NOT NULL columns with BEFORE UPDATE trigger can fail with error 1048 (23000) ([MDEV-36026](#))
- It was not possible to use a package body variable as a fetch target, instead error "Undeclared variable" was returned. ([MDEV-36047](#))
- Validation of SSL certificate fails for mariadb-backup. For a MariaDB Cluster (Galera) SST operations can be affected ([MDEV-35368](#))

Security

- Fixes for the following [security vulnerabilities](#):
 - [CVE-2025-21490](#)

Changelog

For a complete list of changes made in [MariaDB 11.7.2](#), with links to detailed information on each push, see the [changelog](#).

7.0.0.8.2 MariaDB 11.7.1 Release Notes

[Download](#)[Release Notes](#)[Changelog](#)[Overview of 11.7](#)

[Alternate download from mariadb.org](#)

Release date: 21 Nov 2024

Do not use non-stable (non-GA) releases in production!

MariaDB 11.7 is a [rolling release](#). It is an evolution of [MariaDB 11.6](#) with several entirely new features.

MariaDB 11.7.1 is a [Release Candidate \(RC\)](#) release.

For an overview of [MariaDB 11.7](#) see the [What is MariaDB 11.7?](#) page.

Thanks, and enjoy MariaDB!

Notable Items

Vectors

- [Vectors](#) are a feature that allow MariaDB Server to perform as a relational vector database. Previously available in the special [Vector preview release](#), it has now been added to MariaDB Community Server 11.7.1 with various enhancements ([MDEV-34939](#))
 - Data type VECTOR ([MDEV-33410](#))
 - Conversion functions VEC_FromText and VEC_ToText ([MDEV-32886](#))
 - Configuration options ([MDEV-35244](#))
 - [mhns_w_max_cache_size](#) Upper limit for one MHNSW vector index cache
 - [mhns_w_default_distance](#) Default value for the DISTANCE vector index option
 - [mhns_w_default_m](#) Default value for the M vector index option
 - [mhns_w_ef_search](#) Defines the minimal number of result candidates to look for in the vector index for ORDER BY ... LIMIT N queries.

Storage Engines

InnoDB

- Defaults change - the [innodb_snapshot_isolation](#) system variable now defaults to ON, previously was OFF ([MDEV-35124](#))
- Fix attempt to read outside the bounds of the file: ./ibdata1 ([MDEV-34453](#))
- Fix MariaDB crash with SIGILL because the OS does not support AVX512 ([MDEV-34565](#))
- Fix deadlock caused by lock_rec_unlock_unmodified() ([MDEV-34690](#))
- Fix duplicate key error in table 'mysql.innodb_table_stats' ([MDEV-34207](#))
- Fix possible adaptive hash index corruption with ALTER TABLE...IMPORT TABLESPACE and FULLTEXT SEARCH ([MDEV-35059](#))
- XA prepare now correctly releases unmodified records in non-blocking mode ([MDEV-34466](#))
- Fix contention between secondary index UPDATE and purge due to large innodb_purge_batch_size ([MDEV-34515](#))
- Fix redundant page lookups that hurt performance ([MDEV-34791](#))
- Implement [innodb_log_file_mmap](#) on 64-bit systems for improving ib_logfile0 reads ([MDEV-34062](#))

Spider

- Fix server crash when calling `spider UDF` after `aria_encrypt_tables` is enabled ([MDEV-34682](#))
- `SELECT MIN` on Spider table no longer returns more rows than expected ([MDEV-26345](#))
- Fix Spider group by handler wrong result on order by aggregate ([MDEV-29546](#))

S3

- Fix Storage Engine S3 that caused 500 error when using Huawei Cloud S3 and possibly other S3 providers ([MDEV-34867](#))
 - A new option `s3-provider` has been added. `s3-provider=Huawei` needs to be set for Huawei Cloud S3

Optimizer

- Fix crash caused by query containing constant having clause ([MDEV-23983](#))
- Fix assertion with `optimizer_join_limit_pref_ratio` and 1-table select ([MDEV-35072](#))

Data Definition - Alter Table

- Fix InnoDB crash under Windows Subsystem for Linux on `ALTER TABLE` or `OPTIMIZE TABLE` ([MDEV-34938](#))
- Fix case where modification of the column incorrectly checked foreign key constraint ([MDEV-34392](#))
- Fix incorrect NULL value handling for instantly dropped BLOB columns ([MDEV-35122](#))

Galera

- Galera updated to 26.4.20
- Fix server crash when setting `wsrep_cluster_address` after adding invalid value to `wsrep_allowlist` table ([MDEV-31173](#))
- TOI (`ALTER`) no longer hangs on a parent table if SR transaction is in progress on a child table ([MDEV-34836](#))
- Fix `INSERT...SELECT` on MyISAM table suddenly replicated by alera ([MDEV-34647](#))
- Fix case where with `wsrep_mode=REPLICATE_ARIA`, only part of the mixed-engine transactions was replicated ([MDEV-30653](#))
- Fix `galera_ssl_reload` failure with warning message ([MDEV-32778](#))
- When InnoDB gets an assertion failure, WSREP layer is now handled gracefully ([MDEV-32363](#))

Backup

- Recovery now correctly notes some log corruption ([MDEV-34802](#))
- InnoDB now correctly merges the change buffer to `ROW_FORMAT=COMPRESSED` tables ([MDEV-34879](#))
- Can now selectively restore sequences using innodb tables from backup ([MDEV-32350](#))

JSON

- `JSON_TABLE` now properly unquotes strings ([MDEV-27412](#))
- `JSON_TABLE` default values now allows non-string literals ([MDEV-25822](#))

General

- As per the [MariaDB Deprecation Policy](#), this will be the last release of [MariaDB 11.7](#) for Windows 11 22H2
- `mariadb` no longer hangs on startup when `--init-file` target does not exist ([MDEV-34814](#))
- `LOAD DATA INFILE` with geometry data no longer fails ([MDEV-34883](#))
- Fix heap-use-after-free in `group_concat` with compressed or GIS columns ([MDEV-16699](#))
- Fix assertion `'!is_cond()' failed in Item_bool_func::val_int / do_select` ([MDEV-35135](#))
- Trigger now works correctly with bulk update ([MDEV-34718](#))
- Fix assertion failure in `find_producing_item` upon a query from a view ([MDEV-35276](#))
- Add new setting, `--quick-max-column-width` to the mariadb client for use in `--quick` mode ([MDEV-34704](#))

Changelog

For a complete list of changes made in [MariaDB 11.7.1](#), with links to detailed information on each push, see the [changelog](#).

Contributors

Be notified of new MariaDB Server releases automatically by [subscribing](#) to the MariaDB Foundation community announce 'at' lists.mariadb.org announcement list (this is a low traffic, announce-only list). MariaDB plc customers will be notified for all new releases, security issues and critical bug fixes for all MariaDB plc products thanks to the Notification Services.

MariaDB may already be included in your favorite OS distribution. More information can be found on the [Distributions which Include MariaDB](#) page.

7.0.0.8.3 MariaDB 11.7.0 Release Notes

The most recent release of MariaDB 11.7 is:

[MariaDB 11.7.2](#) [Download Now](#)

[Alternate download from mariadb.org](#)

[Download 11.7.1](#)

[Release Notes](#)

[Overview of 11.7](#)

Release date: 25 Sep 2024

Do not use *alpha* releases in production!

MariaDB 11.7 is a [rolling release](#). It is an evolution of [MariaDB 11.6](#) with several entirely new features.

MariaDB 11.7.0 is a single preview release. Features are to be considered preview, and none are guaranteed to make it into MariaDB 11.7.

For an overview of [MariaDB 11.7](#) see the [What is MariaDB 11.7?](#) page.

Thanks, and enjoy MariaDB!

Notable Items

Replication and Binary Log

- When [binlogging](#) is enabled, committing a large transaction no longer freezes all other transactions until completed ([MDEV-32014](#))
- [binlog_optimize_thread_scheduling](#) has been deprecated ([MDEV-33756](#))
- Async rollback prepared transactions during binlog crash recovery ([MDEV-33853](#))
- New variable, [slave_abort_blocking_timeout](#), for aborting long-running queries on a replica ([MDEV-34857](#))
- New variable, [binlog_large_commit_threshold](#), for increasing transaction concurrency for large transactions ([MDEV-32014](#))

UUID

- New function for generating version 4 UUIDs [UUIDv4](#) ([MDEV-11339](#))
- New function for generating version 7 UUIDs [UUIDv7](#) ([MDEV-32637](#))

Optimization

- Optimization improvement for single-table UPDATE/DELETE: make cost-based choice between subquery strategies ([MDEV-25008](#))
- The [Charset Narrowing Optimization](#) is now on by default ([MDEV-34380](#))

GIS

New GIS functions. These functions improve compatibility with MySQL 8. **Note that these were not included in [MariaDB](#)**

11.7

- [ST_Validate \(MDEV-34137\)](#)
- [MBRCoveredBy \(MDEV-34138\)](#)
- [ST_Simplify \(MDEV-34141\)](#)
- [ST_GeoHash \(MDEV-34158\)](#)
- [ST_LatFromGeoHash \(MDEV-34159\)](#)
- [ST_LongFromGeoHash \(MDEV-34160\)](#)
- [ST_IsValid \(MDEV-34276\)](#)
- [ST_Collect \(MDEV-34278\)](#)

System-Versioned Tables

- Allow a [system-versioned table](#) to be converted from implicit to explicit `row_start/row_end` columns ([MDEV-27293](#))

Slow Query Log

- New variable, [log_slow_always_query_time](#), for specifying that all queries longer than this time are logged to the [slow query log](#), regardless of [log_slow_min_examined_row_limit](#) and [log_slow_rate_limit](#) ([MDEV-33144](#))

Stored Routines

- ROW data type for stored function return values ([MDEV-12252](#))

Derived Tables

- Add optional correlation column list for [derived tables](#) ([MDEV-31466](#))

Vectors

- [MariaDB Vector Search \(MDEV-34939\)](#)

[SHOW] CREATE SERVER

- Implement [SHOW CREATE SERVER \(MDEV-15696\)](#)
- Allow arbitrary options in [CREATE SERVER \(MDEV-34716\)](#)

General

- [SESSION_USER\(\)](#), which used to be an alias for [USER\(\)](#) now shows the value of [CURRENT_USER\(\)](#) when the session was created ([MDEV-30908](#))
- [CURRENT_TIMESTAMP](#) should return a [TIMESTAMP \(WITH TIME ZONE?\) \(MDEV-15751\)](#)
- A warning has been added when [max_sort_length](#) is exceeded. ([MDEV-27277](#))

Deprecated Variables

- [binlog_optimize_thread_scheduling \(MDEV-33756\)](#)

Spider

- The Spider variables [spider_table_crd_thread_count](#) and [spider_table_sts_thread_count](#) have been deprecated ([MDEV-28009](#))

Be notified of new MariaDB Server releases automatically by [subscribing](#) to the MariaDB Foundation community announce 'at' lists.mariadb.org announcement list (this is a low traffic, announce-only list). 7.0.0.9 MariaDB Server 11.6

Changes and Improvements in MariaDB 11.6

Current Version: 11.6.2 | Status: Stable (GA) | Release Date: 21 Nov 2024

Release Notes - MariaDB 11.6 Rolling Releases

Release notes for MariaDB 11.6 rolling releases.

Changelogs - MariaDB 11.6 Series

MariaDB 11.6 changelogs [↗](#)

7.0.0.10 Changes and Improvements in MariaDB 11.6

MariaDB 11.6 is an old rolling release and is no longer maintained. Please use a [more recent release](#) [↗](#).

The most recent release of MariaDB 11.6 is:

MariaDB 11.6.2 [↗](#) [Download Now](#) [↗](#)

[Alternate download from mariadb.org](#) [↗](#)

Contents

1. [Upgrading](#)
2. [Notable Items](#)
 1. [Vectors](#)
 2. [Character Sets](#)
 3. [Backup and Restore](#)
 4. [Optimizer](#)
 5. [Syntax](#)
 6. [Authentication](#)
 7. [Replication](#)
 8. [General](#)
 9. [Variables](#)
3. [Security Vulnerabilities Fixed in MariaDB 11.6](#)
4. [List of All MariaDB 11.6 Releases](#)

MariaDB 11.6 is a [rolling release](#) [↗](#).

Notable Items

Vectors

- [Vectors](#) are a feature that allow MariaDB Server to perform as a relational vector database. In [MariaDB 10.6](#), only available in the [Vector preview release](#) [↗](#).
- Vector Search was added to [MariaDB 11.7](#).

Character Sets

- The default [character set](#) has been changed from `latin1` to `utf8mb4` ([MDEV-19123](#) [↗](#))

Backup and Restore

- Added the `--dir` option to [mariadb-import](#), allowing one to restore all tables from a backup directory created using [mariadb-dump --dir](#) ([MDEV-33627](#) [↗](#))
 - Added the related `--database`, `--ignore-database`, `--table` and `--ignore-table` options.
 - Refactor [mariadb-import](#) threading
- Automatic SST user account management ([MDEV-31809](#) [↗](#))

Optimizer

- Improve selectivity computations for multi-part keys ([MDEV-33697](#))

Syntax

- Single-table `DELETES` now support table aliases ([MDEV-33988](#))

Authentication

- New authentication plugin ([MDEV-32618](#))
- Extend `Unix socket authentication` to support `authentication_string` ([MDEV-33479](#))

Replication

- New definition for `Seconds_Behind_Master` ([MDEV-33856](#))
 - Added three variables to `SHOW ALL REPLICAS STATUS`
 - New `Information Schema SLAVE_STATUS` Table

General

- Set thread names for MariaDB Server threads ([MDEV-32537](#))

7.0.0.12 MariaDB Server 11.5

Changes and Improvements in MariaDB 11.5

Current Version: 11.5.2 | Status: *Stable (GA)* | Release Date: 14 Aug 2024

Release Notes - MariaDB 11.5 Rolling Releases

Release notes for MariaDB 11.5 rolling releases.

7.0.0.13 Changes and Improvements in MariaDB 11.5

MariaDB 11.5 is an old rolling release and is no longer maintained. Please use a [more recent release](#).

The most recent release of MariaDB 11.5 is:

MariaDB 11.5.2 [Stable \(GA\)](#) [Download Now](#)

Contents

1. [Upgrading](#)
2. [New Features](#)
 1. [Temporary files and tables](#)
 2. [Data Types](#)
 3. [Optimizer](#)
 4. [Protocol](#)
 5. [Observability](#)
 6. [Sequences](#)
 7. [Other](#)
 8. [Removed Features](#)
 9. [Variables](#)
3. [Security Vulnerabilities Fixed in MariaDB 11.5](#)
4. [List of All MariaDB 11.5 Releases](#)

MariaDB 11.5 is a previous [rolling release](#).

New Features

Temporary files and tables

- [Limit size of created disk temporary files and tables \(MDEV-9101\)](#)
- There are two system variables used for controlling this feature:
 - [max_tmp_session_space_usage](#): Limits the the temporary space allowance per user
 - [max_tmp_total_space_usage](#): Limits the temporary space allowance for all users.

Data Types

- The [TIMESTAMP](#) range of values was extended. The maximal allowed value for timestamps was '2038-01-19 03:14:07 UTC', and is now '2106-02-07 06:28:15 UTC'. This does not change the storage format, and new tables can be read by old MariaDB servers as long as timestamp values are within the old timestamp range. At the moment this is only supported on 64-bit platforms ([MDEV-32188](#)).

Optimizer

- [Index condition pushdown](#) is now supported for partitioned tables ([MDEV-12404](#))
- ANALYZE for statement should show selectivity of pushed index condition ([MDEV-18478](#))

Protocol

- Permit bulk implementation to return ALL individual results ([MDEV-30366](#))
- Send initial values of system variables in first OK packet ([MDEV-31609](#))

Observability

- New [USERS table](#) in the Information Schema for storing information about users, [password expiry](#), and the limits set by [max_password_errors](#) ([MDEV-23729](#), [MDEV-32218](#))

- Add more columns to Information Schema [TABLE_STATISTICS](#), [CLIENT_STATISTICS](#) and [USER STATISTICS](#) tables ([MDEV-33151](#))
- Add QUERIES column to Information Schema [INDEX_STATISTICS](#) table ([MDEV-33152](#))
- Add [FLUSH GLOBAL STATUS](#) ([MDEV-33145](#))
- Provide [InnoDB async IO](#) statistics ([MDEV-32841](#))
 - Including a number of [status variables](#).
- Show variable deprecation for [mariadb --help](#) output ([MDEV-28671](#))
- Extend [Query Response Time plugin](#) to be compatible with Percona server ([MDEV-33501](#))

Sequences

- Additional features for Sequences ([MDEV-28152](#))
 - [CREATE SEQUENCE ... AS](#) permits creating as any [INT](#) type (including [BIGINT UNSIGNED](#)), extending the range
 - [Information Schema Sequences table](#)
 - Parser accepts larger and smaller values for [MINVALUE](#) and [MAXVALUE](#)
- [ANALYZE TABLE](#) on [sequences](#) no longer attempts to collect statistics ([MDEV-33938](#))

Other

- [REPAIR TABLE ... FORCE](#) ([MDEV-33449](#))
- Deprecate and ignore the [alter_algorithm](#) system variable ([MDEV-33655](#))
- Change [default Unicode collation](#) to [uca1400_ai_ci](#), a modern Unicode collation with proper support for SMP characters (including emoji)([MDEV-25829](#))
- Parallel dump of multiple databases via [mariadb-dump](#) with the `--dir` option ([MDEV-33625](#))
- Deprecate [spider_casual_read](#) ([MDEV-31789](#))

Removed Features

The following deprecated features have been removed:

- `<data type> <character set clause> ... COMPRESSED...`
 - the correct syntax is `<data type> COMPRESSED... <character set clause> ...`
- [wsrep_load_data_splitting](#)
- [integer latches in OQGraph](#) (and the related [oqgraph_allow_create_integer_latch](#) variable).

Variables

- For a list of all new variables, see [System Variables Added in MariaDB 11.5](#) and [Status Variables Added in MariaDB 11.5](#).

 20. [Variables](#)
 1. [Removed](#)
3. [Security Vulnerabilities Fixed in MariaDB 11.4](#)
4. [List of All MariaDB 11.4 Releases](#)

MariaDB 11.4 is a current long-term series, maintained until May 2029.

Upgrading

- See [Upgrading Between Major MariaDB Versions](#) and [Upgrading from MariaDB 10.11 to MariaDB 11.4](#).

New Features

This list includes all features since the previous long-term release, [MariaDB 10.11](#) (those introduced in the [MariaDB 11.0](#), [MariaDB 11.1](#) and [MariaDB 11.2](#) short-term releases, and the [MariaDB 11.3](#) rolling release).

Optimizer

- Major improvements to the Optimizer. See [The Optimizer Cost Model from MariaDB 11.0](#).
- [Semi-join optimization](#) for single-table `UPDATE/DELETE` statements. Update and delete statements that use subqueries can now use all subquery optimization strategies that MariaDB offers, so now if you use subqueries in `UPDATE` or `DELETE`, these statements will likely be much faster ([MDEV-7487](#), [MariaDB 11.1](#))
- Queries with the `DATE` or `YEAR` functions comparing against a constant can now make use of indexes, so these will be noticeably quicker in certain instances. For example `SELECT * FROM t2 WHERE YEAR(a) = 2019` or `SELECT * FROM t2 WHERE DATE(a) <= '2017-01-01'`. See [Sargable DATE and YEAR \(MDEV-8320\)](#), [MariaDB 11.1](#))
- Queries like `UCASE(varchar_col)=...` can now use an index on `varchar_col` if its collation is case insensitive. An `optimizer_switch` option, `sargable_casefold=ON`, has been added to enable this optimization. ([MDEV-31496](#), [MariaDB 11.3](#))
- Not only ascending, but also [descending indexes](#) can now be used to optimize `MIN()` and `MAX()` ([MDEV-27576](#))

InnoDB

- Shrink [temporary tablespaces](#) without restart by setting the `innodb_truncate_temporary_tablespace_now` system variable. ([MDEV-28699](#), [MariaDB 11.3](#))
- The [InnoDB system tablespace](#) is now shrunk by reclaiming unused space at startup ([MDEV-14795](#), [MariaDB 11.2](#))

Online Schema Change

- `ALTER TABLE` can now do most operations with `ALGORITHM=COPY`, `LOCK=NONE`, that is, in most cases, unless the algorithm and lock level are explicitly specified, `ALTER TABLE` will be performed using the `COPY` algorithm while simultaneously allowing concurrent [DML statements](#) on the altered table. ([MariaDB 11.2](#))

Replication and Binary Log

- [Binary log](#) writing speed was improved by moving checksum calculations out of the global binlog mutex ([MDEV-31273](#)). The `binlog_legacy_event_pos` system variable is available if the old behavior is desired. This is a contribution by Kristian Nielsen
- New system variable `max_binlog_total_size` enables binary log purging when the total size of all binary logs exceeds the specified threshold. The implementation is based on the patch from Percona ([MDEV-31404](#))
- New system variable `slave_connections_needed_for_purge` disables binary log purging until the number of connected slaves reaches the specified threshold ([MDEV-31404](#)).
- `FULL_NODUP` is a new value for the `binlog_row_image` system variable. It essentially works like `FULL`, that is all columns are included in the event, but it takes less space, because the after image omits columns that were not changed by the `UPDATE` statement, and have same values as in the before image. This is a contribution from Alibaba ([MDEV-32589](#))
- `mariadb-binlog --flashback` support for the `FULL_NODUP` mode. This is a contribution from Alibaba ([MDEV-32894](#))
- MariaDB can optionally maintain a [special index of GTIDs](#) and their location in the binary log. If enabled (the default), it allows finding very quickly where a new connecting replica should start replicating from. Without an index, this required scanning the binlog. This is a contribution by Kristian Nielsen ([MDEV-4991](#)).
- Add keywords "SQL_BEFORE_GTIDS" and "SQL_AFTER_GTIDS" for `START SLAVE UNTIL` ([MDEV-27247](#), [MariaDB 11.3](#)). `SQL_BEFORE_GTIDS` stops the replica when it sees gtid's of the option's argument list, without executing them. ([MariaDB 11.3](#))
- All binlog* variables are now visible as system variables, specifically `binlog_do_db`, `binlog_ignore_db`, `binlog_row_event_max_size` ([MDEV-30188](#), [MariaDB 11.2](#))

SSL/TLS

- [SSL](#) is now enabled in the server by default. No configuration necessary, if no server certificate was provided a self-signed certificate will be automatically generated by the server. See [Mission Impossible: Zero-Configuration SSL](#) for details ([MDEV-31856](#)).
- Clients now can validate self-signed server certificates if the `mysql_native_password` or `ed25519` authentication is

- used and account password is not empty (MDEV-31855 [↗](#)).
- Clients now require SSL and have `--ssl-verify-server-cert` enabled by default (MDEV-31857 [↗](#)).
- Replication clients do that too, `MASTER_SSL_VERIFY_SERVER_CERT` is enabled by default.
- Use `--disable-ssl` or `--disable-ssl-verify-server-cert` to revert to the old behavior.
- Clients can use new command line options `--ssl-fp` and `--ssl-fplist` to verify the server certificate by its fingerprint

JSON

- `JSON_TABLE` now allows retrieval of the key when iterating on JSON objects (MDEV-30145 [↗](#), MariaDB 11.2)
- New functions `JSON_OBJECT_FILTER_KEYS`, `JSON_OBJECT_TO_ARRAY` and `JSON_ARRAY_INTERSECT` to check for JSON intersection (MDEV-26182 [↗](#), MariaDB 11.2)
- `JSON_KEY_VALUE` extracts key/value pairs from a JSON object (MDEV-30145 [↗](#), MariaDB 11.2)
- `JSON_SCHEMA_VALID` function for validating a JSON schema (MDEV-27128 [↗](#), MariaDB 11.1)

Data Types

- It is now possible to create [partitions](#) on tables that contain [GEOMETRY](#) types (MDEV-19177 [↗](#), MariaDB 11.3)
- `INET4` data types can now be cast into `INET6` types (MDEV-31626 [↗](#), MariaDB 11.3)
- This means `INET4` values can be compared with `INET6` values and can be inserted into `INET6` columns; the server can automatically convert `INET4` value into `INET6` as needed (MariaDB 11.3)

Backup and Restore

- New `mariadb-dump` option, `-j`, `--parallel=#` for increased parallelism, specifies the number of dump table jobs executed in parallel (only for use with the `--tab` option). Also added to `mariadb-import`, with `--use-threads` as a synonym. (MDEV-32216 [↗](#))
- `mariabackup --innobackupex` mode has been deprecated (MDEV-31505 [↗](#), MariaDB 11.3)
- Rename `Mariabackup's` `xtrabackup_*` files to `mariadb_backup_*` (MDEV-18931 [↗](#), MariaDB 11.1)

Application-Time Periods

- Add views for [periods](#) in `information_schema` (MDEV-22597 [↗](#)), in particular
- New view `INFORMATION_SCHEMA.PERIODS`
- New view `INFORMATION_SCHEMA.KEY_PERIOD_USAGE`
- New columns `IS_SYSTEM_TIME_PERIOD_START` and `IS_SYSTEM_TIME_PERIOD_END` in the `INFORMATION_SCHEMA.COLUMNS` view

Sys Schema

- New view `sys.privileges_by_table_by_level` shows granted privileges broken down by table on which they allow access and level on which they were granted. For example, if a user `x` has `SELECT` privilege granted `ON db.*`, this view will list all tables in the `db` schema with the user `x` having `SELECT` privilege on them. This is different from `INFORMATION_SCHEMA.TABLE_PRIVILEGES`, which only lists privileges granted on the table level (MDEV-24486 [↗](#))

Partitioning

- `ALTER TABLE ... EXCHANGE PARTITION` and `ALTER TABLE ... CONVERT TABLE ... TO` now support the `WITH VALIDATION` and `WITHOUT VALIDATION` clauses. If neither is specified, the default behavior is `WITH VALIDATION` (MDEV-22164 [↗](#))

Collations

From MariaDB 11.4.5 [↗](#):

- 44 new [collations](#) added. These are aliases for MySQL collations to make it easier to replicate from MySQL to MariaDB (MDEV-35256 [↗](#))
 - The [Information Schema Collations table](#) includes a new column, `COMMENT` which contains information about which collation the alias refers to.

Connection Redirection

- Added a [redirect mechanism](#) using the `redirect_url` system variable (MDEV-15935 [↗](#), MariaDB 11.3)
- At the moment client-side support is missing

Privileges

- Add a new database-level [privilege](#), `SHOW CREATE ROUTINE` that allows one to see the routine definition even if the user isn't the routine owner ([MDEV-29167](#), [MariaDB 11.3](#))

Spider

- The preferred way to specify [Spider parameters](#) is to use the dedicated Spider table options (implemented in [MariaDB 11.3](#)). Abusing the table `COMMENT` clause is now deprecated ([MDEV-28861](#))
- The [Spider](#) storage engine now supports table options instead of having to encode them in `COMMENT/CONNECTION` strings. When any table option is specified, Spider will ignore `COMMENT/CONNECTION` strings at the same table/partition/subpartition. A new variable `spider_ignore_comments` is introduced to ignore them globally at all levels (table/partition/subpartition). Another variable, `spider_suppress_comment_ignored_warning`, is introduced to suppress warnings when Spider ignores `COMMENT/CONNECTION` strings. ([MDEV-28856](#), [MariaDB 11.3](#))

Miscellaneous Functions

- `CONV()` function now supports conversion up to base 62 ([MDEV-30879](#))
- Values generated by the Key Derivation Function `KDF` are resistant against password hashing generators, so are good for strongly hashed passwords ([MDEV-31474](#))
- Given a time in picoseconds, the new function `FORMAT_PICO_TIME` returns a human-readable time value and unit indicator ([MDEV-19629](#), [MariaDB 11.0](#))

Date and Time

- `DATE_FORMAT` function can now print the current time zone abbreviation and current time zone offset from UTC with `%Z` and `%z` format specifiers. ([MDEV-31684](#), [MariaDB 11.3](#))

Processlist

- Added a `SENT_ROWS` column to the [Information Schema PROCESSLIST](#) table, as well as extended the display size for the columns in processlist to ensure that most results will fit in display ([MDEV-3953](#), [MariaDB 11.3](#))

Miscellaneous

- Added support for packages (`CREATE PACKAGE`) outside of `ORACLE sql_mode` ([MDEV-32101](#))
- Setting a non-default `old_mode` value will now always issue a deprecation warning ([MDEV-31811](#), [MariaDB 11.3](#))
- `ALTER TABLE IMPORT` enhancement ([MDEV-26137](#), [MariaDB 11.2](#))
- Temporary tables are now displayed in the [Information Schema TABLES](#) Table, `SHOW TABLES` and `SHOW TABLE STATUS` ([MDEV-12459](#), [MariaDB 11.2](#))
- [Stored programs](#): validation of stored program statements ([MDEV-5816](#), [MariaDB 11.2](#))
- Extend `AES_ENCRYPT()` and `AES_DECRYPT()` to support an initialization vector and algorithm ([MDEV-9069](#), [MariaDB 11.2](#))
- The `transaction_isolation` option is now a system variable, and the `tx_isolation` system variable is deprecated ([MDEV-21921](#), [MariaDB 11.1](#))

Variables

- For a list of all new variables, see [System Variables Added in MariaDB 11.4](#).

Removed

- Remove `thr_alarm` from server codebase
 - Includes removal of the `debug_no_thread_alarm` system variable ([MDEV-32567](#))
- In addition, the following deprecated features and system variables have been removed ([MDEV-32104](#), [MariaDB 11.3](#)):
 - `sr_YU locale` (deprecated since [MariaDB 10.0.11](#))
 - "engine_condition_pushdown" in `optimizer_switch` (deprecated since [MariaDB 10.1.1](#))
 - `date_format`, `datetime_format`, `time_format`, `max_tmp_tables` (deprecated since [MariaDB 10.1.2](#))
 - `wsrep_causal_reads` (deprecated since [MariaDB 10.1.3](#))
 - "parser" in `mroonga` table comment (deprecated since [MariaDB 10.2.11](#))
 - `old_alter_table` variable ([MDEV-30905](#), [MariaDB 11.3](#))
 - `innodb_defragment` and related parameters ([MDEV-30545](#), [MariaDB 11.1](#))

Security Vulnerabilities Fixed in [MariaDB 11.4](#)

For a complete list of security vulnerabilities (CVEs) fixed across all versions of MariaDB, see the [Security Vulnerabilities Fixed in MariaDB](#) page.

- [CVE-2025-21490](#): [MariaDB 11.4.5](#)
- [CVE-2024-21096](#): [MariaDB 11.4.2](#)

7.0.0.17 Release Notes - MariaDB 11.4 Series

-  **MariaDB 11.4.6 Release Notes**
Unreleased
-  **MariaDB 11.4.5 Release Notes**
Status: Stable (GA) | Release Date: 4 Feb 2025
-  **MariaDB 11.4.4 Release Notes**
Status: Stable (GA) | Release Date: 1 Nov 2024
-  **MariaDB 11.4.3 Release Notes**
Status: Stable (GA) | Release Date: 8 Aug 2024
-  **MariaDB 11.4.2 Release Notes**
Status: Stable (GA) | Release Date: 29 May 2024
-  **MariaDB 11.4.1 Release Notes**
Status: Release Candidate (RC) | Release Date: 16 Feb 2024
-  **MariaDB 11.4.0 Release Notes**
Status: Alpha | Release Date: 24 December 2023

7.0.0.17.1 MariaDB 11.4.4 Release Notes

The most recent release of MariaDB 11.4 is:
[MariaDB 11.4.5](#) [Stable \(GA\)](#) [Download Now](#)
[Alternate download from mariadb.org](#)

- [Download 11.4.4](#)
- [Release Notes](#)
- [Changelog](#)
- [Overview of 11.4](#)

Release date: 1 Nov 2024

MariaDB 11.4 is the current long-term series of MariaDB and will be maintained until May 2029. It is an evolution of [MariaDB 11.3](#) with several entirely new features.

MariaDB 11.4.4 is a [Stable \(GA\)](#) release.

For an overview of [MariaDB 11.4](#) see the [What is MariaDB 11.4?](#) page.

Thanks, and enjoy MariaDB!

Notable Items

Storage Engines

InnoDB

- Fix attempt to read outside the bounds of the file: `./ibdata1` ([MDEV-34453](#))
- Fix MariaDB crash with SIGILL because the OS does not support AVX512 ([MDEV-34565](#))
- Fix deadlock caused by `lock_rec_unlock_unmodified()` ([MDEV-34690](#))
- Fix duplicate key error in table 'mysql.innodb_table_stats' ([MDEV-34207](#))
- Fix possible adaptive hash index corruption with `ALTER TABLE...IMPORT TABLESPACE` and `FULLTEXT SEARCH` ([MDEV-35059](#))
- XA prepare now correctly releases unmodified records in non-blocking mode ([MDEV-34466](#))
- Fix contention between secondary index UPDATE and purge due to large `innodb_purge_batch_size` ([MDEV-34515](#))
 - New default of `127` for `innodb_purge_batch_size` (previously `1000`).
- Fix redundant page lookups that hurt performance ([MDEV-34791](#))
- Implement `innodb_log_file_mmap` on 64-bit systems for improving `ib_logfile0` reads ([MDEV-34062](#))

Spider

- Fix server crash when calling `spider UDF` after `aria_encrypt_tables` is enabled ([MDEV-34682](#))
- `SELECT MIN` on Spider table no longer returns more rows than expected ([MDEV-26345](#))
- Fix Spider group by handler wrong result on order by aggregate ([MDEV-29546](#))

S3

- Fix Storage Engine S3 that caused 500 error when using Huawei Cloud S3 and possibly other S3 providers ([MDEV-34867](#))
 - A new option `s3-provider` has been added. `s3-provider=Huawei` needs to be set for Huawei Cloud S3
 - New option `s3_ssl_no_verify`, if true, SSL certificate verification for the S3 endpoint is disabled

Optimizer

- Fix crash caused by query containing constant having clause ([MDEV-23983](#))
- Fix assertion with `optimizer_join_limit_pref_ratio` and 1-table select ([MDEV-35072](#))

Data Definition - Alter Table

- Fix InnoDB crash under Windows Subsystem for Linux on `ALTER TABLE` or `OPTIMIZE TABLE` ([MDEV-34938](#))
- Modification of the column now correctly checks foreign key constraint ([MDEV-34392](#))
- Fix incorrect NULL value handling for instantly dropped BLOB columns ([MDEV-35122](#))

Galera

- Galera updated to 26.4.20
- Fix server crash when setting `wsrep_cluster_address` after adding invalid value to `wsrep_allowlist` table ([MDEV-31173](#))
- TOI (ALTER) no longer hangs on a parent table if SR transaction is in progress on a child table ([MDEV-34836](#))
- Fix `INSERT...SELECT` on MyISAM table suddenly replicated by alera ([MDEV-34647](#))
- Fix case where with `wsrep_mode=REPLICATE_ARIA`, only part of the mixed-engine transactions was replicated ([MDEV-30653](#))
- Fix `galera_ssl_reload` failure with warning message ([MDEV-32778](#))
- When InnoDB gets an assertion failure, WSREP layer is now handled gracefully ([MDEV-32363](#))

Backup

- Recovery now correctly notes some log corruption ([MDEV-34802](#))
- InnoDB now correctly merges the change buffer to ROW_FORMAT=COMPRESSED tables ([MDEV-34879](#))
- Can now selectively restore sequences using innodb tables from backup ([MDEV-32350](#))

JSON

- `JSON_TABLE` now properly unquotes strings ([MDEV-27412](#))
- `JSON_TABLE` default values now allows non-string literals ([MDEV-25822](#))

General

- As per the [MariaDB Deprecation Policy](#), this will be the last release of **MariaDB 11.4** for Windows 11 22H2
- `mysqld` no longer hangs on startup when `--init-file` target does not exist ([MDEV-34814](#))
- `LOAD DATA INFILE` with geometry data no longer fails ([MDEV-34883](#))
- Fix heap-use-after-free in `group_concat` with compressed or GIS columns ([MDEV-16699](#))
- Fix assertion `'is_cond()' failed in Item_bool_func::val_int / do_select` ([MDEV-35135](#))
- Trigger now works correctly with bulk update ([MDEV-34718](#))
- Fix assertion failure in `find_producing_item` upon a query from a view ([MDEV-35276](#))
- Add new setting, `--quick-max-column-width` to the `mysqld` client for use in `--quick` mode ([MDEV-34704](#))

Changelog

For a complete list of changes made in **MariaDB 11.4.4**, with links to detailed information on each push, see the [changelog](#).

Contributors

For a full list of contributors to **MariaDB 11.4.4**, see the [MariaDB Foundation release announcement](#).

Be notified of new MariaDB Server releases automatically by [subscribing](#) to the MariaDB Foundation community announce 'at' lists.mariadb.org announcement list (this is a low traffic, announce-only list). MariaDB plc customers will be notified for all new releases, security issues and critical bug fixes for all MariaDB plc products thanks to the Notification Services.

MariaDB may already be included in your favorite OS distribution. More information can be found on the [Distributions which Include MariaDB](#) page.

7.0.0.17.2 MariaDB 11.4.3 Release Notes

The most recent release of MariaDB 11.4 is:
MariaDB 11.4.5 [Stable \(GA\)](#) [Download Now](#)
[Alternate download from mariadb.org](#)

[Download 11.4.3](#)

[Release Notes](#)

[Changelog](#)

[Overview of 11.4](#)

Release date: 8 Aug 2024

MariaDB 11.4 is the current long-term series of MariaDB and will be maintained until May 2029. It is an evolution of **MariaDB 11.3** with several entirely new features.

MariaDB 11.4.3 is a **Stable (GA)** release.

For an overview of **MariaDB 11.4** see the [What is MariaDB 11.4?](#) page.

Thanks, and enjoy MariaDB!

Notable Items

Storage Engines

InnoDB

- [ALTER TABLE...ALGORITHM=COPY](#) now builds indexes more efficiently ([MDEV-33087](#))
 - Unsetting the `innodb_alter_copy_bulk` system variable restores the old behavior.
- Fix unexpected storage read IO for the redo log, reintroduce `innodb_log_write_ahead_size` ([MDEV-33894](#))
- Correctly terminate transaction early with `ER_LOCK_TABLE_FULL` when lock memory is growing ([MDEV-34167](#))
- Alter operation on redundant table no longer aborts the server ([MDEV-34222](#))
- Fix MariaDB crash with SIGILL because the OS does not support AVX512 ([MDEV-34565](#))
- Fix InnoDB: Failing assertion: `stat_n_leaf_pages > 0` in `ha_innobase::estimate_rows_upper_bound` ([MDEV-34474](#))
- `wait_for_read` in `buf_page_get_low` no longer hurts performance ([MDEV-34458](#))
- Fix InnoDB: Assertion failure in file `./storage/innobase/page/page0zip.cc` line 4211 ([MDEV-34357](#))

Aria

- Fix [Aria](#) index corruption when doing a `REPAIR TABLE` that has a size of over 4G ([MDEV-34522](#))

Spider

- UBSAN: runtime error: applying non-zero offset in `spider_free_mem` and SIGSEGV in `spider_free_mem` on `SELECT` ([MDEV-31475](#))
- SIGSEGV in `ha_resolve_storage_engine_name`, UBSAN: runtime error: index 4294967295 out of bounds for type `'st_plugin_int *[64]'` ([MDEV-32487](#))
- SIGSEGV in `spider_db_conn::fin_loop_check`, and ASAN: heap-use-after-free in `spider_db_mbase::fin_loop_check` on `SHOW TABLE STATUS` ([MDEV-34541](#))
- SIGSEGV in `ha_spider::lock_tables` on `BEGIN` after table lock ([MDEV-29962](#))
- SIGSEGV in `spider_conn_first_link_idx` and others on `DELETE`, `INSERT` and `SELECT` ([MDEV-32492](#))
- Spider: Crashes, asserts, hangs, memory corruptions and ASAN heap-use-after-free's ([MDEV-27902](#))
- Spider: `@@insert_id 128 to TINYINT: Assertion '!is_set() || (m_status == DA_OK_BULK && is_bulk_op())' failed.` ([MDEV-28105](#))
- ASAN errors in `spider_db_free_result` after partition DDL ([MDEV-29027](#))
- Server crashes when calling spider UDF after `aria_encrypt_tables` is enabled ([MDEV-34682](#))

Partitioning

- SIGSEGV in `parse_engine_part_options` on `INSERT`, `SELECT` or `ALTER` ([MDEV-34421](#))
- Assertion `'auto_increment_value'` failed in `ha_partition::info` on `INSERT` into `MEMORY` table ([MDEV-24610](#))

Character Sets

- On startup: UBSAN: applying zero offset to null pointer in `my_copy_fix_mb` from `strings/ctype-mb.c` and other locations ([MDEV-34226](#))
- On startup: UBSAN: runtime error: applying zero offset to null pointer in `skip_trailing_space` and `my_hash_sort_utf8mb3_general1400_nopad_as_ci` ([MDEV-34187](#))
- `SHOW CREATE DATABASE` statement crashes the server when db name contains some unicode characters, ASAN stack-buffer-overflow ([MDEV-32376](#))
- Wrong result set with `utf8mb4_danish_ci` and `BNLH` join ([MDEV-34417](#))

Optimizer

- On startup: UBSAN: runtime error: applying non-zero offset in `JOIN::make_aggr_tables_info` in `sql/sql_select.cc` ([MDEV-34227](#))
- Crash after killing query while it is processed by `test_quick_select` ([MDEV-30651](#))
- Extend condition normalization to include `'NOT a'` ([MDEV-19520](#))
- Constant subquery causing a crash in pushdown optimization ([MDEV-29363](#))
- Crash when pushing condition with `CHARSET()/COERCIBILITY()` into derived table ([MDEV-33010](#))
- 2nd execution name resolution problem with pushdown into unions ([MDEV-34506](#))
- Assertion `'(key_part->key_part_flag & 4) == 0'` failed `key_hashnr` ([MDEV-34580](#))

- Crash caused by query containing constant having clause ([MDEV-23983](#))
- Using `NAME_CONST()` (or executing query from the stored procedure and referring to a local variable) changes the plan and may make execution slower ([MDEV-33971](#))
- `ORDER BY DESC` causes ROWID Filter optimization performance degradation ([MDEV-33875](#))

Replication

- Auto-generated `DELETE` from `HEAP` table no longer breaks replication ([MDEV-25607](#))
- Fix replication failure when `XA transactions` are used where the replica has `replicate_do_db` set and the client has touched a different database when running DML such as inserts. ([MDEV-33921](#))
- Fix replication error when `CHANGE MASTER TO` is used in conjunction with a password longer than 41 ascii characters ([MDEV-23857](#))
- The `--init-rpl-role` option is utilized to avoid a possible error state in `semisync recovery` ([MDEV-33465](#))

Backup

- Hide password passed on commandline from `xtrabackup_info` ([MDEV-34434](#))

Galera

- `Galera` updated to 26.4.19
 - **NOTE:** Includes increasing the GCS protocol version, which prevents downgrades of individual nodes in the cluster as soon as all nodes nodes have been updated
- `galera_gtid_2_cluster : Assertion `thd->wsrep_next_trx_id() != (0x7fffffffffffffffffLL * 2ULL + 1)'` ([MDEV-32633](#))
- `table gtid_slave_pos` entries never been deleted with `wsrep_gtid_mode = 0` ([MDEV-34170](#))
- Deadlock found when trying to get lock during applying ([MDEV-31658](#))
- Change error code for Galera unkillable threads ([MDEV-12008](#))
- 10.11.8 cluster becomes inconsistent when using composite primary key and partitioning ([MDEV-34269](#))
- `wsrep_sst_mariabackup use /tmp` dir during SST rather than user defined `tmpdir` ([MDEV-32158](#))

Error Log

- `server_uid` system variable added, and value added to the `error log` at startup ([MDEV-34494](#))

General

- As per the [MariaDB Deprecation Policy](#), this will be the last release of `MariaDB 11.4` for Debian 10 "Buster", RHEL/CentOS 7, Ubuntu 23.10 "Mantic", and Fedora 38
- Repositories for Ubuntu 24.04 "Noble" have been added
- `IMPORT TABLESPACE` no longer unnecessarily traverses tablespaces list ([MDEV-34670](#))
- Fix unknown variable `defaults-group-suffix=` with `mariadb-secure-installation` ([MDEV-33265](#))
- `mariadb-install-db` no longer hangs on macOS ([MDEV-34129](#))
- Fix transaction termination with `ER_LOCK_TABLE_FULL` when lock memory is growing ([MDEV-34167](#))
- Disable new connections in case of fatal signal ([MDEV-34475](#))
- Control over memory allocated for SP/PS ([MDEV-14959](#))
- `Triggers` now work correctly with bulk insert ([MDEV-24411](#))
- Fix assertion ``table->field[0]->ptr >= table->record[0] && table->field[0]->ptr <= table->record[0] + table->s->reclength'` failed in `void handler::assert_icp_limitations(uchar*)` ([MDEV-34632](#))
- `sandbox mode` \- now compatible with `--binary-mode` ([MDEV-34203](#))

Changelog

7.0.0.17.3 MariaDB 11.4.2 Release Notes

The most recent release of MariaDB 11.4 is:
MariaDB 11.4.5 [Stable \(GA\)](#) [Download Now](#)

[Alternate download from mariadb.org](#)

[Download 11.4.2](#)

[Release Notes](#)

[Changelog](#)

[Overview of 11.4](#)

Release date: 29 May 2024

MariaDB 11.4 is the current long-term series of MariaDB and will be [maintained until](#) May 2029. It is an evolution of MariaDB 11.3 with several entirely new features.

MariaDB 11.4.2 is a [Stable \(GA\)](#) release.

For an overview of MariaDB 11.4 see the [What is MariaDB 11.4?](#) page.

Thanks, and enjoy MariaDB!

Notable Items

From this version, the [mariadb-dump](#) tool adds a new [sandbox](#) command to the top of every dump file. This command cannot be interpreted by MariaDB command line client versions that do not have the sandbox command, or by MySQL command line clients, and an error will be generated in these clients. Other methods of importing the dump will work not have this issue.

Storage Engines

InnoDB

- Introduce the [innodb_log_spin_wait_delay](#) system variable to address excessive context switching caused by [log_sys.lsn_lock](#) (observed on write-intensive workloads on NUMA systems) ([MDEV-33515](#))
- Fix InnoDB holding shared [dict_sys.latch](#) while waiting for FOREIGN KEY child table lock on DDL ([MDEV-32899](#))
- Fix adaptive hash index corruption after [ALTER TABLE...DISCARD TABLESPACE](#) ([MDEV-33400](#))
- Server no longer aborts while altering an InnoDB statistics table ([MDEV-33462](#))
- Fix LeakSanitizer errors in [rec_copy_prefix_to_buf](#) ([MDEV-33230](#))
- Fix InnoDB fatal error: Clustered record field for column x not found ([MDEV-33558](#))
- Fix InnoDB hang when temporarily running out of buffer pool ([MDEV-33613](#))
- Fix alter operation hang when encryption thread works on the same tablespace ([MDEV-33770](#))
- Fix MariaDB segfault on rowid filter query involving generated column ([MDEV-33795](#))
- Fix discard/import tablespace, restart, index corruption ([MDEV-33512](#))
- Fix server hang on DROP INDEX or RENAME INDEX ([MDEV-33993](#))
- Fix mariabackup --backup hang ([MDEV-33669](#))
- Fix server hang caused by InnoDB change buffer ([MDEV-33543](#))
- Fix assertion failures upon adding a too long key to table with COMPRESSED row format ([MDEV-31161](#))
- IMPORT TABLESPACE no longer fails with column count or index count mismatch ([MDEV-30655](#))
- Fix alter table corruption while applying the modification log ([MDEV-19044](#))
- Fix inconsistent behaviors of UPDATE under RU & RC isolation level ([MDEV-26643](#))
- Fix weird SELECT view when a record is modified to the same value by two transactions ([MDEV-26642](#))
- Fix inconsistent read and write, which use the same predicate (WHERE clause) ([MDEV-29565](#))
- Fix inconsistent SELECT view when modifying a record added by another transaction ([MDEV-26671](#))
- Fix weird read view after ROLLBACK of other transactions ([MDEV-33802](#))

- Read only server no longer throws error when running a create temporary table as select statement ([MDEV-33889](#))
- Change buffer index no longer fails to delete the records ([MDEV-32489](#))
- Fix InnoDB include OS error information when failing to write to iblogfile0 ([MDEV-33397](#))
- Fix phantom rows caused by UPDATE of PRIMARY KEY ([MDEV-32898](#))
 - New system variable, [innodb_snapshot_isolation](#)
- In-place migration from MySQL 5.7 no longer causes invalid AUTO_INCREMENT values ([MDEV-33277](#))
- Fix InnoDB log corruption before upgrading it on startup ([MDEV-32445](#))
- Table no longer gets rebuilt with ALTER TABLE ADD COLUMN ([MDEV-33214](#))
- Possible corruption when shrinking the system tablespace on `innodb_fast_shutdown=0` ([MDEV-34216](#))
- InnoDB transaction recovery is incorrect ([MDEV-34212](#))
- InnoDB is disregarding read-only mode on slow shutdown ([MDEV-34209](#))
- InnoDB tries to write to read-only system tablespace in `buf_dblwr_t::init_or_load_pages()` ([MDEV-34200](#))

Aria

- Fixed that internal temporary tables did not wait for freed disk space, and related issues ([MDEV-33813](#))

Federated

- Fix wrong result on 2nd execution of prepared statement for query with derived table ([MDEV-31361](#))

Spider

- Server crashes when deleting partitions from a table with spider engine ([MDEV-33731](#))
- SPIDER plugin initialization failed at 'create table if not exists mysql.spider_tables ... with 'Specified key was too long; max key length is 1000 bytes', Warning: Memory not freed: 10720 ([MDEV-33242](#))
- spider plugin init failure with `no_zero_date sql_mode` ([MDEV-33494](#))
- sql plugin init failure with traditional `sql_mode` ([MDEV-33584](#))
- spider returns parsing failure on valid left join select by translating the on expression to `()` ([MDEV-33679](#))
- Spider: ERROR 12710 (HY000): Invalid information from remote table when using [MariaDB 10.5](#) local and [MariaDB 10.6](#) remote ([MDEV-33777](#))
- Fix bug where [Spider variables](#) were not available if Spider was loaded upon server startup ([MDEV-33441](#))

Backup

- Port backup features from Enterprise Server. This adds support for `BACKUP STAGE` to `mybackup`, and obsoletes the `no-backup-locks` and `rsync` options ([MDEV-32932](#))
- `mybackup` now preserves `innodb_encrypt_tables` ([MDEV-33334](#))
- Fix `mybackup` problem on older mariadb (`opendir(NULL)`) caused by [MDEV-30968](#) ([MDEV-31251](#))
- Fix `mybackup --backup` FATAL ERROR: ... Can't open datafile cool_down/t3 ([MDEV-33011](#))
- `mybackup --backup` now includes retry logic for undo tablespaces ([MDEV-33980](#))
- Fix crash recovery in `mybackup --prepare` due to insufficient `innodb_log_file_size` ([MDEV-33540](#))
- Fix crash in `mybackup --prepare --export` after `--prepare` ([MDEV-33023](#))
- `mybackup` now considers O/S user when `--user` option is omitted ([MDEV-32893](#))

Character Sets, Data Types

- Fixed improper application of `ORDER BY COLLATE` to non-character columns ([MDEV-33318](#))
- Default charset now works with PHP MySQLi extension ([MDEV-32975](#))
- Fixed Bad SEPARATOR value in `GROUP_CONCAT` on character set conversion ([MDEV-33772](#))
- Fixed out of range error in `AVG(YEAR(datetime))` due to a wrong data type ([MDEV-33496](#))
- Fixed `GREATEST()` and `LEAST()` problems with `NULLs` ([MDEV-21034](#))

JSON

- View created via `JSON_ARRAYAGG` now returns correct json object ([MDEV-30646](#))
- `JSON_TYPE` now detects the type of String Values and correctly returns Date/DateTime values ([MDEV-19487](#))
- `JSON_REMOVE` no longer returns NULL on valid arguments ([MDEV-22141](#))
- `JSON_EXTRACT` no longer returns multiple values for same path ([MDEV-32287](#))

Encryption, TLS, SSL

- WolfSSL's math is unnecessarily slow ([MDEV-33482](#))
- Self-signed certificates are x509 Version 1, which are rejected by some TLS libraries ([MDEV-33592](#))

Optimization & Tuning

- Server crashes in JOIN_CACHE::write_record_data upon EXPLAIN with subqueries and constant tables ([MDEV-21102](#))
- Wrong result with cross Join given join order ([MDEV-30975](#))
- Wrong warnings on 2-nd execution of PS for query with GROUP_CONCAT ([MDEV-31276](#))
- Wrong result with semi-join and splittable derived table ([MDEV-23878](#))
- Optimizer choosing incorrect index in 10.6, 10.5 but not in 10.4 ([MDEV-33306](#))
- Aggregation functions fail to leverage uniqueness property ([MDEV-30660](#))
- Partitioning is broken on big endian architectures ([MDEV-33623](#))
- CHECK TABLE does not recognize corruption after EXCHANGE WITHOUT VALIDATION on system-time partitioning ([MDEV-33125](#))

Plugins

- The [audit plugin](#) now reports the user and host in all cases ([MDEV-33393](#))

Replication

- --gtid-ignore-duplicate can double-apply event in case of parallel replication retry ([MDEV-33475](#))
- Deadlock kill of XA PREPARE can break replication / rpl.rpl_parallel_multi_domain_xa sporadic failure ([MDEV-34042](#))
- mysql_manager_submit Segfault at Startup Still Possible During Recovery ([MDEV-33799](#))
- Server crash in Rows_log_event::update_sequence upon replaying binary log ([MDEV-31779](#))
- Slave crashed:reload_acl_and_cache during shutdown ([MDEV-30260](#))
- Rpl_semi_sync_slave_status is ON When Replication Is Not Configured ([MDEV-33546](#))
- When binlog_annotate_row_events on , event of binlog file is truncated ([MDEV-9179](#))
- Add more warnings to be able to better diagnose network issues ([MDEV-33582](#))
- Improve times and states in show processlist for replication ([MDEV-33620](#))
- Adapt parallel slave's round-robin scheduling to XA events ([MDEV-33668](#))
- release row locks for non-modified rows at XA PREPARE ([MDEV-33454](#))
- Semi-sync Wait Point AFTER_COMMIT Slow on Workloads with Heavy Concurrency ([MDEV-33551](#))

Galera

- [Galera](#) updated to 26.4.18
 - **NOTE:** Includes increasing the GCS protocol version, which prevents downgrades of individual nodes in the cluster as soon as all nodes have been updated
- Disallow bulk insert operation during partition update statement ([MDEV-33979](#))

SQL, Data Definition, and Data Manipulation

- Transportable Tablespaces no longer leave AUTO_INCREMENT in a mismatched state ([MDEV-18288](#))
- Fix wrong row targeted with "insert ... on duplicate" and "replace", leading to data corruption ([MDEV-30046](#))
- Fix incorrect DEFAULT expression evaluated in UPDATE ([MDEV-33790](#))
- Fix server crash when UPDATE statement with duplicate key is run after setting a low thread_stack ([MDEV-33622](#))
- Fix incorrect handling of UPDATE in PS mode when a table's column declared as NOT NULL ([MDEV-33549](#))
- Fix crash in EXECUTE IMMEDIATE 'CREATE OR REPLACE TABLE t1 (a INT DEFAULT ?)' USING DEFAULT ([MDEV-15703](#))
- Fix wrong result on 2nd execution of PS to select from view using derived ([MDEV-31277](#))
- Fix wrong warnings on 2nd execution of PS for query with GROUP_CONCAT ([MDEV-31276](#))
- [TIMESTAMP](#) value of '1970-01-01 00:00:00' can no longer be indirectly inserted in strict mode ([MDEV-34088](#))
- Fix out of range error in AVG(YEAR(datetime)) due to a wrong data type ([MDEV-33496](#))
- Fix zero datetime reinterpreting as '1970-01-01 00:00:00' on field_datetime=field_timestamp ([MDEV-34069](#))
- unix_timestamp(coalesce(timestamp_column)) no longer returns NULL on '1970-01-01 00:00:00.000001' ([MDEV-34061](#))
- Fix crash using UDF in WHERE clause of VIEW ([MDEV-24507](#))
- Fix update for portion changes autoincrement key in period table ([MDEV-25370](#))
- Fix SIGABRT resulting from CREATE TABLE with generated column and RLIKE ([MDEV-21058](#))

Platforms & Packaging

- MariaDB-client community can't be installed in red hat ubi9 ([MDEV-32791](#))

General

Scripts & Clients

- It's now possible to disable system commands with the [mariadb --sandbox](#) option. (MDEV-21778 [🔗](#))
- [mariadb-dump](#) now exports the data with sandbox mode enable, so that the mariadb client will not execute potentially dangerous cli commands.(MDEV-33727 [🔗](#))
- [mariadb-dump](#) commands such as `mariadb-dump --dump-slave=2 --master-data=2` now record both positions (MDEV-4827 [🔗](#))
- Loading [time zones](#) [🔗](#) now works with [alter_algorithm INPLACE](#) (MDEV-33044 [🔗](#))

Server

- Moving from [MariaDB 10.5](#) to 10.6 `mysql_upgrade` is not updating some system tables (MDEV-33726 [🔗](#))
- Original IP not shown in network related error messages when `proxy_protocol` is in use (MDEV-33506 [🔗](#))
- Server incorrectly describes known variables as UNKNOWN if invalid values are specified at startup (MDEV-33469 [🔗](#))
- update case insensitive (large) unique key with insensitive change of value - duplicate key (MDEV-29345 [🔗](#))
- MariaDB will abort server startup if it finds an invalid parameter, but won't check for other invalid params (MDEV-26923 [🔗](#))
- Slowdown when running nested statement with many partitions (MDEV-33502 [🔗](#))

Security

- Fixes for the following [security vulnerabilities](#) [🔗](#):
 - [CVE-2024-21096](#) [🔗](#)

Changelog

For a complete list of changes made in [MariaDB 11.4.2](#), with links to detailed information on each push, see the [changelog](#) [🔗](#).

Contributors

For a full list of contributors to [MariaDB 11.4.2](#), see the [MariaDB Foundation release announcement](#) [🔗](#).

Be notified of new MariaDB Server releases automatically by [subscribing](#) [🔗](#) to the MariaDB Foundation community announce 'at' lists.mariadb.org announcement list (this is a low traffic, announce-only list). MariaDB plc customers will be notified for all new releases, security issues and critical bug fixes for all MariaDB plc products thanks to the Notification Services.

MariaDB may already be included in your favorite OS distribution. More information can be found on the [Distributions which Include MariaDB](#) page.

7.0.0.17.4 MariaDB 11.4.1 Release Notes

The most recent release of MariaDB 11.4 is:
MariaDB 11.4.5 [🔗](#) Stable (GA) [Download Now](#) [🔗](#)
Alternate download from [mariadb.org](#) [🔗](#)

[Download 11.4.1](#) [🔗](#)

[Release Notes](#)

[Changelog](#) [🔗](#)

[Overview of 11.4](#)

Release date: 16 Feb 2024

Do not use non-stable (non-GA) releases in production!

MariaDB 11.4 is a current long-term development series of MariaDB. It is an evolution of [MariaDB 11.3](#) with several entirely

new features.

MariaDB 11.4.1 is a [Release Candidate \(RC\)](#) release.

For an overview of MariaDB 11.4 see the [What is MariaDB 11.4?](#) page.

Thanks, and enjoy MariaDB!

Notable Items

InnoDB

- Unique hash key on column prefix is computed incorrectly ([MDEV-29954](#))
- Query from `I_S.INNODB_SYS_INDEXES` exceeding `LIMIT ROWS EXAMINED` causes `ER_UNKNOWN_ERROR` and LeakSanitizer errors in `rec_copy_prefix_to_buf_old` ([MDEV-28613](#))
- Assertion ``0'` failed in `row_sel_convert_mysql_key_to_innobase` upon `UPDATE` using a partial-field key prefix in search ([MDEV-21245](#))
- Assertion failure on `REPLACE` on `ROW_FORMAT=COMPRESSED` table ([MDEV-31574](#))
- Crash emitting "Unsupported meta-data version number" error message ([MDEV-29972](#))
- LeakSanitizer errors in `mem_heap_create_block_func` upon query from `I_S.INNODB_SYS_TABLES` with `LIMIT ROWS EXAMINED` ([MDEV-32890](#))
- Inplace alter rebuild increases file size ([MDEV-26740](#))
- `BLOB` corruption on `UPDATE` of `PRIMARY KEY` with `FOREIGN KEY` ([MDEV-31441](#))
- GNU libc `posix_fallocate()` may be extremely slow ([MDEV-32268](#))
- InnoDB wrong error message ([MDEV-32833](#))
- Assertion failure on `ALTER TABLE...PAGE_COMPRESSED=1` ([MDEV-31000](#))
- InnoDB after `ALTER TABLE...IMPORT TABLESPACE` may not be crash safe ([MDEV-32269](#))
- InnoDB fails to restore tablespace first page from doublewrite buffer when page is empty ([MDEV-32968](#))
- `innodb_fast_shutdown=0` hang after incomplete startup ([MDEV-32798](#))
- `innodb_undo_log_truncate=ON` prevents fast shutdown ([MDEV-33062](#))
- Adaptive flush recommendation ignores dirty ratio and checkpoint age ([MDEV-31939](#))
- `gc01.gc01_purge` contaminates further execution of `innodb.gap_locks` ([MDEV-28682](#))
- `LPAD` in `vc01` created in `ORACLE` mode makes table corrupted in non-`ORACLE` ([MDEV-27744](#))
- Adaptive flushing is still not getting invoked in 10.5.11 ([MDEV-26055](#))
- History list is not shrunk unless there is a pause in the workload ([MDEV-33213](#))
- path separator near `ib_buffer_pool` incorrect ([MDEV-32983](#))
- Deadlock between `buf_page_get_zip()` and `buf_pool_t::corrupted_evict()` on InnoDB `ROW_FORMAT=COMPRESSED` table corruption ([MDEV-32371](#))
- Empty `INSERT` crashes with `innodb_force_recovery=6` or `innodb_read_only=ON` ([MDEV-31861](#))
- Assertion ``end_lsn == page_lsn'` failed in `recv_recover_page` ([MDEV-33137](#))
- Some calls to `buf_read_ahead_linear()` seem to be useless ([MDEV-32068](#))
- Opening all `.ibd` files on InnoDB startup can be slow ([MDEV-32027](#))
- InnoDB LRU flushing does not run before running out of buffer pool ([MDEV-33053](#))
- `innodb_undo_log_truncate=ON` is blocking page writes ([MDEV-33112](#))

Backup

- mariabackup has wrong or missing `plugin-dir` default? ([MDEV-29110](#))
- mariabackup fails when `innodb_max_dirty_pages_pct` contains a fraction (is not an integer) ([MDEV-20286](#))
- Missing required privilege `CONNECTION ADMIN` ([MDEV-33006](#))
- If tables are frequently created, renamed, dropped, a backup cannot be restored ([MDEV-32939](#))
- New `mariadb-dump` option, `-j`, `--parallel=#` for increased parallelism, specifies the number of dump table jobs executed in parallel (only for use with the `--tab` option). Also added to `mariadb-import`, with `--use-threads` as a synonym. ([MDEV-32216](#))
- **BACKUP LOCKS** on table to be accessible to those with `database LOCK TABLES` privileges ([MDEV-28367](#))

JSON

- Wrong function name in `ER_JSON_PATH_NO_WILDCARD` error message for `JSON_REPLACE` ([MDEV-24541](#))
- `JSON_VALID` fail to validate integer zero in scientific notation ([MDEV-32587](#))
- `ASAN` errors in `Item_func_json_contains_path::val_int` upon `PS` execution ([MDEV-32867](#))
- `mysql_json` cannot be used on newly created table ([MDEV-32235](#))
- Problems with a stored function `EMPTY()` on upgrade to 10.6 ([MDEV-31616](#))

Spider

- Thread (10.6+) and server hangs (10.4/10.5) in 'Opening tables' (on optimized builds) and SIGABRT in `safe_mutex_lock` (on debug) on `I_S` read when using Spider (MDEV-29421 [↗](#))
- SIGSEGV in `spider_db_mbase::append_lock_tables` on `LOCK TABLES` (MDEV-29963 [↗](#))
- ASAN heap-use-after-free in `spider_link_get_key` on `LOCK TABLES` (MDEV-31357 [↗](#))
- Crash when lateral derived is guaranteed to return no rows (MDEV-31279 [↗](#))
- Bogus error executing PS for query using CTE with renaming of columns (MDEV-31995 [↗](#))
- Spider: Valid `LEFT JOIN` results in ERROR 1064 (MDEV-26247 [↗](#))
- Trying to lock uninitialized mutex or hang upon shutdown after using Spider with `query_cache` (MDEV-28739 [↗](#))
- Spider tests failing in asan/valgrind builds (MDEV-32849 [↗](#))
- Backport fixes to spider init bugs to 10.4-10.6 once they have SQL service (MDEV-29870 [↗](#))
- Server crash with SIGSEGV or `dynamic-stack-buffer-overflow` in `spider_db_mbase_util::append_table` (MDEV-29163 [↗](#))
- `heap-use-after-free` in `ha_spider::lock_tables()`, highly sporadic SIGSEGV in `intern_close_table` (MDEV-30014 [↗](#))
- Syntax error upon query with subquery from Spider table (MDEV-30392 [↗](#))
- Spider doesn't recognize semi `JOIN` (MDEV-31645 [↗](#))
- MariaDB, SPIDER engine, usage of `REGEXP` (MDEV-32986 [↗](#))
- Spider: variable `spider_same_server_link` not functioning correctly (MDEV-29718 [↗](#))
- Spider fails to autodiscover structure (did in <=10.5) and reports `ERROR 12500 (HY000): unknown` (MDEV-33008 [↗](#))
- Spider spawns unnecessarily many system threads for stats synchronization (MDEV-29020 [↗](#))
 - Defaults for `spider_table_crd_thread_count` and `spider_table_sts_thread_count` changed from 10 to 1
- SIGSEGV in `spider_db_delete_all_rows` on `TRUNCATE`, `UBSAN: member call on null pointer of type 'struct spider_db_handler'` in `spider_db_delete_all_rows` (MDEV-33191 [↗](#))
- mariadb-upgrade fails with 'System table spider_tables is different version' => Can't create database 'performance_schema' (MDEV-27103 [↗](#))
- Spider: SIGSEGV in `spider_db_direct_delete`, SIGSEGV in `spider_db_connect`, ASAN: heap-use-after-free in `spider_db_direct_delete` (MDEV-28683 [↗](#))
- No error for `DROP TABLE` and no warning for `DROP TABLE IF EXISTS` with absent table when Spider plugin is included (MDEV-30170 [↗](#))
- ASAN errors in `spider_conn_queue_and_merge_loop_check` (MDEV-29002 [↗](#))

Optimizer

- Crash caused by multi-table UPDATE over derived with hanging CTE (MDEV-28615 [↗](#))
- Crash on query using CTE with the same name as a base table (MDEV-31657 [↗](#))
- Crash with query using constant subquery as left part of IN subquery (MDEV-29362 [↗](#))
- Incorrect result interceptor passed to `mysql_explain_union()` (MDEV-33165 [↗](#))
- Add `optimizer_adjust_secondary_key_costs` variable to influence how costs for secondary keys are calculated. (MDEV-33118 [↗](#))
- `INSERT ... SELECT` Does not produce an optimizer trace (MDEV-29298 [↗](#))
- Unusable key notes do not get reported for some operations (MDEV-32958 [↗](#))
- Unusable key notes report wrong predicates for `>` and `>=` (MDEV-32957 [↗](#))

Data Definition, Data Manipulation

- `ALTER SEQUENCE IF NOT EXISTS non_existing_seq` Errors rather than note (MDEV-32795 [↗](#))
- Unexpected `ER_ERROR_ON_RENAME` upon `DROP` non-existing `FOREIGN KEY` with `ALGORITHM=COPY` (MDEV-22230 [↗](#))
- `FOREIGN_KEY_CHECKS` does not prevent non-copy alter from creating invalid FK structure (MDEV-29092 [↗](#))
- Assertion `!"wrong page type"` or Assertion `"wrong page type" == 0'` failed in `innobase_instant_try` on `ALTER` (MDEV-18322 [↗](#))
- Assertion `(col.vers_sys_end())` upon inplace `ALTER` with virtual columns (MDEV-20545 [↗](#))
- `DELETE` with `ORDER BY` and semijoin optimization causing crash (MDEV-32212 [↗](#))
- Invalid expr in `cleanup_session_expr()` upon `INSERT DELAYED` (MDEV-29932 [↗](#))
- SIGSEGV in `my_decimal::operator=` and Assertion ``0'` failed in `Item_type_holder::val_decimal` on `SELECT` (MDEV-29070 [↗](#))
- `LONG UNIQUE` does not work like unique key when using `replace` (MDEV-32837 [↗](#))
- `LONG UNIQUE` gives error when used with `REPLACE` (MDEV-32839 [↗](#))
- Backport MDEV-32532 [↗](#) to 10.6 (MDEV-32903 [↗](#))
- Assertion ``0'` failed in `Item_type_holder::val_int` (MDEV-29494 [↗](#))

Character Sets, Data Types

- InnoDB: CHAR+nopad does not work well ([MDEV-26743](#))
- CAST(AS UNSIGNED) fails with --view-protocol ([MDEV-32645](#))
- JSON_ARRAYAGG charset issue ([MDEV-24784](#))
- Server crash in `my_decimal::operator=` or unexpected `ER_DUP_ENTRY` upon comparison with INET6 and similar types ([MDEV-32879](#))

Plugins

- The [SQL Error Log Plugin](#) can optionally (when `sql_error_log_with_db_and_thread_info` is enabled) include the thread ID and database / table in its log ([MDEV-27087](#)). `NULL` is displayed if there is no database ([MDEV-32906](#))
- Backport SQL service, introduced by [MDEV-19275](#) ([MDEV-27595](#))
- "plugin already loaded" should be a Warning, not an Error ([MDEV-32041](#))
- mariadb-upgrade should remove `mysql.plugin` entries for plugins that became bundled ([MDEV-32043](#))

Galera

- Node has been dropped from the cluster on Startup / Shutdown with async replica ([MDEV-31413](#))
- Inconsistency in Galera caused by `ALTER` being aborted before entering TOI mode ([MDEV-32938](#))
- Assertion `'total_length + thd->wsrep_sr().log_position() == saved_pos'` failed in `int wsrep_write_cache_inc(THD*, IO_CACHE*, size_t*)` ([MDEV-28971](#))
- `wsrep_provider_options` can be truncated on deep and long directory paths ([MDEV-32634](#))
- Server crashes in `rpl_sql_thread_info::cached_charset_compare / wsrep_apply_events` ([MDEV-22232](#))
- Galera crash when "create a table as select" ([MDEV-27806](#))
- Cluster is inconsistent after SAVEPOINT statement is rolled back ([MDEV-32549](#))
- `WSREP GTID MODE` is inconsistent ([MDEV-31905](#))
- IST "Donor does not know my secret" with `ssl-mode=VERIFY_CA` ([MDEV-32344](#))

Replication

- Server crashes in `Item_func_binlog_gtid_pos::val_str / Binary_string::c_ptr_safe` ([MDEV-33045](#))
- binlog corruption (/tmp no space left on device at the same moment) ([MDEV-27436](#))
- multi source replication filters breaking GTID semantic ([MDEV-26632](#))
- `SHOW SLAVE STATUS` Can Deadlock an Errored Slave ([MDEV-10653](#))
- `main.rpl_mysqldump_slave` Fails with "Master binlog wasn't deleted" Assertion ([MDEV-32953](#))
- `rpl_seconds_behind_master_spike` Sensitive to IO Thread Stop Position ([MDEV-33327](#))
- Binlog Checksum is Zeroed by Zlib if Part of Event Data is Empty ([MDEV-33283](#))
- "Read semi-sync reply magic number error" warnings on master ([MDEV-32551](#))
- Second Semi-sync Replica Can Hang at Connect Time ([MDEV-32792](#))
- Semi-sync ACKed Transaction can Timeout and Switch Off Semi-sync with Multiple Replicas ([MDEV-32960](#))
- Semi-Sync Ack_Receiver Thread Should Allow `COM_QUIT` Command ([MDEV-32385](#))

Application-Time Periods

- Add views for [periods](#) in `information_schema` ([MDEV-22597](#)), in particular
- New view `INFORMATION_SCHEMA.PERIODS`
- New view `INFORMATION_SCHEMA.KEY_PERIOD_USAGE`
- New columns `IS_SYSTEM_TIME_PERIOD_START` and `IS_SYSTEM_TIME_PERIOD_END` in the `INFORMATION_SCHEMA.COLUMNS` view

General

- As per the [MariaDB Deprecation Policy](#), this will be the last release of [MariaDB 11.4](#) for Fedora 37 and Ubuntu 23.04 "Lunar"
- It is now possible to create [partitions](#) on tables that contain [GEOMETRY](#) types ([MDEV-19177](#))
- `s3_debug` is now dynamic, and `s3_protocol_version` contains new options, and old options have been deprecated ([MDEV-32884](#))
- New `OLD_MODE` value, `NO_NULL_COLLATION_IDS`, a compatibility setting to support connectors (in particular MySQL Connector/NET) that give an exception when collation ids returned by `SHOW COLLATION` are `NULL`. It is automatically set when a MySQL Connector/NET connection is determined.
- Using two temporary tables in `OPTIMIZE TABLE` lead to crash ([MDEV-31523](#))
- `REGEXP_REPLACE` treats empty strings different than `REPLACE` in ORACLE mode ([MDEV-29095](#))
- `CREATE UNIQUE INDEX` fails with "ERROR 1286 (42000): Unknown storage engine 'partition'" ([MDEV-21618](#))

- Failure when executing `PS` for query using `IN` subquery ([MDEV-32569](#))
- Potential memory leak on executing of create view statement ([MDEV-32466](#))
- Assertion failures ([MDEV-32965](#))
- Two JSON related tests running in PS mode fail on server built with `-DWITH_PROTECT_STATEMENT_MEMROOT=YES` ([MDEV-32733](#))
- Alter sequence 2nd ps fails while alter sequence 2nd time (no ps) succeeds ([MDEV-33169](#))
- Set `TaskMax=inifinity` in the MariaDB systemd unit ([MDEV-30236](#))
- Unreliable autocommit flag on connection creation ([MDEV-32875](#))
- A connection can control `RAND()` in following connection ([MDEV-33148](#))
- `THD::rli_fake/rgi_fake` not cleared on new connection ([MDEV-32844](#))
- Assertion failures in `tdc_remove_table` upon interrupted `CREATE TABLE LIKE <sequence>` ([MDEV-20471](#))
- Server crash in `find_field_in_table` ([MDEV-32082](#))
- `LPAD` in vcol created in `ORACLE` mode makes table corrupted in non-ORACLE ([MDEV-27744](#))
- Failure to call SP invoking another SP with parameter requiring type conversion ([MDEV-33270](#))
- The database part is not case sensitive in SP names ([MDEV-33019](#))
- `EXCHANGE PARTITION` with non-matching vcol expression segfault ([MDEV-28127](#))
- Wrong user in `SET DEFAULT ROLE` error ([MDEV-26875](#))
- `quote(NULL)` returns incorrect result in view (`'NU'` instead of `'NULL'`) ([MDEV-28651](#))
- `mysql.slow_log` reports incorrect start time ([MDEV-11628](#))
- Update federated table and column privileges ([MDEV-32984](#))
- Deprecate `secure_auth=0` ([MDEV-32617](#))
- sys schema view `session_ssl_status` is empty ([MDEV-32751](#))
- Memory pressure ([MDEV-24670](#))

Changelog

For a complete list of changes made in [MariaDB 11.4.1](#), with links to detailed information on each push, see the [changelog](#).

Do not use non-stable (non-GA) releases in production!

Be notified of new MariaDB Server releases automatically by [subscribing](#) to the MariaDB Foundation community announce 'at' lists.mariadb.org announcement list (this is a low traffic, announce-only list). MariaDB plc customers will be notified for all new releases, security issues and critical bug fixes for all MariaDB plc products thanks to the Notification Services.

MariaDB may already be included in your favorite OS distribution. More information can be found on the [Distributions which Include MariaDB](#) page.

7.0.0.17.5 MariaDB 11.4.0 Release Notes

The most recent release of MariaDB 11.4 is:
[MariaDB 11.4.5](#) Stable (GA) [Download Now](#)
Alternate download from [mariadb.org](#)

[Download](#)

[Release Notes](#)

[Changelog](#)

[Overview of 11.4](#)

Release date: 24 December 2023

Do not use alpha releases in production!

[MariaDB 11.4](#) is a long-term development series of MariaDB. It is an evolution of [MariaDB 11.3](#) with several entirely new features.

[MariaDB 11.4.0](#) is a single preview release. Features are to be considered preview, and none are guaranteed to make it into [MariaDB 11.4](#).

The preview is available as a container [quay.io/mariadb-foundation/mariadb-devel:11.4](#).

Thanks, and enjoy MariaDB!

Partitioning

- [ALTER TABLE ... EXCHANGE PARTITION](#) and [ALTER TABLE ... CONVERT TABLE ... TO](#) now support the `WITH VALIDATION` and `WITHOUT VALIDATION` clauses. If neither is specified, the default behavior is `WITH VALIDATION` ([MDEV-22164](#) [↗](#))

Sys Schema

- New view [sys.privileges_by_table_by_level](#) shows granted privileges broken down by table on which they allow access and level on which they were granted. For example, if a user `x` has `SELECT` privilege granted `ON db.*`, this view will list all tables in the `db` schema with the user `x` having `SELECT` privilege on them. This is different from [INFORMATION_SCHEMA.TABLE_PRIVILEGES](#), which only lists privileges granted on the table level ([MDEV-24486](#) [↗](#))

Optimizer

- Not only ascending, but also [descending indexes](#) can now be used to optimize `MIN()` and `MAX()` ([MDEV-27576](#) [↗](#))

Spider

- The preferred way to specify [Spider parameters](#) [↗](#) is to use the dedicated Spider table options (implemented in [MariaDB 11.3](#)). Abusing the table `COMMENT` clause is now deprecated ([MDEV-28861](#) [↗](#))

Miscellaneous

- [CONV\(\)](#) function now supports conversion up to base 62 ([MDEV-30879](#) [↗](#))
- Added support for packages ([CREATE PACKAGE](#)) outside of `ORACLE sql_mode` ([MDEV-32101](#) [↗](#))
- Remove `thr_alarm` from server codebase
 - Includes removal of the [debug_no_thread_alarm](#) system variable ([MDEV-32567](#) [↗](#))

Replication

- [Binary log](#) writing speed was improved by moving checksum calculations out of the global binlog mutex ([MDEV-31273](#) [↗](#)). This is a contribution by Kristian Nielsen
- New system variable [max_binlog_total_size](#) enables binary log purging when the total size of all binary logs exceeds the specified threshold. The implementation is based on the patch from Percona ([MDEV-31404](#) [↗](#))
- New system variable [slave_connections_needed_for_purge](#) disables binary log purging until the number of connected slaves reaches the specified threshold ([MDEV-31404](#) [↗](#)).
- `FULL_NODUP` is a new value for the [binlog_row_image](#) system variable. It essentially works like `FULL`, that is all columns are included in the event, but it takes less space, because the after image omits columns that were not changed by the `UPDATE` statement, and have same values as in the before image. This is a contribution from Alibaba ([MDEV-32589](#) [↗](#))
- [mariadb-binlog --flashback](#) support for the `FULL_NODUP` mode. This is a contribution from Alibaba ([MDEV-32894](#) [↗](#)).
- MariaDB can optionally maintain a [special index of GTIDs](#) and their location in the binary log. If enabled (the default), it allows finding very quickly where a new connecting replica should start replicating from. Without an index, this required scanning the binlog. This is a contribution by Kristian Nielsen ([MDEV-4991](#) [↗](#)).
- Note that this feature was not included in [MariaDB 11.4](#). `GTID` events in the [binary log](#) now include connection id of the client connection that generated the event. This allows [mariadb-binlog](#) to tag all row events with a corresponding connection id ([MDEV-7850](#) [↗](#)).

Data Types

- The [TIMESTAMP](#) range of values was extended. The maximal allowed value for timestamps was '2038-01-19 03:14:07 UTC', and is now '2106-02-07 06:28:15 UTC'. This does not change the storage format, and new tables can be read by old MariaDB servers as long as timestamp values are within the old timestamp range. At the moment this

is only supported on 64-bit platforms ([MDEV-32188](#)). This was not included in [MariaDB 11.4](#).

Be notified of new MariaDB Server releases automatically by [subscribing](#) to the MariaDB Foundation community announce 'at' lists.mariadb.org announcement list (this is a low traffic, announce-only list). MariaDB plc customers will be notified for all new releases, security issues and critical bug fixes for all MariaDB plc products thanks to the Notification Services.

MariaDB may already be included in your favorite OS distribution. More information can be found on the [Distributions which Include MariaDB](#) page.

7.0.0.18 MariaDB Server 11.3

Changes and Improvements in MariaDB 11.3

Current Version: 11.3.2 | Status: Stable (GA) | Release Date: 16 Feb 2024

Release Notes - MariaDB 11.3 Rolling Releases

[Release notes for MariaDB 11.3 rolling releases.](#)

Changelogs - MariaDB 11.3 Series

[MariaDB 11.3 changelogs](#)

7.0.0.19 Changes and Improvements in MariaDB 11.3

MariaDB 11.3 is an old rolling release and is no longer maintained. Please use a [more recent release](#).

The most recent release of MariaDB 11.3 is:

MariaDB 11.3.2 [Stable \(GA\)](#) [Download Now](#)

Contents

1. [Upgrading](#)
2. [New Features & Improvements](#)
 1. [Connection Redirection](#)
 2. [InnoDB](#)
 3. [Replication](#)
 4. [Data Types](#)
 5. [Functions](#)
 1. [Date and Time](#)
 6. [Optimizer](#)
 7. [Privileges](#)
 8. [Processlist](#)
 9. [OLD_MODE](#)
 10. [Mariabackup](#)
 11. [Spider](#)
 12. [Removed](#)
 13. [Variables](#)
3. [Security Vulnerabilities Fixed in MariaDB 11.3](#)
4. [List of All MariaDB 11.3 Releases](#)

MariaDB 11.3 is a previous rolling release. It is the first release in the new release model. From 11.3, we stop doing GA bug fix releases within each minor version. See [Adjusting the MariaDB Server release model](#) (mariadb.org).

Upgrading

- See [Upgrading Between Major MariaDB Versions](#) and [Upgrading from MariaDB 11.2 to MariaDB 11.3](#).

New Features & Improvements

Connection Redirection

- Added a [redirect mechanism](#) using the `redirect_url` system variable ([MDEV-15935](#) )
- At the moment client-side support is missing

InnoDB

- Shrink [temporary tablespaces](#) without restart by setting the `innodb_truncate_temporary_tablespace_now` system variable. ([MDEV-28699](#) )

Replication

- Add keywords "SQL_BEFORE_GTIDS" and "SQL_AFTER_GTIDS" for `START SLAVE UNTIL` ([MDEV-27247](#) ).
SQL_BEFORE_GTIDS stops the replica when it sees gtid's of the option's argument list, without executing them.

Data Types

- It is now possible to create [partitions](#) on tables that contain [GEOMETRY](#) types ([MDEV-19177](#) )
- [INET4](#) data types can now be cast into [INET6](#) types ([MDEV-31626](#) )
- This means INET4 values can be compared with INET6 values and can be inserted into INET6 columns; the server can automatically convert INET4 value into INET6 as needed.

Functions

- Values generated by the Key Derivation Function [KDF](#) are resistant against password hashing generators, so are good for strongly hashed passwords ([MDEV-31474](#) )

Date and Time

- [DATE_FORMAT](#) function can now print the current time zone abbreviation and current time zone offset from UTC with `%Z` and `%z` format specifiers. ([MDEV-31684](#) )

Optimizer

- Queries like `UCASE(varchar_col)=...` can now use an index on `varchar_col` if its collation is case insensitive. An [optimizer_switch](#) option, `sargable_casefold=ON`, has been added to enable this optimization. ([MDEV-31496](#) )

Privileges

- Add a new database-level [privilege](#), `SHOW CREATE ROUTINE` that allows one to see the routine definition even if the user isn't the routine owner ([MDEV-29167](#) )

Processlist

- Added a `SENT_ROWS` column to the [Information Schema PROCESSLIST](#) table, as well as extended the display size for the columns in processlist to ensure that most results will fit in display ([MDEV-3953](#) )

OLD_MODE

- Setting a non-default [old_mode](#) value will now always issue a deprecation warning ([MDEV-31811](#) )

Mariabackup

- `mariabackup --innobackupex` mode has been deprecated ([MDEV-31505](#) )

Spider

- The [Spider](#) storage engine now supports table options instead of having to encode them in COMMENT/CONNECTION strings. When any table option is specified, Spider will ignore COMMENT/CONNECTION strings at the same table/partition/subpartition. A new variable [spider_ignore_comments](#) is introduced to ignore them

globally at all levels (table/partition/subpartition). Another variable, [spider_suppress_comment_ignored_warning](#), is introduced to suppress warnings when Spider ignores COMMENT/CONNECTION strings. ([MDEV-28856](#))

Removed

The following deprecated features and system variables have been removed ([MDEV-32104](#)):

- [sr_YU locale](#) (deprecated since [MariaDB 10.0.11](#))
- "engine_condition_pushdown" in [optimizer_switch](#) (deprecated since [MariaDB 10.1.1](#))
- [date_format](#), [datetime_format](#), [time_format](#), [max_tmp_tables](#) (deprecated since [MariaDB 10.1.2](#))
- [wsrep_causal_reads](#) (deprecated since [MariaDB 10.1.3](#))
- "parser" in [mroonga](#) table comment (deprecated since [MariaDB 10.2.11](#))

Variables

- For a list of all new variables, see [System Variables Added in MariaDB 11.3](#).

7.0.0.21 MariaDB Server 11.2

Changes and Improvements in MariaDB 11.2

Current Version: [11.2.6](#) | Status: [Stable \(GA\)](#) | Release Date: [1 Nov 2024](#)

Release Notes - MariaDB 11.2 Series

[MariaDB 11.2 series release notes.](#)

Changelogs - MariaDB 11.2 Series

[MariaDB 11.2 changelogs](#)

7.0.0.22 Changes and Improvements in MariaDB 11.2

MariaDB 11.2 is no longer maintained. Please use a [more recent release](#).

The most recent release of MariaDB 11.2 is:

Contents

1. [Upgrading](#)
2. [New Features & Improvements](#)
 1. [Online Schema Change](#)
 2. [InnoDB](#)
 3. [JSON](#)
 4. [Miscellaneous](#)
 5. [Variables](#)
3. [Security Vulnerabilities Fixed in MariaDB 11.2](#)
4. [List of All MariaDB 11.2 Releases](#)

MariaDB 11.2 is a short-term release series, and was [maintained until](#) [November 2024](#).

Upgrading

- See [Upgrading Between Major MariaDB Versions](#) and [Upgrading from MariaDB 11.1 to MariaDB 11.2](#).

New Features & Improvements

Online Schema Change

- `ALTER TABLE` can now do most operations with `ALGORITHM=COPY`, `LOCK=NONE`, that is, in most cases, unless the algorithm and lock level are explicitly specified, `ALTER TABLE` will be performed using the `COPY` algorithm while simultaneously allowing concurrent [DML statements](#) on the altered table.

InnoDB

- The [InnoDB system tablespace](#) is now shrunk by reclaiming unused space at startup ([MDEV-14795](#))

JSON

- `JSON_TABLE` now allows retrieval of the key when iterating on JSON objects ([MDEV-30145](#))
- New functions `JSON_OBJECT_FILTER_KEYS`, `JSON_OBJECT_TO_ARRAY` and `JSON_ARRAY_INTERSECT` to check for JSON intersection ([MDEV-26182](#))
- `JSON_KEY_VALUE` extracts key/value pairs from a JSON object ([MDEV-30145](#))

Miscellaneous

- All `binlog*` variables are now visible as system variables, specifically `binlog_do_db`, `binlog_ignore_db`, `binlog_row_event_max_size` ([MDEV-30188](#))
- `ALTER TABLE IMPORT` enhancement ([MDEV-26137](#))
- Temporary tables are now displayed in the [Information Schema TABLES Table](#), `SHOW TABLES` and `SHOW TABLE STATUS` ([MDEV-12459](#))
- [Stored programs](#): validation of stored program statements ([MDEV-5816](#))
- Remove the deprecated `old_alter_table` variable ([MDEV-30905](#))
- Extend `AES_ENCRYPT()` and `AES_DECRYPT()` to support an initialization vector and algorithm ([MDEV-9069](#))

Variables

- For a list of all new variables, see [System Variables Added in MariaDB 11.2](#).

7.0.0.24 MariaDB Server 11.1

Changes and Improvements in MariaDB 11.1

Current Version: [11.1.6](#) | Status: [Stable \(GA\)](#) | Release Date: [8 Aug 2024](#)

Release Notes - MariaDB 11.1 Series

[MariaDB 11.1 series release notes.](#)

Changelogs - MariaDB 11.1 Series

[MariaDB 11.1 changelogs](#)

7.0.0.25 Changes and Improvements in MariaDB 11.1

MariaDB 11.1 is no longer maintained. Please use a [more recent release](#).

The most recent release of MariaDB 11.1 is:

[MariaDB 11.1.6](#) Stable (GA) [Download Now](#)

[Alternate download from mariadb.org](#)

Contents

1. [Upgrading](#)
2. [New Features & Improvements](#)
 1. [JSON](#)
 2. [Optimizer](#)
 3. [Transactions](#)
 4. [InnoDB](#)
 5. [Mariabackup](#)
 6. [Variables](#)
3. [Security Vulnerabilities Fixed in MariaDB 11.1](#)
4. [List of All MariaDB 11.1 Releases](#)

MariaDB 11.1 is a short-term release series, and was [maintained until](#) [August 2024](#).

Upgrading

- See [Upgrading Between Major MariaDB Versions](#) and [Upgrading from MariaDB 11.0 to MariaDB 11.1](#).

New Features & Improvements

JSON

- [JSON_SCHEMA_VALID](#) function for validating a JSON schema ([MDEV-27128](#) [↗](#))

Optimizer

- [Semi-join optimization](#) for single-table [UPDATE/DELETE](#) statements. Update and delete statements that use subqueries can now use all subquery optimization strategies that MariaDB offers, so now if you use subqueries in UPDATE or DELETE, these statements will likely be much faster ([MDEV-7487](#) [↗](#))
- Queries with the [DATE](#) or [YEAR](#) functions comparing against a constant can now make use of indexes, so these will be noticeably quicker in certain instances. For example `SELECT * FROM t2 WHERE YEAR(a) = 2019` or `SELECT * FROM t2 WHERE DATE(a) <= '2017-01-01'`. See [Sargable DATE and YEAR](#) ([MDEV-8320](#) [↗](#))

Transactions

- The [transaction_isolation](#) option is now a system variable, and the `tx_isolation` system variable is deprecated ([MDEV-21921](#) [↗](#))

InnoDB

- Remove [innodb_defragment](#) and related parameters ([MDEV-30545](#) [↗](#))

Mariabackup

- Rename [Mariabackup's](#) `xtrabackup_*` files to `mariadb_backup_*` ([MDEV-18931](#) [↗](#))

Variables

- For a list of all new variables, see [System Variables Added in MariaDB 11.1](#) [↗](#).

7.0.0.28 Changes and Improvements in MariaDB 11.0

MariaDB 11.0 is no longer maintained. Please use a [more recent release](#) .

The most recent release of MariaDB 11.0 is:

[MariaDB 11.0.6](#) [Stable \(GA\)](#) [Download Now](#)

Contents

- [Upgrading](#)
- [New Features & Improvements](#)
 - [Functions](#)
 - [Optimizer](#)
 - [InnoDB](#)
 - [Variables](#)
- [Security Vulnerabilities Fixed in MariaDB 11.0](#)
- [List of All MariaDB 11.0 Releases](#)

Upgrading

- See [Upgrading Between Major MariaDB Versions](#) and [Upgrading from MariaDB 10.11 to MariaDB 11.0](#).

New Features & Improvements

Functions

- Given a time in picoseconds, the new function [FORMAT_PICO_TIME](#) returns a human-readable time value and unit indicator ([MDEV-19629](#)).

Optimizer

- Major improvements to the Optimizer. See [The Optimizer Cost Model from MariaDB 11.0](#).

InnoDB

- The [InnoDB Change Buffer](#) has been removed ([MDEV-29694](#)).

Variables

- For a list of all new variables, see [System Variables Added in MariaDB 11.0](#) and [Status Variables Added in MariaDB 11.0](#).
- The default value for [innodb_undo_tablespaces](#) has been changed from 0 to 3 ([MDEV-29986](#)).
- The following variables have been deprecated:
 - [innodb_defragment](#)
 - [innodb_defragment_n_pages](#)
 - [innodb_defragment_stats_accuracy](#)
 - [innodb_defragment_fill_factor_n_recs](#)
 - [innodb_defragment_fill_factor](#)
 - [innodb_defragment_frequency](#)
 - [innodb_file_per_table](#)
 - [innodb_flush_method](#)
- The following deprecated variables have been removed:
 - [innodb_change_buffer_max_size](#)
 - [innodb_change_buffering](#)

 16. [Variables](#)
 1. [InnoDB Variables](#)
 2. [Spider Variables](#)
3. [Security Vulnerabilities Fixed in MariaDB 10.11](#)
 4. [List of All MariaDB 10.11 Releases](#)

[MariaDB 10.11](#) is the previous long-term maintenance release series, [maintained until](#) [February 2028](#).

Upgrading

- See [Upgrading Between Major MariaDB Versions](#) and [Upgrading from MariaDB 10.6 to MariaDB 10.11](#).

New Features & Improvements

This list includes features from the short-term releases [MariaDB 10.7](#), [MariaDB 10.8](#), [MariaDB 10.9](#) and [MariaDB 10.10](#).

Authentication

- [GRANT to PUBLIC \(MDEV-5215\)](#) ([blog post](#))
- Separate [SUPER](#) and [READ ONLY ADMIN](#) privileges ([MDEV-29596](#))
- [bind_address](#) now accepts a comma-separated list of addresses to bind to ([MDEV-24377](#))
- [password_reuse_check](#) plugin is a new password validation plugin that prevents the new password from being the same as the one being used during the configurable retention period. ([MDEV-9245](#), [MariaDB 10.7](#))

Optimizer

- Make [ANALYZE FORMAT=JSON](#) show time spent in the query optimizer ([MDEV-28926](#))
- Improve optimization of joins with many tables, including [eq_ref](#) tables ([MDEV-28852](#), [MariaDB 10.10](#))
- Table elimination does not work across derived tables ([MDEV-26278](#), [MariaDB 10.10](#))
- Histograms in the statistics tables are more precise and stored as JSON, not binary ([MDEV-21130](#), [MDEV-26519](#), [blog post](#), [MariaDB 10.8](#)).
- Improve simple multibyte collation performance on the ASCII range ([MDEV-26572](#), [MariaDB 10.7](#)).

Descending Indexes

- Individual columns in the [index](#) can now be explicitly sorted in the ascending or descending order. This can be useful for optimizing certain [ORDER BY](#) cases ([MDEV-13756](#), [MDEV-26938](#), [MDEV-26939](#), [MDEV-26996](#), [MariaDB 10.8](#)).

Replication

- Change defaults for [CHANGE MASTER TO](#) so that GTID-based replication is used by default if master supports it ([MDEV-19801](#), [MariaDB 10.10](#))

- Added `global.slave_max_statement_time` system variable for SQL thread to limit maximum execution time per query replicated (MDEV-27161 [↗](#), MariaDB 10.10)
- Deprecate `MASTER_USE_GTID=Current_Pos` to favor new `MASTER_DEMOTE_TO_SLAVE` option (MDEV-20122 [↗](#), MariaDB 10.10)
- Implement the `--do-domain-ids`, `--ignore-domain-ids`, and `--ignore-server-ids` options for `mariadb-binlog` (MDEV-20119 [↗](#), MariaDB 10.9)
- Semisync-slave server recovery is extended to work on new `server_id` server (MDEV-27342 [↗](#), MariaDB 10.9)
- `mariadb-binlog --stop-never --raw` now flushes the result file to disk after each processed event so the file can be listed with the actual bytes (MDEV-14608 [↗](#), MariaDB 10.9)
- Normally, `ALTER TABLE` gets fully executed on the primary first and only then it is `replicated` and starts executing on replicas. With this feature `ALTER TABLE` gets replicated and starts executing on replicas when it *starts* executing on the primary, not when it *finishes*. This way the replication lag caused by a heavy `ALTER TABLE` can be completely eliminated (MDEV-11675 [↗](#), MariaDB 10.8).
- Multi-source replication supports MySQL-style CHANNEL syntax (MDEV-26307 [↗](#), MariaDB 10.7)

mysqlbinlog GTID support

- `mariadb-binlog` (or `mysqlbinlog` as it was called back when the task was created) now supports both filtering events by GTID ranges through `--start-position` and `--stop-position`, and validating a binary log's ordering of GTIDs through `--gtid-strict-mode` (MDEV-4989 [↗](#), MariaDB 10.8).

Galera

- Implement a method to add IPs to allowlist for Galera Cluster node addresses that can make SST/IST requests (MDEV-27246 [↗](#), MariaDB 10.10)
- JSON file interface to wsrep node state / SST progress logging (MDEV-26971 [↗](#), MariaDB 10.9)

JSON

- `JSON_OVERLAPS` function (MDEV-27677 [↗](#), MariaDB 10.9)
- Implement range notation for `JSONPath` (MDEV-27911 [↗](#), MariaDB 10.9)
- Support `JSONPath` negative index (MDEV-22224 [↗](#), MariaDB 10.9)
- `JSON_EQUALS` function to check for equality between JSON objects (MDEV-23143 [↗](#), MariaDB 10.7).
- `JSON_NORMALIZE` function, which recursively sorts keys and removes spaces (MDEV-16375 [↗](#), MariaDB 10.7)

UUID

- New `UUID` data type (MDEV-4958 [↗](#), MariaDB 10.7)

SHOW ANALYZE FORMAT=JSON

- Extend `SHOW EXPLAIN` to support `SHOW ANALYZE [FORMAT=JSON]` (MDEV-27021 [↗](#), MariaDB 10.9)
- Add `EXPLAIN FOR CONNECTION` syntax support to `SHOW EXPLAIN` (MDEV-10000 [↗](#), MariaDB 10.9)

Information Schema

- Performance Issues reading the `Information Schema Parameters` table (MDEV-29104 [↗](#))
- Full table scan in the `Information Schema Parameters` and `Information Schema Routines` tables (MDEV-20609 [↗](#))

System versioning

- `System versioning` setting, `system_versioning_insert_history`, to allow history modification (MDEV-16546 [↗](#))
- `mariadb-dump`: dump and restore historical data (MDEV-16029 [↗](#))
- Add option to `dump system versioned table` as of specified timestamp (MDEV-16355 [↗](#), MariaDB 10.7).

InnoDB

- InnoDB performance improvements (MDEV-27557 [↗](#), MDEV-28185 [↗](#), MDEV-27767 [↗](#), MDEV-28313 [↗](#), MDEV-28137 [↗](#), MDEV-28465 [↗](#), MDEV-26789 [↗](#), MariaDB 10.9)
- In bulk insert, pre-sort and build indexes one page at a time (MDEV-24621 [↗](#), MariaDB 10.7)

InnoDB Redo Log Improvements

- autosize `innodb_buffer_pool_chunk_size` (MDEV-25342 [↗](#), MariaDB 10.8).

- Improve the [redo log](#) for concurrency ([MDEV-14425](#), [MariaDB 10.8](#)).
- Remove `FIL_PAGE_FILE_FLUSH_LSN` ([MDEV-27199](#), [MariaDB 10.8](#)).

UCA14 Collation

- Add UCA-14.0.0 [collations](#) ([MDEV-27009](#), [MariaDB 10.10](#))
- Improve contraction performance in UCA collations ([MDEV-27265](#), [MariaDB 10.10](#))
- Improve UCA collation performance for utf8mb3 and utf8mb4 ([MDEV-27266](#), [MariaDB 10.10](#))

Windows

- [Passwordless login](#) for mariadb root user, for OS admin users ([MDEV-26715](#))
- On newer versions of Windows (Windows 10 1903 or later), the `mariadb` client defaults to the utf8mb4 character set. Several problems with Unicode input and output in client were fixed. Command line utilities now accept all Unicode characters in user names, database names, file names etc (in the past, characters were restricted to the current ANSI codepage) ([MariaDB 10.8](#)).

Spider Storage Engine

- This was mostly internal refactoring work. As a result one can now declare [Spider](#) connections using the `REMOTE_SERVER`, `REMOTE_DATABASE`, and `REMOTE_TABLE` attributes and not abuse the `COMMENT` field for that. This works both for the whole table and per partition ([MDEV-5271](#), [MDEV-27106](#), [MariaDB 10.8](#)).

Convert Partitions

- `ALTER TABLE ... CONVERT PARTITION .. TO TABLE` ([MDEV-22166](#), [MariaDB 10.7](#)), and
- `ALTER TABLE ... CONVERT TABLE ... TO PARTITION ...` ([MDEV-22165](#)) as an easy way to convert tables to partitions and back in one command, instead of a sequence of `CREATE/EXCHANGE/DROP` ([MariaDB 10.7](#))

Miscellaneous

- Add `RANDOM_BYTES` function ([MDEV-25704](#), [MariaDB 10.10](#))
- The `INET4` data type ([MDEV-23287](#), [MariaDB 10.10](#))
- Re-design the upper level of handling `UPDATE` and `DELETE` statements ([MDEV-28883](#), [MariaDB 10.10](#))
- Deprecate the `DES_ENCRYPT/DECRYPT` functions ([MDEV-27104](#), [MariaDB 10.10](#))
- [Hashicorp Key Management Plugin](#) for implementing [encryption](#) using keys stored in the Hashicorp Vault KMS ([MDEV-19281](#), [MariaDB 10.9](#))
- Stored procedures already have support for the `IN`, `OUT` and `INOUT` parameter qualifiers. Added as well for [stored functions](#) and (IN only) [cursors](#) ([MDEV-10654](#)). This was a [contribution](#) by [ManoharKB](#) ([MariaDB 10.8](#)).
- Add an optional argument to the `CRC32()` function, as well as the `CRC32C()` function, which uses the Castagnoli polynomial. ([MDEV-27208](#)). **Note:** The order of the 2-ary arguments was swapped after the preview release: `crc32('MariaDB')=crc32(crc32('Maria'),'DB')` ([MariaDB 10.8](#))
- `my_print_defaults` now handles `--default=*` options in exactly the same way as other MariaDB tools ([MDEV-26238](#), [MariaDB 10.8](#)).
- UCA [collations](#) are now notably faster ([MDEV-27266](#), [MDEV-27265](#), [MariaDB 10.8](#)).
- `NATURAL_SORT_KEY` function ([MDEV-4742](#), [MariaDB 10.7](#)).
- Five **provider plugins** (bzip2, lzma, lz4, lzo, snappy) provide [compression capabilities](#) to the server and storage engines ([MDEV-12933](#), [blog post](#), [MariaDB 10.7](#)).
- `SFORMAT` function for arbitrary text formatting ([MDEV-25015](#), [MariaDB 10.7](#))
- `GET DIAGNOSTICS` supports a new condition property name `ROW_NUMBER`. In multi-row inserts it allows one to retrieve a number of a row that has caused the error ([MDEV-10075](#), [MDEV-26611](#), [MariaDB 10.7](#))

Variables

- For a list of all new variables, see [System Variables Added in MariaDB 10.11](#).
- Rename [slow queries](#) variables ([MDEV-7567](#))
 - `log_slow_min_examined_row_limit` (min_examined_row_limit)
 - `log_slow_query` (slow_query_log)
 - `log_slow_query_file` (slow_query_log_file). This was named `log_slow_query_file_name` in the [MariaDB 10.11.0](#) preview release.
 - `log_slow_query_time` (long_query_time)
- `replicate_rewrite_db` is now a system variable, no longer just an option ([MDEV-15530](#))
- Change default of `explicit_defaults_for_timestamp` to ON ([MDEV-28632](#), [MariaDB 10.10](#))
- `--ssl` option set as default for mariadb CLI ([MDEV-27105](#), [MariaDB 10.10](#))

- Merge (and deprecate) `old` to `old_mode` sql variable ([MDEV-24920](#), [MariaDB 10.9](#))
- Deprecate the `keep_files_on_create` variable ([MDEV-23570](#), [MariaDB 10.8](#)).
- Deprecate `wsrep_replicate_myisam` ([MDEV-24947](#), [MariaDB 10.7](#))
- Deprecate `wsrep_strict_ddl` ([MDEV-24843](#), [MariaDB 10.7](#))

InnoDB Variables

- `innodb_write_io_threads` and `innodb_read_io_threads` are now dynamic, and their values can be changed without restarting the server ([MDEV-11026](#))
- Removed `innodb_version` ([MDEV-28554](#), [MariaDB 10.10](#))
- Deprecate `innodb_prefix_index_cluster_optimization` ([MariaDB 10.10](#))
- Deprecate `innodb_change_buffering` ([MariaDB 10.9](#))
- `innodb_disallow_writes` removed ([MDEV-25975](#), [MariaDB 10.9](#))
- `innodb_log_file_size` is now dynamic ([MDEV-27812](#), [MariaDB 10.9](#))

Spider Variables

The following deprecated variables have been removed ([MariaDB 10.10](#)):

- `spider_udf_ct_bulk_insert_interval`
- `spider_udf_ct_bulk_insert_rows`
- `spider_udf_ds_bulk_insert_rows`
- `spider_udf_ds_table_loop_mode`
- `spider_udf_ds_use_real_table`
- `spider_use_handle`
- `spider_udf_table_mon_mutex_count`
- `spider_use_handler`

Security Vulnerabilities Fixed in MariaDB 10.11

For a complete list of security vulnerabilities (CVEs) fixed across all versions of MariaDB, see the [Security Vulnerabilities Fixed in MariaDB](#) page.

- [CVE-2025-21490](#): MariaDB 10.11.11
- [CVE-2024-21096](#): MariaDB 10.11.8
- [CVE-2023-22084](#): MariaDB 10.11.6
- [CVE-2022-47015](#): MariaDB 10.11.3

[Overview of 10.11](#)

[Alternate download from mariadb.org](#) [↗](#)

Release date: 4 Feb 2025

MariaDB 10.11 is a stable long term series of MariaDB, [maintained until](#) [↗](#) February 2028. It is an evolution of [MariaDB 10.10](#) with several entirely new features.

MariaDB 10.11.11 is a [Stable \(GA\)](#) [↗](#) release.

For an overview of [MariaDB 10.11](#) see the [What is MariaDB 10.11?](#) page.

Thanks, and enjoy MariaDB!

Notable Items

Storage Engines

InnoDB

- Fix possible InnoDB hang while running out of buffer pool ([MDEV-35409](#))
- Fix assertion failure on cascading foreign key update of table with vcol index in parent ([MDEV-29182](#))
- Fix potential issue in secondary Index with ROW_FORMAT=COMPRESSED and Change buffering enabled ([MDEV-35679](#))
- Fix issue where ON UPDATE SET NULL could not be specified on a NOT NULL column ([MDEV-35445](#))
- New parameter --skip-freed-pages for `Innochecksum`. Use this parameter to not get freed undo logs reported as existing undo log pages. ([MDEV-35394](#))
- Cloning of table statistics while saving the InnoDB table stats is now avoided ([MDEV-35363](#))
- InnoDB deadlock output query length increased to improve visibility of deadlocked statements. ([MDEV-32576](#))
- `ALTER TABLE...IMPORT TABLESPACE` now works with INDEX DESC ([MDEV-35169](#))
- Fix occasional failure of recovery of a multi-batch operation with InnoDB on startup ([MDEV-35699](#))

Memory

- Fix possible crash on DELETE from a HEAP table ([MDEV-22695](#))

Spider

- Fix possible Spider thread hang in 'Update' state on 2nd INSERT ([MDEV-35064](#))
- Fix possible crash on bootup in spider_sys_open_table «ext-issue»[MDEV-32822](#), «ext-issue»[MDEV-34302](#) ([MDEV-34925](#))

Replication

- Fix incorrect formatting of timestamp during `mariadb-binlog` parsing of a binary log, causing point in time recovery discrepancies ([MDEV-31761](#))
- `mariadb-binlog` can now correctly process more than one logfile when --stop-datetime is specified ([MDEV-35528](#))
- Setting `pseudo_thread_id` to a value exceeding 4 bytes previously resulted in truncation when written to the binary log ([MDEV-35646](#))
- MariaDB now supports MySQL 8.0 binlog events, including PARTIAL_UPDATE_ROWS_EVENT, TRANSACTION_PAYLOAD_EVENT, and HEARTBEAT_LOG_EVENT_V2. ([MDEV-35643](#))

Optimizer

- Fix server crash in get_sort_by_table/make_join_statistics after INSERT into a view with ORDER BY ([MDEV-29935](#))
- Fix failing assertion causing disruption and replication failure ([MDEV-24035](#))
- Conditions with SP local variables are now pushed into derived table. Previous behaviour caused slow performance and table scans instead of using the pushed down condition ([MDEV-35910](#))
- NULL-aware materialization with IN predicate and single column no longer skips building sorted Ordered_key structures ([MDEV-34665](#))
- Fix possibly wrong result using a degenerated subquery (SELECT <expr>) with window function ([MDEV-35869](#))

Partitioning

- History is now stored on the same partitions on different Galera nodes when system versioning is enabled ([MDEV-35096](#))
- Fix possible hang or crash during InnoDB purge with HASH indexes during ALTER TABLE ([MDEV-25654](#))
- EXCHANGE PARTITION now works for tables with unique blobs ([MDEV-35612](#))
- algorithm = instant can now correctly be used if a table has partitions and one tries to change a column with an index which is not the partitions key. This previously gave error "ERROR 1846 (0A000): ALGORITHM=INSTANT is not supported. Reason: ADD INDEX. Try ALGORITHM=NOCOPY". ([MDEV-34813](#))

Character Sets

- Fix assertion failure and possible index corruption with unique key and nopad collation without DESC or HASH keys ([MDEV-30111](#))
- Fix client crash the command after client sets character set to utf32 ([MDEV-34090](#))
- Fix possible runtime error caused by XA RECOVER applying a zero offset to a null pointer ([MDEV-35549](#))
- Fix issue where functions in default values in tables with certain character sets could break SHOW CREATE and mariadb-dump ([MDEV-29968](#))

Galera

- [Galera](#) updated to 26.4.21
 - **NOTE:** Includes increasing the GCS protocol version, which prevents downgrades of individual nodes in the cluster as soon as all nodes nodes have been updated
- Fix streaming replication transaction crash with `innodb_snapshot_isolation` ([MDEV-35281](#))
- Fix sporadic failure of async replication on Galera async replica nodes with parallel replication enabled ([MDEV-35465](#))
- Fix possible failure of `wsrep_sst_rsnc` SST script if user specified `aria_log_dir_path` different from default data directory ([MDEV-35387](#))
- Fix cluster node hang during shutdown if threadpool is used ([MDEV-35710](#))
- MariaDB Cluster and ALTER INPLACE running in Total Order Isolation (`wsrep_OSU_method=TOI`) now correctly abort a DML INSERT operation in InnoDB ([MDEV-33064](#))
- Fix possible crash in `wsrep_check_sequence` ([MDEV-33245](#))
- Fix sporadic reporting of success when a deadlock error occurs under `--ps-protocol BF` aborted transaction ([MDEV-35446](#))
- Rows in table `mysql.gtid_slave_pos` are now correctly deleted on Galera nodes when `wsrep_gtid_mode = 1` is used, which previously lead to wrong information about replica delays ([MDEV-34924](#))
- Undefined behavior could occur when attempting to perform INSERT DELAYED on a Galera cluster node. ([MDEV-35852](#))
- Fix issue where DROP TABLE on child and UPDATE of parent table can cause a metadata lock BF-BF conflict when applied concurrently. ([MDEV-35018](#))
- Galera protocol versions are now shown by `show status - change` available with installation of galera library 26.4.21+ ([MDEV-35505](#))
- Fix possible crash in `wsrep_sst_mariabackup` script when upgrading node in cluster from 10.11.9 to 10.11.10. ([MDEV-35526](#))
- `wsrep_sst_mariabackup.sh` no longer uses `--use-memory` default (100MB) resulting in prepare stage which could take hours ([MDEV-35749](#))

Audit Plugin

- For an authentication with the [ed25519 authentication plugin](#) the password of the CREATE USER statement is now masked in the audit log ([MDEV-35507](#))
- MariaDB Audit now detects all DCLs forms for masking a password ([MDEV-35522](#))

General

- Fix possible crash where server could not construct a geometry object from the input ([MDEV-33987](#))
- Fix trigger created with "`CREATE TRIGGER `table1_after_insert` AFTER INSERT`" which is adding rows to another table using "`FOR EACH ROW insert into table2(`id`, `name`) values (NEW.`id`, NEW.`name`);`" that did not work correctly when if bulk inserts are used by the application. Only the first row of the bulk insert would be added to the table ([MDEV-34958](#))
- After changing the table definition for the system table `'mysql.servers'`, a following execution of CREATE SERVER would previously lead to a server crash.
 - NOTE: System tables should never be modified by a user anyhow ([MDEV-33783](#))
- Fix connection hang after query on a partitioned table with UNION and LIMIT ROWS EXAMINED ([MDEV-35571](#))
- Fix possible crash during index traversal using ``tree_search_next``. ([MDEV-28130](#))
- Fix assertion failure where CURRENT_USER was not correctly copied during condition pushdown ([MDEV-35090](#))
- START TRANSACTION, when triggering an implicit commit as a COMMIT or ROLLBACK has not been executed before, now resets optional characteristics added to the last START TRANSACTION command ([MDEV-35335](#))
- `sql_mode='NO_UNSIGNED_SUBTRACTION'` now works for multiple unsigned integers ([MDEV-35651](#))
- The "Failed to write to mysql.slow_log" error no longer shown without a detailed reason for the error ([MDEV-20281](#))
- Fix doublewrite recovery of `innodb_checksum_algorithm=full_crc32` encrypted pages ([MDEV-34898](#))
- Can now correctly add a foreign key on a table with a long UNIQUE multi-column index that contains a foreign key as a prefix ([MDEV-33658](#))
- During an online table rebuild of an InnoDB statistics table, `opt_search_plan_for_table()` no longer sometimes degrades to full table scan ([MDEV-35443](#))
- Fix debian-start script failure when using non-standard socket path ([MDEV-35907](#))
- Fix possible hang or crash where zero offset applied to null pointer ([MDEV-35864](#))
- Fixed issue where ST_PointFromWKB ignored SRID parameter and returned 0 ([MDEV-32619](#))
- Fix possible hang during CREATE TABLE...SELECT error handling, especially with `innodb_snapshot_isolation` enabled ([MDEV-35647](#))
- Fix incorrect locking order of `LOCK_log/LOCK_commit_ordered` and `LOCK_global_system_variables` ([MDEV-29744](#))
- Fix rare cases where binlog entries could receive incorrect timestamps on secondary nodes of a Galera cluster, potentially impacting replication accuracy ([MDEV-35157](#))
- Fix possible memory leak on SHUTDOWN ([MDEV-35326](#))
- Fix possible memory leak while shutting down server after installing the `auth_gssapi` plugin ([MDEV-35575](#))

- Fix possible server crash when using INSERT DELAYED on tables with virtual columns. ([MDEV-26891](#))
- Fix possible Spider crash or hang when the first byte of a connection key is changed ([MDEV-34849](#))
- A BEFORE INSERT Trigger previously returned with error ""Field 'xxx' doesn't have a default value", if a NULL value is added for a column defined NOT NULL without explicit value and no DEFAULT specified ([MDEV-19761](#))
- Calling a stored routine that executes a join on three or more tables and referencing not-existent column name in the USING clause could previously result in a crash on its second invocation. ([MDEV-24935](#))
- Fix rare cases where binlog entries could receive incorrect timestamps on secondary nodes of a Galera cluster, potentially impacting replication accuracy ([MDEV-35157](#))
- Comparison of UUID v1 and V6 could return incorrect results ([MDEV-35468](#))

Security

- Fixes for the following [security vulnerabilities](#):
 - [CVE-2025-21490](#)

Changelog

For a complete list of changes and bugfixes made in [MariaDB 10.11.11](#), with links to detailed information on each push, see the [changelog](#).

Contributors

For a full list of contributors to [MariaDB 10.11.11](#), see the [MariaDB Foundation release announcement](#).

Be notified of new MariaDB Server releases automatically by [subscribing](#) to the MariaDB Foundation community announce 'at' lists.mariadb.org announcement list (this is a low traffic, announce-only list). MariaDB plc customers will be notified for all new releases, security issues and critical bug fixes for all MariaDB plc products thanks to the Notification Services.

MariaDB may already be included in your favorite OS distribution. More information can be found on the [Distributions which Include MariaDB](#) page.

Thanks, and enjoy MariaDB!

Notable Items

Storage Engines

InnoDB

- Fix attempt to read outside the bounds of the file: `./ibdata1` ([MDEV-34453](#))
- Fix MariaDB crash with SIGILL because the OS does not support AVX512 ([MDEV-34565](#))
- Fix deadlock caused by `lock_rec_unlock_unmodified()` ([MDEV-34690](#))
- Fix duplicate key error in table 'mysql.innodb_table_stats' ([MDEV-34207](#))
- Fix possible adaptive hash index corruption with `ALTER TABLE...IMPORT TABLESPACE` and `FULLTEXT SEARCH` ([MDEV-35059](#))
- XA prepare now correctly releases unmodified records in non-blocking mode ([MDEV-34466](#))
- Fix contention between secondary index UPDATE and purge due to large `innodb_purge_batch_size` ([MDEV-34515](#))
 - New default of `127` for `innodb_purge_batch_size` (previously `1000`).
- Fix redundant page lookups that hurt performance ([MDEV-34791](#))
- Implement `innodb_log_file_mmap` on 64-bit systems for improving `ib_logfile0` reads ([MDEV-34062](#))

Spider

- Fix server crash when calling `spider UDF` after `aria_encrypt_tables` is enabled ([MDEV-34682](#))
- `SELECT MIN` on Spider table no longer returns more rows than expected ([MDEV-26345](#))
- Fix Spider group by handler wrong result on order by aggregate ([MDEV-29546](#))

S3

- Fix Storage Engine S3 that caused 500 error when using Huawei Cloud S3 and possibly other S3 providers ([MDEV-34867](#))
 - A new option `s3-provider` has been added. `s3-provider=Huawei` needs to be set for Huawei Cloud S3
 - New option `s3_ssl_no_verify`, if true, SSL certificate verification for the S3 endpoint is disabled

Optimizer

- Fix crash caused by query containing constant having clause ([MDEV-23983](#))
- Fix assertion with `optimizer_join_limit_pref_ratio` and 1-table select ([MDEV-35072](#))

Data Definition - Alter Table

- Fix InnoDB crash under Windows Subsystem for Linux on `ALTER TABLE` or `OPTIMIZE TABLE` ([MDEV-34938](#))
- Modification of the column now correctly checks foreign key constraint ([MDEV-34392](#))
- Fix incorrect NULL value handling for instantly dropped BLOB columns ([MDEV-35122](#))

Galera

- Galera updated to 26.4.20
- Fix server crash when setting `wsrep_cluster_address` after adding invalid value to `wsrep_allowlist` table ([MDEV-31173](#))
- TOI (ALTER) no longer hangs on a parent table if SR transaction is in progress on a child table ([MDEV-34836](#))
- Fix `INSERT...SELECT` on MyISAM table suddenly replicated by alera ([MDEV-34647](#))
- Fix case where with `wsrep_mode=REPLICATE_ARIA`, only part of the mixed-engine transactions was replicated ([MDEV-30653](#))
- Fix `galera_ssl_reload` failure with warning message ([MDEV-32778](#))
- When InnoDB gets an assertion failure, WSREP layer is now handled gracefully ([MDEV-32363](#))

Backup

- Recovery now correctly notes some log corruption ([MDEV-34802](#))
- InnoDB now correctly merges the change buffer to `ROW_FORMAT=COMPRESSED` tables ([MDEV-34879](#))
- Can now selectively restore sequences using `innodb` tables from backup ([MDEV-32350](#))

JSON

- `JSON_TABLE` now properly unquotes strings ([MDEV-27412](#))
- `JSON_TABLE` default values now allows non-string literals ([MDEV-25822](#))

General

- As per the [MariaDB Deprecation Policy](#), this will be the last release of [MariaDB 10.11](#) for SLES 12, and Windows 11 22H2

- [mariadb](#) no longer hangs on startup when `--init-file` target does not exist ([MDEV-34814](#))
- `LOAD DATA INFILE` with geometry data no longer fails ([MDEV-34883](#))
- Fix heap-use-after-free in `group_concat` with compressed or GIS columns ([MDEV-16699](#))
- Fix assertion `'lis_cond()'` failed in `Item_bool_func::val_int / do_select` ([MDEV-35135](#))
- Trigger now works correctly with bulk update ([MDEV-34718](#))
- Fix assertion failure in `find_producing_item` upon a query from a view ([MDEV-35276](#))
- Add new setting, `--quick-max-column-width` to the mariadb client for use in `--quick` mode ([MDEV-34704](#))

Changelog

7.0.1.2.3 MariaDB 10.11.9 Release Notes

The most recent release of MariaDB 10.11 is:
[MariaDB 10.11.11 Stable \(GA\)](#) [Download Now](#)
Alternate download from [mariadb.org](#)

[Download 10.11.9](#)

[Release Notes](#)

[Changelog](#)

[Overview of 10.11](#)

Release date: 8 Aug 2024

[MariaDB 10.11](#) is a stable long term series of MariaDB, [maintained until](#) February 2028. It is an evolution of [MariaDB 10.10](#) with several entirely new features.

[MariaDB 10.11.9](#) is a **Stable (GA)** release.

For an overview of [MariaDB 10.11](#) see the [What is MariaDB 10.11?](#) page.

Thanks, and enjoy MariaDB!

Notable Items

Storage Engines

InnoDB

- `ALTER TABLE...ALGORITHM=COPY` now builds indexes more efficiently ([MDEV-33087](#))
 - Unsetting the `innodb_alter_copy_bulk` system variable restores the old behavior.
- Fix unexpected storage read IO for the redo log, reintroduce `innodb_log_write_ahead_size` ([MDEV-33894](#))
- Correctly terminate transaction early with `ER_LOCK_TABLE_FULL` when lock memory is growing ([MDEV-34167](#))
- Alter operation on redundant table no longer aborts the server ([MDEV-34222](#))
- Fix MariaDB crash with SIGILL because the OS does not support AVX512 ([MDEV-34565](#))
- Fix InnoDB: Failing assertion: `stat_n_leaf_pages > 0` in `ha_innobase::estimate_rows_upper_bound` ([MDEV-34474](#))

- wait_for_read in buf_page_get_low no longer hurts performance ([MDEV-34458](#))
- Fix InnoDB: Assertion failure in file ./storage/innobase/page/page0zip.cc line 4211 ([MDEV-34357](#))

Aria

- Fix [Aria](#) index corruption when doing a REPAIR TABLE that has a size of over 4G ([MDEV-34522](#))

Spider

- UBSAN: runtime error: applying non-zero offset in spider_free_mem and SIGSEGV in spider_free_mem on SELECT ([MDEV-31475](#))
- SIGSEGV in ha_resolve_storage_engine_name, UBSAN: runtime error: index 4294967295 out of bounds for type 'st_plugin_int *[64]' ([MDEV-32487](#))
- SIGSEGV in spider_db_conn::fin_loop_check, and ASAN: heap-use-after-free in spider_db_mbase::fin_loop_check on SHOW TABLE STATUS ([MDEV-34541](#))
- SIGSEGV in ha_spider::lock_tables on BEGIN after table lock ([MDEV-29962](#))
- SIGSEGV in spider_conn_first_link_idx and others on DELETE, INSERT and SELECT ([MDEV-32492](#))
- Spider: Crashes, asserts, hangs, memory corruptions and ASAN heap-use-after-free's ([MDEV-27902](#))
- Spider: @@insert_id 128 to TINYINT: Assertion '!is_set() || (m_status == DA_OK_BULK && is_bulk_op())' failed. ([MDEV-28105](#))
- ASAN errors in spider_db_free_result after partition DDL ([MDEV-29027](#))
- Server crashes when calling spider UDF after aria_encrypt_tables is enabled ([MDEV-34682](#))

Partitioning

- MariaDB Server crashes with ill-formed partitions ([MDEV-32155](#))
- SIGSEGV in parse_engine_part_options on INSERT, SELECT or ALTER ([MDEV-34421](#))
- Assertion 'auto_increment_value' failed in ha_partition::info on INSERT into MEMORY table ([MDEV-24610](#))

Character Sets

- On startup: UBSAN: applying zero offset to null pointer in my_copy_fix_mb from strings/ctype-mb.c and other locations ([MDEV-34226](#))
- On startup: UBSAN: runtime error: applying zero offset to null pointer in skip_trailing_space and my_hash_sort_utf8mb3_general1400_nopad_as_ci ([MDEV-34187](#))
- SHOW CREATE DATABASE statement crashes the server when db name contains some unicode characters, ASAN stack-buffer-overflow ([MDEV-32376](#))
- Wrong result set with utf8mb4_danish_ci and BNLH join ([MDEV-34417](#))

Optimizer

- On startup: UBSAN: runtime error: applying non-zero offset in JOIN::make_aggr_tables_info in sql/sql_select.cc ([MDEV-34227](#))
- Crash after killing query while it is processed by test_quick_select ([MDEV-30651](#))
- Extend condition normalization to include 'NOT a' ([MDEV-19520](#))
- Constant subquery causing a crash in pushdown optimization ([MDEV-29363](#))
- Crash when pushing condition with CHARSET()/COERCIBILITY() into derived table ([MDEV-33010](#))
- 2nd execution name resolution problem with pushdown into unions ([MDEV-34506](#))
- Assertion '(key_part->key_part_flag & 4) == 0' failed key_hashnr ([MDEV-34580](#))
- Crash caused by query containing constant having clause ([MDEV-23983](#))
- Using NAME_CONST() (or executing query from the stored procedure and referring to a local variable) changes the plan and may make execution slower ([MDEV-33971](#))
- ORDER BY DESC causes ROWID Filter optimization performance degradation ([MDEV-33875](#))

Replication

- Auto-generated DELETE from HEAP table no longer breaks replication ([MDEV-25607](#))
- Fix replication failure when XA transactions are used where the replica has replicate_do_db set and the client has touched a different database when running DML such as inserts. ([MDEV-33921](#))
- Fix replication error when CHANGE MASTER TO is used in conjunction with a password longer than 41 ascii characters ([MDEV-23857](#))
- The --init-rpl-role option is utilized to avoid a possible error state in semisync recovery ([MDEV-33465](#))

Backup

- Hide password passed on commandline from `xtrabackup_info` (MDEV-34434 [↗](#))

Galera

- Galera updated to 26.4.19
 - **NOTE:** Includes increasing the GCS protocol version, which prevents downgrades of individual nodes in the cluster as soon as all nodes nodes have been updated
- `galera_gtid_2_cluster: Assertion `thd->wsrep_next_trx_id() != (0x7fffffffffffffffffLL * 2ULL + 1)'` (MDEV-32633 [↗](#))
- `table gtid_slave_pos` entries never been deleted with `wsrep_gtid_mode = 0` (MDEV-34170 [↗](#))
- Deadlock found when trying to get lock during applying (MDEV-31658 [↗](#))
- Change error code for Galera unkillable threads (MDEV-12008 [↗](#))
- 10.11.8 cluster becomes inconsistent when using composite primary key and partitioning (MDEV-34269 [↗](#))
- `wsrep_sst_mariabackup` use `/tmp` dir during SST rather than user defined `tmpdir` (MDEV-32158 [↗](#))

Error Log

- `server_uid` system variable added, and value added to the `error log` at startup (MDEV-34494 [↗](#))

General

- As per the [MariaDB Deprecation Policy](#), this will be the last release of [MariaDB 10.11](#) for Debian 10 "Buster", RHEL/CentOS 7, Ubuntu 23.10 "Mantic", and Fedora 38
- Repositories for Ubuntu 24.04 "Noble" have been added
- `IMPORT TABLESPACE` no longer unnecessarily traverses tablespaces list (MDEV-34670 [↗](#))
- Fix unknown variable `defaults-group-suffix=` with `mariadb-secure-installation` (MDEV-33265 [↗](#))
- `mariadb-install-db` no longer hangs on macOS (MDEV-34129 [↗](#))
- Fix transaction termination with `ER_LOCK_TABLE_FULL` when lock memory is growing (MDEV-34167 [↗](#))
- Disable new connections in case of fatal signal (MDEV-34475 [↗](#))
- Control over memory allocated for SP/PS (MDEV-14959 [↗](#))
- `Triggers` now work correctly with bulk insert (MDEV-24411 [↗](#))
- Fix assertion ``table->field[0]->ptr >= table->record[0] && table->field[0]->ptr <= table->record[0] + table->s->reclength'` failed in `void handler::assert_icp_limitations(uchar*)` (MDEV-34632 [↗](#))
- `sandbox mode` \- now compatible with `--binary-mode` (MDEV-34203 [↗](#))

Changelog

For a complete list of changes made in [MariaDB 10.11.9](#), with links to detailed information on each push, see the [changelog](#) [↗](#).

Notable Items

From this version, the [mariadb-dump](#) tool adds a new [sandbox](#) command to the top of every dump file. This command cannot be interpreted by MariaDB command line client versions that do not have the sandbox command, or by MySQL command line clients, and an error will be generated in these clients. Other methods of importing the dump will work not have this issue.

Storage Engines

InnoDB

- Introduce the [innodb_log_spin_wait_delay](#) system variable to address excessive context switching caused by `log_sys.lsn_lock` (observed on write-intensive workloads on NUMA systems) ([MDEV-33515](#))
- Fix InnoDB holding shared `dict_sys.latch` while waiting for FOREIGN KEY child table lock on DDL ([MDEV-32899](#))
- Fix adaptive hash index corruption after `ALTER TABLE...DISCARD TABLESPACE` ([MDEV-33400](#))
- Server no longer aborts while altering an InnoDB statistics table ([MDEV-33462](#))
- Fix LeakSanitizer errors in `rec_copy_prefix_to_buf` ([MDEV-33230](#))
- Fix InnoDB fatal error: Clustered record field for column x not found ([MDEV-33558](#))
- Fix InnoDB hang when temporarily running out of buffer pool ([MDEV-33613](#))
- Fix alter operation hang when encryption thread works on the same tablespace ([MDEV-33770](#))
- Fix MariaDB segfault on rowid filter query involving generated column ([MDEV-33795](#))
- Fix discard/import tablespace, restart, index corruption ([MDEV-33512](#))
- Fix server hang on DROP INDEX or RENAME INDEX ([MDEV-33993](#))
- Fix mariabackup --backup hang ([MDEV-33669](#))
- Fix server hang caused by InnoDB change buffer ([MDEV-33543](#))
- Fix assertion failures upon adding a too long key to table with COMPRESSED row format ([MDEV-31161](#))

- `IMPORT TABLESPACE` no longer fails with column count or index count mismatch ([MDEV-30655](#))
- Fix alter table corruption while applying the modification log ([MDEV-19044](#))
- Fix inconsistent behaviors of `UPDATE` under `RU` & `RC` isolation level ([MDEV-26643](#))
- Fix weird `SELECT` view when a record is modified to the same value by two transactions ([MDEV-26642](#))
- Fix inconsistent read and write, which use the same predicate (`WHERE` clause) ([MDEV-29565](#))
- Fix inconsistent `SELECT` view when modifying a record added by another transaction ([MDEV-26671](#))
- Fix weird read view after `ROLLBACK` of other transactions ([MDEV-33802](#))
- Read only server no longer throws error when running a create temporary table as select statement ([MDEV-33889](#))
- Change buffer index no longer fails to delete the records ([MDEV-32489](#))
- Fix InnoDB include OS error information when failing to write to `iblogfile0` ([MDEV-33397](#))
- Fix phantom rows caused by `UPDATE` of `PRIMARY KEY` ([MDEV-32898](#))
 - New system variable, `innodb_snapshot_isolation`
- In-place migration from MySQL 5.7 no longer causes invalid `AUTO_INCREMENT` values ([MDEV-33277](#))
- Fix InnoDB log corruption before upgrading it on startup ([MDEV-32445](#))
- Table no longer gets rebuilt with `ALTER TABLE ADD COLUMN` ([MDEV-33214](#))

Aria

- Fixed that internal temporary tables did not wait for freed disk space, and related issues ([MDEV-33813](#))

Federated

- Fix wrong result on 2nd execution of prepared statement for query with derived table ([MDEV-31361](#))

Spider

- Improve Spider performance by pushing down `TIMESTAMPDIFF` function ([MDEV-28992](#)) and `CASE` statement ([MDEV-28993](#)) to data nodes
- Fix server crash when deleting partitions from a table with spider engine ([MDEV-33731](#))
- SPIDER plugin initialization no longer fails at 'create table if not exists mysql.spider_tables ... with 'Specified key was too long; max key length is 1000 bytes', Warning: Memory not freed: 10720 ([MDEV-33242](#))
- Fix spider plugin init failure with `no_zero_date sql_mode` ([MDEV-33494](#))
- Fix sql plugin init failure with traditional `sql_mode` ([MDEV-33584](#))
- Fix parsing failure on valid left join select by translating the on expression to `()` ([MDEV-33679](#))
- Fix Spider: `ERROR 12710 (HY000): Invalid information from remote table when using MariaDB 10.5 local and MariaDB 10.6 remote` ([MDEV-33777](#))
- Fix bug where `Spider variables` were not available if Spider was loaded upon server startup ([MDEV-33441](#))

Backup

- Port backup features from Enterprise Server. This adds support for `BACKUP STAGE` to `mybackup`, and obsoletes the `no-backup-locks` and `mysync` options ([MDEV-32932](#))
- `mybackup` now preserves `innodb_encrypt_tables` ([MDEV-33334](#))
- Fix `mybackup` problem on older mariadb (`opendir(NULL)`) caused by [MDEV-30968](#) ([MDEV-31251](#))
- Fix `mybackup --backup` `FATAL ERROR: ... Can't open datafile cool_down/t3` ([MDEV-33011](#))
- `mybackup --backup` now includes retry logic for undo tablespaces ([MDEV-33980](#))
- Fix crash recovery in `mybackup --prepare` due to insufficient `innodb_log_file_size` ([MDEV-33540](#))
- Fix crash in `mybackup --prepare --export` after `--prepare` ([MDEV-33023](#))
- `mybackup` now considers O/S user when `--user` option is omitted ([MDEV-32893](#))

Character Sets, Data Types

- Fixed improper application of `ORDER BY COLLATE` to non-character columns ([MDEV-33318](#))
- Default charset now works with PHP MySQLi extension ([MDEV-32975](#))
- Fixed Bad `SEPARATOR` value in `GROUP_CONCAT` on character set conversion ([MDEV-33772](#))
- Fixed out of range error in `AVG(YEAR(datetime))` due to a wrong data type ([MDEV-33496](#))
- Fixed `GREATEST()` and `LEAST()` problems with `NULLs` ([MDEV-21034](#))

JSON

- View created via `JSON_ARRAYAGG` now returns correct json object ([MDEV-30646](#))
- `JSON_TYPE` now detects the type of String Values and correctly returns Date/DateTime values ([MDEV-19487](#))
- `JSON_REMOVE` no longer returns `NULL` on valid arguments ([MDEV-22141](#))
- `JSON_EXTRACT` no longer returns multiple values for same path ([MDEV-32287](#))

Encryption, TLS, SSL

- WolfSSL's math is unnecessarily slow ([MDEV-33482](#))

Optimization & Tuning

- Server crashes in JOIN_CACHE::write_record_data upon EXPLAIN with subqueries and constant tables ([MDEV-21102](#))
- Wrong result with cross Join given join order ([MDEV-30975](#))
- Wrong warnings on 2-nd execution of PS for query with GROUP_CONCAT ([MDEV-31276](#))
- Wrong result with semi-join and splittable derived table ([MDEV-23878](#))
- Optimizer choosing incorrect index in 10.6, 10.5 but not in 10.4 ([MDEV-33306](#))
- Aggregation functions fail to leverage uniqueness property ([MDEV-30660](#))
- Partitioning is broken on big endian architectures ([MDEV-33623](#))
- `optimizer_adjust_secondary_key_costs` server option changed from having a numeric value to a set value with new options to affect the optimizer. The old numeric values still work.

Plugins

- The `audit plugin` now reports the user and host in all cases ([MDEV-33393](#))

Replication

- `--gtid-ignore-duplicate` can double-apply event in case of parallel replication retry ([MDEV-33475](#))
- Deadlock kill of XA PREPARE can break replication / `rpl.rpl_parallel_multi_domain_xa` sporadic failure ([MDEV-34042](#))
- `mysql_manager_submit` Segfault at Startup Still Possible During Recovery ([MDEV-33799](#))
- Server crash in `Rows_log_event::update_sequence` upon replaying binary log ([MDEV-31779](#))
- Slave crashed: `reload_acl_and_cache` during shutdown ([MDEV-30260](#))
- `Rpl_semi_sync_slave_status` is ON When Replication Is Not Configured ([MDEV-33546](#))
- When `binlog_annotate_row_events` on , event of binlog file is truncated ([MDEV-9179](#))
- Add more warnings to be able to better diagnose network issues ([MDEV-33582](#))
- Improve times and states in `show processlist` for replication ([MDEV-33620](#))
- Adapt parallel slave's round-robin scheduling to XA events ([MDEV-33668](#))
- release row locks for non-modified rows at XA PREPARE ([MDEV-33454](#))
- Semi-sync Wait Point AFTER_COMMIT Slow on Workloads with Heavy Concurrency ([MDEV-33551](#))

Galera

- Galera updated to 26.4.18
 - **NOTE:** Includes increasing the GCS protocol version, which prevents downgrades of individual nodes in the cluster as soon as all nodes have been updated
- Disallow bulk insert operation during partition update statement ([MDEV-33979](#))

SQL, Data Definition, and Data Manipulation

- Transportable Tablespace no longer leave `AUTO_INCREMENT` in a mismatched state ([MDEV-18288](#))
- Fix wrong row targeted with "insert ... on duplicate" and "replace", leading to data corruption ([MDEV-30046](#))
- Fix incorrect DEFAULT expression evaluated in UPDATE ([MDEV-33790](#))
- Fix server crash when UPDATE statement with duplicate key is run after setting a low `thread_stack` ([MDEV-33622](#))
- Fix incorrect handling of UPDATE in PS mode when a table's column declared as NOT NULL ([MDEV-33549](#))
- Fix crash in EXECUTE IMMEDIATE 'CREATE OR REPLACE TABLE t1 (a INT DEFAULT ?)' USING DEFAULT ([MDEV-15703](#))
- Fix wrong result on 2nd execution of PS to select from view using derived ([MDEV-31277](#))
- Fix wrong warnings on 2nd execution of PS for query with GROUP_CONCAT ([MDEV-31276](#))
- `TIMESTAMP` value of '1970-01-01 00:00:00' can no longer be indirectly inserted in `strict mode` ([MDEV-34088](#))
- Fix out of range error in `AVG(YEAR(datetime))` due to a wrong data type ([MDEV-33496](#))
- Fix zero datetime reinterpreting as '1970-01-01 00:00:00' on `field_datetime=field_timestamp` ([MDEV-34069](#))
- `unix_timestamp(coalesce(timestamp_column))` no longer returns NULL on '1970-01-01 00:00:00.000001' ([MDEV-34061](#))
- Fix crash using UDF in WHERE clause of VIEW ([MDEV-24507](#))
- Fix update for portion changes autoincrement key in period table ([MDEV-25370](#))
- Fix SIGABRT resulting from CREATE TABLE with generated column and RLIKE ([MDEV-21058](#))

Platforms & Packaging

- MariaDB-client community can't be installed in red hat ubi9 ([MDEV-32791](#))

General

Scripts & Clients

- It's now possible to disable system commands with the `mariadb --sandbox` option. ([MDEV-21778](#))
- `mariadb-dump` now exports the data with sandbox mode enable, so that the mariadb client will not execute potentially dangerous cli commands. ([MDEV-33727](#))
- `mariadb-dump` commands such as `mariadb-dump --dump-slave=2 --master-data=2` now record both positions ([MDEV-4827](#))
- Loading `time zones` now works with `alter_algorithm INPLACE` ([MDEV-33044](#))

Server

- Moving from MariaDB 10.5 to 10.6 `mysql_upgrade` is not updating some system tables ([MDEV-33726](#))
- Original IP not shown in network related error messages when `proxy_protocol` is in use ([MDEV-33506](#))
- Server incorrectly describes known variables as UNKNOWN if invalid values are specified at startup ([MDEV-33469](#))
- update case insensitive (large) unique key with insensitive change of value - duplicate key ([MDEV-29345](#))
- MariaDB will abort server startup if it finds an invalid parameter, but won't check for other invalid params ([MDEV-26923](#))
- Slowdown when running nested statement with many partitions ([MDEV-33502](#))

Security

- Fixes for the following [security vulnerabilities](#):
 - [CVE-2024-21096](#)

Changelog

For a complete list of changes made in [MariaDB 10.11.8](#), with links to detailed information on each push, see the [changelog](#).

7.0.1.2.5 MariaDB 10.11.7 Release Notes

The most recent release of MariaDB 10.11 is:

MariaDB 10.11.11 Stable (GA) [Download Now](#)

Alternate download from [mariadb.org](#)

[Download 10.11.7](#)

[Release Notes](#)

[Changelog](#)

[Overview of 10.11](#)

Release date: 7 Feb 2024

[MariaDB 10.11](#) is the current stable long term series of MariaDB, [maintained until](#) February 2028. It is an evolution of

MariaDB 10.10 with several entirely new features.

MariaDB 10.11.7 is a [Stable \(GA\)](#) release.

For an overview of MariaDB 10.11 see the [What is MariaDB 10.11?](#) page.

Thanks, and enjoy MariaDB!

Notable Items

- Windows packages were delayed but have now been added to the downloads site

InnoDB

- Unique hash key on column prefix is computed incorrectly ([MDEV-29954](#))
- Query from `I_S.INNOODB_SYS_INDEXES` exceeding `LIMIT ROWS EXAMINED` causes `ER_UNKNOWN_ERROR` and LeakSanitizer errors in `rec_copy_prefix_to_buf_old` ([MDEV-28613](#))
- Assertion ``0'` failed in `row_sel_convert_mysql_key_to_innabase` upon `UPDATE` using a partial-field key prefix in search ([MDEV-21245](#))
- Assertion failure on `REPLACE` on `ROW_FORMAT=COMPRESSED` table ([MDEV-31574](#))
- Crash emitting "Unsupported meta-data version number" error message ([MDEV-29972](#))
- LeakSanitizer errors in `mem_heap_create_block_func` upon query from `I_S.INNOODB_SYS_TABLES` with `LIMIT ROWS EXAMINED` ([MDEV-32890](#))
- Inplace alter rebuild increases file size ([MDEV-26740](#))
- `BLOB` corruption on `UPDATE` of `PRIMARY KEY` with `FOREIGN KEY` ([MDEV-31441](#))
- GNU libc `posix_fallocate()` may be extremely slow ([MDEV-32268](#))
- InnoDB wrong error message ([MDEV-32833](#))
- Assertion failure on `ALTER TABLE...PAGE_COMPRESSED=1` ([MDEV-31000](#))
- InnoDB after `ALTER TABLE...IMPORT TABLESPACE` may not be crash safe ([MDEV-32269](#))
- InnoDB fails to restore tablespace first page from doublewrite buffer when page is empty ([MDEV-32968](#))
- `innodb_fast_shutdown=0` hang after incomplete startup ([MDEV-32798](#))
- `innodb_undo_log_truncate=ON` prevents fast shutdown ([MDEV-33062](#))
- Adaptive flush recommendation ignores dirty ratio and checkpoint age ([MDEV-31939](#))
- `gc01.gc01_purge` contaminates further execution of `innodb.gap_locks` ([MDEV-28682](#))
- `LPAD` in `vc01` created in `ORACLE` mode makes table corrupted in non-`ORACLE` ([MDEV-27744](#))
- Adaptive flushing is still not getting invoked in 10.5.11 ([MDEV-26055](#))
- History list is not shrunk unless there is a pause in the workload ([MDEV-33213](#))
- path separator near `ib_buffer_pool` incorrect ([MDEV-32983](#))
- Deadlock between `buf_page_get_zip()` and `buf_pool_t::corrupted_evict()` on InnoDB `ROW_FORMAT=COMPRESSED` table corruption ([MDEV-32371](#))
- Empty `INSERT` crashes with `innodb_force_recovery=6` or `innodb_read_only=ON` ([MDEV-31861](#))
- Assertion ``end_lsn == page_lsn'` failed in `recv_recover_page` ([MDEV-33137](#))
- Some calls to `buf_read_ahead_linear()` seem to be useless ([MDEV-32068](#))
- Opening all `.ibd` files on InnoDB startup can be slow ([MDEV-32027](#))
- InnoDB LRU flushing does not run before running out of buffer pool ([MDEV-33053](#))
- `innodb_undo_log_truncate=ON` is blocking page writes ([MDEV-33112](#))

Backup

- mariabackup has wrong or missing plugin-dir default? ([MDEV-29110](#))
- mariabackup fails when `innodb_max_dirty_pages_pct` contains a fraction (is not an integer) ([MDEV-20286](#))
- Missing required privilege `CONNECTION ADMIN` ([MDEV-33006](#))
- If tables are frequently created, renamed, dropped, a backup cannot be restored ([MDEV-32939](#))
- **BACKUP LOCKS** on table to be accessible to those with `database LOCK TABLES` privileges ([MDEV-28367](#))

JSON

- Wrong function name in `ER_JSON_PATH_NO_WILDCARD` error message for `JSON_REPLACE` ([MDEV-24541](#))
- `JSON_VALID` fail to validate integer zero in scientific notation ([MDEV-32587](#))
- `ASAN` errors in `Item_func_json_contains_path::val_int` upon PS execution ([MDEV-32867](#))
- `mysql_json` cannot be used on newly created table ([MDEV-32235](#))
- Problems with a stored function `EMPTY()` on upgrade to 10.6 ([MDEV-31616](#))

Spider

- Thread (10.6+) and server hangs (10.4/10.5) in 'Opening tables' (on optimized builds) and SIGABRT in `safe_mutex_lock` (on debug) on `I_S` read when using Spider ([MDEV-29421](#))
- SIGSEGV in `spider_db_mbase::append_lock_tables` on `LOCK TABLES` ([MDEV-29963](#))
- ASAN heap-use-after-free in `spider_link_get_key` on `LOCK TABLES` ([MDEV-31357](#))
- Crash when lateral derived is guaranteed to return no rows ([MDEV-31279](#))
- Bogus error executing PS for query using CTE with renaming of columns ([MDEV-31995](#))
- Spider: Valid `LEFT JOIN` results in ERROR 1064 ([MDEV-26247](#))
- Trying to lock uninitialized mutex or hang upon shutdown after using Spider with `query_cache` ([MDEV-28739](#))
- Spider tests failing in asan/valgrind builds ([MDEV-32849](#))
- Backport fixes to spider init bugs to 10.4-10.6 once they have SQL service ([MDEV-29870](#))
- Server crash with SIGSEGV or `dynamic-stack-buffer-overflow` in `spider_db_mbase_util::append_table` ([MDEV-29163](#))
- heap-use-after-free in `ha_spider::lock_tables()`, highly sporadic SIGSEGV in `intern_close_table` ([MDEV-30014](#))
- Syntax error upon query with subquery from Spider table ([MDEV-30392](#))
- Spider doesn't recognize semi `JOIN` ([MDEV-31645](#))
- MariaDB, SPIDER engine, usage of `REGEXP` ([MDEV-32986](#))
- Spider: variable `spider_same_server_link` not functioning correctly ([MDEV-29718](#))
- Spider fails to autodiscover structure (did in <=10.5) and reports `ERROR 12500 (HY000): unknown` ([MDEV-33008](#))
- Spider spawns unnecessarily many system threads for stats synchronization ([MDEV-29020](#))
 - Defaults for `spider_table_crd_thread_count` and `spider_table_sts_thread_count` changed from 10 to 1
- SIGSEGV in `spider_db_delete_all_rows` on `TRUNCATE`, UBSAN: member call on null pointer of type 'struct `spider_db_handler`' in `spider_db_delete_all_rows` ([MDEV-33191](#))
- mariadb-upgrade fails with 'System table spider_tables is different version' => Can't create database 'performance_schema' ([MDEV-27103](#))
- Spider: SIGSEGV in `spider_db_direct_delete`, SIGSEGV in `spider_db_connect`, ASAN: heap-use-after-free in `spider_db_direct_delete` ([MDEV-28683](#))
- No error for `DROP TABLE` and no warning for `DROP TABLE IF EXISTS` with absent table when Spider plugin is included ([MDEV-30170](#))
- ASAN errors in `spider_conn_queue_and_merge_loop_check` ([MDEV-29002](#))

Optimizer

- Crash caused by multi-table UPDATE over derived with hanging CTE ([MDEV-28615](#))
- Crash on query using CTE with the same name as a base table ([MDEV-31657](#))
- Crash with query using constant subquery as left part of IN subquery ([MDEV-29362](#))
- Incorrect result interceptor passed to `mysql_explain_union()` ([MDEV-33165](#))
- `INSERT ... SELECT` Does not produce an optimizer trace ([MDEV-29298](#))
- Unusable key notes do not get reported for some operations ([MDEV-32958](#))
- Unusable key notes report wrong predicates for `>` and `>=` ([MDEV-32957](#))
- Add `optimizer_adjust_secondary_key_costs` variable to influence how costs for secondary keys are calculated. ([MDEV-33118](#))

Data Definition, Data Manipulation

- `ALTER SEQUENCE IF NOT EXISTS non_existing_seq` Errors rather than note ([MDEV-32795](#))
- Unexpected `ER_ERROR_ON_RENAME` upon `DROP non-existing FOREIGN KEY with ALGORITHM=COPY` ([MDEV-22230](#))
- `FOREIGN_KEY_CHECKS` does not prevent non-copy alter from creating invalid FK structure ([MDEV-29092](#))
- Assertion `!"wrong page type"` or Assertion `"wrong page type" == 0'` failed in `innobase_instant_try` on `ALTER` ([MDEV-18322](#))
- Assertion (`col.vers_sys_end()`) upon `inplace ALTER` with virtual columns ([MDEV-20545](#))
- `DELETE` with `ORDER BY` and semijoin optimization causing crash ([MDEV-32212](#))
- Invalid expr in `cleanup_session_expr()` upon `INSERT DELAYED` ([MDEV-29932](#))
- SIGSEGV in `my_decimal::operator=` and Assertion ``0'` failed in `Item_type_holder::val_decimal` on `SELECT` ([MDEV-29070](#))
- `LONG UNIQUE` does not work like unique key when using `replace` ([MDEV-32837](#))
- `LONG UNIQUE` gives error when used with `REPLACE` ([MDEV-32839](#))
- Backport [MDEV-32532](#) to 10.6 ([MDEV-32903](#))
- Assertion ``0'` failed in `Item_type_holder::val_int` ([MDEV-29494](#))

Character Sets, Data Types

- InnoDB: CHAR+nopad does not work well ([MDEV-26743](#))
- CAST(AS UNSIGNED) fails with --view-protocol ([MDEV-32645](#))
- JSON_ARRAYAGG charset issue ([MDEV-24784](#))
- Server crash in my_decimal::operator= or unexpected ER_DUP_ENTRY upon comparison with INET6 and similar types ([MDEV-32879](#))

Plugins

- The [SQL Error Log Plugin](#) can optionally (when [sql_error_log_with_db_and_thread_info](#) is enabled) include the thread ID and database / table in its log ([MDEV-27087](#)). NULL is displayed if there is no database ([MDEV-32906](#))
- Backport SQL service, introduced by [MDEV-19275](#) ([MDEV-27595](#))
- "plugin already loaded" should be a Warning, not an Error ([MDEV-32041](#))
- mariadb-upgrade should remove mysql.plugin entries for plugins that became bundled ([MDEV-32043](#))

Galera

- Node has been dropped from the cluster on Startup / Shutdown with async replica ([MDEV-31413](#))
- Inconsistency in Galera caused by ALTER being aborted before entering TOI mode ([MDEV-32938](#))
- Assertion `total_length + thd->wsrep_sr().log_position() == saved_pos' failed in int wsrep_write_cache_inc(THD*, IO_CACHE*, size_t*) ([MDEV-28971](#))
- wsrep_provider_options can be truncated on deep and long directory paths ([MDEV-32634](#))
- Server crashes in rpl_sql_thread_info::cached_charset_compare / wsrep_apply_events ([MDEV-22232](#))
- Galera crash when "create a table as select" ([MDEV-27806](#))
- Cluster is inconsistent after SAVEPOINT statement is rolled back ([MDEV-32549](#))
- WSREP GTID MODE is inconsistent ([MDEV-31905](#))
- IST "Donor does not know my secret" with ssl-mode=VERIFY_CA ([MDEV-32344](#))

Replication

- Server crashes in Item_func_binlog_gtid_pos::val_str / Binary_string::c_ptr_safe ([MDEV-33045](#))
- binlog corruption (/tmp no space left on device at the same moment) ([MDEV-27436](#))
- multi source replication filters breaking GTID semantic ([MDEV-26632](#))
- SHOW SLAVE STATUS Can Deadlock an Errored Slave ([MDEV-10653](#))
- main.rpl_mysql_dump_slave Fails with "Master binlog wasn't deleted" Assertion ([MDEV-32953](#))
- rpl_seconds_behind_master_spike Sensitive to IO Thread Stop Position ([MDEV-33327](#))
- Binlog Checksum is Zeroed by Zlib if Part of Event Data is Empty ([MDEV-33283](#))
- "Read semi-sync reply magic number error" warnings on master ([MDEV-32551](#))
- Second Semi-sync Replica Can Hang at Connect Time ([MDEV-32792](#))
- Semi-sync ACKed Transaction can Timeout and Switch Off Semi-sync with Multiple Replicas ([MDEV-32960](#))
- Semi-Sync Ack_Receiver Thread Should Allow COM_QUIT Command ([MDEV-32385](#))

General

- As per the [MariaDB Deprecation Policy](#), this will be the last release of [MariaDB 10.11](#) for Fedora 37, Ubuntu 23.04 "Lunar", and Windows Server 2019
- [s3_debug](#) is now dynamic, and [s3_protocol_version](#) contains new options, and old options have been deprecated ([MDEV-32884](#))
- New [OLD_MODE](#) value, [NO_NULL_COLLATION_IDS](#), a compatibility setting to support connectors (in particular MySQL Connector/NET) that give an exception when collation ids returned by [SHOW COLLATION](#) are NULL. It is automatically set when a MySQL Connector/NET connection is determined.
- Upgrade [HeidiSQL](#) to 12.6.
- Using two temporary tables in OPTIMIZE TABLE lead to crash ([MDEV-31523](#))
- REGEXP_REPLACE treats empty strings different than REPLACE in ORACLE mode ([MDEV-29095](#))
- CREATE UNIQUE INDEX fails with "ERROR 1286 (42000): Unknown storage engine 'partition'" ([MDEV-21618](#))
- Failure when executing PS for query using IN subquery ([MDEV-32569](#))
- Potential memory leak on executing of create view statement ([MDEV-32466](#))
- Assertion failures ([MDEV-32965](#))
- Two JSON related tests running in PS mode fail on server built with -DWITH_PROTECT_STATEMENT_MEMROOT=YES ([MDEV-32733](#))
- Alter sequence 2nd ps fails while alter sequence 2nd time (no ps) succeeds ([MDEV-33169](#))
- Set TaskMax=inifinity in the MariaDB systemd unit ([MDEV-30236](#))
- Unreliable autocommit flag on connection creation ([MDEV-32875](#))
- A connection can control RAND() in following connection ([MDEV-33148](#))

- `THD::rli_fake/rgi_fake` not cleared on new connection ([MDEV-32844](#))
- Assertion failures in `tdc_remove_table` upon interrupted `CREATE TABLE LIKE <sequence>` ([MDEV-20471](#))
- Server crash in `find_field_in_table` ([MDEV-32082](#))
- `LPAD` in `vcol` created in `ORACLE` mode makes table corrupted in non-ORACLE ([MDEV-27744](#))
- Failure to call SP invoking another SP with parameter requiring type conversion ([MDEV-33270](#))
- The database part is not case sensitive in SP names ([MDEV-33019](#))
- `EXCHANGE PARTITION` with non-matching `vcol` expression segfault ([MDEV-28127](#))
- Wrong user in `SET DEFAULT ROLE` error ([MDEV-26875](#))
- `quote(NULL)` returns incorrect result in view (`'NU'` instead of `'NULL'`) ([MDEV-28651](#))
- `mysql.slow_log` reports incorrect start time ([MDEV-11628](#))
- Update federated table and column privileges ([MDEV-32984](#))
- Disable transparent huge pages after page buffers have been allocated ([MDEV-33279](#))
- Deprecate `secure_auth=0` ([MDEV-32617](#))
- `sys` schema view `session_ssl_status` is empty ([MDEV-32751](#))
- Memory pressure ([MDEV-24670](#))

Changelog

For a complete list of changes made in [MariaDB 10.11.7](#), with links to detailed information on each push, see the [changelog](#).

Contributors

For a full list of contributors to [MariaDB 10.11.7](#), see the [MariaDB Foundation release announcement](#).

Be notified of new MariaDB Server releases automatically by [subscribing](#) to the MariaDB Foundation community announce 'at' lists.mariadb.org announcement list (this is a low traffic, announce-only list). MariaDB plc customers will be notified for all new releases, security issues and critical bug fixes for all MariaDB plc products thanks to the Notification Services.

MariaDB may already be included in your favorite OS distribution. More information can be found on the [Distributions which Include MariaDB](#) page.

7.0.1.2.6 MariaDB 10.11.6 Release Notes

The most recent release of MariaDB 10.11 is:
MariaDB 10.11.11 Stable (GA) [Download Now](#)
Alternate download from [mariadb.org](#)

[Download 10.11.6](#)

[Release Notes](#)

[Changelog](#)

[Overview of 10.11](#)

Release date: 13 Nov 2023

This version of MariaDB Server can cause InnoDB to hang on systems with very intensive write loads when running out of I/O slots. This problem is fixed with MariaDB Server 10.11.7. See also [MDEV-32861](#)

MariaDB 10.11 is the current stable long term series of MariaDB, [maintained until](#) February 2028. It is an evolution of MariaDB 10.10 with several entirely new features.

MariaDB 10.11.6 is a **Stable (GA)** release.

For an overview of MariaDB 10.11 see the [What is MariaDB 10.11?](#) page.

Thanks, and enjoy MariaDB!

Notable Items

InnoDB

- [DROP INDEX](#) followed by [CREATE INDEX](#) may corrupt data ([MDEV-32132](#))
- [ROW_FORMAT=COMPRESSED](#) table: InnoDB: 2048 bytes should have been read. Only 0 bytes read. ([MDEV-31875](#))
- Server aborts during alter operation when table doesn't have foreign index ([MDEV-32527](#))
- [row_merge_fts_doc_tokenize\(\)](#) handles FTS plugin parser inconsistently ([MDEV-32578](#))
- InnoDB: tried to purge non-delete-marked record of an index on a virtual column prefix ([MDEV-30024](#))
- [lock_row_lock_current_waits](#) counter in [information_schema.innodb_metrics](#) may become negative ([MDEV-30658](#))
- [SET GLOBAL innodb_max_purge_lag_wait=...](#) hangs if [innodb_read_only=ON](#) ([MDEV-31813](#))
- Auto-increment no longer works for explicit [FTS_DOC_ID](#) ([MDEV-32017](#))
- Assertion ``pos < table->n_def` failed in dict_table_get_nth_col` ([MDEV-32337](#))
- [innochecksum](#) man pages seem to be inconsistent with the binary (10.2.25) ([MDEV-20583](#))
- [innodb_compression_algorithm=0](#) (none) increments [Innodb_num_pages_page_compression_error](#) ([MDEV-30825](#))
- wrong table name in innodb's "row too big" errors ([MDEV-32128](#))
- Optimize [is_file_on_ssd\(\)](#) to speedup opening tablespaces on Windows ([MDEV-32228](#))
- Race condition between page write completion and log checkpoint ([MDEV-32511](#))
- After crash recovery, Checksum mismatch + Failing assertion: `!i || prev_id + 1 == space_id,` ([MDEV-31851](#))
- Deadlock due to [log_free_check\(\)](#), involving [trx_purge_truncate_rseg_history\(\)](#) and [trx_undo_assign_low\(\)](#) ([MDEV-32049](#))
- Write-ahead logging is broken for freed pages ([MDEV-32552](#))
- X-lock on supremum for prepared transaction for RR ([MDEV-30165](#))
- Assertion failures in [log_sort_flush_list](#) upon crash recovery ([MDEV-32029](#))
- Race condition between page write completion and log checkpoint ([MDEV-32511](#))
- Assertion ``purge_sys.tail.trx_no <= purge_sys.rseg->last_trx_no()`' ([MDEV-30100](#))
- Assertion ``index->is_btree() || index->is_ibuf()`' failed in [btr_search_guess_on_hash](#) ([MDEV-30802](#))
- InnoDB hang in [buf_flush_wait_LRU_batch_end\(\)](#) ([MDEV-32134](#))
- InnoDB may hang when running out of buffer pool ([MDEV-32588](#))
- Corrupt index(es) on busy table when using FOREIGN KEY ([MDEV-30531](#))
- InnoDB Recovery doesn't display encryption message when no encryption configuration passed ([MDEV-31098](#))
- Wrong information about [innodb_checksum_algorithm](#) in the [information_schema.SYSTEM_VARIABLES](#) ([MDEV-31473](#))
- InnoDB may fail to recover after being killed in [fil_delete_tablespace\(\)](#) ([MDEV-31826](#))
- Create separate tpool thread for async aio ([MDEV-31095](#))
- UNDO logs still growing for write-intensive workloads ([MDEV-32050](#))
 - Increase the default for [innodb_purge_batch_size](#) from 300 to 1000 ([MDEV-32050](#))
 - Deprecate [innodb_purge_rseg_truncate_frequency](#).
 - The motivation for introducing this in MySQL seems to have been to avoid stalls due to freeing undo log pages or truncating undo log tablespaces. In MariaDB, [innodb_undo_log_truncate=ON](#) should be a much lighter operation because it will not involve any log checkpoint. ([MDEV-32050](#))
- Slow full index scan in 10.6 vs 10.5 for the (slow) I/O-bound case ([MDEV-30986](#))
- LOAD DATA into InnoDB w/partitions: huge performance loss, affected 10.6+ ([MDEV-31835](#))
- Disable read-ahead for temporary tablespace ([MDEV-32145](#))

Optimizer

- New [optimizer_switch](#) setting, [cset_narrowing](#), to enable the [Charset Narrowing Optimization](#) ([MDEV-32113](#))
- Crash when HAVING in a correlated subquery references columns in the outer query ([MDEV-29731](#))
- Server crashes at [TABLE::add_tmp_key](#) ([MDEV-32320](#))
- Server crashes inside filesort at [my_decimal::to_binary](#) ([MDEV-32324](#))
- Assertion ``bitmap_is_set(&m_part_info->read_partitions, m_part_spec.start_part)` failed in ha_partition::handle_ordered_index_scan` ([MDEV-24283](#))
- Crash when searching for the best split of derived table ([MDEV-32064](#))
- Test case from [opt_tvc.test](#) fails with statement memory protection ([MDEV-32225](#))
- Significant slowdown for query with many outer joins ([MDEV-32351](#))
- [test_if_skip_sort_order\(\)](#) should catch the join types JT_EQ_REF, JT_CONST and JT_SYSTEM and skip sort order for these ([MDEV-32475](#))
- jointable materialization subquery optimization ignoring errors, then failing ASSERT. ([MDEV-31983](#))
- Server crashes in [JOIN::cleanup](#) after erroneous query with view ([MDEV-32164](#))
- Prepared statement return wrong result (missing row) ([MDEV-9938](#))
- Assertion ``range->rows >= s->found_records` failed in best_access_path` ([MDEV-32682](#))

Replication

- [rpl.rpl_parallel_temptable](#) failure due to incorrect commit optimization of temptables ([MDEV-10356](#))

- Lock wait timeout with INSERT-SELECT, autoinc, and statement-based replication ([MDEV-31482](#))
- strings/ctype-ucs2.c:2336: my_vsnprintf_utf32: Assertion `(n % 4) == 0' failed in my_vsnprintf_utf32 on INSERT ([MDEV-32249](#))
- Assertion fails in MDL_context::acquire_lock upon parallel replication of CREATE SEQUENCE ([MDEV-31792](#))
- SHOW SLAVE STATUS Last_SQL_Errno Race Condition on Errored Slave Restart ([MDEV-31177](#))
- seconds_behind_master is inaccurate for Delayed replication ([MDEV-32265](#))
- detailize the semisync replication magic number error ([MDEV-32365](#))
- Parallel replication deadlock victim preference code erroneously removed ([MDEV-31655](#))
- Parallel replication lags because innobase_kill_query() may fail to interrupt a lock wait ([MDEV-32096](#))

Galera

- Galera updated to 26.4.16
- Assertion `state() == s_executing || state() == s_prepared || state() == s_committing || state() == s_must_abort || state() == s_replaying' failed. ([MDEV-24912](#))
- Assertion `state() == s_executing || state() == s_preparing || state() == s_prepared || state() == s_must_abort || state() == s_aborting || state() == s_cert_failed || state() == s_must_replay' failed ([MDEV-31285](#))
- wsrep_sst_mariabackup not working on FreeBSD ([MDEV-31467](#))
- Galera library 26.4.16 fails with every server version ([MDEV-32024](#))
- Galera node remains paused after interleaving FTWRLs ([MDEV-32282](#))
- Failed to insert streaming client ([MDEV-32051](#))
- When set at runtime, `wsrep_sst_method` accepts any value ([MDEV-31470](#))
- galera needs packaging script changes to successfully build ([MDEV-32642](#))
- replication breaks when using optimistic replication and replica is a galera node ([MDEV-31833](#))
- McAfee database vulnerability scan caused MariaDB crash with signal 6 (system abort) ([MDEV-27004](#))
- Assertion `mode == m_local || transaction_is_streaming()' failed in int wsrep::client_state::bf_abort(wsrep::seqno) ([MDEV-30217](#))

Data Definition

- MariaDB crash on calling function ([MDEV-23902](#))
- ASAN errors in grn_obj_unlink / ha_mroonga::clear_indexes upon index operations ([MDEV-31970](#))
- vcol circular references lead to stack overflow ([MDEV-31112](#))
- OPTIMIZE TABLE crash ([MDEV-28122](#))
- Server crashes in Alter_info::add_stat_drop_index upon CREATE TABLE ([MDEV-32449](#))

Scripts and Clients

- `mariadb-binlog -T/--table` (mysqlbinlog) option ([MDEV-25369](#))
- `mariadb-admin` (mysqladmin) wrong error with `simple_password_check` ([MDEV-22418](#))
- `mariadb-install-db` shows warning on missing directory `$pamtool_dir/auth_pam_tool_dir` ([MDEV-32142](#))
- `main.mysql_client_test`, `main.mysql_client_test_comp` failed on ASAN build with error: 5888, status: 23, errno: 2 ([MDEV-19369](#))
- `mariadb-install-db` (mysql_install_db) doesn't properly grant `proxy privileges` to all default root user accounts ([MDEV-21194](#))

Tests

- `main.events_stress` or `events.events_stress` fails with view-protocol ([MDEV-31455](#))
- `main.delete_use_source` fails (hangs) with view-protocol ([MDEV-31457](#))
- `main.sum_distinct-big` and `main.merge-big` fail with timeout with view-protocol ([MDEV-31465](#))
- `main.secure_file_priv_win` fails with 2nd execution PS protocol ([MDEV-32023](#))
- Windows : `mtr` output on is messed up with large `MTR_PARALLEL` ([MDEV-32387](#))
- `main.mysql_client_test_comp` failed in buildbot, error on exec ([MDEV-16641](#))
- `main.order_by_pack_big` fails with view-protocol ([MDEV-31460](#))
- `mysql_install_db_win.test` fails on second execution ([MDEV-32232](#))

MariaBackup

- MariaBackup full backup failed with InnoDB: Failing assertion: success in storage/innobase/fil/fil0fil.cc line 657 ([MDEV-18200](#))
- `mbstream` breaks page compression on XFS ([MDEV-25734](#))

Character Sets, Data Types, Collations

- Prefix keys for CHAR work differently for MyISAM vs InnoDB ([MDEV-30048](#))
- Inconsistent results of DISTINCT with NOPAD ([MDEV-30050](#))
- Assertion `(length % 4) == 0` failed in my_lengthsp_utf32 on INSERT ([MDEV-28835](#))
- Compressed varchar values lost on joins when sorting on columns from joined table(s) ([MDEV-31724](#))
- UBSAN shift exponent X is too large for 64-bit type 'long long int' in sql/field.cc ([MDEV-32226](#))
- Wrong bit encoding using COALESCE ([MDEV-32244](#))

Spider

- Spider UBSAN runtime error: applying non-zero offset x to null pointer in st_spider_param_string_parse::restore_delims ([MDEV-31117](#))
- Segfault when setting spider_delete_all_rows to 0 and delete all rows of a spider table, ASAN heap-use-after-free in spider_db_delete_all_rows ([MDEV-31996](#))
- ASAN errors in spider_fields::free_conn_holder or spider_create_group_by_handler ([MDEV-28998](#))
- ASAN: heap-buffer-overflow & stack-buffer-overflow in spider_db_mbase_row::append_to_str | SIGSEGV's in memmove_avx_unaligned_erms from memcpy in Binary_string::q_append, in Static_binary_string::q_append and my_strntoull10rnd_8bit | Unknown error 12801 ([MDEV-29502](#))

General

- binlog_do_db option breaks importing sql dumps ([MDEV-29989](#))
- Crashes in MDL_key::mdl_key_init with lower-case-table-names=2 ([MDEV-32025](#))
- getting error 'Illegal parameter data types row and bigint for operation '+' ' when using ITERATE in a FOR..DO ([MDEV-32275](#))
- Assertion `arena_for_set_stmt== 0` failed in LEX::set_arena_for_set_stmt upon SET STATEMENT ([MDEV-17711](#))
- main.mysqlcheck fails on ARM with ASAN use-after-poison in my_mb_wc_filename ([MDEV-26494](#))
- main.delayed fails with wrong error code or timeout when executed after main.deadlock_fwrl ([MDEV-27523](#))
- Assertion failed: !pfs->m_idle || (state == PSI_SOCKET_STATE_ACTIVE) ([MDEV-28561](#))
- MyISAM wrong server status flags ([MDEV-28820](#))
- Server crashes in check_sequence_fields upon CREATE TABLE .. SEQUENCE=1 AS SELECT .. ([MDEV-29771](#))
- slow log Rows_examined out of range ([MDEV-30820](#))
- " rpm --setugids " breaks PAM authentication ([MDEV-30904](#))
- incorrect examined rows in case of stored function usage ([MDEV-31742](#))
- Compilation failing on MacOS (unknown warning option -Wno-unused-but-set-variable) ([MDEV-31890](#))
- Server crash upon inserting into Mroonga table with compressed column ([MDEV-31966](#))
- hash unique corrupts index on virtual blobs ([MDEV-32012](#))
- insert into an empty table fails with hash unique ([MDEV-32015](#))
- Valgrind/MSAN warnings in dynamic_column_update_move_left ([MDEV-32140](#))
- Memory leak showed in [MDEV-6146](#) test suite ([MDEV-32223](#))
- Test from subselect.test fails with statement memory protection ([MDEV-32245](#))
- Memory leak when executing PS for query with IN subquery ([MDEV-32369](#))
- Allow the setting of Auto_increment on FK referenced columns ([MDEV-32018](#))
- mariadb-upgrade fails with sql_safe_updates = on ([MDEV-29914](#))
- Assertion `!(thd->server_status & (1U | 8192U))` failed in MDL_context::release_transactional_locks ([MDEV-32541](#))
- Information schema leaks table names and structure to unauthorized users ([MDEV-32500](#))
- Missing CHACHA20-POLY1305 support in WolfSSL ([MDEV-31653](#))
- incorrect error about cyclic reference about JSON type virtual column ([MDEV-32586](#))
- Disable TLS v1.0 and 1.1 for MariaDB ([MDEV-31369](#))
- Better indication of refusing to start because of ProtectHome ([MDEV-25177](#))
- Database upgrade fails: slow_log table ([MDEV-27757](#))
- myrocks_hotbackup.1 and test suite files installed when engine is disabled ([MDEV-29993](#))
- client_ed25519.dll isn't included for HeidiSQL. ([MDEV-31315](#))
- Assertion `!m_null_value` failed in int FixedBinTypeBundle<FbtImpl>::cmp_item_fbt::compare or in cmp_item_inet6::compare ([MDEV-27207](#))
- type_test.type_test_double fails with 'NUMERIC_SCALE NULL' ([MDEV-22243](#))
- LeakSanitizer errors in get_quick_select or Assertion `status_var.local_memory_used == 0` | debug_assert_on_not_freed_memory` failed ([MDEV-32476](#))
- Update signal handler user info more compassion and correct url ([MDEV-32535](#))
- maria-install-db fails on MacOS ([MDEV-31871](#))
- MSAN / Valgrind errors in Item_func_like::get_mm_leaf upon query from partitioned table ([MDEV-32388](#))
- MSAN / Valgrind errors in Item_func_like::get_mm_leaf with temporal field ([MDEV-32531](#))
- ASAN errors in base_list_iterator::next / setup_table_map upon 2nd execution of PS ([MDEV-32656](#))
- safe_mutex: Found wrong usage of mutex 'LOCK_thd_data' and 'wait_mutex' ([MDEV-32728](#))

SQL Error Log Plugin

- Added the [sql_error_log_warnings](#) system variable, which permits warnings to be logged in addition to errors.

Docker Official Images

- Invert single and double quotes for sql command definitions in [healthcheck.sh](#) due to failure under `sql_mode=ANSI_QUOTES` - contribution by Dominik Häckel
- [healthcheck.sh](#) `--no-defaults` behaviour was corrected - reported by Dominik Häckel
- Added `/docker-entrypoint-init.d` for `tar{compression}` from [mariadb-backup - instructions](#)
- Refactor `docker_mariadb_init` in the entrypoint for extending the MariaDB image
- CIS failure due to world-writable directory `/var/run/mysqld`, added sticky bit - reported by @ollie1
- Add [PROXY privileges](#) for `root@MARIADB_ROOT_HOST` - reported by Matthieu Gusmini
- [healthcheck.sh](#) added `--galera_online` test, to match what the [mariadb-operator](#) does.

Warnings and Notes

- Added the [note_verbosity](#) system variable to manage [notes when an index cannot be used](#).

Security

- Fixes for the following [security vulnerabilities](#):
 - [CVE-2023-22084](#)

Changelog

For a complete list of changes made in [MariaDB 10.11.6](#), with links to detailed information on each push, see the [changelog](#).

Contributors

For a full list of contributors to [MariaDB 10.11.6](#), see the [MariaDB Foundation release announcement](#).

Be notified of new MariaDB Server releases automatically by [subscribing](#) to the MariaDB Foundation community announce 'at' lists.mariadb.org announcement list (this is a low traffic, announce-only list). MariaDB plc customers will be notified for all new releases, security issues and critical bug fixes for all MariaDB plc products thanks to the Notification Services.

MariaDB may already be included in your favorite OS distribution. More information can be found on the [Distributions which Include MariaDB](#) page.

7.0.1.2.7 MariaDB 10.11.5 Release Notes

The most recent release of MariaDB 10.11 is:
MariaDB 10.11.11 Stable (GA) [Download Now](#)
Alternate download from [mariadb.org](#)

[Download 10.11.5](#)

[Release Notes](#)

[Changelog](#)

[Overview of 10.11](#)

Release date: 14 Aug 2023

[MariaDB 10.11](#) is the current stable long term series of MariaDB, [maintained until](#) February 2028. It is an evolution of [MariaDB 10.10](#) with several entirely new features.

[MariaDB 10.11.5](#) is a **Stable (GA)** release.

For an overview of [MariaDB 10.11](#) see the [What is MariaDB 10.11?](#) page.

Thanks, and enjoy MariaDB!

Notable Items

Upgrading from MySQL

- MariaDB now detects and converts previously incompatible MySQL partition schemes ([MDEV-29253](#))

General

- As per the [MariaDB Deprecation Policy](#), this will be the last release of [MariaDB 10.11](#) for Ubuntu 18.04 LTS "Bionic" and Ubuntu 22.10 "Kinetic"
- In this release repositories for Debian 12 "Bookworm" have been added.
- `mariadb-dump --force` doesn't ignore error as it should ([MDEV-31092](#))
- 280 Bytes lost in `mysys/array.c`, `mysys/hash.c`, `sql/sp.cc`, `sql/sp.cc`, `sql/item_create.cc`, `sql/item_create.cc`, `sql/sql_yacc.yy:10748` when using oracle `sql_mode` ([MDEV-26186](#))
- SQL/PL package body does not appear in `I_S.ROUTINES.ROUTINE_DEFINITION` ([MDEV-30662](#))
- Unexpected result when combining `DISTINCT`, subselect and `LIMIT` ([MDEV-28285](#))
- `ROW` variables do not get assigned from subselects ([MDEV-31250](#))
- Crash after setting global `session_track_system_variables` to an invalid value ([MDEV-25237](#))
- ODKU of non-versioning column inserts history row ([MDEV-23100](#))
- UPDATE not working properly on transaction precise system versioned table ([MDEV-25644](#))
- Assertion ``const_item_cache == true'` failed in `Item_func::fix_fields` ([MDEV-31319](#))
- ANALYZE doesn't work with pushed derived tables ([MDEV-29284](#))
- `get_partition_set` is never executed in `ha_partition::multi_range_key_create_key` due to bitwise & with 0 constant ([MDEV-24712](#))
- Client can crash the server with a `mysql_list_fields("view")` call ([MDEV-30159](#))
- `I_S.parameters` not immediately changed updated after procedure change ([MDEV-31064](#))
- `bzero` wipes more bytes than necessary in `set_global_from_ddl_log_entry` ([MDEV-31521](#))
- Assertion ``0'` failed in `Type_handler_row::field_type` upon `TO_CHAR` with wrong argument ([MDEV-29152](#))
- `mysql_upgrade` fails due to `old_mode=""`, with "Cannot load from mysql.proc. The table is probably corrupted" ([MDEV-28915](#))
- [SQL Error Log Plugin](#) can now log warnings as well, by setting the `sql_error_log_warnings` option.

Character Sets, Data Types

- [UUIDs](#) version `>= 6` are now stored without byte-swapping, UUIDs with version `>= 8` and `variant=0` are now considered invalid, old tables are supported, old (always byte swapped) and new (swapped for version `< 6`) UUIDs can be compared and converted transparently ([MDEV-29959](#))
- UBSAN: null pointer passed as argument 1, which is declared to never be null in `my_strncoll_binary` on `SELECT ... COUNT or GROUP_CONCAT` ([MDEV-28384](#))
- Possibly wrong result or Assertion ``0'` failed in `Item_func_round::native_op` ([MDEV-23838](#))
- Assertion ``(length % 4) == 0'` failed in `my_lengthsp_utf32` on `SELECT` ([MDEV-29019](#))
- UBSAN: negation of `-X` cannot be represented in type `'long long int'`; cast to an unsigned type to negate this value to itself in `Item_func_mul::int_op` and `Item_func_round::int_op` ([MDEV-30932](#))
- Assorted assertion failures in `json_find_path` with certain collations ([MDEV-23187](#))

InnoDB

- Crashing on I/O error is unhelpful ([MDEV-27593](#))
- SIGSEGV in `log_sort_flush_list()` in InnoDB crash recovery ([MDEV-31354](#))
- InnoDB tables are being flagged as corrupted on an I/O bound server ([MDEV-31767](#))
- Duplicate entry allowed into a [UNIQUE column](#) ([MDEV-31120](#))
- Server Status `InnoDB_row_lock_time%` is reported in seconds ([MDEV-29311](#))
- `innochecksum` dies with Floating point exception ([MDEV-31641](#))
- Add InnoDB engine information to the [slow query log](#) ([MDEV-31558](#))
- Deadlock with 3 concurrent `DELETES` by `unique key` ([MDEV-10962](#))
- `innodb` protection against dual processes accessing data insufficient ([MDEV-31568](#))
- `ER_DUP_KEY` in `mysql.innodb_table_stats` upon `RENAME` on sequence ([MDEV-31607](#))
- Assertion ``!strcmp(index->table->name.m_name, "SYS_FOREIGN") || !strcmp(index->table->name.m_name, "SYS_FOREIGN_COLS)'` failed in `btr_node_ptr_max_size` ([MDEV-19216](#))
- InnoDB: Failing assertion: `page_type == i_s_page_type[page_type].type_value` ([MDEV-31386](#))
- `btr_estimate_n_rows_in_range()` accesses unfixed, unlatched page ([MDEV-30648](#))
- `MODIFY COLUMN` can break FK constraints, and lead to unrestoreable dumps ([MDEV-31086](#))
- Recovery or backup failure after `innodb_undo_log_truncate=ON` ([MDEV-31487](#))

- Assertion 'n & PENDING' failed in `fil_space_t::set_needs_flush()` ([MDEV-31442](#))
- `fil_node_open_file()` releases `fil_system.mutex` allowing other thread to open its file node ([MDEV-31256](#))
- ASAN errors in `dict_v_col_t::detach` upon adding key to virtual column ([MDEV-31416](#))
- Purge trying to access freed secondary index page ([MDEV-31264](#))
- Freed data pages are not always being scrubbed ([MDEV-31253](#))
- InnoDB recovery hangs after reporting corruption ([MDEV-31353](#))
- `!cursor->index->is_committed()` in `row0ins.cc` after update to 10.4.13 from 10.3.21 ([MDEV-22739](#))
- `innodb_undo_log_truncate=ON` fails to wait for purge of enough transaction history ([MDEV-31355](#))
- SET GLOBAL `innodb_undo_log_truncate=ON` does not free space when no undo logs exist ([MDEV-31382](#))
- `innodb_read_ahead_threshold` (linear read-ahead) does not work ([MDEV-29967](#))
- InnoDB recovery and `mariadb-backup --prepare` fail to report detailed progress ([MDEV-29911](#))
- `fil_ibd_create()` may hijack the file handle of an old file ([MDEV-31347](#))
- `innodb_undo_log_truncate=ON` recovery results in a corrupted undo log ([MDEV-31373](#))
- Server freeze due to `innodb_change_buffering` and `innodb_file_per_table=0` ([MDEV-31088](#))
- Change buffer entries are left behind when freeing a page, causing secondary index corruption when the page is later reused ([MDEV-31385](#))
- Foreign Key Constraint actions don't affect Virtual Column ([MDEV-18114](#))

Aria

- Various crashes upon INSERT/UPDATE after changing Aria settings ([MDEV-28054](#))
- Various crashes/asserts/corruptions when Aria encryption is enabled/used, but the encryption plugin is not loaded ([MDEV-26258](#))

Spider

- SIGSEGV in `spider_db_open_item_field` and SIGSEGV in `spider_db_print_item_type`, on SELECT ([MDEV-29447](#))
- [Spider variables](#) that double as table params overriding mechanism is buggy ([MDEV-31524](#))

Optimizer

- [ANALYZE FORMAT=JSON now includes](#) InnoDB engine statistics for each table ([MDEV-31577](#))
- Assertion '`last_key_entry >= end_pos`' failed in virtual bool `JOIN_CACHE_HASHED::put_record()` ([MDEV-31348](#))
- Problem with open ranges on prefix blobs keys ([MDEV-31800](#))
- Equal on two [RANK window functions](#) create wrong result ([MDEV-20010](#))
- Recursive CTE execution is interrupted without errors or warnings ([MDEV-31214](#))
- Assertion '`s->table->opt_range_condition_rows <= s->found_records`' failed in `apply_selectivity_for_table` ([MDEV-31449](#))
- Inconsistency between MRR and SQL layer costs can cause poor query plan ([MDEV-31479](#))
- `MAX_SEL_ARG` memory exhaustion is not visible in the optimizer trace ([MDEV-30964](#))
- [SHOW TABLES](#) not working properly with `lower_case_table_names=2` ([MDEV-30765](#))
- Segfault on select query using index for group-by and filesort ([MDEV-30143](#))
- Server crash in `store_length`, assertion failure in `Type_handler_string_result::sort_length` ([MDEV-31743](#))

Replication

- Parallel Slave SQL Thread Can Update Seconds_Behind_Master with Active Workers ([MDEV-30619](#))
- [ALTER SEQUENCE](#) ends up in optimistic parallel slave binlog out-of-order ([MDEV-31503](#))
- [STOP SLAVE](#) takes very long time on a busy system ([MDEV-13915](#))
- On slave [XA COMMIT/XA ROLLBACK](#) fail to return an error in read-only mode ([MDEV-30978](#))
- Calling a function from a different database in a slave side trigger crashes ([MDEV-29894](#))
- `rpl.rpl_manual_change_index_file` occasionally fails in BB with Result length mismatch ([MDEV-30214](#))

Galera

- Node never returns from Donor/Desynced to Synced when `wsrep_mode = BF_ABORT_MARIABACKUP` ([MDEV-31737](#))
- Node has been dropped from the cluster on Startup / Shutdown with async replica ([MDEV-31413](#))
- KILL QUERY maintains nodes data consistency but breaks GTID sequence ([MDEV-31075](#))
- Assertion failure `!lock.was_chosen_as_deadlock_victim` in `trx0trx.h:1065` ([MDEV-30963](#))

- MariaDB stuck on starting commit state (waiting on commit order critical section) ([MDEV-29293](#))
- Assertion `state() == s_aborting || state() == s_must_replay` failed in `int wsrep::transaction::after_rollback()` ([MDEV-30013](#))
- Assertion `!wsrep_has_changes(thd) || (thd->lex->sql_command == SQLCOM_CREATE_TABLE && !thd->is_current_stmt_binlog_format_row()) || thd->wsrep_cs().transaction().state() == wsrep::transaction::s_aborted` failed ([MDEV-30388](#))
- Server crashes when `wsrep_sst_donor` and `wsrep_cluster_address` set to NULL ([MDEV-28433](#))
- Create temporary sequence can cause inconsistency ([MDEV-31335](#))
- Galera 4 unable to query cluster state if not primary component ([MDEV-21479](#))

Changelog

7.0.1.2.8 MariaDB 10.11.4 Release Notes

The most recent release of MariaDB 10.11 is:

MariaDB 10.11.11 Stable (GA) [Download Now](#)

Alternate download from [mariadb.org](#)

[Download 10.11.4](#)

[Release Notes](#)

[Changelog](#)

[Overview of 10.11](#)

Release date: 7 Jun 2023

[MariaDB 10.11](#) is the current long term maintenance development series of MariaDB, [maintained until](#) February 2028. It is an evolution of [MariaDB 10.10](#) with several entirely new features.

For an overview of [MariaDB 10.11](#) see the [What is MariaDB 10.11?](#) page.

Thanks, and enjoy MariaDB!

Notable Items

InnoDB

- Server crashes in `st_join_table::choose_best_splitting` ([MDEV-31403](#))
- Crash with condition pushable into derived and containing outer reference ([MDEV-31240](#))
- InnoDB does not free UNDO after the fix of [MDEV-30671](#) ([MDEV-31234](#))
- InnoDB hang fixes ([MDEV-31158](#), [MDEV-31343](#), [MDEV-31350](#))
- `InnoDB_buffer_pool_read_requests` is not updated correctly ([MDEV-31309](#))
- InnoDB monitor `trx_rseg_history_len` was accidentally disabled by default ([MDEV-31308](#))
- Revert "[MDEV-30473](#): Do not allow GET_LOCK() / RELEASE_LOCK() in cluster"

Optimizer

- Crash with condition pushable into derived and containing outer reference ([MDEV-31403](#) [MDEV-31240](#))
- Crash with [EXPLAIN EXTENDED](#) for multi-table update of system table ([MDEV-31224](#))

Changelog

7.0.1.2.9 MariaDB 10.11.3 Release Notes

The most recent release of MariaDB 10.11 is:
MariaDB 10.11.11 Stable (GA) [Download Now](#)
Alternate download from [mariadb.org](#)

[Download 10.11.3](#)

[Release Notes](#)

[Changelog](#)

[Overview of 10.11](#)

Release date: 10 May 2023

[MariaDB 10.11](#) is the current long term maintenance development series of MariaDB, [maintained until](#) February 2028. It is an evolution of [MariaDB 10.10](#) with several entirely new features.

For an overview of [MariaDB 10.11](#) see the [What is MariaDB 10.11?](#) page.

Thanks, and enjoy MariaDB!

Notable Items

InnoDB

- Crash on [ROLLBACK](#) in a [ROW_FORMAT=COMPRESSED](#) table ([MDEV-30882](#))
- UNIQUE USING HASH accepts duplicate entries for tricky collations ([MDEV-30034](#))
- `rec_get_offsets()` is not optimal ([MDEV-30567](#))
- Performance regression in `fil_space_t::try_to_close()` introduced in [MDEV-23855](#) ([MDEV-30775](#))
- InnoDB recovery hangs when buffer pool ran out of memory ([MDEV-30551](#))
- InnoDB undo log truncation fails to wait for purge of history ([MDEV-30671](#))
- MariaDB crash due to DB_FAIL reported for a corrupted page ([MDEV-30397](#))
- Deadlock between INSERT and InnoDB non-persistent statistics update ([MDEV-30638](#))
- InnoDB hang on B-tree split or merge ([MDEV-29835](#))
- Performance regression in locking reads from secondary indexes ([MDEV-30357](#))
- Improve adaptive flushing ([MDEV-26055](#))
- Make page flushing even faster ([MDEV-26827](#))
- Purge misses a chance to free not-yet-reused undo pages ([MDEV-29593](#))
- InnoDB temporary tablespace: reclaiming of free space does not work ([MDEV-26782](#))

- Deadlock between CHECK TABLE and bulk insert ([MDEV-30798](#))
- UPPER() returns an empty string for U+0251 in uca1400 collations for utf8 ([MDEV-30661](#))
- System-wide max transaction id corrupted after changing the undo tablespaces ([MDEV-30311](#))
- Fix miscount of doublewrites by `InnoDB_data_written` ([MDEV-31124](#))

Backup

- mariadb-backup doesn't utilise innodb-undo-log-directory (if specified as a relative path) during copy-back operation ([MDEV-28187](#))
- mariabackup issues error messages during InnoDB tablespaces export on partial backup preparing ([MDEV-29050](#))
- mariadb-backup does not copy Aria logs if `aria_log_dir_path` is used ([MDEV-30968](#))
- Race condition between buffer pool flush and log file deletion in mariadb-backup `--prepare` ([MDEV-30860](#))

Replication

- Fixed a deadlock on parallel slave involving full image Write event on the sequence engine ([MDEV-29621](#))
- Fixed an attempted out-of-order binlogging error on slave involving ALTER on the sequence engine ([MDEV-31077](#))
- Corrected non-versioned master to versioned slave replication on no-unique attribute table ([MDEV-30430](#))
- Mended encrypted binlog master to error out to gtid-mode slave when master could not decrypt a binlog file ([MDEV-28798](#))
- Refined optimistic parallel slave to error-exit without any hang ([MDEV-30780](#))
- Ensured SHOW-SLAVE-STATUS is processed on the parallel slave having a necessary mutex always initialized ([MDEV-30620](#))
- Fixed the slave applier to report a correct error when `gtid_slave_pos` insert fails for some (engine) reasons ([MDEV-31038](#))
- Made parallel slave reports in performance schema consistent with that of show-slave-status ([MDEV-26071](#))

Optimizer

- **Split Materialized** optimization is improved to re-fill the materialized table only if necessary. The fewer number of table refills is taken into account when choosing query plan, too ([MDEV-26301](#))
- New optimizer_switch option, `hash_join_cardinality`, is added. It is off by default. When set to ON, the optimizer will produce tighter bounds for hash join output cardinality. ([MDEV-30812](#))
- Queries using `SELECT DISTINCT some_expression(aggregate_function())` could produce wrong query result. ([MDEV-20057](#))
- **ANALYZE FORMAT=JSON** now prints more information about **Block Nested Loop joins**: `block-nl-join` element now has `r_loops`, `r_effective_rows` and `r_other_time_ms` fields ([MDEV-30806](#), [MDEV-30972](#)).
- A GROUP BY query with `MIN(primary_key)` in select list and `primary_key<>const` in the WHERE could produce wrong result when executed with "Using index for group-by" strategy ([MDEV-30605](#))
- EXPLAIN could erroneously report that **Rowid Filter optimization** is used for partitioned tables. Partitioned tables do not support it. ([MDEV-30596](#))
- A bug in selectivity computations for SINGLE/DOUBLE_PREC_HB histograms could cause wrong estimates to be produced. This could cause the optimizer to pick sub-optimal query plans ([MDEV-31067](#)).

Docker Official Image

- Add replication setup to containers contributed by Md Sahil ([MDEV-29762](#))
- Added LTS tags for easier identification of LTS releases:
 - `lts-jammy`
 - `lts`

General

- As per the [MariaDB Deprecation Policy](#), this will be the last release of **MariaDB 10.11** for Fedora 36.
- In this release repositories for Fedora 38 and Ubuntu 23.04 Lunar have been added.

Security

- Fixes for the following **security vulnerabilities**:
 - [CVE-2022-47015](#)

Changelog

For a complete list of changes made in [MariaDB 10.11.3](#), with links to detailed information on each push, see the [changelog](#)

Contributors

For a full list of contributors to [MariaDB 10.11.3](#), see the [MariaDB Foundation release announcement](#).

Be notified of new MariaDB Server releases automatically by [subscribing](#) to the MariaDB Foundation community announce 'at' lists.mariadb.org announcement list (this is a low traffic, announce-only list). MariaDB plc customers will be notified for all new releases, security issues and critical bug fixes for all MariaDB plc products thanks to the Notification Services.

MariaDB may already be included in your favorite OS distribution. More information can be found on the [Distributions which Include MariaDB](#) page.

7.0.1.2.10 MariaDB 10.11.2 Release Notes

[Download](#)[Release Notes](#)[Changelog](#)[Overview of 10.11](#)

Release date: 16 Feb 2023

[MariaDB 10.11](#) is a long term maintenance release series of MariaDB, [maintained until](#) February 2028. It is an evolution of [MariaDB 10.10](#) with several entirely new features.

[MariaDB 10.11.2](#) is a [Stable \(GA\)](#) release.

For an overview of [MariaDB 10.11](#) see the [What is MariaDB 10.11?](#) page.

Thanks, and enjoy MariaDB!

Notable Items

- As mentioned in the [10.11.1 release notes](#), our Yum/DNF/Zypper repositories for Red Hat Enterprise Linux, CentOS, Fedora, openSUSE, and SUSE are changing **with this release** to being signed with a new GPG key with SHA2 digest algorithms instead of SHA1. See [this blog post](#) and the [GPG](#) page for more details.

InnoDB

- [Full-text index](#) corruption with [system versioning](#) ([MDEV-25004](#))
- [innodb_undo_log_truncate=ON](#) recovery and backup fixes ([MDEV-29999](#), [MDEV-30179](#), [MDEV-30438](#))
- Upgrade after a crash is not supported ([MDEV-24412](#))
- Remove [InnoDB buffer pool](#) load throttling ([MDEV-25417](#))
- InnoDB shutdown hangs when the change buffer is corrupted ([MDEV-30009](#))
- `innodb_fast_shutdown=0` fails to report change buffer merge progress ([MDEV-29984](#))
- `mariadb-backup --backup --incremental --throttle=...` hangs ([MDEV-29896](#))
- Crash after recovery, with InnoDB: Tried to read ([MDEV-30132](#))
- Trying to write ... bytes at ... outside the bounds ([MDEV-30069](#))
- TRUNCATE breaks FOREIGN KEY locking ([MDEV-29504](#), [MDEV-29849](#))
- `INFORMATION_SCHEMA.INNODB_TABLESPACES_ENCRYPTION.NAME` is NULL for undo tablespaces ([MDEV-30119](#))
- Fixed hangs and error handling in B-tree operations ([MDEV-29603](#), [MDEV-30400](#))
- InnoDB bulk insert fixes ([MDEV-30047](#), [MDEV-30321](#))
- InnoDB fails to start on `innodb_undo_tablespaces` mismatch ([MDEV-30158](#))
- `mariabackup.skip_innodb` crashes when `innodb_undo_tablespaces > 0` ([MDEV-30122](#))

Galera

- Fixes for cluster wide write conflict resolving ([MDEV-29684](#))

Replication

- Parallel slave applying in binlog order is corrected for admin class of commands including ANALYZE ([MDEV-30323](#))

- [↗](#))
- [Seconds_Behind_Master](#) is now shown now more precisely at the slave applier start, including in the delayed mode ([MDEV-29639](#) [↗](#))
- [mariadb-binlog --verbose](#) is made to show the type of compressed columns ([MDEV-25277](#) [↗](#))
- Deadlock is resolved on replica involving `BACKUP STAGE BLOCK_COMMIT` and a committing user XA ([MDEV-30423](#) [↗](#))

General

- Infinite sequence of recursive calls when processing embedded CTE ([MDEV-30248](#) [↗](#))
- Crash with a query containing nested WINDOW clauses ([MDEV-30052](#) [↗](#))
- Major performance regression with 10.6.11 ([MDEV-29988](#) [↗](#))
- Json Range only affects first row of the result set ([MDEV-30304](#) [↗](#))
- As per the [MariaDB Deprecation Policy](#), this will be the last release of [MariaDB 10.11](#) for Fedora 35.
- In this release repositories for Fedora 37 and Ubuntu 22.10 Kinetic have been added.

Changelog

For a complete list of changes made in [MariaDB 10.11.1](#), with links to detailed information on each push, see the [changelog](#) [↗](#).

Be notified of new MariaDB Server releases automatically by [subscribing](#) [↗](#) to the MariaDB Foundation community announce 'at' lists.mariadb.org announcement list (this is a low traffic, announce-only list). MariaDB plc customers will be notified for all new releases, security issues and critical bug fixes for all MariaDB plc products thanks to the Notification Services.

MariaDB may already be included in your favorite OS distribution. More information can be found on the [Distributions which Include MariaDB](#) page.

7.0.1.2.11 MariaDB 10.11.1 Release Notes

The most recent release of [MariaDB 10.11](#) is:
MariaDB 10.11.11 Stable (GA) [Download Now](#) [↗](#)
[Alternate download from mariadb.org](#) [↗](#)

[Download 10.11.1](#) [↗](#)

[Release Notes](#)

[Changelog](#) [↗](#)

[Overview of 10.11](#)

Release date: 17 Nov 2022

Do not use non-stable (non-GA) releases in production!

[MariaDB 10.11](#) is a current development series of MariaDB. It is an evolution of [MariaDB 10.10](#) with several entirely new features.

For an overview of [MariaDB 10.11](#) see the [What is MariaDB 10.11?](#) page.

Thanks, and enjoy MariaDB!

Notable Items

Authentication

- [bind_address](#) now accepts a comma-separated list of addresses to bind to ([MDEV-24377](#) [↗](#))

InnoDB

- Allow `innodb_undo_tablespaces` to be changed after database creation ([MDEV-19229](#))

Replication

- Formerly only a server option, `replicate_rewrite_db` is now a global system variable ([MDEV-15530](#))

Repositories

- Beginning with the next release (Q1 2023), our Yum, DNF, and Zypper repositories for Red Hat, Fedora, and SUSE will be migrated to being signed with a new [GPG key](#). The key we are migrating to is the same one we already use for our Debian and Ubuntu Repositories.
 - The short Key ID is: `0xC74CD1D8`
 - The long Key ID is: `0xF1656F24C74CD1D8`
 - The full fingerprint of the key is: `177F 4010 FE56 CA33 3630 0305 F165 6F24 C74C D1D8`
 - The key can be imported now in preparation for this change using the following command:

```
sudo rpm --import https://supplychain.mariadb.com/MariaDB-Server-GPG-KEY
```

Docker Official Image

The following changes have been made to the `docker.io/library/mariadb` container image.

- The number of gpg packages packages has been removed, leaving enough to `apt-get update`, but `dirmngr` that would fetch keys has been removed. (inspired by [issue #469](#))
- The environment variable `LANG=C.UTF-8` has been added for those that exec into containers and copy paste UTF8 characters (fixes [issue #468](#)).
- Adds OCI labels to image (fixes [issue 436](#) and [users need for version](#))
- MariaDB config: `skip-host-cache` and `skip-name-resolve` moved to `/etc/mysql/mariadb.conf.d/05-skipcache.cnf`

Changelog

7.0.1.2.12 MariaDB 10.11.0 Release Notes

The most recent release of MariaDB 10.11 is:
MariaDB 10.11.11 Stable (GA) [Download Now](#)
Alternate download from [mariadb.org](#)

[Download](#)

[Release Notes](#)

[Changelog](#)

[Overview of 10.11](#)

Release date: 26 Sep 2022

Do not use alpha releases in production!

[MariaDB 10.11](#) is a current development series of MariaDB. It is an evolution of [MariaDB 10.10](#) with several entirely new features.

Unlike recent new releases, [MariaDB 10.11.0](#) is a single preview release. Features are to be considered preview, and none are guaranteed to make it into [MariaDB 10.11](#).

The preview is available as a container [quay.io/mariadb-foundation/mariadb-devel:10.11-preview](#).

For an overview of [MariaDB 10.11](#) see the [What is MariaDB 10.11?](#) page.

Thanks, and enjoy MariaDB!

Authentication

- Windows - passwordless login for mariadb root user, for OS admin users, using the [gssapi authentication plugin \(MDEV-26715\)](#)
- [GRANT to PUBLIC \(MDEV-5215\)](#) ([blog post](#))
- Separate [SUPER](#) and [READ ONLY ADMIN](#) privileges ([MDEV-29596](#))

Optimizer

- Semi-join optimization for single-table update/delete statements ([MDEV-7487](#))
- Allow pushdown of queries involving UNIONS in outer select to foreign engines ([MDEV-25080](#))
- Make [ANALYZE FORMAT=JSON](#) show time spent in the query optimizer ([MDEV-28926](#))

Information Schema

- Performance Issues reading the [Information Schema Parameters table \(MDEV-29104\)](#)
- Full table scan in the [Information Schema Parameters](#) and [Information Schema Routines](#) tables ([MDEV-20609](#))

System versioning

- [System versioning](#) setting, [system_versioning_insert_history](#), to allow history modification ([MDEV-16546](#))
- [mariadb-dump](#): dump and restore historical data ([MDEV-16029](#))

InnoDB

- [innodb_write_io_threads](#) and [innodb_read_io_threads](#) are now dynamic, and their values can be changed without restarting the server ([MDEV-11026](#))

General

- Rename [slow queries](#) variables ([MDEV-7567](#))
 - [log_slow_min_examined_row_limit](#) (min_examined_row_limit)
 - [log_slow_query](#) (slow_query_log)
 - [log_slow_query_file_name](#) (slow_query_log_file) This will be renamed to [log_slow_query_file](#) in the next [MariaDB 10.11](#) release.
 - [log_slow_query_time](#) (long_query_time)
- [replicate_rewrite_db](#) is now a system variable, no longer just an option ([MDEV-15530](#))

Be notified of new MariaDB Server releases automatically by [subscribing](#) to the MariaDB Foundation community announce 'at' lists.mariadb.org announcement list (this is a low traffic, announce-only list). MariaDB plc customers will be notified for all new releases, security issues and critical bug fixes for all MariaDB plc products thanks to the Notification Services.

MariaDB may already be included in your favorite OS distribution. More information can be found on the [Distributions which Include MariaDB](#) page.

7.0.2 MariaDB Server 10.10

7.0.2.1 Changes and Improvements in MariaDB 10.10

MariaDB 10.10 is no longer maintained. Please use a [more recent release](#).

The most recent release of MariaDB 10.10 is:

MariaDB 10.10.7 [Stable \(GA\)](#) [Download Now](#)

Contents

1. [Upgrading](#)
2. [New Features & Improvements](#)
 1. [Variables](#)
 2. [Replication](#)
 3. [Optimizer](#)
 4. [UCA14 Collation](#)
 5. [Galera](#)
 6. [Miscellaneous](#)
 7. [Variables](#)
 1. [InnoDB](#)
 2. [Spider](#)
3. [Security Vulnerabilities Fixed in MariaDB 10.10](#)
4. [List of All MariaDB 10.10 Releases](#)

MariaDB 10.10 is a short-term release series, [maintained until](#) November 2023.

New Features & Improvements

Replication

- Change defaults for CHANGE MASTER TO so that GTID-based replication is used by default if master supports it ([MDEV-19801](#))
- Added `global.slave_max_statement_time` system variable for SQL thread to limit maximum execution time per query replicated ([MDEV-27161](#))
- Deprecate `MASTER_USE_GTID=Current_Pos` to favor new `MASTER_DEMOTE_TO_SLAVE` option ([MDEV-20122](#))

Optimizer

- Improve optimization of joins with many tables, including `eq_ref` tables ([MDEV-28852](#))
- Table elimination does not work across derived tables ([MDEV-26278](#))

UCA14 Collation

- Add UCA-14.0.0 [collations](#) ([MDEV-27009](#))
- Improve contraction performance in UCA collations ([MDEV-27265](#))
- Improve UCA collation performance for `utf8mb3` and `utf8mb4` ([MDEV-27266](#))

Galera

- Implement a method to add IPs to allowlist for Galera Cluster node addresses that can make SST/IST requests ([MDEV-27246](#))

Miscellaneous

- Change default of `explicit_defaults_for_timestamp` to ON ([MDEV-28632](#))
- `--ssl` option set as default for mariadb CLI ([MDEV-27105](#))
- Add `RANDOM_BYTES` function ([MDEV-25704](#))
- The `INET4` data type ([MDEV-23287](#))
- Re-design the upper level of handling UPDATE and DELETE statements ([MDEV-28883](#))
- Deprecate the `DES_ENCRYPT/DECRYPT` functions ([MDEV-27104](#))

Variables

- For a list of all new variables, see [System Variables Added in MariaDB 10.10](#).

InnoDB

- Removed `innodb_version` ([MDEV-28554](#))
- Deprecated `innodb_prefix_index_cluster_optimization`

Spider

The following deprecated variables have been removed:

- `spider_udf_ct_bulk_insert_interval`
- `spider_udf_ct_bulk_insert_rows`
- `spider_udf_ds_bulk_insert_rows`
- `spider_udf_ds_table_loop_mode`
- `spider_udf_ds_use_real_table`
- `spider_use_handle`
- `spider_udf_table_mon_mutex_count`
- `spider_use_handler`

7.0.3 MariaDB Server 10.9

Changes and Improvements in MariaDB 10.9

Current Version: [10.9.8](#) | Status: [Stable \(GA\)](#) | Release Date: [14 Aug 2023](#)

Release Notes - MariaDB 10.9 Series

[MariaDB 10.9 series release notes.](#)

Changelogs - MariaDB 10.9 Series

[MariaDB 10.9 changelogs](#)

There are [1 related questions](#).

7.0.3.1 Changes and Improvements in MariaDB 10.9

MariaDB 10.9 is no longer maintained. Please use a [more recent release](#).

The most recent release of MariaDB 10.9 is:

MariaDB 10.9.8 [Stable \(GA\)](#) [Download Now](#)

Contents

1. [Upgrading](#)
2. [New Features & Improvements](#)
 1. [JSON](#)
 2. [InnoDB](#)
 3. [Hashicorp Key Management Plugin](#)
 4. [Replication and Galera](#)
 5. [SHOW ANALYZE FORMAT=JSON](#)
 6. [Variables](#)
3. [Security Vulnerabilities Fixed in MariaDB 10.9](#)
4. [List of All MariaDB 10.9 Releases](#)

MariaDB 10.9 is a previous short-term release series. The first stable release was in August 2022, and it was [maintained until](#) [August 2023](#).

New Features & Improvements

JSON

- [JSON_OVERLAPS](#) function ([MDEV-27677](#))
- Implement range notation for [JSONPath](#) ([MDEV-27911](#))
- Support [JSONPath](#) negative index ([MDEV-22224](#))

InnoDB

- [innodb_log_file_size](#) is now dynamic ([MDEV-27812](#))
- InnoDB performance improvements ([MDEV-27557](#), [MDEV-28185](#), [MDEV-27767](#), [MDEV-28313](#), [MDEV-28137](#), [MDEV-28465](#), [MDEV-26789](#))
- [innodb_disallow_writes](#) removed ([MDEV-25975](#))

Hashicorp Key Management Plugin

- [Hashicorp Key Management Plugin](#) for implementing [encryption](#) using keys stored in the Hashicorp Vault KMS ([MDEV-19281](#))

Replication and Galera

- Implement the `--do-domain-ids`, `--ignore-domain-ids`, and `--ignore-server-ids` options for [mariadb-binlog](#) ([MDEV-20119](#))
- Semisync-slave server recovery is extended to work on new `server_id` server ([MDEV-27342](#))
- `mariadb-binlog --stop-never --raw` now flushes the result file to disk after each processed event so the file can be listed with the actual bytes ([MDEV-14608](#))
- JSON file interface to wsrep node state / SST progress logging ([MDEV-26971](#))

SHOW ANALYZE FORMAT=JSON

- Extend [SHOW EXPLAIN](#) to support `SHOW ANALYZE [FORMAT=JSON]` ([MDEV-27021](#))
- Add `EXPLAIN FOR CONNECTION` syntax support to [SHOW EXPLAIN](#) ([MDEV-10000](#))

Variables

- For a list of all new variables, see [System Variables Added in MariaDB 10.9](#).
- Merge `old` to `old_mode` sql variable ([MDEV-24920](#))

The following variables have been deprecated:

- `innodb_change_buffering`
- `old` (replaced by `old_mode`)

Security Vulnerabilities Fixed in MariaDB 10.9

For a complete list of security vulnerabilities (CVEs) fixed across all versions of MariaDB, see the [Security Vulnerabilities Fixed in MariaDB](#) page.

[MariaDB 10.8 changelogs](#)

7.0.4.1 Changes and Improvements in MariaDB 10.8

MariaDB 10.8 is no longer maintained. Please use a [more recent release](#).

The most recent release of MariaDB 10.8 is:
MariaDB 10.8.8 [Stable \(GA\)](#) [Download Now](#)

Contents

1. [Upgrading](#)
2. [New Features & Improvements](#)
 1. [Stored Procedures INOUT Parameters](#)
 2. [Lag free ALTER TABLE in replication](#)
 3. [Descending indexes](#)
 4. [InnoDB redo log improvements](#)
 5. [JSON Histograms](#)
 6. [Spider Storage Engine Improvements](#)
 7. [Misc. features](#)
 8. [mysqlbinlog GTID support](#)
 9. [Windows - Improved i18n support](#)
 10. [Variables](#)
3. [Security Vulnerabilities Fixed in MariaDB 10.8](#)
4. [List of All MariaDB 10.8 Releases](#)

MariaDB 10.8 is a previous short-term maintenance series. The first stable release was in May 2022, and it was [maintained](#) for one year.

Upgrading

- See [Upgrading Between Major MariaDB Versions](#) and [Upgrading from MariaDB 10.7 to MariaDB 10.8](#).

New Features & Improvements

Stored Procedures INOUT Parameters

- Stored procedures already have support for the [IN](#), [OUT](#) and [INOUT](#) parameter qualifiers. Added as well for [stored functions](#) and (IN only) [cursors](#) ([MDEV-10654](#)). This was a [contribution](#) by [ManoharKB](#).

Lag free ALTER TABLE in replication

- Normally, [ALTER TABLE](#) gets fully executed on the primary first and only then it is [replicated](#) and starts executing on replicas. With this feature [ALTER TABLE](#) gets replicated and starts executing on replicas when it *starts* executing on the primary, not when it *finishes*. This way the replication lag caused by a heavy [ALTER TABLE](#) can be completely eliminated ([MDEV-11675](#)).

Descending indexes

- Individual columns in the [index](#) can now be explicitly sorted in the ascending or descending order. This can be useful for optimizing certain [ORDER BY](#) cases ([MDEV-13756](#), [MDEV-26938](#), [MDEV-26939](#), [MDEV-26996](#)).

InnoDB redo log improvements

- autosize [innodb_buffer_pool_chunk_size](#) ([MDEV-25342](#)).
- Improve the [redo log](#) for concurrency ([MDEV-14425](#)).
- Remove [FIL_PAGE_FILE_FLUSH_LSN](#) ([MDEV-27199](#)).

JSON Histograms

- Histograms in the statistics tables are more precise and stored as JSON, not binary ([MDEV-21130](#), [MDEV-26519](#), [blog post](#)).

Spider Storage Engine Improvements

- This was mostly internal refactoring work. As a result one can now declare [Spider](#) connections using the

`REMOTE_SERVER`, `REMOTE_DATABASE`, and `REMOTE_TABLE` attributes and not abuse the `COMMENT` field for that. This works both for the whole table and per partition ([MDEV-5271](#), [MDEV-27106](#)).

Misc. features

- Add an optional argument to the `CRC32()` function, as well as the `CRC32C()` function, which uses the Castagnoli polynomial. ([MDEV-27208](#)). **Note:** The order of the 2-ary arguments was swapped after the preview release:

```
crc32('MariaDB')=crc32(crc32('Maria'),'DB')
```
- Deprecate the `keep_files_on_create` variable ([MDEV-23570](#)).
- `my_print_defaults` now handles `--default-*` options in exactly the same way as other MariaDB tools ([MDEV-26238](#)).
- UCA collations are now notably faster ([MDEV-27266](#), [MDEV-27265](#)).

mysqlbinlog GTID support

- `mariadb-binlog` (or `mysqlbinlog` as it was called back when the task was created) now supports both filtering events by GTID ranges through `--start-position` and `--stop-position`, and validating a binary log's ordering of GTIDs through `--gtid-strict-mode` ([MDEV-4989](#)).

Windows - Improved i18n support

- On newer versions of Windows (Windows 10 1903 or later), the `mariadb` client defaults to the `utf8mb4` character set. Several problems with Unicode input and output in client were fixed. Command line utilities now accept all Unicode characters in user names, database names, file names etc (in the past, characters were restricted to the current ANSI codepage).

Variables

- For a list of all new variables, see [System Variables Added in MariaDB 10.8](#).

Security Vulnerabilities Fixed in MariaDB 10.8

For a complete list of security vulnerabilities (CVEs) fixed across all versions of MariaDB, see the [Security Vulnerabilities Fixed in MariaDB](#) page.

4. [List of All MariaDB 10.7 Releases](#)

MariaDB 10.7 is a previous short-term maintenance stable series. The first stable release was in February 2022, and it was maintained for one year.

Upgrading

- See [Upgrading Between Major MariaDB Versions](#) and [Upgrading from MariaDB 10.6 to MariaDB 10.7](#).

New Features & Improvements

UUID

- New [UUID data type \(MDEV-4958\)](#)

JSON

- [JSON_EQUALS](#) function to check for equality between JSON objects ([MDEV-23143](#)).
- [JSON_NORMALIZE](#) function, which recursively sorts keys and removes spaces ([MDEV-16375](#))

Natural Sort

- [NATURAL_SORT_KEY](#) function ([MDEV-4742](#)).

Optimization

- Improve simple multibyte collation performance on the ASCII range ([MDEV-26572](#)).

Provider Plugins

- Five **provider plugins** (bzip2, lzma, lz4, lzo, snappy) provide [compression capabilities](#) to the server and storage engines ([MDEV-12933](#), [blog post](#)).

SFORMAT

- [SFORMAT](#) function for arbitrary text formatting ([MDEV-25015](#))

mariadb-dump

- Add option to [dump system versioned table](#) as of specified timestamp ([MDEV-16355](#)).

Convert Partitions

- ALTER TABLE ... CONVERT PARTITION .. TO TABLE ([MDEV-22166](#)), and
- ALTER TABLE ... CONVERT TABLE ... TO PARTITION ... ([MDEV-22165](#)) as an easy way to convert tables to partitions and back in one command, instead of a sequence of CREATE/EXCHANGE/DROP

Password Reuse

- password_reuse_check plugin is a new password validation plugin that prevents the new password from being the same as the one being used during the configurable retention period. ([MDEV-9245](#))

Replication

- Multi-source replication supports MySQL-style CHANNEL syntax ([MDEV-26307](#))

InnoDB Bulk Insert

- In bulk insert, pre-sort and build indexes one page at a time ([MDEV-24621](#))

Diagnostics

- [GET DIAGNOSTICS](#) supports a new condition property name `ROW_NUMBER`. In multi-row inserts it allows one to retrieve a number of a row that has caused the error ([MDEV-10075](#), [MDEV-26611](#))

Variables

The following deprecated variables have been removed :

- [wsrep_replicate_myisam](#) ([MDEV-24947](#))
- [wsrep_strict_ddl](#) ([MDEV-24843](#))

Security Vulnerabilities Fixed in [MariaDB 10.7](#)

For a complete list of security vulnerabilities (CVEs) fixed across all versions of MariaDB, see the [Security Vulnerabilities Fixed in MariaDB](#) page.

4. [List of All MariaDB 10.6 Releases](#)

MariaDB 10.6 is the current long-term maintenance stable version. The first stable release was in July 2021, and it will be [maintained until](#) July 2026.

Upgrading

- See [Upgrading Between Major MariaDB Versions](#) and [Upgrading from MariaDB 10.5 to MariaDB 10.6](#).

New Features & Improvements

See the [Differences in MariaDB Enterprise Server 10.6](#) page for items that are different between MariaDB Community Server 10.6 and MariaDB Enterprise Server 10.6.

Atomic DDL

- [CREATE TABLE](#), [ALTER TABLE](#), [RENAME TABLE](#), [DROP TABLE](#), [DROP DATABASE](#) and related DDL statements are now atomic. Either the statement is fully completed, or everything is reverted to its original state. Note that when deleting multiple tables with [DROP TABLE](#), only each individual drop is atomic, not the full list of tables). ([MDEV-23842](#) [↗](#)).

SQL Syntax

- Implement SQL-standard [SELECT ... OFFSET ... FETCH](#) ([MDEV-23908](#) [↗](#))
- Add [SELECT ... SKIP LOCKED](#) syntax (InnoDB only) ([MDEV-13115](#) [↗](#))
- [Indexes can be ignored](#) ([MDEV-7317](#) [↗](#), [MDEV-25075](#) [↗](#))
- [JSON_TABLE](#), used to extract JSON data based on a JSON path expression and to return it as a relational table ([MDEV-17399](#) [↗](#))

Oracle Compatibility

- Anonymous [subqueries in a FROM clause](#) (no AS clause) are permitted in [ORACLE mode](#) ([MDEV-19162](#) [↗](#))
- [ADD_MONTHS\(\)](#) added ([MDEV-20025](#) [↗](#))
- [TO_CHAR\(\)](#) added ([MDEV-20017](#) [↗](#))
- [SYS_GUID\(\)](#) added ([MDEV-24285](#) [↗](#))
- MINUS is mapped to [EXCEPT](#) in UNION ([MDEV-20021](#) [↗](#))
- [ROWNUM](#) function returns the current number of accepted rows in the current context ([MDEV-24089](#) [↗](#))

InnoDB

- Optimization to speed up inserts into an empty table ([MDEV-515](#) [↗](#))
- We intended to deprecate and eventually remove the InnoDB's [COMPRESSED row format](#). The first step was to make the tables [read-only by default](#), but this plan was abandoned from [MariaDB 10.6.6](#) ([MDEV-23497](#) [↗](#)) ([MDEV-27736](#) [↗](#))
- [Information Schema SYS_TABLESPACES](#) now directly reflects the filesystem, and [SYS_DATAFILES](#) has been removed ([MDEV-22343](#) [↗](#))
- Defer writes to the InnoDB temporary tablespace ([MDEV-12227](#) [↗](#))
- The old [MariaDB 5.5-compatible innodb checksum](#) is no longer supported, only `crc32`. Removed the `*innodb` and `*none` options from `innodb_checksum_algorithm`, and the `--strict-check / -C` and `--write / -w` options from `innochecksum` ([MDEV-25105](#) [↗](#))

Replication, Galera and Binlog

- Increase `master_host` limit to 255, user to 128 ([MDEV-24312](#) [↗](#))
- The `wsrep_mode` system variable, for turning on WSREP features which are not part of default behavior (including the experimental Aria replication) ([MDEV-20008](#) [↗](#), [MDEV-20715](#) [↗](#), [MDEV-24946](#) [↗](#))
- The delay between binary log purges can now be specified with much greater precision. The system variable `binlog_expire_logs_seconds` is introduced as a form of alias for `expire_logs_days`, which now accepts a precision of 1/1000000 days ([MDEV-19371](#) [↗](#))
- Allow transition from unencrypted to TLS [Galera](#) cluster communication without cluster downtime ([MDEV-22131](#) [↗](#))

Sys Schema

- Bundle [sys-schema](#), a collection of views, functions and procedures to help administrators get insight into database usage. ([MDEV-9077](#) [↗](#))

Performance Schema

- Merged replication instrumentation and tables ([MDEV-16437](#) [↗](#), [MDEV-20220](#) [↗](#))

Information Schema

- The views `INFORMATION_SCHEMA.KEYWORDS` and `INFORMATION_SCHEMA.SQL_FUNCTIONS` have been added to the information schema ([MDEV-25129](#) [↗](#))

Storage Engines

- [TokuDB](#) [↗](#) has been removed ([MDEV-19780](#) [↗](#))

- [CassandraSE](#) has been removed ([MDEV-23024](#))

Character Sets

- The `utf8` [character set](#) (and related collations) is now by default an alias for `utf8mb3` rather than the other way around. It can be set to imply `utf8mb4` by changing the value of the `old_mode` system variable ([MDEV-8334](#))

General

- Bundle sys schema ([MDEV-9077](#))
- Do not resend unchanged resultset metadata for prepared statements ([MDEV-19237](#))
- `--bind-address=hostname` now listens on both IPv6 and IPv4 addresses ([MDEV-6536](#))
- Support systemd socket activation ([MDEV-5536](#))
- For the [GSSAPI plugin](#), support AD or local group name, and SIDs on Windows ([MDEV-23959](#))
- Check for `$MARIADB_HOME/my.cnf` ([MDEV-21365](#))

Variables

- For a list of all new variables, see [System Variables Added in MariaDB 10.6](#) and [Status Variables Added in MariaDB 10.6](#).
- `max_recursive_iterations` has been reduced to 1000 ([MDEV-17239](#))

InnoDB Variables

The following deprecated variables have been removed ([MDEV-23397](#)):

- `innodb_adaptive_max_sleep_delay`
- `innodb_background_scrub_data_check_interval`
- `innodb_background_scrub_data_compressed`
- `innodb_background_scrub_data_interval`
- `innodb_background_scrub_data_uncompressed`
- `innodb_buffer_pool_instances`
- `innodb_commit_concurrency`
- `innodb_concurrency_tickets`
- `innodb_file_format`
- `innodb_large_prefix`
- `innodb_lock_schedule_algorithm`
- `innodb_log_checksums`
- `innodb_log_compressed_pages`
- `innodb_log_files_in_group`
- `innodb_log_optimize_ddl`
- `innodb_page_cleaners`
- `innodb_replication_delay`
- `innodb_scrub_log`
- `innodb_scrub_log_speed`
- `innodb_sync_array_size`
- `innodb_thread_concurrency`
- `innodb_thread_sleep_delay`
- `innodb_undo_logs`

Security Vulnerabilities Fixed in MariaDB 10.6

[Release Notes](#)

[Changelog](#)

[Overview of 10.6](#)

[Alternate download from mariadb.org](#)

Release date: 4 Feb 2025

MariaDB 10.6 is a current long-term series of MariaDB, [maintained until](#) July 2026. It is an evolution of [MariaDB 10.5](#) with several entirely new features.

MariaDB 10.6.21 is a [Stable \(GA\)](#) release.

For an overview of [MariaDB 10.6](#) see the [What is MariaDB 10.6?](#) page.

Thanks, and enjoy MariaDB!

Notable Items

Storage Engines

InnoDB

- Fix possible InnoDB hang while running out of buffer pool ([MDEV-35409](#))
- Fix assertion failure on cascading foreign key update of table with vcol index in parent ([MDEV-29182](#))
- Fix potential issue in secondary Index with ROW_FORMAT=COMPRESSED and Change buffering enabled ([MDEV-35679](#))

- Fix issue where ON UPDATE SET NULL could not be specified on a NOT NULL column ([MDEV-35445](#))
- New parameter --skip-freed-pages for [Innochecksum](#). Use this parameter to not get freed undo logs reported as existing undo log pages. ([MDEV-35394](#))
- Cloning of table statistics while saving the InnoDB table stats is now avoided ([MDEV-35363](#))
- InnoDB deadlock output query length increased to improve visibility of deadlocked statements. ([MDEV-32576](#))

Memory

- Fix possible crash on DELETE from a HEAP table ([MDEV-22695](#))

Spider

- Fix possible Spider thread hang in 'Update' state on 2nd INSERT ([MDEV-35064](#))
- Fix possible crash on bootup in spider_sys_open_table «ext-issue» ([MDEV-32822](#)), «ext-issue» ([MDEV-34302](#)) ([MDEV-34925](#))

Replication

- Fix incorrect formatting of timestamp during [mariadb-binlog](#) parsing of a binary log, causing point in time recovery discrepancies ([MDEV-31761](#))
- [mariadb-binlog](#) can now correctly process more than one logfile when --stop-datetime is specified ([MDEV-35528](#))
- Setting `pseudo_thread_id` to a value exceeding 4 bytes previously resulted in truncation when written to the binary log ([MDEV-35646](#))
- MariaDB now supports MySQL 8.0 binlog events, including PARTIAL_UPDATE_ROWS_EVENT, TRANSACTION_PAYLOAD_EVENT, and HEARTBEAT_LOG_EVENT_V2. ([MDEV-35643](#))

Optimizer

- Fix server crash in get_sort_by_table/make_join_statistics after INSERT into a view with ORDER BY ([MDEV-29935](#))
- Fix failing assertion causing disruption and replication failure ([MDEV-24035](#))
- Conditions with SP local variables are now pushed into derived table. Previous behaviour caused slow performance and table scans instead of using the pushed down condition ([MDEV-35910](#))
- NULL-aware materialization with IN predicate and single column no longer skips building sorted Ordered_key structures ([MDEV-34665](#))
- Fix possibly wrong result using a degenerated subquery (SELECT <expr>) with window function ([MDEV-35869](#))

Partitioning

- History is now stored on the same partitions on different Galera nodes when system versioning is enabled ([MDEV-35096](#))
- Fix possible hang or crash during InnoDB purge with HASH indexes during ALTER TABLE ([MDEV-25654](#))
- EXCHANGE PARTITION now works for tables with unique blobs ([MDEV-35612](#))
- algorithm = instant can now correctly be used if a table has partitions and one tries to change a column with an index which is not the partitions key. This previously gave error "ERROR 1846 (0A000): ALGORITHM=INSTANT is not supported. Reason: ADD INDEX. Try ALGORITHM=NOCOPY". ([MDEV-34813](#))

Character Sets

- Fix assertion failure and possible index corruption with unique key and nopad collation without DESC or HASH keys ([MDEV-30111](#))
- Fix client crash the command after client sets character set to utf32 ([MDEV-34090](#))
- Fix possible runtime error caused by XA RECOVER applying a zero offset to a null pointer ([MDEV-35549](#))
- Fix issue where functions in default values in tables with certain character sets could break SHOW CREATE and mariadb-dump ([MDEV-29968](#))

Galera

- [Galera](#) updated to 26.4.21
 - **NOTE:** Includes increasing the GCS protocol version, which prevents downgrades of individual nodes in the cluster as soon as all nodes nodes have been updated
- Fix streaming replication transaction crash with innodb_snapshot_isolation ([MDEV-35281](#))
- Fix sporadic failure of async replication on Galera async replica nodes with parallel replication enabled ([MDEV-35465](#))
- Fix possible failure of wsrep_sst_rsnc SST script if user specified aria_log_dir_path different from default data

- directory ([MDEV-35387](#))
- Fix cluster node hang during shutdown if threadpool is used ([MDEV-35710](#))
- MariaDB Cluster and ALTER INPLACE running in Total Order Isolation (wsrep_osu_method=TOI) now correctly abort a DML INSERT operation in InnoDB ([MDEV-33064](#))
- Fix possible crash in wsrep_check_sequence ([MDEV-33245](#))
- Fix sporadic reporting of success when a deadlock error occurs under --ps-protocol BF aborted transaction ([MDEV-35446](#))
- Rows in table mysql.gtid_slave_pos are now correctly deleted on Galera nodes when wsrep_gtid_mode = 1 is used, which previously lead to wrong information about replica delays ([MDEV-34924](#))
- Undefined behavior could occur when attempting to perform INSERT DELAYED on a Galera cluster node. ([MDEV-35852](#))
- Fix issue where DROP TABLE on child and UPDATE of parent table can cause a metadata lock BF-BF conflict when applied concurrently. ([MDEV-35018](#))
- Galera protocol versions are now shown by show status - change available with installation of galera library 26.4.21+ ([MDEV-35505](#))
- Fix possible crash in wsrep_sst_mariabackup script when upgrading node in cluster from 10.11.9 to 10.11.10. ([MDEV-35526](#))
- wsrep_sst_mariabackup.sh no longer uses --use-memory default (100MB) resulting in prepare stage which could take hours ([MDEV-35749](#))

Audit Plugin

- For an authentication with the [ed25519 authentication plugin](#) the password of the CREATE USER statement is now masked in the audit log ([MDEV-35507](#))
- MariaDB Audit now detects all DCLs forms for masking a password ([MDEV-35522](#))

General

- Fix possible crash where server could not construct a geometry object from the input ([MDEV-33987](#))
- Fix trigger created with "CREATE TRIGGER `table1_after_insert` AFTER INSERT" which is adding rows to another table using "FOR EACH ROW insert into table2(`id`, `name`) values (NEW.`id`, NEW.`name`);" that did not work correctly when if bulk inserts are used by the application. Only the first row of the bulk insert would be added to the table ([MDEV-34958](#))
- After changing the table definition for the system table 'mysql.servers', a following execution of CREATE SERVER would previously lead to a server crash.
 - NOTE: System tables should never be modified by a user anyhow ([MDEV-33783](#))
- Fix connection hang after query on a partitioned table with UNION and LIMIT ROWS EXAMINED ([MDEV-35571](#))
- Fix possible crash during index traversal using `tree_search_next`. ([MDEV-28130](#))
- Fix assertion failure where CURRENT_USER was not correctly copied during condition pushdown ([MDEV-35090](#))
- START TRANSACTION, when triggering an implicit commit as a COMMIT or ROLLBACK has not been executed before, now resets optional characteristics added to the last START TRANSACTION command ([MDEV-35335](#))
- sql_mode='NO_UNSIGNED_SUBTRACTION' now works for multiple unsigned integers ([MDEV-35651](#))
- The "Failed to write to mysql.slow_log" error no longer shown without a detailed reason for the error ([MDEV-20281](#))
- Fix doublewrite recovery of innodb_checksum_algorithm=full_crc32 encrypted pages ([MDEV-34898](#))
- Can now correctly add a foreign key on a table with a long UNIQUE multi-column index that contains a foreign key as a prefix ([MDEV-33658](#))
- During an online table rebuild of an InnoDB statistics table, opt_search_plan_for_table() no longer sometimes degrades to full table scan ([MDEV-35443](#))
- Fix debian-start script failure when using non-standard socket path ([MDEV-35907](#))
- Fix possible hang or crash where zero offset applied to null pointer ([MDEV-35864](#))
- Fixed issue where ST_PointFromWKB ignored SRID parameter and returned 0 ([MDEV-32619](#))
- Fix possible hang during CREATE TABLE...SELECT error handling, especially with innodb_snapshot_isolation enabled ([MDEV-35647](#))
- Fix incorrect locking order of LOCK_log/LOCK_commit_ordered and LOCK_global_system_variables ([MDEV-29744](#))
- Fix rare cases where binlog entries could receive incorrect timestamps on secondary nodes of a Galera cluster, potentially impacting replication accuracy ([MDEV-35157](#))
- Fix possible memory leak on SHUTDOWN ([MDEV-35326](#))
- Fix possible memory leak while shutting down server after installing the auth_gssapi plugin ([MDEV-35575](#))
- Fix possible server crash when using INSERT DELAYED on tables with virtual columns. ([MDEV-26891](#))
- Fix possible Spider crash or hang when the first byte of a connection key is changed ([MDEV-34849](#))
- A BEFORE INSERT Trigger previously returned with error ""Field 'xxx' doesn't have a default value", if a NULL value is added for a column defined NOT NULL without explicit value and no DEFAULT specified ([MDEV-19761](#))
- Calling a stored routine that executes a join on three or more tables and referencing not-existent column name in the USING clause could previously result in a crash on its second invocation. ([MDEV-24935](#))
- Fix rare cases where binlog entries could receive incorrect timestamps on secondary nodes of a Galera cluster,

potentially impacting replication accuracy ([MDEV-35157](#))

Security

- Fixes for the following [security vulnerabilities](#):
 - [CVE-2025-21490](#)

Changelog

For a complete list of changes and bugfixes made in [MariaDB 10.6.21](#), with links to detailed information on each push, see the [changelog](#).

Contributors

For a full list of contributors to [MariaDB 10.6.21](#), see the [MariaDB Foundation release announcement](#).

Be notified of new MariaDB Server releases automatically by [subscribing](#) to the MariaDB Foundation community announce 'at' lists.mariadb.org announcement list (this is a low traffic, announce-only list). MariaDB plc customers will be notified for all new releases, security issues and critical bug fixes for all MariaDB plc products thanks to the Notification Services.

MariaDB may already be included in your favorite OS distribution. More information can be found on the [Distributions which Include MariaDB](#) page.

7.0.6.2.2 MariaDB 10.6.20 Release Notes

The most recent release of MariaDB 10.6 is:
MariaDB 10.6.21 Stable (GA) [Download Now](#)
[Alternate download from mariadb.org](#)

[Download 10.6.20](#)

[Release Notes](#)

[Changelog](#)

[Overview of 10.6](#)

Release date: 1 Nov 2024

[MariaDB 10.6](#) is a current long-term series of MariaDB, [maintained until](#) July 2026. It is an evolution of [MariaDB 10.5](#) with several entirely new features.

[MariaDB 10.6.20](#) is a **Stable (GA)** release.

For an overview of [MariaDB 10.6](#) see the [What is MariaDB 10.6?](#) page.

Thanks, and enjoy MariaDB!

Notable Items

Storage Engines

InnoDB

- Fix attempt to read outside the bounds of the file: ./ibdata1 ([MDEV-34453](#))
- Fix MariaDB crash with SIGILL because the OS does not support AVX512 ([MDEV-34565](#))
- Fix deadlock caused by lock_rec_unlock_unmodified() ([MDEV-34690](#))
- Fix duplicate key error in table 'mysql.innodb_table_stats' ([MDEV-34207](#))
- Fix possible adaptive hash index corruption with ALTER TABLE...IMPORT TABLESPACE and FULLTEXT SEARCH ([MDEV-35059](#))
- XA prepare now correctly releases unmodified records in non-blocking mode ([MDEV-34466](#))
- Fix contention between secondary index UPDATE and purge due to large innodb_purge_batch_size ([MDEV-34515](#))

-)
 - New default of 127 for `innodb_purge_batch_size` (previously 1000).
- Fix redundant page lookups that hurt performance ([MDEV-34791](#))

Spider

- Fix server crash when calling `spider UDF` after `aria_encrypt_tables` is enabled ([MDEV-34682](#))
- SELECT MIN on Spider table no longer returns more rows than expected ([MDEV-26345](#))
- Fix Spider group by handler wrong result on order by aggregate ([MDEV-29546](#))

S3

- Fix Storage Engine S3 that caused 500 error when using Huawei Cloud S3 and possibly other S3 providers ([MDEV-34867](#))
 - A new option `s3-provider` has been added. `s3-provider=Huawei` needs to be set for Huawei Cloud S3
 - New option `s3_ssl_no_verify`, if true, SSL certificate verification for the S3 endpoint is disabled

Optimizer

- Fix crash caused by query containing constant having clause ([MDEV-23983](#))
- Fix assertion with `optimizer_join_limit_pref_ratio` and 1-table select ([MDEV-35072](#))

Data Definition - Alter Table

- Fix InnoDB crash under Windows Subsystem for Linux on ALTER TABLE or OPTIMIZE TABLE ([MDEV-34938](#))
- Modification of the column now correctly checks foreign key constraint ([MDEV-34392](#))
- Fix incorrect NULL value handling for instantly dropped BLOB columns ([MDEV-35122](#))

Galera

- Galera updated to 26.4.20
- Fix server crash when setting `wsrep_cluster_address` after adding invalid value to `wsrep_allowlist` table ([MDEV-31173](#))
- TOI (ALTER) no longer hangs on a parent table if SR transaction is in progress on a child table ([MDEV-34836](#))
- Fix INSERT...SELECT' on MyISAM table suddenly replicated by alera ([MDEV-34647](#))
- Fix case where with `wsrep_mode=REPLICATE_ARIA`, only part of the mixed-engine transactions was replicated ([MDEV-30653](#))
- Fix `galera_ssl_reload` failure with warning message ([MDEV-32778](#))
- When InnoDB gets an assertion failure, WSREP layer is now handled gracefully ([MDEV-32363](#))

Backup

- Recovery now correctly notes some log corruption ([MDEV-34802](#))
- InnoDB now correctly merges the change buffer to ROW_FORMAT=COMPRESSED tables ([MDEV-34879](#))
- Can now selectively restore sequences using innodb tables from backup ([MDEV-32350](#))

JSON

- `JSON_TABLE` now properly unquotes strings ([MDEV-27412](#))
- `JSON_TABLE` default values now allows non-string literals ([MDEV-25822](#))

General

- As per the [MariaDB Deprecation Policy](#), this will be the last release of **MariaDB 10.6** for SLES 12, and Windows 11 22H2
- `mariabd` no longer hangs on startup when `--init-file` target does not exist ([MDEV-34814](#))
- LOAD DATA INFILE with geometry data no longer fails ([MDEV-34883](#))
- Fix heap-use-after-free in `group_concat` with compressed or GIS columns ([MDEV-16699](#))
- Fix assertion `'!is_cond()' failed in Item_bool_func::val_int / do_select` ([MDEV-35135](#))
- Trigger now works correctly with bulk update ([MDEV-34718](#))
- Fix assertion failure in `find_producing_item` upon a query from a view ([MDEV-35276](#))
- Add new setting, `--quick-max-column-width` to the mariadb client for use in `--quick` mode ([MDEV-34704](#))

Changelog

For a complete list of changes and bugfixes made in [MariaDB 10.6.20](#), with links to detailed information on each push, see the [changelog](#).

7.0.6.2.3 MariaDB 10.6.19 Release Notes

The most recent release of MariaDB 10.6 is:
MariaDB 10.6.21 Stable (GA) [Download Now](#)
Alternate download from [mariadb.org](#)

[Download 10.6.19](#)

[Release Notes](#)

[Changelog](#)

[Overview of 10.6](#)

Release date: 8 Aug 2024

MariaDB 10.6 is a current long-term series of MariaDB, [maintained until](#) July 2026. It is an evolution of [MariaDB 10.5](#) with several entirely new features.

MariaDB 10.6.19 is a [Stable \(GA\)](#) release.

For an overview of [MariaDB 10.6](#) see the [What is MariaDB 10.6?](#) page.

Thanks, and enjoy MariaDB!

Notable Items

Storage Engines

InnoDB

- We fail to terminate transaction early with ER_LOCK_TABLE_FULL when lock memory is growing ([MDEV-34167](#))
- Alter operation on redundant table aborts the server ([MDEV-34222](#))
- MariaDB crashes with SIGILL because the OS does not support AVX512 ([MDEV-34565](#))
- InnoDB: Failing assertion: `stat_n_leaf_pages > 0` in `ha_innobase::estimate_rows_upper_bound` ([MDEV-34474](#))
- `wait_for_read` in `buf_page_get_low` hurts performance ([MDEV-34458](#))
- InnoDB: Assertion failure in file `./storage/innobase/page/page0zip.cc` line 4211 ([MDEV-34357](#))

Aria

- Fix [Aria](#) index corruption when doing a REPAIR TABLE that has a size of over 4G ([MDEV-34522](#))

Spider

- UBSAN: runtime error: applying non-zero offset in `spider_free_mem` and SIGSEGV in `spider_free_mem` on SELECT ([MDEV-31475](#))

- SIGSEGV in `ha_resolve_storage_engine_name`, UBSAN: runtime error: index 4294967295 out of bounds for type 'st_plugin_int *[64]' ([MDEV-32487](#))
- SIGSEGV in `spider_db_conn::fin_loop_check`, and ASAN: heap-use-after-free in `spider_db_mbase::fin_loop_check` on SHOW TABLE STATUS ([MDEV-34541](#))
- SIGSEGV in `ha_spider::lock_tables` on BEGIN after table lock ([MDEV-29962](#))
- SIGSEGV in `spider_conn_first_link_idx` and others on DELETE, INSERT and SELECT ([MDEV-32492](#))
- Spider: Crashes, asserts, hangs, memory corruptions and ASAN heap-use-after-free's ([MDEV-27902](#))
- Spider: `@@insert_id 128 to TINYINT: Assertion '!is_set() || (m_status == DA_OK_BULK && is_bulk_op())' failed.` ([MDEV-28105](#))
- ASAN errors in `spider_db_free_result` after partition DDL ([MDEV-29027](#))
- Server crashes when calling spider UDF after `aria_encrypt_tables` is enabled ([MDEV-34682](#))

Partitioning

- MariaDB Server crashes with ill-formed partitions ([MDEV-32155](#))
- SIGSEGV in `parse_engine_part_options` on INSERT, SELECT or ALTER ([MDEV-34421](#))
- Assertion `'auto_increment_value'` failed in `ha_partition::info` on INSERT into MEMORY table ([MDEV-24610](#))

Character Sets

- On startup: UBSAN: applying zero offset to null pointer in `my_copy_fix_mb` from `strings/ctype-mb.c` and other locations ([MDEV-34226](#))
- On startup: UBSAN: runtime error: applying zero offset to null pointer in `skip_trailing_space` and `my_hash_sort_utf8mb3_general1400_nopad_as_ci` ([MDEV-34187](#))
- SHOW CREATE DATABASE statement crashes the server when db name contains some unicode characters, ASAN stack-buffer-overflow ([MDEV-32376](#))
- Wrong result set with `utf8mb4_danish_ci` and BNLH join ([MDEV-34417](#))

Optimizer

- On startup: UBSAN: runtime error: applying non-zero offset in `JOIN::make_aggr_tables_info` in `sql/sql_select.cc` ([MDEV-34227](#))
- Crash after killing query while it is processed by `test_quick_select` ([MDEV-30651](#))
- Extend condition normalization to include `'NOT a'` ([MDEV-19520](#))
- Constant subquery causing a crash in pushdown optimization ([MDEV-29363](#))
- Crash when pushing condition with `CHARSET()/COERCIBILITY()` into derived table ([MDEV-33010](#))
- 2nd execution name resolution problem with pushdown into unions ([MDEV-34506](#))
- Assertion `!(key_part->key_part_flag & 4) == 0` failed `key_hashnr` ([MDEV-34580](#))
- Crash caused by query containing constant having clause ([MDEV-23983](#))
- Using `NAME_CONST()` (or executing query from the stored procedure and referring to a local variable) changes the plan and may make execution slower ([MDEV-33971](#))
- `ORDER BY DESC` causes ROWID Filter optimization performance degradation ([MDEV-33875](#))

Replication

- Auto-generated `DELETE` from `HEAP` table no longer breaks replication ([MDEV-25607](#))
- Fix replication failure when `XA transactions` are used where the replica has `replicate_do_db` set and the client has touched a different database when running DML such as inserts. ([MDEV-33921](#))
- Fix replication error when `CHANGE MASTER TO` is used in conjunction with a password longer than 41 ascii characters ([MDEV-23857](#))
- The `--init-rpl-role` option is utilized to avoid a possible error state in `semisync recovery` ([MDEV-33465](#))

Backup

- Hide password passed on commandline from `xtrabackup_info` ([MDEV-34434](#))

Galera

- `Galera` updated to 26.4.19
 - **NOTE:** Includes increasing the GCS protocol version, which prevents downgrades of individual nodes in the cluster as soon as all nodes nodes have been updated
- `galera_gtid_2_cluster`: Assertion ``thd->wsrep_next_trx_id() != (0x7fffffffffffffffffLL * 2ULL +`

- 1)' (MDEV-32633 [↗](#))
- table `gtid_slave_pos` entries never been deleted with `wsrep_gtid_mode = 0` (MDEV-34170 [↗](#))
- Deadlock found when trying to get lock during applying (MDEV-31658 [↗](#))
- Change error code for Galera unkillable threads (MDEV-12008 [↗](#))
- 10.11.8 cluster becomes inconsistent when using composite primary key and partitioning (MDEV-34269 [↗](#))
- `wsrep_sst_mariabackup use /tmp dir` during SST rather than user defined `tmpdir` (MDEV-32158 [↗](#))

Error Log

- `server_uid` system variable added, and value added to the [error log](#) at startup (MDEV-34494 [↗](#))

General

- As per the [MariaDB Deprecation Policy](#), this will be the last release of [MariaDB 10.6](#) for Debian 10 "Buster", RHEL/CentOS 7, and Fedora 38
- `IMPORT TABLESPACE` no longer unnecessarily traverses tablespaces list (MDEV-34670 [↗](#))
- Fix unknown variable `defaults-group-suffix=` with [mariadb-secure-installation](#) (MDEV-33265 [↗](#))
- `mariadb-install-db` no longer hangs on macOS (MDEV-34129 [↗](#))
- Fix transaction termination with `ER_LOCK_TABLE_FULL` when lock memory is growing (MDEV-34167 [↗](#))
- Disable new connections in case of fatal signal (MDEV-34475 [↗](#))
- Control over memory allocated for SP/PS (MDEV-14959 [↗](#))
- `Triggers` now work correctly with bulk insert (MDEV-24411 [↗](#))
- Fix assertion ``table->field[0]->ptr >= table->record[0] && table->field[0]->ptr <= table->record[0] + table->s->reclength'` failed in `void handler::assert_icp_limitations(uchar*)` (MDEV-34632 [↗](#))
- `sandbox mode` \- now compatible with `--binary-mode` (MDEV-34203 [↗](#))

Changelog

For a complete list of changes made in [MariaDB 10.6.19](#), with links to detailed information on each push, see the [changelog](#) [↗](#).

Notable Items

From this version, the [mariadb-dump](#) tool adds a new [sandbox](#) command to the top of every dump file. This command cannot be interpreted by MariaDB command line client versions that do not have the [sandbox](#) command, or by MySQL command line clients, and an error will be generated in these clients. Other methods of importing the dump will work not have this issue.

Storage Engines

InnoDB

- Fix InnoDB holding shared dict_sys.latch while waiting for FOREIGN KEY child table lock on DDL ([MDEV-32899](#))
- Fix adaptive hash index corruption after [ALTER TABLE...DISCARD TABLESPACE](#) ([MDEV-33400](#))
- Fix fatal InnoDB error or assertion `!is_v'` failure upon multi-update with indexed virtual column ([MDEV-31154](#))
- Fix fatal error InnoDB: Clustered record field for column x not found ([MDEV-33558](#))
- Fix InnoDB hang when temporarily running out of buffer pool ([MDEV-33613](#))
- Fix alter operation hang when encryption thread works on the same tablespace ([MDEV-33770](#))
- Fix MariaDB segfault on rowid filter query involving generated column ([MDEV-33795](#))
- Fix discard/import tablespace, restart, index corruption ([MDEV-33512](#))
- Fix server hang on DROP INDEX or RENAME INDEX ([MDEV-33993](#))
- Fix mariabackup --backup hang ([MDEV-33669](#))
- Fix server hang caused by InnoDB change buffer ([MDEV-33543](#))
- Fix assertion failures upon adding a too long key to table with COMPRESSED row format ([MDEV-31161](#))
- IMPORT TABLESPACE no longer fails with column count or index count mismatch ([MDEV-30655](#))
- Fix alter table corruption while applying the modification log ([MDEV-19044](#))
- Fix inconsistent behaviors of UPDATE under RU & RC isolation level ([MDEV-26643](#))
- Fix weird SELECT view when a record is modified to the same value by two transactions ([MDEV-26642](#))
- Fix inconsistent read and write, which use the same predicate (WHERE clause) ([MDEV-29565](#))
- Fix inconsistent SELECT view when modifying a record added by another transaction ([MDEV-26671](#))
- Fix weird read view after ROLLBACK of other transactions ([MDEV-33802](#))
- Read only server no longer throws error when running a create temporary table as select statement ([MDEV-33889](#))
- Change buffer index no longer fails to delete the records ([MDEV-32489](#))
- Fix InnoDB include OS error information when failing to write to iblogfile0 ([MDEV-33397](#))
- Fix phantom rows caused by UPDATE of PRIMARY KEY ([MDEV-32898](#))
 - New system variable, [innodb_snapshot_isolation](#)
- In-place migration from MySQL 5.7 no longer causes invalid AUTO_INCREMENT values ([MDEV-33277](#))
- Fix InnoDB log corruption before upgrading it on startup ([MDEV-32445](#))

- Table no longer gets rebuilt with ALTER TABLE ADD COLUMN ([MDEV-33214](#))

Aria

- Fixed that internal temporary tables did not wait for freed disk space, and related issues ([MDEV-33813](#))

Federated

- Fix wrong result on 2nd execution of prepared statement for query with derived table ([MDEV-31361](#))

Spider

- Improve Spider performance by pushing down `TIMESTAMPDIFF` function ([MDEV-28992](#)) and `CASE` statement ([MDEV-28993](#)) to data nodes
- Fix server crash when deleting partitions from a table with spider engine ([MDEV-33731](#))
- SPIDER plugin initialization no longer fails at 'create table if not exists mysql.spider_tables ... with 'Specified key was too long; max key length is 1000 bytes', Warning: Memory not freed: 10720 ([MDEV-33242](#))
- Fix spider plugin init failure with `no_zero_date sql_mode` ([MDEV-33494](#))
- Fix sql plugin init failure with traditional `sql_mode` ([MDEV-33584](#))
- Fix parsing failure on valid left join select by translating the on expression to `()` ([MDEV-33679](#))
- Fix Spider: ERROR 12710 (HY000): Invalid information from remote table when using MariaDB 10.5 local and MariaDB 10.6 remote ([MDEV-33777](#))
- Fix bug where `Spider variables` were not available if Spider was loaded upon server startup ([MDEV-33441](#))

Backup

- `mariadb-backup` now preserves `innodb_encrypt_tables` ([MDEV-33334](#))
- Fix `mariabackup` problem on older mariadb (`opendir(NULL)`) caused by [MDEV-30968](#) ([MDEV-31251](#))
- Fix `mariabackup --backup` FATAL ERROR: ... Can't open datafile cool_down/t3 ([MDEV-33011](#))
- `mariadb-backup --backup` now includes retry logic for undo tablespaces ([MDEV-33980](#))
- Fix crash recovery in `mariabackup --prepare` due to insufficient `innodb_log_file_size` ([MDEV-33540](#))
- Fix crash in `mariadb-backup --prepare --export` after `--prepare` ([MDEV-33023](#))
- `mariadb-backup` now considers O/S user when `--user` option is omitted ([MDEV-32893](#))

Character Sets, Data Types

- Fixed improper application of `ORDER BY COLLATE` to non-character columns ([MDEV-33318](#))
- Default charset now works with PHP MySQLi extension ([MDEV-32975](#))
- Fixed Bad SEPARATOR value in `GROUP_CONCAT` on character set conversion ([MDEV-33772](#))
- Fixed out of range error in `AVG(YEAR(datetime))` due to a wrong data type ([MDEV-33496](#))
- Fixed `GREATEST()` and `LEAST()` problems with `NULLs` ([MDEV-21034](#))

JSON

- View created via `JSON_ARRAYAGG` now returns correct json object ([MDEV-30646](#))
- `JSON_TYPE` now detects the type of String Values and correctly returns Date/DateTime values ([MDEV-19487](#))
- `JSON_REMOVE` no longer returns NULL on valid arguments ([MDEV-22141](#))
- `JSON_EXTRACT` no longer returns multiple values for same path ([MDEV-32287](#))

Encryption, TLS, SSL

- WolfSSL's math is unnecessarily slow ([MDEV-33482](#))

Optimization & Tuning

- Server crashes in `JOIN_CACHE::write_record_data` upon EXPLAIN with subqueries and constant tables ([MDEV-21102](#))
- Wrong result with cross Join given join order ([MDEV-30975](#))
- Wrong warnings on 2-nd execution of PS for query with `GROUP_CONCAT` ([MDEV-31276](#))
- Wrong result with semi-join and splittable derived table ([MDEV-23878](#))
- Optimizer choosing incorrect index in 10.6, 10.5 but not in 10.4 ([MDEV-33306](#))
 - `optimizer_adjust_secondary_key_costs` server option changed from having a numeric value to a set value with new options to affect the optimizer. The old numeric values still work.
- Aggregation functions fail to leverage uniqueness property ([MDEV-30660](#))
- Partitioning is broken on big endian architectures ([MDEV-33623](#))

Plugins

- The [audit plugin](#) now reports the user and host in all cases ([MDEV-33393](#))

Replication

- `--gtid-ignore-duplicate` can double-apply event in case of parallel replication retry ([MDEV-33475](#))
- Deadlock kill of XA PREPARE can break replication / `rpl.rpl_parallel_multi_domain_xa` sporadic failure ([MDEV-34042](#))
- `mysql_manager_submit` Segfault at Startup Still Possible During Recovery ([MDEV-33799](#))
- Server crash in `Rows_log_event::update_sequence` upon replaying binary log ([MDEV-31779](#))
- Slave crashed: `reload_acl_and_cache` during shutdown ([MDEV-30260](#))
- When `binlog_annotate_row_events` on, event of binlog file is truncated ([MDEV-9179](#))
- Add more warnings to be able to better diagnose network issues ([MDEV-33582](#))
- Improve times and states in `show processlist` for replication ([MDEV-33620](#))
- Adapt parallel slave's round-robin scheduling to XA events ([MDEV-33668](#))
- release row locks for non-modified rows at XA PREPARE ([MDEV-33454](#))
- Semi-sync Wait Point AFTER_COMMIT Slow on Workloads with Heavy Concurrency ([MDEV-33551](#))

Galera

- [Galera](#) updated to 26.4.18
 - **NOTE:** Includes increasing the GCS protocol version, which prevents downgrades of individual nodes in the cluster as soon as all nodes have been updated
- Disallow bulk insert operation during partition update statement ([MDEV-33979](#))

SQL, Data Definition, and Data Manipulation

- Transportable Tablespaces no longer leave `AUTO_INCREMENT` in a mismatched state ([MDEV-18288](#))
- Fix wrong row targeted with "insert ... on duplicate" and "replace", leading to data corruption ([MDEV-30046](#))
- Fix incorrect DEFAULT expression evaluated in UPDATE ([MDEV-33790](#))
- Fix server crash when UPDATE statement with duplicate key is run after setting a low `thread_stack` ([MDEV-33622](#))
- Fix incorrect handling of UPDATE in PS mode when a table's column declared as NOT NULL ([MDEV-33549](#))
- Fix crash in EXECUTE IMMEDIATE 'CREATE OR REPLACE TABLE t1 (a INT DEFAULT ?)' USING DEFAULT ([MDEV-15703](#))
- Fix wrong result on 2nd execution of PS to select from view using derived ([MDEV-31277](#))
- Fix wrong warnings on 2nd execution of PS for query with GROUP_CONCAT ([MDEV-31276](#))
- `TIMESTAMP` value of '1970-01-01 00:00:00' can no longer be indirectly inserted in `strict mode` ([MDEV-34088](#))
- Fix out of range error in `AVG(YEAR(datetime))` due to a wrong data type ([MDEV-33496](#))
- Fix zero datetime reinterpreting as '1970-01-01 00:00:00' on `field_datetime=field_timestamp` ([MDEV-34069](#))
- `unix_timestamp(coalesce(timestamp_column))` no longer returns NULL on '1970-01-01 00:00:00.000001' ([MDEV-34061](#))
- Fix crash using UDF in WHERE clause of VIEW ([MDEV-24507](#))
- Fix update for portion changes autoincrement key in period table ([MDEV-25370](#))
- Fix SIGABRT resulting from CREATE TABLE with generated column and RLIKE ([MDEV-21058](#))

Platforms & Packaging

- MariaDB-client community can't be installed in red hat ubi9 ([MDEV-32791](#))

General

Scripts & Clients

- It's now possible to disable system commands with the `mariadb --sandbox` option. ([MDEV-21778](#))
- `mariadb-dump` now exports the data with sandbox mode enable, so that the mariadb client will not execute potentially dangerous cli commands. ([MDEV-33727](#))
- `mariadb-dump` commands such as `mariadb-dump --dump-slave=2 --master-data=2` now record both positions ([MDEV-4827](#))
- Loading `time zones` now works with `alter_algorithm INPLACE` ([MDEV-33044](#))

Server

- Moving from [MariaDB 10.5](#) to 10.6 `mysql_upgrade` is not updating some system tables ([MDEV-33726](#))
- Original IP not shown in network related error messages when `proxy_protocol` is in use ([MDEV-33506](#))

- Server incorrectly describes known variables as UNKNOWN if invalid values are specified at startup ([MDEV-33469](#))
- update case insensitive (large) unique key with insensitive change of value - duplicate key ([MDEV-29345](#))
- MariaDB will abort server startup if it finds an invalid parameter, but won't check for other invalid params ([MDEV-26923](#))
- Slowdown when running nested statement with many partitions ([MDEV-33502](#))

Security

- Fixes for the following [security vulnerabilities](#):
 - [CVE-2024-21096](#)

Changelog

For a complete list of changes and bugfixes made in [MariaDB 10.6.18](#), with links to detailed information on each push, see the [changelog](#).

Contributors

For a full list of contributors to [MariaDB 10.6.18](#), see the [MariaDB Foundation release announcement](#).

Be notified of new MariaDB Server releases automatically by [subscribing](#) to the MariaDB Foundation community announce 'at' lists.mariadb.org announcement list (this is a low traffic, announce-only list). MariaDB plc customers will be notified for all new releases, security issues and critical bug fixes for all MariaDB plc products thanks to the Notification Services.

MariaDB may already be included in your favorite OS distribution. More information can be found on the [Distributions which Include MariaDB](#) page.

7.0.6.2.5 MariaDB 10.6.17 Release Notes

The most recent release of MariaDB 10.6 is:
MariaDB 10.6.21 Stable (GA) [Download Now](#)

[Alternate download from mariadb.org](#)

[Download 10.6.17](#)

[Release Notes](#)

[Changelog](#)

[Overview of 10.6](#)

Release date: 7 Feb 2024

[MariaDB 10.6](#) is a current long-term series of MariaDB, [maintained until](#) July 2026. It is an evolution of [MariaDB 10.5](#) with several entirely new features.

[MariaDB 10.6.17](#) is a **Stable (GA)** release.

For an overview of [MariaDB 10.6](#) see the [What is MariaDB 10.6?](#) page.

Thanks, and enjoy MariaDB!

Notable Items

- Windows packages were delayed but have now been added to the downloads site

InnoDB

- Unique hash key on column prefix is computed incorrectly ([MDEV-29954](#))
- Query from `I_S.INNOBDB_SYS_INDEXES` exceeding `LIMIT ROWS EXAMINED` causes `ER_UNKNOWN_ERROR` and LeakSanitizer errors in `rec_copy_prefix_to_buf_old` ([MDEV-28613](#))

- Assertion `'0'` failed in `row_sel_convert_mysql_key_to_innobase` upon UPDATE using a partial-field key prefix in search (MDEV-21245 [↗](#))
- Assertion failure on REPLACE on ROW_FORMAT=COMPRESSED table (MDEV-31574 [↗](#))
- Crash emitting "Unsupported meta-data version number" error message (MDEV-29972 [↗](#))
- LeakSanitizer errors in `mem_heap_create_block_func` upon query from `I_S.INNO_DB_SYS_TABLES` with LIMIT ROWS EXAMINED (MDEV-32890 [↗](#))
- Inplace alter rebuild increases file size (MDEV-26740 [↗](#))
- BLOB corruption on UPDATE of PRIMARY KEY with FOREIGN KEY (MDEV-31441 [↗](#))
- GNU libc `posix_fallocate()` may be extremely slow (MDEV-32268 [↗](#))
- InnoDB wrong error message (MDEV-32833 [↗](#))
- Assertion failure on ALTER TABLE...PAGE_COMPRESSED=1 (MDEV-31000 [↗](#))
- InnoDB after ALTER TABLE...IMPORT TABLESPACE may not be crash safe (MDEV-32269 [↗](#))
- InnoDB fails to restore tablespace first page from doublewrite buffer when page is empty (MDEV-32968 [↗](#))
- `innodb_fast_shutdown=0` hang after incomplete startup (MDEV-32798 [↗](#))
- `innodb_undo_log_truncate=ON` prevents fast shutdown (MDEV-33062 [↗](#))
- Adaptive flush recommendation ignores dirty ratio and checkpoint age (MDEV-31939 [↗](#))
- `gc01.gc01_purge` contaminates further execution of `innodb.gap_locks` (MDEV-28682 [↗](#))
- LPAD in vcol created in ORACLE mode makes table corrupted in non-ORACLE (MDEV-27744 [↗](#))
- Adaptive flushing is still not getting invoked in 10.5.11 (MDEV-26055 [↗](#))
- History list is not shrunk unless there is a pause in the workload (MDEV-33213 [↗](#))
- path separator near `ib_buffer_pool` incorrect (MDEV-32983 [↗](#))
- Deadlock between `buf_page_get_zip()` and `buf_pool_t::corrupted_evict()` on InnoDB ROW_FORMAT=COMPRESSED table corruption (MDEV-32371 [↗](#))
- Empty INSERT crashes with `innodb_force_recovery=6` or `innodb_read_only=ON` (MDEV-31861 [↗](#))
- Assertion `'end_lsn == page_lsn'` failed in `recv_recover_page` (MDEV-33137 [↗](#))
- Some calls to `buf_read_ahead_linear()` seem to be useless (MDEV-32068 [↗](#))
- Opening all `.ibd` files on InnoDB startup can be slow (MDEV-32027 [↗](#))
- InnoDB LRU flushing does not run before running out of buffer pool (MDEV-33053 [↗](#))
- `innodb_undo_log_truncate=ON` is blocking page writes (MDEV-33112 [↗](#))

Backup

- mariabackup has wrong or missing plugin-dir default? (MDEV-29110 [↗](#))
- mariabackup fails when `innodb_max_dirty_pages_pct` contains a fraction (is not an integer) (MDEV-20286 [↗](#))
- Missing required privilege CONNECTION ADMIN (MDEV-33006 [↗](#))
- If tables are frequently created, renamed, dropped, a backup cannot be restored (MDEV-32939 [↗](#))
- BACKUP LOCKS on table to be accessible to those with database LOCK TABLES privileges (MDEV-28367 [↗](#))

JSON

- Wrong function name in ER_JSON_PATH_NO_WILDCARD error message for JSON_REPLACE (MDEV-24541 [↗](#))
- JSON_VALID fail to validate integer zero in scientific notation (MDEV-32587 [↗](#))
- ASAN errors in `Item_func_json_contains_path::val_int` upon PS execution (MDEV-32867 [↗](#))
- `mysql_json` cannot be used on newly created table (MDEV-32235 [↗](#))
- Problems with a stored function `EMPTY()` on upgrade to 10.6 (MDEV-31616 [↗](#))

Spider

- Thread (10.6+) and server hangs (10.4/10.5) in 'Opening tables' (on optimized builds) and SIGABRT in `safe_mutex_lock` (on debug) on `I_S` read when using Spider (MDEV-29421 [↗](#))
- SIGSEGV in `spider_db_mbase::append_lock_tables` on LOCK TABLES (MDEV-29963 [↗](#))
- ASAN heap-use-after-free in `spider_link_get_key` on LOCK TABLES (MDEV-31357 [↗](#))
- Crash when lateral derived is guaranteed to return no rows (MDEV-31279 [↗](#))
- Bogus error executing PS for query using CTE with renaming of columns (MDEV-31995 [↗](#))
- Spider: Valid LEFT JOIN results in ERROR 1064 (MDEV-26247 [↗](#))
- Trying to lock uninitialized mutex or hang upon shutdown after using Spider with `query_cache` (MDEV-28739 [↗](#))
- Spider tests failing in asan/valgrind builds (MDEV-32849 [↗](#))
- Backport fixes to spider init bugs to 10.4-10.6 once they have SQL service (MDEV-29870 [↗](#))
- Server crash with SIGSEGV or dynamic-stack-buffer-overflow in `spider_db_mbase_util::append_table` (MDEV-29163 [↗](#))
- heap-use-after-free in `ha_spider::lock_tables()`, highly sporadic SIGSEGV in `intern_close_table` (MDEV-30014 [↗](#))
- Syntax error upon query with subquery from Spider table (MDEV-30392 [↗](#))
- Spider doesn't recognize semi JOIN (MDEV-31645 [↗](#))

- MariaDB, SPIDER engine, usage of `REGEXP` ([MDEV-32986](#))
- Spider: variable `spider_same_server_link` not functioning correctly ([MDEV-29718](#))
- Spider fails to autodiscover structure (did in <=10.5) and reports `ERROR 12500 (HY000): unknown` ([MDEV-33008](#))
- Spider spawns unnecessarily many system threads for stats synchronization ([MDEV-29020](#))
 - Defaults for `spider_table_crd_thread_count` and `spider_table_sts_thread_count` changed from 10 to 1
- `SIGSEGV` in `spider_db_delete_all_rows` on `TRUNCATE`, `UBSAN: member call on null pointer of type 'struct spider_db_handler'` in `spider_db_delete_all_rows` ([MDEV-33191](#))
- `mariadb-upgrade` fails with `'System table spider_tables is different version' => Can't create database 'performance_schema'` ([MDEV-27103](#))
- Spider: `SIGSEGV` in `spider_db_direct_delete`, `SIGSEGV` in `spider_db_connect`, `ASAN: heap-use-after-free` in `spider_db_direct_delete` ([MDEV-28683](#))
- No error for `DROP TABLE` and no warning for `DROP TABLE IF EXISTS` with absent table when Spider plugin is included ([MDEV-30170](#))
- `ASAN errors` in `spider_conn_queue_and_merge_loop_check` ([MDEV-29002](#))

Optimizer

- Crash caused by multi-table `UPDATE` over derived with hanging CTE ([MDEV-28615](#))
- Crash on query using CTE with the same name as a base table ([MDEV-31657](#))
- Crash with query using constant subquery as left part of `IN` subquery ([MDEV-29362](#))
- Incorrect result interceptor passed to `mysql_explain_union()` ([MDEV-33165](#))
- Add `optimizer_adjust_secondary_key_costs` variable to influence how costs for secondary keys are calculated. ([MDEV-33118](#))
- `INSERT ... SELECT` Does not produce an optimizer trace ([MDEV-29298](#))
- Unusable key notes do not get reported for some operations ([MDEV-32958](#))
- Unusable key notes report wrong predicates for `>` and `>=` ([MDEV-32957](#))

Data Definition, Data Manipulation

- `ALTER SEQUENCE IF NOT EXISTS non_existing_seq` Errors rather than note ([MDEV-32795](#))
- Unexpected `ER_ERROR_ON_RENAME` upon `DROP` non-existing `FOREIGN KEY` with `ALGORITHM=COPY` ([MDEV-22230](#))
- `FOREIGN_KEY_CHECKS` does not prevent non-copy alter from creating invalid FK structure ([MDEV-29092](#))
- Assertion `!"wrong page type"` or Assertion `"wrong page type" == 0'` failed in `innobase_instant_try` on `ALTER` ([MDEV-18322](#))
- Assertion `(col.vers_sys_end())` upon inplace `ALTER` with virtual columns ([MDEV-20545](#))
- `DELETE` with `ORDER BY` and semijoin optimization causing crash ([MDEV-32212](#))
- Invalid expr in `cleanup_session_expr()` upon `INSERT DELAYED` ([MDEV-29932](#))
- `SIGSEGV` in `my_decimal::operator=` and Assertion `'0'` failed in `Item_type_holder::val_decimal` on `SELECT` ([MDEV-29070](#))
- `LONG UNIQUE` does not work like unique key when using `replace` ([MDEV-32837](#))
- `LONG UNIQUE` gives error when used with `REPLACE` ([MDEV-32839](#))
- Backport [MDEV-32532](#) to 10.6 ([MDEV-32903](#))
- Assertion `'0'` failed in `Item_type_holder::val_int` ([MDEV-29494](#))

Character Sets, Data Types

- InnoDB: `CHAR+nopad` does not work well ([MDEV-26743](#))
- `CAST(AS UNSIGNED)` fails with `--view-protocol` ([MDEV-32645](#))
- `JSON_ARRAYAGG` charset issue ([MDEV-24784](#))
- Server crash in `my_decimal::operator=` or unexpected `ER_DUP_ENTRY` upon comparison with `INET6` and similar types ([MDEV-32879](#))

Plugins

- The `SQL Error Log Plugin` can optionally (when `sql_error_log_with_db_and_thread_info` is enabled) include the thread ID and database / table in its log ([MDEV-27087](#)). `NULL` is displayed if there is no database ([MDEV-32906](#))
- The `SQL Error Log Plugin` can optionally (when `sql_error_log_with_db_and_thread_info` is enabled) include the thread ID and database / table in its log ([MDEV-27087](#))
- Backport SQL service, introduced by [MDEV-19275](#) ([MDEV-27595](#))
- "plugin already loaded" should be a Warning, not an Error ([MDEV-32041](#))
- `mariadb-upgrade` should remove `mysql.plugin` entries for plugins that became bundled ([MDEV-32043](#))

Galera

- Node has been dropped from the cluster on Startup / Shutdown with async replica ([MDEV-31413](#))
- Inconsistency in Galera caused by `ALTER` being aborted before entering TOI mode ([MDEV-32938](#))
- Assertion ``total_length + thd->wsrep_sr().log_position() == saved_pos'` failed in `int wsrep_write_cache_inc(THD*, IO_CACHE*, size_t*)` ([MDEV-28971](#))
- `wsrep_provider_options` can be truncated on deep and long directory paths ([MDEV-32634](#))
- Server crashes in `rpl_sql_thread_info::cached_charset_compare / wsrep_apply_events` ([MDEV-22232](#))
- Galera crash when "create a table as select" ([MDEV-27806](#))
- Cluster is inconsistent after SAVEPOINT statement is rolled back ([MDEV-32549](#))
- `WSREP GTID MODE` is inconsistent ([MDEV-31905](#))
- IST "Donor does not know my secret" with `ssl-mode=VERIFY_CA` ([MDEV-32344](#))

Replication

- Server crashes in `Item_func_binlog_gtid_pos::val_str / Binary_string::c_ptr_safe` ([MDEV-33045](#))
- binlog corruption (/tmp no space left on device at the same moment) ([MDEV-27436](#))
- multi source replication filters breaking GTID semantic ([MDEV-26632](#))
- `SHOW SLAVE STATUS` Can Deadlock an Errored Slave ([MDEV-10653](#))
- `main.rpl_mysql_dump_slave` Fails with "Master binlog wasn't deleted" Assertion ([MDEV-32953](#))
- `rpl_seconds_behind_master_spike` Sensitive to IO Thread Stop Position ([MDEV-33327](#))
- Binlog Checksum is Zeroed by Zlib if Part of Event Data is Empty ([MDEV-33283](#))
- "Read semi-sync reply magic number error" warnings on master ([MDEV-32551](#))
- Second Semi-sync Replica Can Hang at Connect Time ([MDEV-32792](#))
- Semi-sync ACKed Transaction can Timeout and Switch Off Semi-sync with Multiple Replicas ([MDEV-32960](#))
- Semi-Sync Ack_Receiver Thread Should Allow COM_QUIT Command ([MDEV-32385](#))

General

- As per the [MariaDB Deprecation Policy](#), this will be the last release of [MariaDB 10.6](#) for Fedora 37, and Windows Server 2019
- `s3_debug` is now dynamic, and `s3_protocol_version` contains new options, and old options have been deprecated ([MDEV-32884](#))
- Upgrade [HeidiSQL](#) to 12.6.
- Using two temporary tables in `OPTIMIZE TABLE` lead to crash ([MDEV-31523](#))
- `REGEXP_REPLACE` treats empty strings different than `REPLACE` in ORACLE mode ([MDEV-29095](#))
- `CREATE UNIQUE INDEX` fails with "ERROR 1286 (42000): Unknown storage engine 'partition'" ([MDEV-21618](#))
- Failure when executing `PS` for query using `IN` subquery ([MDEV-32569](#))
- Potential memory leak on executing of create view statement ([MDEV-32466](#))
- Assertion failures ([MDEV-32965](#))
- Two JSON related tests running in PS mode fail on server built with `-DWITH_PROTECT_STATEMENT_MEMROOT=YES` ([MDEV-32733](#))
- Alter sequence 2nd ps fails while alter sequence 2nd time (no ps) succeeds ([MDEV-33169](#))
- Set `TaskMax=inifinity` in the MariaDB systemd unit ([MDEV-30236](#))
- Unreliable autocommit flag on connection creation ([MDEV-32875](#))
- A connection can control `RAND()` in following connection ([MDEV-33148](#))
- `THD::rli_fake/rqi_fake` not cleared on new connection ([MDEV-32844](#))
- Assertion failures in `tdc_remove_table` upon interrupted `CREATE TABLE LIKE <sequence>` ([MDEV-20471](#))
- Server crash in `find_field_in_table` ([MDEV-32082](#))
- `LPAD` in vcol created in `ORACLE` mode makes table corrupted in non-ORACLE ([MDEV-27744](#))
- Failure to call SP invoking another SP with parameter requiring type conversion ([MDEV-33270](#))
- The database part is not case sensitive in SP names ([MDEV-33019](#))
- `EXCHANGE PARTITION` with non-matching vcol expression segfault ([MDEV-28127](#))
- Wrong user in `SET DEFAULT ROLE` error ([MDEV-26875](#))
- `quote(NULL)` returns incorrect result in view ('NU' instead of 'NULL') ([MDEV-28651](#))
- `mysql.slow_log` reports incorrect start time ([MDEV-11628](#))
- Update federated table and column privileges ([MDEV-32984](#))
- Disable transparent huge pages after page buffers have been allocated ([MDEV-33279](#))
- Deprecate `secure_auth=0` ([MDEV-32617](#))
- sys schema view `session_ssl_status` is empty ([MDEV-32751](#))

Changelog

For a complete list of changes and bugfixes made in [MariaDB 10.6.17](#), with links to detailed information on each push, see

Contributors

For a full list of contributors to [MariaDB 10.6.17](#), see the [MariaDB Foundation release announcement](#) [↗](#).

Be notified of new MariaDB Server releases automatically by [subscribing](#) [↗](#) to the MariaDB Foundation community announce 'at' lists.mariadb.org announcement list (this is a low traffic, announce-only list). MariaDB plc customers will be notified for all new releases, security issues and critical bug fixes for all MariaDB plc products thanks to the Notification Services.

7.0.6.2.6 MariaDB 10.6.16 Release Notes

The most recent release of MariaDB 10.6 is:
MariaDB 10.6.21 Stable (GA) [Download Now](#) [↗](#)
Alternate download from [mariadb.org](#) [↗](#)

[Download 10.6.16](#) [↗](#)

[Release Notes](#)

[Changelog](#) [↗](#)

[Overview of 10.6](#)

Release date: 13 Nov 2023

[MariaDB 10.6](#) is the current long-term series of MariaDB, [maintained until](#) [↗](#) July 2026. It is an evolution of [MariaDB 10.5](#) with several entirely new features.

[MariaDB 10.6.16](#) is a **Stable (GA)** [↗](#) release.

For an overview of [MariaDB 10.6](#) see the [What is MariaDB 10.6?](#) page.

Thanks, and enjoy MariaDB!

Notable Items

InnoDB

- [DROP INDEX](#) followed by [CREATE INDEX](#) may corrupt data ([MDEV-32132](#) [↗](#))
- `ROW_FORMAT=COMPRESSED` table: InnoDB: 2048 bytes should have been read. Only 0 bytes read. ([MDEV-31875](#) [↗](#))
- Server aborts during alter operation when table doesn't have foreign index ([MDEV-32527](#) [↗](#))
- `row_merge_fts_doc_tokenize()` handles FTS plugin parser inconsistently ([MDEV-32578](#) [↗](#))
- InnoDB: tried to purge non-delete-marked record of an index on a virtual column prefix ([MDEV-30024](#) [↗](#))
- `lock_row_lock_current_waits` counter in `information_schema.innodb_metrics` may become negative ([MDEV-30658](#) [↗](#))
- `SET GLOBAL innodb_max_purge_lag_wait=...` hangs if `innodb_read_only=ON` ([MDEV-31813](#) [↗](#))
- Auto-increment no longer works for explicit `FTS_DOC_ID` ([MDEV-32017](#) [↗](#))
- Assertion ``pos < table->n_def` failed in `dict_table_get_nth_col` ([MDEV-32337](#) [↗](#))
- `innochecksum` man pages seem to be inconsistent with the binary (10.2.25) ([MDEV-20583](#) [↗](#))
- `innodb_compression_algorithm=0` (none) increments `Innodb_num_pages_page_compression_error` ([MDEV-30825](#) [↗](#))
- wrong table name in innodb's "row too big" errors ([MDEV-32128](#) [↗](#))
- Optimize `is_file_on_ssd()` to speedup opening tablespaces on Windows ([MDEV-32228](#) [↗](#))
- Race condition between page write completion and log checkpoint ([MDEV-32511](#) [↗](#))
- After crash recovery, Checksum mismatch + Failing assertion: `!i || prev_id + 1 == space_id`, ([MDEV-31851](#) [↗](#))
- Deadlock due to `log_free_check()`, involving `trx_purge_truncate_rseg_history()` and `trx_undo_assign_low()` ([MDEV-32049](#) [↗](#))
- Write-ahead logging is broken for freed pages ([MDEV-32552](#) [↗](#))
- X-lock on supremum for prepared transaction for RR ([MDEV-30165](#) [↗](#))
- Assertion failures in `log_sort_flush_list` upon crash recovery ([MDEV-32029](#) [↗](#))

- Race condition between page write completion and log checkpoint ([MDEV-32511](#))
- Assertion `purge_sys.tail.trx_no <= purge_sys.rseg->last_trx_no()` ([MDEV-30100](#))
- Assertion `index->is_btree() || index->is_ibuf()` failed in btr_search_guess_on_hash ([MDEV-30802](#))
- InnoDB hang in buf_flush_wait_LRU_batch_end() ([MDEV-32134](#))
- InnoDB may hang when running out of buffer pool ([MDEV-32588](#))
- Corrupt index(es) on busy table when using FOREIGN KEY ([MDEV-30531](#))
- InnoDB Recovery doesn't display encryption message when no encryption configuration passed ([MDEV-31098](#))
- Wrong information about innodb_checksum_algorithm in the information_schema.SYSTEM_VARIABLES ([MDEV-31473](#))
- InnoDB may fail to recover after being killed in fil_delete_tablespace() ([MDEV-31826](#))
- Create separate pool thread for async aio ([MDEV-31095](#))
- UNDO logs still growing for write-intensive workloads ([MDEV-32050](#))
 - Increase the default for `innodb_purge_batch_size` from 300 to 1000 ([MDEV-32050](#))
 - Deprecate `innodb_purge_rseg_truncate_frequency`.
 - The motivation for introducing this in MySQL seems to have been to avoid stalls due to freeing undo log pages or truncating undo log tablespaces. In MariaDB, `innodb_undo_log_truncate=ON` should be a much lighter operation because it will not involve any log checkpoint. ([MDEV-32050](#))
- Slow full index scan in 10.6 vs 10.5 for the (slow) I/O-bound case ([MDEV-30986](#))
- LOAD DATA into InnoDB w/partitions: huge performance loss, affected 10.6+ ([MDEV-31835](#))
- Disable read-ahead for temporary tablespace ([MDEV-32145](#))

Optimizer

- New `optimizer_switch` setting, `cset_narrowing`, to enable the [Charset Narrowing Optimization](#) ([MDEV-32113](#))
- Crash when HAVING in a correlated subquery references columns in the outer query ([MDEV-29731](#))
- Server crashes at TABLE::add_tmp_key ([MDEV-32320](#))
- Server crashes inside filesort at my_decimal::to_binary ([MDEV-32324](#))
- Assertion `bitmap_is_set(&m_part_info->read_partitions, m_part_spec.start_part)` failed in ha_partition::handle_ordered_index_scan ([MDEV-24283](#))
- Crash when searching for the best split of derived table ([MDEV-32064](#))
- Test case from opt_tvc.test fails with statement memory protection ([MDEV-32225](#))
- Significant slowdown for query with many outer joins ([MDEV-32351](#))
- `test_if_skip_sort_order()` should catch the join types JT_EQ_REF, JT_CONST and JT_SYSTEM and skip sort order for these ([MDEV-32475](#))
- jointable materialization subquery optimization ignoring errors, then failing ASSERT. ([MDEV-31983](#))
- Server crashes in JOIN::cleanup after erroneous query with view ([MDEV-32164](#))
- Prepared statement return wrong result (missing row) ([MDEV-9938](#))
- Assertion `range->rows >= s->found_records` failed in best_access_path ([MDEV-32682](#))

Replication

- rpl.rpl_parallel_temptable failure due to incorrect commit optimization of temptables ([MDEV-10356](#))
- Lock wait timeout with INSERT-SELECT, autoinc, and statement-based replication ([MDEV-31482](#))
- strings/ctype-ucs2.c:2336: my_vsnprintf_utf32: Assertion `(n % 4) == 0' failed in my_vsnprintf_utf32 on INSERT ([MDEV-32249](#))
- Assertion fails in MDL_context::acquire_lock upon parallel replication of CREATE SEQUENCE ([MDEV-31792](#))
- SHOW SLAVE STATUS Last_SQL_Errno Race Condition on Errored Slave Restart ([MDEV-31177](#))
- seconds_behind_master is inaccurate for Delayed replication ([MDEV-32265](#))
- detailize the semisync replication magic number error ([MDEV-32365](#))
- Parallel replication deadlock victim preference code erroneously removed ([MDEV-31655](#))
- Parallel replication lags because innobase_kill_query() may fail to interrupt a lock wait ([MDEV-32096](#))

Galera

- [Galera](#) updated to 26.4.16
- Assertion `state() == s_executing || state() == s_prepared || state() == s_committing || state() == s_must_abort || state() == s_replaying' failed. ([MDEV-24912](#))
- Assertion `state() == s_executing || state() == s_preparing || state() == s_prepared || state() == s_must_abort || state() == s_aborting || state() == s_cert_failed || state() == s_must_replay' failed ([MDEV-31285](#))
- wsrep_sst_mariabackup not working on FreeBSD ([MDEV-31467](#))
- Galera library 26.4.16 fails with every server version ([MDEV-32024](#))
- Galera node remains paused after interleaving FTWRLs ([MDEV-32282](#))
- Failed to insert streaming client ([MDEV-32051](#))
- When set at runtime, `wsrep_sst_method` accepts any value ([MDEV-31470](#))
- galera needs packaging script changes to successfully build ([MDEV-32642](#))
- replication breaks when using optimistic replication and replica is a galera node ([MDEV-31833](#))

- McAfee database vulnerability scan caused MariaDB crash with signal 6 (system abort) ([MDEV-27004](#))
- Assertion `mode == m_local || transaction_is_streaming()` failed in int wsrep::client_state::bf_abort(wsrep::seqno) ([MDEV-30217](#))

Data Definition

- MariaDB crash on calling function ([MDEV-23902](#))
- ASAN errors in grn_obj_unlink / ha_mroonga::clear_indexes upon index operations ([MDEV-31970](#))
- vcol circular references lead to stack overflow ([MDEV-31112](#))
- OPTIMIZE TABLE crash ([MDEV-28122](#))
- Server crashes in Alter_info::add_stat_drop_index upon CREATE TABLE ([MDEV-32449](#))

Scripts and Clients

- mariadb-binlog -T/--table (mysqlbinlog) option ([MDEV-25369](#))
- mariadb-admin (mysqldadmin) wrong error with simple_password_check ([MDEV-22418](#))
- mariadb-install-db shows warning on missing directory \$pamtool_dir/auth_pam_tool_dir ([MDEV-32142](#))
- main.mysql_client_test, main.mysql_client_test_comp failed on ASAN build with error: 5888, status: 23, errno: 2 ([MDEV-19369](#))
- mariadb-install-db (mysql_install_db) doesn't properly grant proxy privileges to all default root user accounts ([MDEV-21194](#))

Tests

- main.events_stress or events.events_stress fails with view-protocol ([MDEV-31455](#))
- main.delete_use_source fails (hangs) with view-protocol ([MDEV-31457](#))
- main.sum_distinct-big and main.merge-big fail with timeout with view-protocol ([MDEV-31465](#))
- main.secure_file_priv_win fails with 2nd execution PS protocol ([MDEV-32023](#))
- Windows : mtr output on is messed up with large MTR_PARALLEL ([MDEV-32387](#))
- main.mysql_client_test_comp failed in buildbot, error on exec ([MDEV-16641](#))
- main.order_by_pack_big fails with view-protocol ([MDEV-31460](#))
- mysql_install_db_win.test fails on second execution ([MDEV-32232](#))

MariaBackup

- MariaBackup full backup failed with InnoDB: Failing assertion: success in storage/innobase/fil/fil0fil.cc line 657 ([MDEV-18200](#))
- mbstream breaks page compression on XFS ([MDEV-25734](#))

Character Sets, Data Types, Collations

- Prefix keys for CHAR work differently for MyISAM vs InnoDB ([MDEV-30048](#))
- Inconsistent results of DISTINCT with NOPAD ([MDEV-30050](#))
- Assertion `(length % 4) == 0` failed in my_lengthsp_utf32 on INSERT ([MDEV-28835](#))
- Compressed varchar values lost on joins when sorting on columns from joined table(s) ([MDEV-31724](#))
- UBSAN shift exponent X is too large for 64-bit type 'long long int' in sql/field.cc ([MDEV-32226](#))
- Wrong bit encoding using COALESCE ([MDEV-32244](#))

Spider

- Spider UBSAN runtime error: applying non-zero offset x to null pointer in st_spider_param_string_parse::restore_delims ([MDEV-31117](#))
- Segfault when setting spider_delete_all_rows to 0 and delete all rows of a spider table, ASAN heap-use-after-free in spider_db_delete_all_rows ([MDEV-31996](#))
- ASAN errors in spider_fields::free_conn_holder or spider_create_group_by_handler ([MDEV-28998](#))
- ASAN: heap-buffer-overflow & stack-buffer-overflow in spider_db_mbase_row::append_to_str | SIGSEGV's in memmove_avx_unaligned_erms from memcpy in Binary_string::q_append, in Static_binary_string::q_append and my_strntoull10rnd_8bit | Unknown error 12801 ([MDEV-29502](#))

General

- binlog_do_db option breaks importing sql dumps ([MDEV-29989](#))
- Crashes in MDL_key::mdl_key_init with lower-case-table-names=2 ([MDEV-32025](#))
- getting error 'Illegal parameter data types row and bigint for operation '+' when using ITERATE in a FOR..DO

([MDEV-32275](#))

- Assertion `arena_for_set_stmt== 0` failed in LEX::set_arena_for_set_stmt upon SET STATEMENT ([MDEV-17711](#))
- main.mysqlcheck fails on ARM with ASAN use-after-poison in my_mb_wc_filename ([MDEV-26494](#))
- main.delayed fails with wrong error code or timeout when executed after main.deadlock_ftwrl ([MDEV-27523](#))
- Assertion failed: !pfs->m_idle || (state == PSI_SOCKET_STATE_ACTIVE) ([MDEV-28561](#))
- MyISAM wrong server status flags ([MDEV-28820](#))
- Server crashes in check_sequence_fields upon CREATE TABLE .. SEQUENCE=1 AS SELECT .. ([MDEV-29771](#))
- slow log Rows_examined out of range ([MDEV-30820](#))
- " rpm --setugids " breaks PAM authentication ([MDEV-30904](#))
- incorrect examined rows in case of stored function usage ([MDEV-31742](#))
- Compilation failing on MacOS (unknown warning option -Wno-unused-but-set-variable) ([MDEV-31890](#))
- Server crash upon inserting into Mroonga table with compressed column ([MDEV-31966](#))
- hash unique corrupts index on virtual blobs ([MDEV-32012](#))
- insert into an empty table fails with hash unique ([MDEV-32015](#))
- Valgrind/MSAN warnings in dynamic_column_update_move_left ([MDEV-32140](#))
- Memory leak showed in [MDEV-6146](#) test suite ([MDEV-32223](#))
- Test from subselect.test fails with statement memory protection ([MDEV-32245](#))
- Memory leak when executing PS for query with IN subquery ([MDEV-32369](#))
- Allow the setting of Auto_increment on FK referenced columns ([MDEV-32018](#))
- mariadb-upgrade fails with sql_safe_updates = on ([MDEV-29914](#))
- Assertion `!(thd->server_status & (1U | 8192U))` failed in MDL_context::release_transactional_locks ([MDEV-32541](#))
- Information schema leaks table names and structure to unauthorized users ([MDEV-32500](#))
- Missing CHACHA20-POLY1305 support in WolfSSL ([MDEV-31653](#))
- incorrect error about cyclic reference about JSON type virtual column ([MDEV-32586](#))
- Disable TLS v1.0 and 1.1 for MariaDB ([MDEV-31369](#))
- Better indication of refusing to start because of ProtectHome ([MDEV-25177](#))
- Database upgrade fails: slow_log table ([MDEV-27757](#))
- myrocks_hotbackup.1 and test suite files installed when engine is disabled ([MDEV-29993](#))
- client_ed25519.dll isn't included for HeidiSQL. ([MDEV-31315](#))
- Assertion `!m_null_value` failed in int FixedBinTypeBundle<FbtImpl>::cmp_item_fbt::compare or in cmp_item_inet6::compare ([MDEV-27207](#))
- type_test.type_test_double fails with 'NUMERIC_SCALE NULL' ([MDEV-22243](#))
- LeakSanitizer errors in get_quick_select or Assertion `status_var.local_memory_used == 0 || !debug_assert_on_not_freed_memory` failed ([MDEV-32476](#))
- Update signal handler user info more compassion and correct url ([MDEV-32535](#))
- maria-install-db fails on MacOS ([MDEV-31871](#))
- MSAN / Valgrind errors in Item_func_like::get_mm_leaf upon query from partitioned table ([MDEV-32388](#))
- MSAN / Valgrind errors in Item_func_like::get_mm_leaf with temporal field ([MDEV-32531](#))
- ASAN errors in base_list_iterator::next / setup_table_map upon 2nd execution of PS ([MDEV-32656](#))
- safe_mutex: Found wrong usage of mutex 'LOCK_thd_data' and 'wait_mutex' ([MDEV-32728](#))

Docker Official Images

- Invert single and double quotes for sql command definitions in [healthcheck.sh](#) due to failure under `sql_mode=ANSI_QUOTES` - contribution by Dominik Häckel
- [healthcheck.sh](#) --no-defaults behaviour was corrected - reported by Dominik Häckel
- Added `/docker-entrypoint-init.d` for `tar{compression}` from [mariadb-backup - instructions](#)
- Refactor `docker_mariadb_init` in the entrypoint for extending the MariaDB image
- CIS failure due to world-writable directory `/var/run/mysqld`, added sticky bit - reported by @ollie1
- Add [PROXY privileges](#) for `root@MARIADB_ROOT_HOST` - reported by Matthieu Gusmini
- [healthcheck.sh](#) added `--galera_online` test, to match what the [mariadb-operator](#) does.

Variables

- Added the `note_verbosity` system variable to manage [notes when an index cannot be used](#).

Security

- Fixes for the following [security vulnerabilities](#):
 - [CVE-2023-22084](#)

Changelog

Thanks, and enjoy MariaDB!

Notable Items

Upgrading from MySQL

- MariaDB now detects and converts previously incompatible MySQL partition schemes ([MDEV-29253](#))

General

- As per the [MariaDB Deprecation Policy](#), this will be the last release of [MariaDB 10.6](#) for Ubuntu 18.04 LTS "Bionic" and Ubuntu 22.10 "Kinetic"
- `mariadb-dump --force` doesn't ignore error as it should ([MDEV-31092](#))
- 280 Bytes lost in `mysys/array.c`, `mysys/hash.c`, `sql/sp.cc`, `sql/sp.cc`, `sql/item_create.cc`, `sql/item_create.cc`, `sql/sql_yacc.yy:10748` when using oracle `sql_mode` ([MDEV-26186](#))
- SQL/PL package body does not appear in `I_S.ROUTINES.ROUTINE_DEFINITION` ([MDEV-30662](#))
- Unexpected result when combining `DISTINCT`, subselect and `LIMIT` ([MDEV-28285](#))
- `ROW` variables do not get assigned from subselects ([MDEV-31250](#))
- Crash after setting global `session_track_system_variables` to an invalid value ([MDEV-25237](#))
- ODKU of non-versioning column inserts history row ([MDEV-23100](#))
- UPDATE not working properly on transaction precise system versioned table ([MDEV-25644](#))
- Assertion ``const_item_cache == true'` failed in `Item_func::fix_fields` ([MDEV-31319](#))
- ANALYZE doesn't work with pushed derived tables ([MDEV-29284](#))
- `get_partition_set` is never executed in `ha_partition::multi_range_key_create_key` due to bitwise & with 0 constant ([MDEV-24712](#))
- Client can crash the server with a `mysql_list_fields("view")` call ([MDEV-30159](#))
- `I_S.parameters` not immediately changed updated after procedure change ([MDEV-31064](#))
- `bzero` wipes more bytes than necessary in `set_global_from_ddl_log_entry` ([MDEV-31521](#))
- Assertion ``0'` failed in `Type_handler_row::field_type` upon `TO_CHAR` with wrong argument ([MDEV-29152](#))

- `mysql_upgrade` fails due to `old_mode=""`, with "Cannot load from mysql.proc. The table is probably corrupted" ([MDEV-28915](#))

Character Sets, Data Types

- UBSAN: null pointer passed as argument 1, which is declared to never be null in `my_strncoll_binary` on `SELECT ... COUNT` or `GROUP_CONCAT` ([MDEV-28384](#))
- Possibly wrong result or Assertion ``0' failed in Item_func_round::native_op` ([MDEV-23838](#))
- Assertion ``(length % 4) == 0' failed in my_lengthsp_utf32` on `SELECT` ([MDEV-29019](#))
- UBSAN: negation of `-X` cannot be represented in type `'long long int'`; cast to an unsigned type to negate this value to itself in `Item_func_mul::int_op` and `Item_func_round::int_op` ([MDEV-30932](#))
- Assorted assertion failures in `json_find_path` with certain collations ([MDEV-23187](#))

InnoDB

- Crashing on I/O error is unhelpful ([MDEV-27593](#))
- SIGSEGV in `log_sort_flush_list()` in InnoDB crash recovery ([MDEV-31354](#))
- InnoDB tables are being flagged as corrupted on an I/O bound server ([MDEV-31767](#))
- Deadlock with 3 concurrent `DELETEs` by `unique key` ([MDEV-10962](#))
- Server Status `InnoDB_row_lock_time%` is reported in seconds ([MDEV-29311](#))
- `innochecksum` dies with Floating point exception ([MDEV-31641](#))
- Add InnoDB engine information to the `slow query log` ([MDEV-31558](#))
- `innodb` protection against dual processes accessing data insufficient ([MDEV-31568](#))
- `ER_DUP_KEY` in `mysql.innodb_table_stats` upon `RENAME` on sequence ([MDEV-31607](#))
- Assertion ``!strcmp(index->table->name.m_name, "SYS_FOREIGN") || !strcmp(index->table->name.m_name, "SYS_FOREIGN_COLS")' failed in btr_node_ptr_max_size` ([MDEV-19216](#))
- InnoDB: Failing assertion: `page_type == i_s_page_type[page_type].type_value` ([MDEV-31386](#))
- `btr_estimate_n_rows_in_range()` accesses unfixed, unlatched page ([MDEV-30648](#))
- `MODIFY COLUMN` can break FK constraints, and lead to unrestorable dumps ([MDEV-31086](#))
- Recovery or backup failure after `innodb_undo_log_truncate=ON` ([MDEV-31487](#))
- Assertion `'n & PENDING' failed in fil_space_t::set_needs_flush()` ([MDEV-31442](#))
- `fil_node_open_file()` releases `fil_system.mutex` allowing other thread to open its file node ([MDEV-31256](#))
- ASAN errors in `dict_v_col_t::detach` upon adding key to virtual column ([MDEV-31416](#))
- Purge trying to access freed secondary index page ([MDEV-31264](#))
- Freed data pages are not always being scrubbed ([MDEV-31253](#))
- InnoDB recovery hangs after reporting corruption ([MDEV-31353](#))
- `!cursor->index->is_committed()` in `row0ins.cc` after update to 10.4.13 from 10.3.21 ([MDEV-22739](#))
- `innodb_undo_log_truncate=ON` fails to wait for purge of enough transaction history ([MDEV-31355](#))
- `SET GLOBAL innodb_undo_log_truncate=ON` does not free space when no undo logs exist ([MDEV-31382](#))
- `innodb_read_ahead_threshold` (linear read-ahead) does not work ([MDEV-29967](#))
- InnoDB recovery and `mariadb-backup --prepare` fail to report detailed progress ([MDEV-29911](#))
- `fil_ibd_create()` may hijack the file handle of an old file ([MDEV-31347](#))
- `innodb_undo_log_truncate=ON` recovery results in a corrupted undo log ([MDEV-31373](#))
- Server freeze due to `innodb_change_buffering` and `innodb_file_per_table=0` ([MDEV-31088](#))
- Change buffer entries are left behind when freeing a page, causing secondary index corruption when the page is later reused ([MDEV-31385](#))
- Foreign Key Constraint actions don't affect Virtual Column ([MDEV-18114](#))

Aria

- Various crashes upon `INSERT/UPDATE` after changing Aria settings ([MDEV-28054](#))
- Various crashes/asserts/corruptions when Aria encryption is enabled/used, but the encryption plugin is not loaded ([MDEV-26258](#))

Spider

- SIGSEGV in `spider_db_open_item_field` and SIGSEGV in `spider_db_print_item_type`, on `SELECT` ([MDEV-29447](#))
- `Spider variables` that double as table params overriding mechanism is buggy ([MDEV-31524](#))

Optimizer

- `ANALYZE FORMAT=JSON` now includes InnoDB engine statistics for each table ([MDEV-31577](#))

- Assertion ``last_key_entry >= end_pos'` failed in virtual bool JOIN_CACHE_HASHED::put_record() (MDEV-31348 [🔗](#))
- Problem with open ranges on prefix blobs keys (MDEV-31800 [🔗](#))
- Equal on two RANK window functions create wrong result (MDEV-20010 [🔗](#))
- Recursive CTE execution is interrupted without errors or warnings (MDEV-31214 [🔗](#))
- Assertion ``s->table->opt_range_condition_rows <= s->found_records'` failed in apply_selectivity_for_table (MDEV-31449 [🔗](#))
- Inconsistency between MRR and SQL layer costs can cause poor query plan (MDEV-31479 [🔗](#))
- MAX_SEL_ARG memory exhaustion is not visible in the optimizer trace (MDEV-30964 [🔗](#))
- SHOW TABLES not working properly with lower_case_table_names=2 (MDEV-30765 [🔗](#))
- Segfault on select query using index for group-by and filesort (MDEV-30143 [🔗](#))
- Server crash in store_length, assertion failure in Type_handler_string_result::sort_length (MDEV-31743 [🔗](#))

Replication

- Parallel Slave SQL Thread Can Update Seconds_Behind_Master with Active Workers (MDEV-30619 [🔗](#))
- ALTER SEQUENCE ends up in optimistic parallel slave binlog out-of-order (MDEV-31503 [🔗](#))
- STOP SLAVE takes very long time on a busy system (MDEV-13915 [🔗](#))
- On slave XA COMMIT/XA ROLLBACK fail to return an error in read-only mode (MDEV-30978 [🔗](#))
- Calling a function from a different database in a slave side trigger crashes (MDEV-29894 [🔗](#))
- rpl.rpl_manual_change_index_file occasionally fails in BB with Result length mismatch (MDEV-30214 [🔗](#))

Galera

- Node never returns from Donor/Desynced to Synced when wsrep_mode = BF_ABORT_MARIABACKUP (MDEV-31737 [🔗](#))
- Node has been dropped from the cluster on Startup / Shutdown with async replica (MDEV-31413 [🔗](#))
- KILL QUERY maintains nodes data consistency but breaks GTID sequence (MDEV-31075 [🔗](#))
- Assertion failure !lock.was_chosen_as_deadlock_victim in trx0trx.h:1065 (MDEV-30963 [🔗](#))
- MariaDB stuck on starting commit state (waiting on commit order critical section) (MDEV-29293 [🔗](#))
- Assertion state() == s_aborting || state() == s_must_replay failed in int wsrep::transaction::after_rollback() (MDEV-30013 [🔗](#))
- Assertion !wsrep_has_changes(thd) || (thd->lex->sql_command == SQLCOM_CREATE_TABLE && !thd->is_current_stmt_binlog_format_row()) || thd->wsrep_cs().transaction().state() == wsrep::transaction::s_aborted failed (MDEV-30388 [🔗](#))
- Server crashes when wsrep_sst_donor and wsrep_cluster_address set to NULL (MDEV-28433 [🔗](#))
- Create temporary sequence can cause inconsistency (MDEV-31335 [🔗](#))
- Galera 4 unable to query cluster state if not primary component (MDEV-21479 [🔗](#))

Changelog

For a complete list of changes and bugfixes made in [MariaDB 10.6.15](#), with links to detailed information on each push, see the [changelog](#) [🔗](#).

Contributors

7.0.6.2.8 MariaDB 10.6.14 Release Notes

The most recent release of MariaDB 10.6 is:
MariaDB 10.6.21 Stable (GA) [Download Now](#)

[Alternate download from mariadb.org](#)

[Download 10.6.14](#)

[Release Notes](#)

[Changelog](#)

[Overview of 10.6](#)

Release date: 7 Jun 2023

Warning: This version can cause InnoDB file corruption under high I/O-bound load. Stick to an earlier release, or upgrade to a more recent release, if possible. See [MDEV-31767](#).

MariaDB 10.6 is the current long-term series of MariaDB, [maintained until](#) July 2026. It is an evolution of [MariaDB 10.5](#) with several entirely new features.

MariaDB 10.6.14 is a **Stable (GA)** release.

For an overview of MariaDB 10.6 see the [What is MariaDB 10.6?](#) page.

Thanks, and enjoy MariaDB!

Notable Items

InnoDB

- Server crashes in `st_join_table::choose_best_splitting` ([MDEV-31403](#))
- Crash with condition pushable into derived and containing outer reference ([MDEV-31240](#))
- InnoDB does not free UNDO after the fix of [MDEV-30671](#) ([MDEV-31234](#))
- InnoDB hang fixes ([MDEV-31158](#), [MDEV-31343](#), [MDEV-31350](#))
- `InnoDB_buffer_pool_read_requests` is not updated correctly ([MDEV-31309](#))
- InnoDB monitor `trx_rseg_history_len` was accidentally disabled by default ([MDEV-31308](#))
- Revert "[MDEV-30473](#): Do not allow GET_LOCK() / RELEASE_LOCK() in cluster"

Optimizer

- Crash with condition pushable into derived and containing outer reference ([MDEV-31403](#) [MDEV-31240](#))
- Crash with `EXPLAIN EXTENDED` for multi-table update of system table ([MDEV-31224](#))

Changelog

For a complete list of changes and bugfixes made in [MariaDB 10.6.14](#), with links to detailed information on each push, see the [changelog](#).

Contributors

For a full list of contributors to [MariaDB 10.6.14](#), see the [MariaDB Foundation release announcement](#).

Be notified of new MariaDB Server releases automatically by [subscribing](#) to the MariaDB Foundation community announce 'at' lists.mariadb.org announcement list (this is a low traffic, announce-only list). MariaDB plc customers will be notified for all new releases, security issues and critical bug fixes for all MariaDB plc products thanks to the Notification Services.

MariaDB may already be included in your favorite OS distribution. More information can be found on the [Distributions which Include MariaDB](#) page.

7.0.6.2.9 MariaDB 10.6.13 Release Notes

The most recent release of MariaDB 10.6 is:
MariaDB 10.6.21 Stable (GA) [Download Now](#)

[Alternate download from mariadb.org](#)

[Download 10.6.13](#)

[Release Notes](#)

[Changelog](#)

[Overview of 10.6](#)

Release date: 10 May 2023

MariaDB 10.6 is the current long-term series of MariaDB, [maintained until](#) July 2026. It is an evolution of [MariaDB 10.5](#) with several entirely new features.

MariaDB 10.6.13 is a **Stable (GA)** release.

For an overview of MariaDB 10.6 see the [What is MariaDB 10.6?](#) page.

Thanks, and enjoy MariaDB!

Notable Items

InnoDB

- Crash on [ROLLBACK](#) in a [ROW_FORMAT=COMPRESSED](#) table ([MDEV-30882](#))
- UNIQUE USING HASH accepts duplicate entries for tricky collations ([MDEV-30034](#))
- [rec_get_offsets\(\)](#) is not optimal ([MDEV-30567](#))
- Performance regression in [fil_space_t::try_to_close\(\)](#) introduced in [MDEV-23855](#) ([MDEV-30775](#))
- InnoDB recovery hangs when buffer pool ran out of memory ([MDEV-30551](#))
- InnoDB undo log truncation fails to wait for purge of history ([MDEV-30671](#))
- MariaDB crash due to DB_FAIL reported for a corrupted page ([MDEV-30397](#))
- Deadlock between INSERT and InnoDB non-persistent statistics update ([MDEV-30638](#))
- InnoDB hang on B-tree split or merge ([MDEV-29835](#))
- Performance regression in locking reads from secondary indexes ([MDEV-30357](#))
- Improve adaptive flushing ([MDEV-26055](#))
- Make page flushing even faster ([MDEV-26827](#))
- Purge misses a chance to free not-yet-reused undo pages ([MDEV-29593](#))
- InnoDB temporary tablespace: reclaiming of free space does not work ([MDEV-26782](#))
- Fix miscount of doublewrites by [Innodb_data_written](#) ([MDEV-31124](#))

Backup

- mariadb-backup doesn't utilise innodb-undo-log-directory (if specified as a relative path) during copy-back operation ([MDEV-28187](#))
- mariabackup issues error messages during InnoDB tablespaces export on partial backup preparing ([MDEV-29050](#))
- mariadb-backup does not copy Aria logs if [aria_log_dir_path](#) is used ([MDEV-30968](#))
- Race condition between buffer pool flush and log file deletion in mariadb-backup --prepare ([MDEV-30860](#))

Replication

- Fixed a deadlock on parallel slave involving full image Write event on the sequence engine ([MDEV-29621](#))
- Fixed an attempted out-of-order binlogging error on slave involving ALTER on the sequence engine ([MDEV-31077](#))
- Corrected non-versioned master to versioned slave replication on no-unique attribute table ([MDEV-30430](#))
- Mended encrypted binlog master to error out to gtid-mode slave when master could not decrypt a binlog file ([MDEV-28798](#))
- Refined optimistic parallel slave to error-exit without any hang ([MDEV-30780](#))
- Ensured SHOW-SLAVE-STATUS is processed on the parallel slave having a necessary mutex always initialized ([MDEV-30620](#))
- Fixed the slave applier to report a correct error when [gtid_slave_pos](#) insert fails for some (engine) reasons ([MDEV-31038](#))
- Made parallel slave reports in performance schema consistent with that of show-slave-status ([MDEV-26071](#))

Optimizer

- [Split Materialized](#) optimization is improved to re-fill the materialized table only if necessary. The fewer number of table refills is taken into account when choosing query plan, too ([MDEV-26301](#)).

- New optimizer_switch option, [hash_join_cardinality](#), is added. It is off by default. When set to ON, the optimizer will produce tighter bounds for hash join output cardinality. ([MDEV-30812](#))
- Queries using `SELECT DISTINCT some_expression(aggregate_function())` could produce wrong query result. ([MDEV-20057](#))
- `ANALYZE FORMAT=JSON` now prints more information about [Block Nested Loop joins](#): `block-nl-join` element now has `r_loops`, `r_effective_rows` and `r_other_time_ms` fields ([MDEV-30806](#), [MDEV-30830](#), [MDEV-30972](#)).
- A GROUP BY query with `MIN(primary_key)` in select list and `primary_key<>const` in the WHERE could produce wrong result when executed with "Using index for group-by" strategy ([MDEV-30605](#))
- EXPLAIN could erroneously report that [Rowid Filter optimization](#) is used for partitioned tables. Partitioned tables do not support it. ([MDEV-30596](#))
- A bug in selectivity computations for SINGLE/DOUBLE_PREC_HB histograms could cause wrong estimates to be produced. This could cause the optimizer to pick sub-optimal query plans ([MDEV-31067](#)).

Docker Official Image

- Add replication setup to containers contributed by Md Sahil ([MDEV-29762](#))

General

- As per the [MariaDB Deprecation Policy](#), this will be the last release of [MariaDB 10.6](#) for Fedora 36.
- In this release repositories for Fedora 38 and Ubuntu 23.04 Lunar have been added.

Security

- Fixes for the following [security vulnerabilities](#):
 - [CVE-2022-47015](#)

Changelog

For a complete list of changes and bugfixes made in [MariaDB 10.6.13](#), with links to detailed information on each push, see the [changelog](#).

MariaDB may already be included in your favorite OS distribution. More information can be found on the [Distributions which Include MariaDB](#) page.

7.0.6.2.10 MariaDB 10.6.12 Release Notes

[Download](#)[Release Notes](#)[Changelog](#)[Overview of 10.6](#)

Release date: 6 Feb 2023

[MariaDB 10.6](#) is the current long-term series of MariaDB, [maintained until](#) July 2026. It is an evolution of [MariaDB 10.5](#) with several entirely new features.

[MariaDB 10.6.12](#) is a [Stable \(GA\)](#) release.

For an overview of [MariaDB 10.6](#) see the [What is MariaDB 10.6?](#) page.

Thanks, and enjoy MariaDB!

Notable Items

- As mentioned in the [10.6.11 release notes](#), our Yum/DNF/Zypper repositories for Red Hat Enterprise Linux, CentOS, Fedora, openSUSE, and SUSE are changing **with this release** to being signed with a new GPG key with SHA2 digest algorithms instead of SHA1. See [this blog post](#) and the [GPG](#) page for more details.

InnoDB

- [Full-text index](#) corruption with [system versioning](#) (MDEV-25004)
- [innodb_undo_log_truncate=ON](#) recovery and backup fixes (MDEV-29999, MDEV-30179, MDEV-30438)
- Upgrade after a crash is not supported (MDEV-24412)
- Remove [InnoDB buffer pool](#) load throttling (MDEV-25417)
- InnoDB shutdown hangs when the change buffer is corrupted (MDEV-30009)
- `innodb_fast_shutdown=0` fails to report change buffer merge progress (MDEV-29984)
- `mariadb-backup --backup --incremental --throttle=...` hangs (MDEV-29896)
- Crash after recovery, with InnoDB: Tried to read (MDEV-30132)
- Trying to write ... bytes at ... outside the bounds (MDEV-30069)
- TRUNCATE breaks FOREIGN KEY locking (MDEV-29504, MDEV-29849)
- `INFORMATION_SCHEMA.INNODB_TABLESPACES_ENCRYPTION.NAME` is NULL for undo tablespaces (MDEV-30119)
- Fixed hangs and error handling in B-tree operations (MDEV-29603, MDEV-30400)

Galera

- Galera updated to 26.4.14
- Fixes for cluster wide write conflict resolving (MDEV-29684)

Replication

- Parallel slave applying in binlog order is corrected for admin class of commands including ANALYZE (MDEV-30323)
- [Seconds_Behind_Master](#) is now shown now more precisely at the slave applier start, including in the delayed mode (MDEV-29639)
- `mysqlbinlog --verbose` is made to show the type of compressed columns (MDEV-25277)
- Deadlock is resolved on replica involving `BACKUP STAGE BLOCK_COMMIT` and a committing user XA (MDEV-30423)

JSON

- `JSON_PRETTY` added as an alias for `JSON_DETAILED` (MDEV-19160)

General

- Infinite sequence of recursive calls when processing embedded CTE (MDEV-30248)
- Crash with a query containing nested WINDOW clauses (MDEV-30052)
- Major performance regression with 10.6.11 (MDEV-29988)
- As per the [MariaDB Deprecation Policy](#), this will be the last release of [MariaDB 10.6](#) for Fedora 35.
- In this release repositories for Fedora 37 and Ubuntu 22.10 Kinetic have been added.

Changelog

For a complete list of changes and bugfixes made in [MariaDB 10.6.12](#), with links to detailed information on each push, see the [changelog](#).

Contributors

For a full list of contributors to [MariaDB 10.6.12](#), see the [MariaDB Foundation release announcement](#).

Be notified of new MariaDB Server releases automatically by [subscribing](#) to the MariaDB Foundation community announce 'at' lists.mariadb.org announcement list (this is a low traffic, announce-only list). MariaDB plc customers will be notified for all new releases, security issues and critical bug fixes for all MariaDB plc products thanks to the Notification Services.

MariaDB may already be included in your favorite OS distribution. More information can be found on the [Distributions which Include MariaDB](#) page.

7.0.6.2.11 MariaDB 10.6.11 Release Notes

The most recent release of MariaDB 10.6 is:
MariaDB 10.6.21 Stable (GA) [Download Now](#)
[Alternate download from mariadb.org](#)

[Download 10.6.11](#)

[Release Notes](#)

[Changelog](#)

[Overview of 10.6](#)

Release date: 7 Nov 2022

MariaDB 10.6 is the current long-term maintenance stable series of MariaDB, maintained until July 2026. It is an evolution of MariaDB 10.5 with several entirely new features.

MariaDB 10.6.11 is a [Stable \(GA\)](#) release.

For an overview of MariaDB 10.6 see the [What is MariaDB 10.6?](#) page.

Thanks, and enjoy MariaDB!

Notable Items

SSL

- The server no longer tolerates incorrectly configured SSL ([MDEV-29811](#)). If you have enabled SSL in `my.cnf` but have not configured it properly (for example, a certificate file is missing), MariaDB used to silently disable SSL, leaving you under impression that everything was fine and connections were secure. Since this release, MariaDB will fail to start if SSL is enabled, but cannot be switched on.

Backup

- Assertion on `info.page_size` failed in `xb_delta_open_matching_space` ([MDEV-18589](#))

InnoDB

- Adaptive hash index [MDEV-27700](#), [MDEV-29384](#)
- MVCC and locking ([MDEV-29666](#), [MDEV-27927](#), [MDEV-28709](#), [MDEV-29635](#))
- Virtual columns ([MDEV-29299](#), [MDEV-29753](#))
- InnoDB crash recovery fixes ([MDEV-29559](#))
- Race condition between KILL and transaction commit ([MDEV-29368](#))
- Implement `CHECK TABLE...EXTENDED` for InnoDB ([MDEV-24402](#))
- InnoDB persistent statistics fail to update after bulk insert ([MDEV-28327](#))

Galera

- Galera updated to 26.4.13
- Galera server crashes after 10.3 > 10.4 upgrade ([MDEV-29375](#))
- `wsrep_incoming_addresses` status variable prints 0 as port number if the port is not mentioned in `wsrep_node_incoming_address` system variable ([MDEV-28868](#))

Replication

- XA COMMIT is not binlogged when the XA transaction has not updated any transaction engine ([MDEV-25616](#))
- Concurrent `CREATE TRIGGER` statements made to binlog without any mixup ([MDEV-25606](#))

Repositories

- Beginning with the next release (Q1 2023), our Yum, DNF, and Zypper repositories for Red Hat, Fedora, and SUSE will be migrated to being signed with a new [GPG key](#). The key we are migrating to is the same one we already use for our Debian and Ubuntu Repositories.
 - The short Key ID is: `0xC74CD1D8`
 - The long Key ID is: `0xF1656F24C74CD1D8`
 - The full fingerprint of the key is: `177F 4010 FE56 CA33 3630 0305 F165 6F24 C74C D1D8`
 - The key can be imported now in preparation for this change using the following command:

```
sudo rpm --import https://supplychain.mariadb.com/MariaDB-Server-GPG-KEY
```

Docker Official Image

The following changes have been made to the `docker.io/library/mariadb` container image.

- The number of gpg packages packages has been removed, leaving enough to `apt-get update`, but `dirmngr` that would fetch keys has been removed. (inspired by [issue #469](#))
- The environment variable `LANG=C.UTF-8` has been added for those that exec into containers and copy paste UTF8 characters (fixes [issue #468](#)).
- Adds OCI labels to image (fixes [issue 436](#) and [users need for version](#))
- MariaDB config: `skip-host-cache` and `skip-name-resolve` moved to `/etc/mysql/mariadb.conf.d/05-skipcache.cnf`

Changelog

For a complete list of changes and bugfixes made in [MariaDB 10.6.11](#), with links to detailed information on each push, see the [changelog](#).

7.0.6.2.12 MariaDB 10.6.10 Release Notes

The most recent release of MariaDB 10.6 is:
[MariaDB 10.6.21 Stable \(GA\)](#) [Download Now](#)
Alternate download from [mariadb.org](#)

[Download 10.6.10](#)

[Release Notes](#)

[Changelog](#)

[Overview of 10.6](#)

Release date: 19 Sep 2022

MariaDB 10.6 is the current long-term maintenance stable series of MariaDB, maintained until July 2026. It is an evolution of MariaDB 10.5 with several entirely new features.

MariaDB 10.6.10 is a [Stable \(GA\)](#) release.

For an overview of MariaDB 10.6 see the [What is MariaDB 10.6?](#) page.

Thanks, and enjoy MariaDB!

Notable Items

Issues Fixed

- Assertion `mysql_mutex_assert_owner(&log_sys.flush_order_mutex)` failed in `mtr_t::commit()` ([MDEV-29383](#))
- Frequent "Data structure corruption" in InnoDB after OOM ([MDEV-29374](#))
- Recovery or backup of instant ALTER TABLE is incorrect ([MDEV-29438](#))
- InnoDB Temporary Tablespace (ibtmp1) is continuously growing ([MDEV-28240](#))
- Full text index corruption if shutdown before changes are fully flushed ([MDEV-29342](#))
- `JSON_VALUE()` does not parse NULL properties properly ([MDEV-27151](#))
- InnoDB hangs on multiple concurrent requests of a cold `ROW_FORMAT=COMPRESSED` page ([MDEV-27983](#))

Changelog

For a complete list of changes and bugfixes made in [MariaDB 10.6.10](#), with links to detailed information on each push, see the [changelog](#).

7.0.6.2.13 MariaDB 10.6.9 Release Notes

The most recent release of MariaDB 10.6 is:
MariaDB 10.6.21 Stable (GA) [Download Now](#)
Alternate download from [mariadb.org](#)

[Download 10.6.9](#)

[Release Notes](#)

[Changelog](#)

[Overview of 10.6](#)

Release date: 15 Aug 2022

[MariaDB 10.6](#) is the current long-term maintenance stable series of MariaDB. It is an evolution of [MariaDB 10.5](#) with several entirely new features.

[MariaDB 10.6.8](#) is a **Stable (GA)** release.

For an overview of MariaDB 10.6 see the [What is MariaDB 10.6?](#) page.

Thanks, and enjoy MariaDB!

Regressions

Unfortunately, some bugs have been found post release, so this is updated to help avoid these issues if possible. All are fixed in [MariaDB 10.6.10](#).

- [MDEV-29374](#) — a crash shortly after a page merge (can be triggered by an UPDATE or DELETE or, say, rollback of an INSERT) can cause data corruption
- [MDEV-29342](#) — if InnoDB table had a fulltext index and only one new row was inserted between the last sync (performed asynchronously by a dedicated thread) and server shutdown, the fulltext index wasn't properly updated and became out of sync with the data. Before 10.6.9 this happened silently, in 10.6.9 an assertion crashed the server

after detecting the inconsistency.

Notable Items

InnoDB

- InnoDB corruption due to lack of file locking ([MDEV-28495](#))
- FULLTEXT search with apostrophe, and mandatory words ([MDEV-20797](#))
- ALTER TABLE IMPORT TABLESPACE corrupts an encrypted table ([MDEV-28779](#))
- ALTER TABLE wrong-result fix ([MDEV-26294](#))
- Crash recovery fixes ([MDEV-28668](#), [MDEV-28731](#))
- DDL crash recovery fixes ([MDEV-28752](#), [MDEV-28802](#), [MDEV-28864](#), [MDEV-28870](#), [MDEV-28923](#), [MDEV-28977](#))
- Avoid crashes on corrupted data ([MDEV-13542](#), [MDEV-18519](#), [MDEV-21098](#), [MDEV-22388](#), [MDEV-28457](#))

Replication

- `explicit_defaults_for_timestamp` is stored in binlog, so that CREATE TABLE on slave would always have the same effect as on master. ([MDEV-29078](#))
- ER_SLAVE_INCIDENT error is specified now on slave to be seen with SHOW-SLAVE-STATUS ([MDEV-21087](#))
- INCIDENT_EVENT is no longer binlogged when a being logged transaction can be safely rolledback ([MDEV-21443](#))
- sequences related row-format events are made to correspond to binlog_row_image ([MDEV-28487](#))
- Possible reason of FLUSH BINARY LOGS hang is eliminated ([MDEV-28948](#))
- Fix out-of-order gtid error in the circular semisync setup ([MDEV-28609](#))

Galera

- Galera updated to 26.4.12
- Possible to write/update with read_only=ON and not a SUPER privilege ([MDEV-28546](#))
- Node crashes with Transport endpoint is not connected mysqld got signal 6 ([MDEV-25068](#))
- Galera4 not able to report proper wsrep_incoming_addresses ([MDEV-20627](#))
- Galera should replicate nextval()-related changes in sequences with INCREMENT <> 0, at least NOCACHE ones with engine=InnoDB ([MDEV-27862](#))
- Add support for OpenSSL 3.0 in Galera ([MDEV-25949](#))

Optimizer

- Server crash in JOIN_CACHE::free or in copy_fields ([MDEV-23809](#))
 - Queries that use DISTINCT and an always-constant function like COLLATION(aggregate_func(...)) could cause a server crash. Note that COLLATION() is a special function - its value is constant even if its argument is not constant.
- Crash when using ANY predicand with redundant subquery in GROUP BY clause ([MDEV-29139](#))
 - A query with a subquery in this form could cause a crash:

```
... ANY (SELECT ... GROUP BY (SELECT redundant_subselect_here)) ...
```

- MariaDB Server SEGV on INSERT .. SELECT ([MDEV-26427](#))
 - Certain queries in form "INSERT ... SELECT with_aggregate_or_window_func" could cause a crash.
- restore_prev_nj_state() doesn't update cur_sj_inner_tables correctly ([MDEV-28749](#))
 - Subquery semi-join optimization could miss LooseScan or FirstMatch strategies for certain queries.
- Optimizer uses all partitions after upgrade to 10.3 ([MDEV-28246](#))
 - For multi-table UPDATE or DELETE queries, the optimizer failed to apply Partition Pruning optimization for the table that is updated or deleted from.
- Range optimizer regression for key IN (const,) ([MDEV-25020](#))
 - The issue can be observed on [MariaDB 10.5.9](#) and later versions which have the fix for [MDEV-9750](#). That fix introduced optimizer_max_sel_arg_weight.
 - If one sets optimizer_max_sel_arg_weight to a very high value or zero (which means "unlimited") and runs queries that produce heavy-weight graphs, they can observe a performance slowdown, e.g.:

```
table.keyXpartY [NOT] IN ( ... )
```

- Wrong result with table elimination combined with not_null_range_scan ([MDEV-28858](#))

- If one runs with `optimizer_switch='not_null_range_scan=on'` (which is not enabled by default), a query that does a join and has const tables could produce a wrong result.

OpenSSL

- Backport OpenSSL-3.0 compatibility to 10.6 branch ([MDEV-28133](#))

JSON

- `JSON_TABLE`: extract document fragment into JSON column ([MDEV-25875](#))

CONNECT

- `CONNECT Engine` now supports `INSERT IGNORE` with `Mysql Table type` ([MDEV-27766](#))

mariadb Client

- New `mariadb client` option, `-enable-cleartext-plugin`. Option does not do anything, and is for MySQL-compatibility purposes only.

General

- `explicit_defaults_for_timestamp` now also has a session scope, not only global ([MDEV-29225](#))
- Crash in `JSON_EXTRACT` ([MDEV-29188](#))
- `ALTER TABLE ALGORITHM=NOCOPY` does not work after upgrade ([MDEV-28727](#))
- Server crash upon `CREATE VIEW` with unknown column in `ON` condition ([MDEV-29088](#))
- As per the [MariaDB Deprecation Policy](#), this will be the last release of `MariaDB 10.6` for Debian 10 "Buster" for ppc64el
- Repositories for Ubuntu 22.04 and RHEL/Rocky 9 have been added in this release

Security

- Fixes for the following [security vulnerabilities](#):
 - [CVE-2023-5157](#)
 - [CVE-2022-32082](#)
 - [CVE-2022-32089](#)
 - [CVE-2022-32081](#)
 - [CVE-2018-25032](#)
 - [CVE-2022-32091](#)
 - [CVE-2022-32084](#)
 - [CVE-2022-38791](#)

Changelog

7.0.6.2.14 MariaDB 10.6.8 Release Notes

The most recent release of MariaDB 10.6 is:
MariaDB 10.6.21 Stable (GA) [Download Now](#)
Alternate download from mariadb.org

[Download 10.6.8](#)

[Release Notes](#)

[Changelog](#)

[Overview of 10.6](#)

Release date: 20 May 2022

MariaDB 10.6 is the current long-term maintenance stable series of MariaDB. It is an evolution of [MariaDB 10.5](#) with several entirely new features.

MariaDB 10.6.8 is a **Stable (GA)** release.

For an overview of [MariaDB 10.6](#) see the [What is MariaDB 10.6?](#) page.

Thanks, and enjoy MariaDB!

Note that [MariaDB 10.6.8](#) is not yet available for Ubuntu 22.04 due to [MDEV-28133](#). [MariaDB 10.6.9](#) will be available.

Notable Items

InnoDB

- [innodb_disallow_writes](#) removed ([MDEV-25975](#))
- InnoDB gap locking fixes ([MDEV-20605](#), [MDEV-28422](#))
- InnoDB performance improvements ([MDEV-27557](#), [MDEV-28185](#), [MDEV-27767](#), [MDEV-28313](#), [MDEV-28137](#), [MDEV-28465](#), [MDEV-26789](#))
- Backup regression fixes ([MDEV-27919](#))
- InnoDB portability: FreeBSD futexes ([MDEV-26476](#)), POWER and s390x transactional memory ([MDEV-27956](#))
- ALTER TABLE: Fixed bogus duplicate key errors ([MDEV-15250](#))
- DDL and crash recovery fixes ([MDEV-27274](#), [MDEV-27234](#), [MDEV-27817](#))
- Requests to recalculate [persistent statistics](#) were sometimes lost ([MDEV-27805](#))

Replication

- Semisync-slave server recovery is refined to correctly rollback prepared transaction ([MDEV-28461](#))
- Circular semisync setup endless event circulation is handled ([MDEV-27760](#))
- Semisync-slave server recovery is extended to work on new server_id server ([MDEV-27342](#))
- Server initialization time gtid_slave_pos purge related reason of crashing in binlog background thread is removed ([MDEV-26473](#))
- Shutdown of the semisync master can't produce inconsistent state anymore ([MDEV-11853](#))
- Binlogs disappear after rsync IST ([MDEV-28583](#))
- master crash is eliminated in compressed semisync replication protocol with packet counting amendment ([MDEV-25580](#))
- OPTIMIZE on a sequence does not cause counterfactual ER_BINLOG_UNSAFE_STATEMENT anymore ([MDEV-24617](#))
- Automatically generated Gtid_log_list_event is made to recognize within replication event group as a formal member ([MDEV-28550](#))
- Replication unsafe INSERT .. ON DUPLICATE KEY UPDATE using two or more unique key values at a time with MIXED format binlogging is corrected ([MDEV-28310](#))
- Replication unsafe INSERT .. ON DUPLICATE KEY UPDATE stops issuing unnecessary "Unsafe statement" with MIXED binlog format ([MDEV-21810](#))
- Incomplete replication event groups are detected to error out by the slave IO thread ([MDEV-27697](#))
- mysqlbinlog --stop-never --raw now flushes the result file to disk after each processed event so the file can be listed with the actual bytes ([MDEV-14608](#))

Backup

- Incorrect binlogs after Galera SST using rsync and [mariabackup](#) (MDEV-27524 [🔗](#))
- [mariabackup](#) does not detect multi-source replication slave (MDEV-21037 [🔗](#))
- Useless warning "InnoDB: Allocated tablespace ID <id> for <tablename>, old maximum was 0" during backup stage (MDEV-27343 [🔗](#))
- [mariabackup](#) prepare fails for incrementals if a new schema is created after full backup is taken (MDEV-28446 [🔗](#))

Optimizer

- Query performance degradation in newer MariaDB versions when using many tables (MDEV-28073 [🔗](#))
- A SEGV in Item_field::used_tables/update_depend_map_for_order... (MDEV-26402 [🔗](#))
- ANALYZE FORMAT=JSON fields are incorrect for UNION ALL queries (MDEV-27699 [🔗](#))
- Subquery in an UPDATE query uses full scan instead of range (MDEV-22377 [🔗](#))
- Assertion `item1->type() == Item::FIELD_ITEM ...` (MDEV-19398 [🔗](#))
- Server crashes in Expression_cache_tracker::fetch_current_stats (MDEV-28268 [🔗](#))
- MariaDB server crash at Item_subselect::init_expr_cache_tracker (MDEV-26164 [🔗](#), MDEV-26047 [🔗](#))
- Crash with union of my_decimal type in ORDER BY clause (MDEV-25994 [🔗](#))
- SIGSEGV in st_join_table::cleanup (MDEV-24560 [🔗](#))
- Assertion `!eliminated` failed in Item_subselect::exec (MDEV-28437 [🔗](#))

General

- Server [error messages](#) are [now available in Chinese](#) (MDEV-28227 [🔗](#))
- For RHEL/CentOS 7, non x86_64 architectures are no longer supported upstream and so our support will also be dropped with this release
- Packages for Ubuntu 22.04 LTS "Jammy" and Fedora 36 are not yet available pending the resolution of [MDEV-28133](#) [🔗](#): *Backport OpenSSL-3.0 compatibility to 10.6 branch*
- As per the [MariaDB Deprecation Policy](#), this will be the last release of [MariaDB 10.6](#) for Debian 9 "Stretch", Ubuntu 21.10 "Impish", and Fedora 34

Security

- Fixes for the following [security vulnerabilities](#) [🔗](#):
 - [CVE-2021-46669](#) [🔗](#)
 - [CVE-2022-27376](#) [🔗](#)
 - [CVE-2022-27377](#) [🔗](#)

7.0.6.2.15 MariaDB 10.6.7 Release Notes

The most recent release of MariaDB 10.6 is:
MariaDB 10.6.21 Stable (GA) [Download Now](#)
Alternate download from [mariadb.org](#)

[Download 10.6.7](#)

[Release Notes](#)

[Changelog](#)

[Overview of 10.6](#)

Release date: 12 Feb 2022

[MariaDB 10.6](#) is the current long-term maintenance stable series of MariaDB. It is an evolution of [MariaDB 10.5](#) with several entirely new features.

[MariaDB 10.6.7](#) is a **Stable (GA)** release.

For an overview of [MariaDB 10.6](#) see the [What is MariaDB 10.6?](#) page.

Thanks, and enjoy MariaDB!

- This release fixes a blocking problem with the [MariaDB 10.6.6](#) release when manually running [mariadb-upgrade](#). ([MDEV-27789](#))
- See [MariaDB 10.6.6](#) for other changes since the previous release.

InnoDB

- Set `innodb_change_buffering=none` by default ([MDEV-27734](#))

Security

- Fixes for the following [security vulnerabilities](#):
 - [CVE-2021-46665](#)
 - [CVE-2021-46664](#)
 - [CVE-2021-46661](#)
 - [CVE-2021-46668](#)
 - [CVE-2021-46663](#)

Changelog

For a complete list of changes and bugfixes made in [MariaDB 10.6.7](#), with links to detailed information on each push, see the [changelog](#).

Contributors

7.0.6.2.16 MariaDB 10.6.6 Release Notes

The most recent release of MariaDB 10.6 is:
MariaDB 10.6.21 Stable (GA) [Download Now](#)
[Alternate download from mariadb.org](#)

[Download 10.6.6](#)

[Release Notes](#)

[Changelog](#)

[Overview of 10.6](#)

Release date: 9 Feb 2022

This release is no longer available for download after a problem was noticed when manually running mariadb-upgrade. See [MDEV-27789](#) for more details.

Please use a later release.

MariaDB 10.6 is the current long-term maintenance stable series of MariaDB. It is an evolution of [MariaDB 10.5](#) with several entirely new features.

MariaDB 10.6.6 is a **Stable (GA)** release.

For an overview of [MariaDB 10.6](#) see the [What is MariaDB 10.6?](#) page.

Thanks, and enjoy MariaDB!

Notable Items

InnoDB

- `--skip-symbolic-links` does not disallow `.isl` file creation ([MDEV-26870](#))
- Indexed `CHAR` columns are broken with `NO_PAD` collations ([MDEV-25440](#))
- insert-intention lock conflicts with waiting `ORDINARY` lock ([MDEV-27025](#))
- Crash recovery improvements ([MDEV-26784](#), [MDEV-27022](#), [MDEV-27183](#), [MDEV-27610](#))
- `mariabackup` skips valid `.ibd` file ([MDEV-26326](#))
- Allow seamless upgrade despite `ROW_FORMAT=COMPRESSED` ([MDEV-27736](#))

Galera

- `Galera` updated to 26.4.11
- Galera SST scripts should use `ssl_capath` (not `ssl_ca`) for CA directory ([MDEV-27181](#))
- Alter Sequence do not replicate to another nodes with in Galera Cluster ([MDEV-19353](#))
- Galera crash - Assertion. Possible parallel writeset problem ([MDEV-26803](#))
- CREATE TABLE with FOREIGN KEY constraint fails to apply in parallel ([MDEV-27276](#))
- Galera cluster node consider old `server_id` value even after modification of `server_id` [`wsrep_gtid_mode=ON`] ([MDEV-26223](#))

Replication

- Seconds behind master corrected from artificial spikes at relay-log rotation ([MDEV-16091](#))
- Statement rollback in binlog when transaction creates or drop temporary table is set right ([MDEV-26833](#))
- CREATE-or-REPLACE SEQUENCE is made to binlog with the DDL flag to stabilize its parallel execution on slave

Packaging & Misc

- prohibition running two upgrades in parallel ([MDEV-27068](#), [MDEV-27107](#), [MDEV-27279](#))
- As per the [MariaDB Deprecation Policy](#), this will be the last release of [MariaDB 10.6](#) for Ubuntu 21.04 Hirsute, CentOS 8, and Fedora 33
- [mariadb_repo_setup](#) script updated to version 2022-02-08, with the following fixes and enhancements:
 - Default location of the script has been moved to: https://r.mariadb.com/downloads/mariadb_repo_setup (old location is deprecated, but still works)
 - The GPG keyring file, used with Debian and Ubuntu repositories, has moved to: <https://supplychain.mariadb.com/mariadb-keyring-2019.gpg> and the checksum for the file can be found at: <https://supplychain.mariadb.com/mariadb-keyring-2019.gpg.sha256>
 - Support for RHEL and SLES aarch64 repositories added
 - New function added to verify that the MariaDB Server version, if specified on the command line, follows the correct naming and that a corresponding repository actually exists.
 - Fixed repository pinning for Ubuntu and Debian repositories
 - MariaDB Server 10.7 is now the default server version

Docker Library

- Faster initialization by disabling binary logging during initialization ([MDEV-27074](#))
- `mysql_upgrade` can be run if needed using the environment variable `MARIADB_AUTO_UPGRADE=1` ([MDEV-25670](#))
- A healthcheck script `/usr/local/bin/healthcheck.sh` is installed in the container with various checking options ([MDEV-25434](#))
- `mysql@localhost` user is created with the environment variable `MARIADB_MYSQL_LOCALHOST_USER=1` and additional grants (beyond USAGE) with `MARIADB_MYSQL_LOCALHOST_GRANTS={global grant list}` ([MDEV-27732](#))
- skip innodb buffer pool loads/dumps on temporary startup/shutdown for faster startup/initialization, and accurate "healthcheck.sh --innodb_buffer_pool_loaded"
- change group ownership on datadir/socket dir ([issue #401](#))
- log note about note on Securing system users, `mysql_secure_installation` not required ([reddit suggestion](#))
- speed up Docker Library initialization of timezones ([MDEV-27608](#), [MDEV-23326](#))
- MariaDB names of executable programs and scripts used instead of historical mysql ones

Security

- Fixes for the following [security vulnerabilities](#):
 - [CVE-2022-24052](#)
 - [CVE-2022-24051](#)
 - [CVE-2022-24050](#)
 - [CVE-2022-24048](#)
 - [CVE-2021-46659](#)
 - [CVE-2022-0778](#)
 - [CVE-2022-21595](#)

Changelog

7.0.6.2.17 MariaDB 10.6.5 Release Notes

The most recent release of MariaDB 10.6 is:
MariaDB 10.6.21 Stable (GA) [Download Now](#)

[Alternate download from mariadb.org](#)

[Download 10.6.5](#)

[Release Notes](#)

[Changelog](#)

[Overview of 10.6](#)

Release date: 8 Nov 2021

MariaDB 10.6 is the current stable series of MariaDB. It is an evolution of MariaDB 10.5 with several entirely new features.

MariaDB 10.6.5 is a **Stable (GA)** release.

For an overview of MariaDB 10.6 see the [What is MariaDB 10.6?](#) page.

Thanks, and enjoy MariaDB!

Notable Items

InnoDB

- Linux after kernel version 5.10 has a io-uring regression causing a write to storage to be lost, or not acknowledged. As such `innodb_use_native_aio` will default to 0 (off) until 5.16. If `innodb_use_native_aio` is enabled in your configuration, a warning will be logged, however it will continue with the io-uring enabled, potentially resulting in a hang, or an assertion later. The long term support kernel 5.14.14 we haven't observed failures, and 5.15.0-rc7 failures have been observed, though less frequently. If you have `innodb_use_native_aio` explicitly enabled, and are using watch out for a lack of InnoDB updates followed by a 10 minute timeout. See [MDEV-26674](#) for details.
- `ALTER TABLE...IMPORT TABLESPACE` fixes ([MDEV-18543](#), [MDEV-20931](#), [MDEV-26131](#), [MDEV-26621](#))
- `innodb_undo_log_truncate` fixes ([MDEV-26445](#), [MDEV-26450](#), [MDEV-26672](#), [MDEV-26864](#))
- Page I/O performance fixes ([MDEV-25215](#), [MDEV-26547](#), [MDEV-26626](#), [MDEV-26819](#))
- Replication timeouts with `XA PREPARE` ([MDEV-26682](#))
- Improved DDL and data dictionary ([MDEV-25919](#))
- Performance fixes ([MDEV-26356](#), [MDEV-26467](#), [MDEV-26826](#))

Replication

- Memory hogging on slave by ROW event applier is eliminated ([MDEV-26712](#))
- `mysql --binary-mode` now properly handles `\0` in data ([MDEV-25444](#))
- Fixes race condition between `SHOW BINARY LOGS` and `RESET MASTER` ([MDEV-20215](#))
- Missed statement rollback in case transaction drops or create temporary table is corrected ([MDEV-26833](#))

Audit Plugin

- The `QUERY_DDL` `server_audit_events` setting now logs `CREATE/DROP [PROCEDURE / FUNCTION / USER]` statements. See [MariaDB Audit Plugin - Log Settings](#). ([MDEV-23457](#))

Packaging & Misc

- Session tracking flag in `OK_PACKET` ([MDEV-26868](#))
- Some views force server (and mysqldump) to generate invalid SQL for their definitions ([MDEV-26299](#))

Security

- Fixes for the following security vulnerabilities:
 - [CVE-2021-46667](#)
 - [CVE-2021-46662](#)
 - [CVE-2022-27385](#)

- [CVE-2022-27385](#)
- [CVE-2022-31624](#)

Changelog

For a complete list of changes and bugfixes made in [MariaDB 10.6.5](#), with links to detailed information on each push, see the [changelog](#).

Contributors

For a full list of contributors to [MariaDB 10.6.5](#), see the [MariaDB Foundation release announcement](#).

MariaDB plc customers will be notified for all new releases, security issues and critical bug fixes for all MariaDB plc products thanks to the Notification Services.

MariaDB may already be included in your favorite OS distribution. More information can be found on the [Distributions which Include MariaDB](#) page.

7.0.6.2.18 MariaDB 10.6.4 Release Notes

The most recent release of MariaDB 10.6 is:
MariaDB 10.6.21 Stable (GA) [Download Now](#)
Alternate download from [mariadb.org](#)

[Download 10.6.4](#)

[Release Notes](#)

[Changelog](#)

[Overview of 10.6](#)

Release date: 6 Aug 2021

Warning: This version can cause InnoDB file corruption on FreeBSD and on AIX. Stick to an earlier release, or upgrade to a more recent release, if you are running either of these environments. See [MDEV-26537](#).

[MariaDB 10.6](#) is the current stable series of MariaDB. It is an evolution of [MariaDB 10.5](#) with several entirely new features.

[MariaDB 10.6.4](#) is a **Stable (GA)** release.

For an overview of [MariaDB 10.6](#) see the [What is MariaDB 10.6?](#) page.

Thanks, and enjoy MariaDB!

Notable Items

InnoDB

- InnoDB no longer acquires advisory file locks by default ([MDEV-24393](#))
- Encryption: Automatically disable key rotation checks for file_key_management plugin ([MDEV-14180](#))
- Some fixes from MySQL 5.7.35 ([MDEV-26205](#))
- Fixed scrubbing on AIX ([MDEV-26110](#))
- buf_pool.flush_list corrupted by buffer pool resizing or ROW_FORMAT=COMPRESSED ([MDEV-26200](#))

Optimizer

- A query that uses ORDER BY .. LIMIT clause and "Range checked for each record optimization" could produce incorrect results under some circumstances ([MDEV-25858](#))
- Queries that have more than 32 equality conditions comparing columns of different tables ("tableX.colX=tableY.colY")

could cause a stack overrun in the query optimizer ([MDEV-17783](#), [MDEV-23937](#))

- "Condition pushdown into derived table" optimization cannot be applied if the expression being pushed refers to a derived table column which is computed from expression that has a stored function call, @session variable reference, or other similar construct. The fix for [MDEV-25969](#) makes it so that only the problematic part of the condition is not pushed. The rest of the condition is now pushed. ([MDEV-25969](#))
- A query with window function on the left side of the subquery could cause a crash. ([MDEV-25630](#))
- Fixed the issue fixed in MySQL Bug #76803: DML or locking SELECT statements that use outer joins could produce this warning in the error log: [ERROR] InnoDB: Unlock row could not find a 3 mode lock on the record. ([MDEV-26106](#))

Packaging & Misc

- As per the [MariaDB Deprecation Policy](#), this will be the last release of [MariaDB 10.6](#) for Ubuntu 20.10 Groovy
- Debian 11 Bullseye repositories added
- [Galera](#) updated to 26.4.9
- Linux on IBM Z (s390x) architecture added with releases on Ubuntu-20.04 Focal

Security

- Fixes for the following [security vulnerabilities](#):
 - [CVE-2021-2372](#)
 - [CVE-2021-2389](#)

Changelog

For a complete list of changes and bugfixes made in [MariaDB 10.6.4](#), with links to detailed information on each push, see the [changelog](#).

Contributors

For a full list of contributors to [MariaDB 10.6.4](#), see the [MariaDB Foundation release announcement](#).

Be notified of new MariaDB Server releases automatically by [subscribing](#) to the MariaDB Foundation community announce 'at' lists.mariadb.org announcement list (this is a low traffic, announce-only list). MariaDB plc customers will be notified for all new releases, security issues and critical bug fixes for all MariaDB plc products thanks to the Notification Services.

MariaDB may already be included in your favorite OS distribution. More information can be found on the [Distributions which Include MariaDB](#) page.

7.0.6.2.19 MariaDB 10.6.3 Release Notes

The most recent release of MariaDB 10.6 is:
MariaDB 10.6.21 Stable (GA) [Download Now](#)
Alternate download from [mariadb.org](#)

[Download 10.6.3](#)

[Release Notes](#)

[Changelog](#)

[Overview of 10.6](#)

Release date: 6 Jul 2021

MariaDB 10.6 is the current stable series of MariaDB. It is an evolution of [MariaDB 10.5](#) with several entirely new features.

MariaDB 10.6.3 is a [Stable \(GA\)](#) release.

For an overview of [MariaDB 10.6](#) see the [What is MariaDB 10.6?](#) page.

Thanks, and enjoy MariaDB!

Notable Changes

InnoDB

- Maximum value of `innodb_lock_wait_timeout` is now 100000000, which means infinite timeout ([MDEV-26067](#))
- Write performance improvements: [MDEV-25954](#), [MDEV-25948](#), [MDEV-25113](#), [MDEV-26004](#), [MDEV-25801](#)
- Atomic DDL rewrite ([MDEV-25506](#))
- Thinly provisioned SSD support for `page_compressed` tables ([MDEV-26029](#))

Replication

- Fix binlog background thread hang at shutdown ([MDEV-26031](#))

General

- The views `INFORMATION_SCHEMA.KEYWORDS` and `INFORMATION_SCHEMA.SQL_FUNCTIONS` have been added to the information schema ([MDEV-25129](#))
- Assertion ``thd->locked_tables_mode == LTM_NONE'` failed in `Locked_tables_list::init_locked_tables` ([MDEV-25837](#))

Security

- Fixes for the following security vulnerabilities:
 - [CVE-2021-35604](#)
 - [CVE-2021-46658](#)

Changelog

For a complete list of changes and bugfixes made in [MariaDB 10.6.3](#), with links to detailed information on each push, see the [changelog](#).

Contributors

For a full list of contributors to [MariaDB 10.6.3](#), see the [MariaDB Foundation release announcement](#).

MariaDB plc customers will be notified for all new releases, security issues and critical bug fixes for all MariaDB plc products thanks to the Notification Services.

MariaDB may already be included in your favorite OS distribution. More information can be found on the [Distributions which Include MariaDB](#) page.

7.0.6.2.20 MariaDB 10.6.2 Release Notes

The most recent release of MariaDB 10.6 is:
MariaDB 10.6.21 Stable (GA) [Download Now](#)
Alternate download from [mariadb.org](#)

[Download 10.6.2](#)

[Release Notes](#)

[Changelog](#)

[Overview of 10.6](#)

Release date: 18 Jun 2021

[MariaDB 10.6](#) is the current development series of MariaDB. It is an evolution of [MariaDB 10.5](#) with several entirely new features.

[MariaDB 10.6.2](#) is a [Release Candidate \(RC\)](#) release.

Do not use non-stable (non-GA) releases in production!

For an overview of [MariaDB 10.6](#) see the [What is MariaDB 10.6?](#) page.

Register now for our MariaDB Community Server 10.6 webinar to be held 2021-06-29 [📅](#) and be one of the first to see the biggest features coming in MariaDB Community Server 10.6, with an exclusive opportunity to have your questions answered by MariaDB engineering and product leads.

Thanks, and enjoy MariaDB!

Notable Changes

InnoDB

- When `innodb_adaptive_hash_index=OFF` (the default), the following counters (which reflect `btr_cur_n_non_sea`) will no longer be updated ([MDEV-25882](#) [🔗](#)):
 - `adaptive_hash_index` in `INFORMATION_SCHEMA.INNODB_METRICS`
 - `InnoDB_adaptive_hash_non_hash_searches` in `INFORMATION_SCHEMA.GLOBAL_STATUS`

Replication

- `Semisync` replica recovery is introduced. `rpl-semi-sync-slave-enabled = ON` server executes a special recovery branch to guarantee its consistency with a primary server ([MDEV-21117](#) [🔗](#))

General

- Error messages now use "MariaDB" instead of "MySQL" ([MDEV-22189](#) [🔗](#))
- Implement `FLUSH TABLES tbl_name [, tbl_name] ... WITH READ LOCK` for views ([MDEV-15888](#) [🔗](#))
- All statements can be prepared, except `PREPARE`, `EXECUTE`, and `DEALLOCATE / DROP PREPARE` ([MDEV-16708](#) [🔗](#))

Changelog

For a complete list of changes and bugfixes made in [MariaDB 10.6.2](#), with links to detailed information on each push, see the [changelog](#) [🔗](#).

Contributors

For a full list of contributors to [MariaDB 10.6.2](#), see the [MariaDB Foundation release announcement](#) [🔗](#).

Do not use non-stable (non-GA) releases in production!

7.0.6.2.21 MariaDB 10.6.1 Release Notes

The most recent release of MariaDB 10.6 is:
MariaDB 10.6.21 Stable (GA) [Download Now](#)

[Alternate download from mariadb.org](#)

[Download 10.6.1](#)

[Release Notes](#)

[Changelog](#)

[Overview of 10.6](#)

Release date: 21 May 2021

MariaDB 10.6 is the current development series of MariaDB. It is an evolution of [MariaDB 10.5](#) with several entirely new features.

MariaDB 10.6.1 is a [Beta](#) release.

Do not use beta releases in production!

For an overview of [MariaDB 10.6](#) see the [What is MariaDB 10.6?](#) page.

Register now for our [MariaDB Community Server 10.6 webinar to be held 2021-06-29](#) and be one of the first to see the biggest features coming in MariaDB Community Server 10.6, with an exclusive opportunity to have your questions answered by MariaDB engineering and product leads.

Thanks, and enjoy MariaDB!

Notable Changes

Notable changes of this release include:

Atomic DDL

- [CREATE TABLE](#), [ALTER TABLE](#), [RENAME TABLE](#), [DROP TABLE](#), [DROP DATABASE](#) and related DDL statements are now atomic. Either the statement is fully completed, or everything is reverted to its original state. Note that when deleting multiple tables with [DROP TABLE](#), only each individual drop is atomic, not the full list of tables). ([MDEV-23842](#)).

Replication, Galera and Binlog

- [Galera](#) updated to 26.4.8
- The delay between binary log purges can now be specified with much greater precision. The system variable [binlog_expire_logs_seconds](#) is introduced as a form of alias for [expire_logs_days](#), which now accepts a precision of 1/1000000 days ([MDEV-19371](#))
- Allow transition from unencrypted to TLS [Galera](#) cluster communication without cluster downtime ([MDEV-22131](#))
- DDL information logged on all [Galera](#) cluster nodes if [wsrep_debug](#) is set to `SERVER` and [wsrep_OSU_method](#) is `'TOI'` ([MDEV-9609](#))
- For the [mysqlbinlog / mariadb-binlog --base64-output](#) option, removed the deprecated `always` option, and changed the default to `auto` ([MDEV-25222](#))

Oracle Compatibility

- [ADD_MONTHS\(\)](#) added ([MDEV-20025](#))
- [TO_CHAR\(\)](#) added ([MDEV-20017](#))
- [SYS_GUID\(\)](#) added ([MDEV-24285](#))
- `MINUS` is mapped to `EXCEPT` in `UNION` ([MDEV-20021](#))
- [ROWNUM](#) function returns the current number of accepted rows in the current context ([MDEV-24089](#))

Character Sets

- The `utf8` character set (and related collations) is now by default an alias for `utf8mb3` rather than the other way around. It can be set to imply `utf8mb4` by changing the value of the `old_mode` system variable ([MDEV-8334](#))

Clients

- For clients such as [mysql / mariadb](#), the connection property specified via the command line (e.g. --port=3306) will now force its type ([MDEV-14974](#) )

Changelog

For a complete list of changes made in [MariaDB 10.6.1](#), with links to detailed information on each push, see the [changelog](#) .

Contributors

7.0.6.2.22 MariaDB 10.6.0 Release Notes

The most recent release of [MariaDB 10.6](#) is:
MariaDB 10.6.21 Stable (GA) [Download Now](#) 
Alternate download from [mariadb.org](#) 

[Download 10.6.0](#) 

[Release Notes](#)

[Changelog](#) 

[Overview of 10.6](#)

Release date: 26 Apr 2021

[MariaDB 10.6](#) is the current development series of MariaDB. It is an evolution of [MariaDB 10.5](#) with several entirely new features.

[MariaDB 10.6.0](#) is an [Alpha](#)  release.

Do not use *alpha* releases in production!

For an overview of [MariaDB 10.6](#) see the [What is MariaDB 10.6?](#) page.

Thanks, and enjoy MariaDB!

Notable Changes

This is the first alpha release in the [MariaDB 10.6](#) series.

Notable changes of this release include:

SQL Syntax

- [Indexes can be ignored](#) ([MDEV-7317](#) )
- Implement SQL-standard [SELECT ... OFFSET ... FETCH](#) ([MDEV-23908](#) )
- Add [SELECT ... SKIP LOCKED](#) syntax (InnoDB only) ([MDEV-13115](#) )

- [JSON_TABLE](#), used to extract JSON data based on a JSON path expression and to return it as a relational table ([MDEV-17399](#))

Oracle Compatibility

- Anonymous [subqueries in a FROM clause](#) (no AS clause) are permitted in [ORACLE mode](#)

Storage Engines

- [TokuDB](#) has been removed ([MDEV-19780](#))
- [CassandraSE](#) has been removed ([MDEV-23024](#))

InnoDB

- Optimization to speed up inserts into an empty table ([MDEV-515](#))
- Make [InnoDB's COMPRESSED row format read-only by default](#) ([MDEV-23497](#))
- [Information Schema SYS_TABLESPACES](#) now directly reflects the filesystem, and [SYS_DATAFILES](#) has been removed ([MDEV-22343](#))
- [innodb_flush_method=O_DIRECT](#) is enabled by default ([MDEV-24854](#)), and [liburing](#) replaces [libaio](#) on recent Linux kernels ([MDEV-24883](#)).
- The InnoDB transaction deadlock reporter was improved ([MDEV-24738](#)).
- The old [MariaDB 5.5-compatible innodb checksum](#) is no longer supported, only [crc32](#) and [full_crc32](#). Removed the [*innodb](#) and [*none](#) options from [innodb_checksum_algorithm](#), and the [--strict-check / -C](#) and [--write / -w](#) options from [innochecksum](#) ([MDEV-25105](#))

Replication, Galera and Binlog

- Increase [master_host](#) limit to 255, user to 128 ([MDEV-24312](#))
- The [wsrep_mode](#) system variable, for turning on WSREP features which are not part of default behavior (including the experimental Aria replication) ([MDEV-20008](#), [MDEV-20715](#), [MDEV-24946](#))

Sys Schema

- Bundle [sys-schema](#), a collection of views, functions and procedures to help administrators get insight into database usage. ([MDEV-9077](#))

Performance Schema

- Merged replication instrumentation and tables ([MDEV-16437](#), [MDEV-20220](#))

General

- Do not resend unchanged resultset metadata for prepared statements ([MDEV-19237](#))
- [--bind-address=hostname](#) now listens on both IPv6 and IPv4 addresses ([MDEV-6536](#))
- Support systemd socket activation ([MDEV-5536](#))
- For the [GSSAPI plugin](#), support AD or local group name, and SIDs on Windows ([MDEV-23959](#))
- Check for [\\$MARIADB_HOME/my.cnf](#) ([MDEV-21365](#))
- [max_recursive_iterations](#) has been reduced to 1000 ([MDEV-17239](#))
- Setting system variables to negative values will no longer set them to the maximum value ([MDEV-22219](#))

Galera

- [wsrep_mode](#) variable for turning on WSREP features which are not part of default behavior.
- [wsrep_strict_ddl](#) has been deprecated. Use [wsrep_mode=STRICT_REPLICATION](#) instead.

InnoDB Variables

The following deprecated variables have been removed ([MDEV-23397](#)):

- [innodb_adaptive_max_sleep_delay](#)
- [innodb_background_scrub_data_check_interval](#)
- [innodb_background_scrub_data_compressed](#)
- [innodb_background_scrub_data_interval](#)
- [innodb_background_scrub_data_uncompressed](#)

- [innodb_buffer_pool_instances](#)
- [innodb_commit_concurrency](#)
- [innodb_concurrency_tickets](#)
- [innodb_file_format](#)
- [innodb_large_prefix](#)
- [innodb_log_checksums](#)
- [innodb_log_compressed_pages](#)
- [innodb_log_files_in_group](#)
- [innodb_log_optimize_ddl](#)
- [innodb_page_cleaners](#)
- [innodb_replication_delay](#)
- [innodb_scrub_log](#)
- [innodb_scrub_log_speed](#)
- [innodb_thread_concurrency](#)
- [innodb_thread_sleep_delay](#)
- [innodb_undo_logs](#)

Changelog

For a complete list of changes made in [MariaDB 10.6.0](#), with links to detailed information on each push, see the [changelog](#) .

Contributors

For a full list of contributors to [MariaDB 10.6.0](#), see the [MariaDB Foundation release announcement](#) .

Do not use *alpha* releases in production!

Be notified of new MariaDB Server releases automatically by [subscribing](#)  to the MariaDB Foundation community announce 'at' lists.mariadb.org announcement list (this is a low traffic, announce-only list). MariaDB plc customers will be notified for all new releases, security issues and critical bug fixes for all MariaDB plc products thanks to the Notification Services.

MariaDB may already be included in your favorite OS distribution. More information can be found on the [Distributions which Include MariaDB](#) page.

7.0.7 MariaDB Server 10.5

4. [Resources](#)
5. [List of All MariaDB 10.5 Releases](#)

[MariaDB 10.5](#) is a previous major stable version. The first stable release was in June 2020, and it will be [maintained until](#) [June 2025](#).

Upgrading

- See [Upgrading Between Major MariaDB Versions](#) and [Upgrading from MariaDB 10.4 to MariaDB 10.5](#).

Implemented Features

See the [Differences in MariaDB Enterprise Server 10.5](#) page for items that are different between MariaDB Community Server 10.5 and MariaDB Enterprise Server 10.5.

ColumnStore

- This release of MariaDB Server includes the [MariaDB ColumnStore](#) storage engine. *Note, that plugins have [independent maturity levels](#) and [MariaDB ColumnStore in 10.5.4 has **Beta** maturity.](#)*

Binaries Named mariadb (mysql Symlinked)

- All binaries previously beginning with `mysql` now begin with `mariadb`, with symlinks for the corresponding `mysql` command. ([MDEV-21303](#))
- When starting the MariaDB server via the `systemd` service it will be started using the `mariabdd` binary name, so this will now show up in the system process list instead of `mysqld`
- Same for the `mariabdd-safe` wrapper script. Even when called via the `mysqld_safe` symlink, it will start the actual server process as `mariabdd`, not `mysqld` now. This also affects startup via system service init scripts on platforms that don't yet have switched to SystemD

INET 6 Data Type

- New [INET6](#) data type for storing IPv6 addresses ([MDEV-274](#))

Amazon S3

- The [S3 storage engine](#) allows one to archive MariaDB tables in Amazon S3, or any third-party public or private cloud that implements S3 API ([MDEV-22606](#))
- Both S3 tables and [partitioned](#) S3 tables are discoverable. This means that if you create a partitioned S3 table, both

the partitioned table and its partitions can be directly used by another server that has access to the S3 storage. ([MDEV-22088](#))

Privileges Made More Granular

- Split `SUPER` privilege to smaller privileges ([MDEV-21743](#)). New privileges were added so that more fine grained tuning of what each user can do can be applied:
 - `BINLOG ADMIN`
 - `BINLOG REPLAY`
 - `CONNECTION ADMIN`
 - `FEDERATED ADMIN`
 - `READ_ONLY ADMIN`
 - `REPLICATION MASTER ADMIN`
 - `REPLICATION SLAVE ADMIN`
 - `SET USER`
- The `REPLICATION CLIENT` privilege was renamed to `BINLOG MONITOR`. The old syntax is understood for compatibility ([MDEV-21743](#)).
- The `SHOW MASTER STATUS` statement was renamed to `SHOW BINLOG STATUS` ([MDEV-21743](#)). The old syntax is understood for compatibility.
- A number of statements changed the privileges that they require. The old privileges were historically inappropriately chosen in the upstream. 10.5.2 fixes this problem. Note, these changes are incompatible to previous versions. A number of `GRANT` commands might be needed after upgrade.
 - `SHOW BINLOG EVENTS` now requires the `BINLOG MONITOR` privilege (required `REPLICATION SLAVE` prior to 10.5.2).
 - `SHOW SLAVE HOSTS` now requires the `REPLICATION MASTER ADMIN` privilege (required `REPLICATION SLAVE` prior to 10.5.2).
 - `SHOW SLAVE STATUS` now requires the `REPLICATION SLAVE ADMIN` or the `SUPER` privilege (required `REPLICATION CLIENT` or `SUPER` prior to 10.5.2).
 - `SHOW RELAYLOG EVENTS` now requires the `REPLICATION SLAVE ADMIN` privilege (required `REPLICATION SLAVE` prior to 10.5.2).
- In order to help the server understand which version a privilege record was written by, the `mysql.global_priv.priv` field contains a new JSON field, `version_id` ([MDEV-21704](#))
- `SHOW PRIVILEGES` now correctly lists the `Delete history` privilege, rather than displaying it as `Delete versioning rows`. ([MDEV-20382](#))

InnoDB: Performance Improvements etc.

- Extend `SHOW STATUS LIKE 'InnoDB_%'` ([MDEV-18582](#))
- Clean up `INFORMATION_SCHEMA.INNODB_` tables ([MDEV-19940](#))
- Doublewrite buffer is unnecessarily used for newly (re)initialized pages ([MDEV-19738](#))
- Defer change buffer merge until pages are requested ([MDEV-19514](#))
- Remove dummy tablespace for the redo log ([MDEV-18115](#))
- Optimize access to InnoDB page header fields ([MDEV-21133](#))
- Remove multiple InnoDB buffer pool instances ([MDEV-15058](#))
 - Columns that indicated the buffer pool instance from the Information Schema `innodb_buffer_page`, `innodb_buffer_page_lru`, `innodb_buffer_pool_stats`, `innodb_cmpmem` and `innodb_cmpmem_reset` tables now return a dummy value of `0`.
- Remove `buf_page_t::newest_modification` ([MDEV-21132](#))
- Replace `recv_sys_t::addr_hash` with a `std::map` ([MDEV-19586](#))
- Obsolete internal parser for FK in InnoDB ([MDEV-20480](#))
- InnoDB thread pool for background tasks ([MDEV-16264](#))
- An upgrade will only be possible after a clean shutdown. `mariabackup --prepare` will not work with backups taken before version 10.5.2.
- Efficient InnoDB redo log record format ([MDEV-12353](#))
- Improve InnoDB redo log group commit performance ([MDEV-21534](#))
- Do not acquire InnoDB record locks when covering table locks exist ([MDEV-14479](#))
- Issue a message on changing deprecated `innodb_log_files_in_group` ([MDEV-21990](#))
- Optimize append only files for NVDIMM ([MDEV-17084](#))
- Avoid writing freed InnoDB pages ([MDEV-15528](#))

InnoDB New Defaults for Variables

- `innodb_adaptive_hash_index` now defaults to `OFF` ([MDEV-20487](#))
- `innodb_checksum_algorithm` now defaults to `full_crc32` ([MDEV-19534](#))

InnoDB Removed or Deprecated Variables

- [innodb_buffer_pool_instances](#)
- [innodb_checksums](#) (MDEV-19534 [🔗](#))
- [innodb_locks_unsafe_for_binlog](#) (MDEV-19544 [🔗](#))
- [innodb_log_checksums](#) (MDEV-19543 [🔗](#))
- [innodb_log_files_in_group](#) (MDEV-14425 [🔗](#) & MDEV-20907 [🔗](#))
- [innodb_log_optimize_ddl](#) (MDEV-19747 [🔗](#))
- [innodb_rollback_segments](#) (MDEV-19570 [🔗](#))
- [innodb_scrub_log](#) and [innodb_scrub_log_speed](#) (MDEV-21870 [🔗](#))
- Remove [INFORMATION_SCHEMA.INNODB_TABLESPACES_SCRUBBING](#) table and deprecate and ignore:
- [innodb-background-scrub-data-uncompressed](#)
- [innodb-background-scrub-data-compressed](#)
- [innodb-background-scrub-data-interval](#)
- [innodb-background-scrub-data-check-interval](#) (MDEV-15528 [🔗](#))
- [innodb_stats_sample_pages](#) (MDEV-19551 [🔗](#))
- [innodb_undo_logs](#) (MDEV-19570 [🔗](#))
- [innodb_thread_concurrency](#)
- [innodb_commit_concurrency](#)
- [innodb_replication_delay](#)
- [innodb_concurrency_tickets](#)
- [innodb_thread_sleep_delay](#)
- [innodb_adaptive_max_sleep_delay](#) (MDEV-23379 [🔗](#))

Performance Schema Updates to Match MySQL 5.7 Instrumentation and Tables

- Memory (MDEV-16431 [🔗](#))
- Meta data locking (MDL) (MDEV-16432 [🔗](#))
- Prepared statements (ps) (MDEV-16433 [🔗](#))
- [show] status instrumentation and tables (MDEV-16438 [🔗](#))
- Stored procedures (MDEV-16434 [🔗](#))
- Sxlocks (MDEV-16436 [🔗](#))
- Transactions (MDEV-16435 [🔗](#))
- User variables (MDEV-16439 [🔗](#))

Galera: Full GTID Support

- Add full [GTID](#) support to [Galera](#) cluster ([commit](#) [🔗](#)). With this feature all nodes in a cluster will have the same GTID for replicated events originating from the cluster. Also added a new variable, `wsrep_gtid_seq_no`, to manually update the WSREP GTID sequence number in the cluster (similar to how the `gtid_seq_no` variable is used for non-WSREP transactions).
- Add new mode to `wsrep_OSU_method` in which Galera checks storage engine of the affected table ([MDEV-20051](#) [🔗](#))
- Galera: Replicate MariaDB GTID to other nodes in the cluster ([MDEV-20720](#) [🔗](#))

Binary Log and Replication: More Metadata

- `slave_parallel_mode` now defaults to `optimistic` ([MDEV-18648](#) [🔗](#)).
- Make `REPLICA` a synonym for `SLAVE` in [SQL statements](#) ([MDEV-20601](#) [🔗](#))
- `ENFORCE` option for `slave_run_triggers_for_rbr` ([MDEV-21833](#) [🔗](#))
- Extended [binlog](#) metadata ([MDEV-20477](#) [🔗](#)) to include new fields. This was done to solve replication issues when the Master and Slave table had different definitions for a column which could lead to data loss ([MDEV-19708](#) [🔗](#)). It also enables us to do better replication with pluggable data types in the future.
 - The new metadata fields are:
 - Signedness of Numeric Columns
 - Character Set of Character Columns and Binary Columns
 - Column Name
 - String Value of SET Columns
 - String Value of ENUM Columns
 - Primary Key
 - Character Set of SET Columns and ENUM Columns
 - Geometry Type
 - Also added a new global variable, `binlog_row_metadata` to control the amount of metadata logged. Possible values are:
 - `FULL` - all metadata is logged
 - `MINIMAL` - only metadata required by a worker is logged
 - `NO_LOG` - No metadata is logged (default)

- Binary log DDL entries can now be marked that they should be ignored if the target table doesn't exist (implicit `IF EXISTS`).
- `mariadb-binlog` output is extended to show all replication flags. Example of output: `SET @@session.foreign_key_checks=1, @@session.sql_auto_is_null=0, @@session.unique_checks=1, @@session.autocommit=1, @@session.check_constraint_checks=1, @@session.sql_if_exists=0/*!*/.`
- `SHOW BINLOG EVENTS` and `SHOW RELAYLOG EVENTS` are extended to show replication flags.

Syntax

- `INSERT ... RETURNING` ([MDEV-10014](#)) - returns `SELECT` of inserted rows (analogous to `DELETE ... RETURNING`)
- `REPLACE ... RETURNING` ([MDEV-10014](#))
- `EXCEPT ALL` and `INTERSECT ALL` ([MDEV-18844](#))
- Application period tables: `WITHOUT OVERLAPS` ([MDEV-16978](#))
- Setup default partitions for system versioning ([MDEV-19903](#))
- Database comments in `CREATE DATABASE` and `ALTER DATABASE` statements ([MDEV-307](#))
- `ALTER TABLE ... RENAME INDEX / KEY` ([MDEV-7318](#))
- `ALTER TABLE ... RENAME COLUMN` ([MDEV-16290](#))
- `ALTER TABLE` and `RENAME TABLE` now support `IF EXISTS`.
- Add `VISIBLE` attribute for indexes in `CREATE TABLE` ([MDEV-22199](#))
- Recursive `CTE` cycle detection using `CYCLE` clause ([MDEV-20632](#))
- `RELEASE_ALL_LOCKS` hold by `GET_LOCK()` ([MDEV-10569](#))
- Fix `REFERENCES` constraint in column definition ([MDEV-20729](#))

JSON

- Added `JSON_ARRAYAGG`. This returns a JSON array containing an element for each value in a given set of JSON or SQL values. It acts on a column or an expression that evaluates to a single value.
- Added `JSON_OBJECTAGG`. This returns a JSON object containing key-value pairs. It takes two expressions that evaluate to a single value, or two column names, as arguments, the first used as a key, and the second as a value.

Thread Pool

- Information Schema tables (`THREAD_POOL_GROUPS`, `THREAD_POOL_QUEUES`, `THREAD_POOL_STATS` and `THREAD_POOL_WAITS`) for internals of generic `thread_pool` ([MDEV-19313](#)).

Performance Improvements

- Speed up binary row logging code
- Range optimizer speedups. Removed double calls to `records_in_range()` for some cases.
- Costs for using `MEMORY` tables updated to be more accurate
- Fixed that 'ref' access is preferred over 'range' for the same index.
- Improve connect speed (up to 25%). ([MDEV-19515](#))

Query Optimizer

- Improve Protocol performance for numeric data by avoiding unnecessary character string conversions ([MDEV-23162](#), [MDEV-23478](#))
- `ANALYZE` for statements is improved, now it also shows the time spent checking the `WHERE` clause and doing other auxiliary operations ([MDEV-20854](#))
- Inferred `IS NOT NULL` predicates can be used by the range optimizer ([MDEV-15777](#))
- Allow packed sort keys and values of non-sorted fields in the sort buffer ([MDEV-21263](#) & [MDEV-21580](#))
 - Makes filesort temporary files much smaller when `VARCHAR`, `CHAR` or `BLOBs` are used!

General

- The Information Schema `SYSTEM_VARIABLES` Table has a new column showing from which config file a variable derives its value ([MDEV-12684](#))
- Switch Perl DBI scripts from `DBD::mysql` to `DBD::MariaDB` driver ([MDEV-19755](#))
- The `Aria` max key length is now 2000 bytes, compared to 1000 bytes in `MyISAM`.
- `DROP TABLE` now reliably deletes table remnants inside a storage engine even if the `.frm` file is missing ([MDEV-11412](#))
- Accelerated `crc32()` function for AMD64, ARMv8, POWER 8 ([MDEV-22669](#))
- Binary tarball size has been reduced ([MDEV-21943](#))

PCRE (Perl Compatible Regular Expressions)

- Migrate to [PCRE2 \(MDEV-14024\)](#), a newer version of the pcre library.

Variables

- For a list of all new variables, see [System Variables Added in MariaDB 10.5](#) and [Status Variables Added in MariaDB 10.5](#).
- The [Information Schema SYSTEM_VARIABLES Table](#) has a new column showing from which config file a variable derives its value ([MDEV-12684](#)).
- Port [show_old_temporals](#) from MySQL 5.6 ([MDEV-19906](#)). If set, old temporal data types (created with a pre-10.0 version of MariaDB) are displayed with a `/* mariadb-5.3 */` comment.
- Numerous deprecated variables removed ([MDEV-18650](#))
 - [multi_range_count](#)
 - [thread_concurrency](#)
 - [timed_mutexes](#)

Security Vulnerabilities Fixed in MariaDB 10.5

For a complete list of security vulnerabilities (CVEs) fixed across all versions of MariaDB, see the [Security Vulnerabilities Fixed in MariaDB](#) page.

Status: Stable (GA) | Release Date: 10 May 2023

MariaDB 10.5.19 Release Notes

Status: Stable (GA) | Release Date: 6 Feb 2023

MariaDB 10.5.18 Release Notes

Status: Stable (GA) | Release Date: 7 Nov 2022

MariaDB 10.5.17 Release Notes

Status: *Stable (GA)* | Release Date: 15 Aug 2022

MariaDB 10.5.16 Release Notes

Status: *Stable (GA)* | Release Date: 20 May 2022

MariaDB 10.5.15 Release Notes

Status: *Stable (GA)* | Release Date: 12 Feb 2022

MariaDB 10.5.14 Release Notes

Status: *Stable (GA)* | Release Date: 9 Feb 2022

MariaDB 10.5.13 Release Notes

Status: *Stable (GA)* | Release Date: 8 Nov 2021

MariaDB 10.5.12 Release Notes

Status: *Stable (GA)* | Release Date: 6 Aug 2021

MariaDB 10.5.11 Release Notes

Status: *Stable (GA)* | Release Date: 23 Jun 2021

MariaDB 10.5.10 Release Notes

Status: *Stable (GA)* | Release Date: 7 May 2021

MariaDB 10.5.9 Release Notes

Status: *Stable (GA)* | Release Date: 22 Feb 2021

MariaDB 10.5.8 Release Notes

Status: *Stable (GA)* | Release Date: 11 Nov 2020

MariaDB 10.5.7 Release Notes

Status: *Stable (GA)* | Release Date: 3 Nov 2020

MariaDB 10.5.6 Release Notes

Status: *Stable (GA)* | Release Date: 7 Oct 2020

MariaDB 10.5.5 Release Notes

Status: *Stable (GA)* | Release Date: 10 Aug 2020

MariaDB 10.5.4 Release Notes

Status: *Stable (GA)* | Release Date: 24 Jun 2020

MariaDB 10.5.3 Release Notes

Status: *RC* | Release Date: 12 May 2020

MariaDB 10.5.2 Release Notes

Status: *Beta* | Release Date: 26 Mar 2020

MariaDB 10.5.1 Release Notes

Status: *Beta* | Release Date: 14 Feb 2020

MariaDB 10.5.0 Release Notes

Status: *Alpha* | Release Date: 3 Dec 2019

7.0.7.2.1 MariaDB 10.5.27 Release Notes

The most recent release of MariaDB 10.5 is:

MariaDB 10.5.28 [🔗](#) *Stable (GA)* [Download Now](#) [🔗](#)

[Alternate download from mariadb.org](#) [🔗](#)

Release date: 1 Nov 2024

MariaDB 10.5 is a previous *stable* series of MariaDB, [maintained until](#) June 2025. It is an evolution of [MariaDB 10.4](#) with several entirely new features not found anywhere else and with backported and reimplemented features from MySQL.

MariaDB 10.5.27 is a [Stable \(GA\)](#) release.

For an overview of [MariaDB 10.5](#) see the [What is MariaDB 10.5?](#) page.

Thanks, and enjoy MariaDB!

Notable Items

Storage Engines

InnoDB

- Fix MariaDB crash with SIGILL because the OS does not support AVX512 ([MDEV-34565](#))
- Fix innodb.innodb-lock-inherit-read_committed failure with timeout ([MDEV-33106](#))

Spider

- Fix server crash when calling [spider UDF](#) after [aria_encrypt_tables](#) is enabled ([MDEV-34682](#))
- SELECT MIN on Spider table no longer returns more rows than expected ([MDEV-26345](#))
- Fix Spider group by handler wrong result on order by aggregate ([MDEV-29546](#))

Optimizer

- Fix crash caused by query containing constant having clause ([MDEV-23983](#))

Data Definition - Alter Table

- Fix InnoDB crash under Windows Subsystem for Linux on ALTER TABLE or OPTIMIZE TABLE ([MDEV-34938](#))
- Modification of the column now correctly checks foreign key constraint ([MDEV-34392](#))
- Fix incorrect NULL value handling for instantly dropped BLOB columns ([MDEV-35122](#))

Galera

- Galera updated to 26.4.20
- Fix server crash when setting [wsrep_cluster_address](#) after adding invalid value to [wsrep_allowlist](#) table ([MDEV-31173](#))
- Fix INSERT...SELECT' on MyISAM table suddenly replicated by alera ([MDEV-34647](#))
- Fix galera_ssl_reload failure with warning message ([MDEV-32778](#))
- When InnoDB gets an assertion failure, WSREP layer is now handled gracefully ([MDEV-32363](#))

Backup

- Recovery now correctly notes some log corruption ([MDEV-34802](#))
- Can now selectively restore sequences using innodb tables from backup ([MDEV-32350](#))

General

- As per the [MariaDB Deprecation Policy](#), this will be the last release of [MariaDB 10.5](#) for SLES 12, and Windows 11 22H2
- [mariadb](#) no longer hangs on startup when `--init-file` target does not exist ([MDEV-34814](#))
- LOAD DATA INFILE with geometry data no longer fails ([MDEV-34883](#))
- Fix heap-use-after-free in [group_concat](#) with compressed or GIS columns ([MDEV-16699](#))
- Trigger now works correctly with bulk update ([MDEV-34718](#))
- Fix assertion failure in [find_producing_item](#) upon a query from a view ([MDEV-35276](#))
- Add new setting, `--quick-max-column-width` to the mariadb client for use in `--quick` mode ([MDEV-34704](#))

Changelog

For a complete list of changes made in [MariaDB 10.5.27](#), with links to detailed information on each push, see the [changelog](#).

Contributors

For a full list of contributors to [MariaDB 10.5.27](#), see the [MariaDB Foundation release announcement](#).

Be notified of new MariaDB Server releases automatically by [subscribing](#) to the MariaDB Foundation community announce 'at' lists.mariadb.org announcement list (this is a low traffic, announce-only list). MariaDB plc customers will be notified for all new releases, security issues and critical bug fixes for all MariaDB plc products thanks to the Notification Services.

MariaDB may already be included in your favorite OS distribution. More information can be found on the [Distributions which Include MariaDB](#) page.

7.0.7.2.2 MariaDB 10.5.26 Release Notes

The most recent release of MariaDB 10.5 is:
MariaDB 10.5.28 [Stable \(GA\)](#) [Download Now](#)
Alternate download from [mariadb.org](#)

[Download 10.5.26](#)

[Release Notes](#)

[Changelog](#)

[Overview of 10.5](#)

Release date: 8 Aug 2024

MariaDB 10.5 is a previous *stable* series of MariaDB, [maintained until](#) June 2025. It is an evolution of [MariaDB 10.4](#) with several entirely new features not found anywhere else and with backported and reimplemented features from MySQL.

MariaDB 10.5.26 is a [Stable \(GA\)](#) release.

For an overview of [MariaDB 10.5](#) see the [What is MariaDB 10.5?](#) page.

Thanks, and enjoy MariaDB!

Notable Items

Storage Engines

InnoDB

- Alter operation on redundant table aborts the server ([MDEV-34222](#))
- MariaDB crashes with SIGILL because the OS does not support AVX512 ([MDEV-34565](#))
- InnoDB: Failing assertion: `stat_n_leaf_pages > 0` in `ha_innobase::estimate_rows_upper_bound` ([MDEV-34474](#))

Aria

- Fix [Aria](#) index corruption when doing a REPAIR TABLE that has a size of over 4G ([MDEV-34522](#))

Spider

- UBSAN: runtime error: applying non-zero offset in `spider_free_mem` and SIGSEGV in `spider_free_mem` on SELECT ([MDEV-31475](#))
- SIGSEGV in `ha_resolve_storage_engine_name`, UBSAN: runtime error: index 4294967295 out of bounds for type 'st_plugin_int*[64]' ([MDEV-32487](#))
- SIGSEGV in `spider_db_conn::fin_loop_check`, and ASAN: heap-use-after-free in

- spider_db_mbase::fin_loop_check on SHOW TABLE STATUS ([MDEV-34541](#))
- SIGSEGV in ha_spider::lock_tables on BEGIN after table lock ([MDEV-29962](#))
- SIGSEGV in spider_conn_first_link_idx and others on DELETE, INSERT and SELECT ([MDEV-32492](#))
- Spider: Crashes, asserts, hangs, memory corruptions and ASAN heap-use-after-free's ([MDEV-27902](#))
- Spider: @@insert_id 128 to TINYINT: Assertion '!is_set() || (m_status == DA_OK_BULK && is_bulk_op())' failed. ([MDEV-28105](#))
- Server crashes when calling spider UDF after aria_encrypt_tables is enabled ([MDEV-34682](#))

Partitioning

- MariaDB Server crashes with ill-formed partitions ([MDEV-32155](#))
- SIGSEGV in parse_engine_part_options on INSERT, SELECT or ALTER ([MDEV-34421](#))
- Assertion 'auto_increment_value' failed in ha_partition::info on INSERT into MEMORY table ([MDEV-24610](#))

Character Sets

- On startup: UBSAN: applying zero offset to null pointer in my_copy_fix_mb from strings/ctype-mb.c and other locations ([MDEV-34226](#))
- On startup: UBSAN: runtime error: applying zero offset to null pointer in skip_trailing_space and my_hash_sort_utf8mb3_general1400_nopad_as_ci ([MDEV-34187](#))
- SHOW CREATE DATABASE statement crashes the server when db name contains some unicode characters, ASAN stack-buffer-overflow ([MDEV-32376](#))
- Wrong result set with utf8mb4_danish_ci and BNLH join ([MDEV-34417](#))

Optimizer

- On startup: UBSAN: runtime error: applying non-zero offset in JOIN::make_aggr_tables_info in sql/sql_select.cc ([MDEV-34227](#))
- Crash after killing query while it is processed by test_quick_select ([MDEV-30651](#))
- Extend condition normalization to include 'NOT a' ([MDEV-19520](#))
- Constant subquery causing a crash in pushdown optimization ([MDEV-29363](#))
- Crash when pushing condition with CHARSET()/COERCIBILITY() into derived table ([MDEV-33010](#))
- 2nd execution name resolution problem with pushdown into unions ([MDEV-34506](#))
- Assertion '(key_part->key_part_flag & 4) == 0' failed key_hashnr ([MDEV-34580](#))
- Crash caused by query containing constant having clause ([MDEV-23983](#))
- ORDER BY DESC causes ROWID Filter optimization performance degradation ([MDEV-33875](#))

Replication

- Auto-generated DELETE from HEAP table no longer breaks replication ([MDEV-25607](#))
- Fix replication failure when XA transactions are used where the replica has replicate_do_db set and the client has touched a different database when running DML such as inserts. ([MDEV-33921](#))
- Fix replication error when CHANGE MASTER TO is used in conjunction with a password longer than 41 ascii characters ([MDEV-23857](#))

Backup

- Hide password passed on commandline from xtrabackup_info ([MDEV-34434](#))

Galera

- Galera updated to 26.4.19
 - **NOTE:** Includes increasing the GCS protocol version, which prevents downgrades of individual nodes in the cluster as soon as all nodes nodes have been updated
- galera_gtid_2_cluster: Assertion 'thd->wsrep_next_trx_id() != (0x7fffffffLL * 2ULL + 1)' ([MDEV-32633](#))
- table gtid_slave_pos entries never been deleted with wsrep_gtid_mode = 0 ([MDEV-34170](#))
- Change error code for Galera unkillable threads ([MDEV-12008](#))
- 10.11.8 cluster becomes inconsistent when using composite primary key and partitioning ([MDEV-34269](#))
- wsrep_sst_mariabackup use /tmp dir during SST rather then user defined tmpdir ([MDEV-32158](#))

Error Log

- `server_uid` system variable added, and value added to the [error log](#) at startup (MDEV-34494 [↗](#))

General

- As per the [MariaDB Deprecation Policy](#), this will be the last release of [MariaDB 10.5](#) for Debian 10 "Buster", and RHEL/CentOS 7
- `IMPORT TABLESPACE` no longer unnecessarily traverses tablespaces list (MDEV-34670 [↗](#))
- Fix unknown variable `defaults-group-suffix=` with [mariadb-secure-installation](#) (MDEV-33265 [↗](#))
- `mariadb-install-db` no longer hangs on macOS (MDEV-34129 [↗](#))
- Control over memory allocated for SP/PS (MDEV-14959 [↗](#))
- `Triggers` now work correctly with bulk insert (MDEV-24411 [↗](#))
- Fix assertion ``table->field[0]->ptr >= table->record[0] && table->field[0]->ptr <= table->record[0] + table->s->reclength'` failed in `void handler::assert_icp_limitations(uchar*)` (MDEV-34632 [↗](#))
- `sandbox mode` \- now compatible with `--binary-mode` (MDEV-34203 [↗](#))

Changelog

For a complete list of changes made in [MariaDB 10.5.26](#), with links to detailed information on each push, see the [changelog](#) [↗](#).

Contributors

Be notified of new MariaDB Server releases automatically by [subscribing](#) [↗](#) to the MariaDB Foundation community announce 'at' lists.mariadb.org announcement list (this is a low traffic, announce-only list). MariaDB plc customers will be notified for all new releases, security issues and critical bug fixes for all MariaDB plc products thanks to the Notification Services.

MariaDB may already be included in your favorite OS distribution. More information can be found on the [Distributions which Include MariaDB](#) page.

7.0.7.2.3 MariaDB 10.5.25 Release Notes

The most recent release of MariaDB 10.5 is:
MariaDB 10.5.28 [↗](#) Stable (GA) [Download Now](#) [↗](#)
Alternate download from [mariadb.org](#) [↗](#)

[Download 10.5.25](#) [↗](#)

[Release Notes](#)

[Changelog](#) [↗](#)

[Overview of 10.5](#)

Release date: 16 May 2024

[MariaDB 10.5](#) is a previous *stable* series of MariaDB, [maintained until](#) [↗](#) June 2025. It is an evolution of [MariaDB 10.4](#) with several entirely new features not found anywhere else and with backported and reimplemented features from MySQL.

[MariaDB 10.5.25](#) is a **Stable (GA)** [↗](#) release.

For an overview of [MariaDB 10.5](#) see the [What is MariaDB 10.5?](#) page.

Thanks, and enjoy MariaDB!

Notable Items

From this version, the [mariadb-dump](#) tool adds a new [sandbox](#) command to the top of every dump file. This command cannot be interpreted by MariaDB command line client versions that do not have the `sandbox` command, or by MySQL command line clients, and an error will be generated in these clients. Other methods of importing the dump will work not have this issue.

Storage Engines

InnoDB

- Fix adaptive hash index corruption after [ALTER TABLE...DISCARD TABLESPACE](#) ([MDEV-33400](#))
- Fix fatal InnoDB error or assertion ``!is_v'` failure upon multi-update with indexed virtual column ([MDEV-31154](#))
- Fix InnoDB: Failing assertion on UPDATE ([MDEV-32346](#))
- Fix fatal error InnoDB: Clustered record field for column x not found ([MDEV-33558](#))
- Fix alter operation hang when encryption thread works on the same tablespace ([MDEV-33770](#))
- Fix MariaDB segfault on rowid filter query involving generated column ([MDEV-33795](#))
- Fix discard/import tablespace, restart, index corruption ([MDEV-33512](#))
- Fix alter table corruption while applying the modification log ([MDEV-19044](#))
- Fix weird read view after ROLLBACK of other transactions ([MDEV-33802](#))
- Read only server no longer throws error when running a create temporary table as select statement ([MDEV-33889](#))
- Change buffer index no longer fails to delete the records ([MDEV-32489](#))
- Fix InnoDB include OS error information when failing to write to iblogfile0 ([MDEV-33397](#))
- In-place migration from MySQL 5.7 no longer causes invalid AUTO_INCREMENT values ([MDEV-33277](#))
- Fix InnoDB log corruption before upgrading it on startup ([MDEV-32445](#))
- Table no longer gets rebuilt with ALTER TABLE ADD COLUMN ([MDEV-33214](#))

Federated

- Fix wrong result on 2nd execution of prepared statement for query with derived table ([MDEV-31361](#))

Spider

- Improve Spider performance by pushing down [TIMESTAMPDIFF](#) function ([MDEV-28992](#)) and [CASE](#) statement ([MDEV-28993](#)) to data nodes
- Fix server crash when deleting partitions from a table with spider engine ([MDEV-33731](#))
- Fix spider plugin init failure with `no_zero_date sql_mode` ([MDEV-33494](#))
- Fix sql plugin init failure with traditional `sql_mode` ([MDEV-33584](#))
- Fix parsing failure on valid left join select by translating the on expression to `()` ([MDEV-33679](#))
- Fix Spider: ERROR 12710 (HY000): Invalid information from remote table when using [MariaDB 10.5](#) local and [MariaDB 10.6](#) remote ([MDEV-33777](#))
- Fix Spider: `@@insert_id 128 to TINYINT: Assertion `!is_set() || (m_status == DA_OK_BULK && is_bulk_op())' failed.` ([MDEV-28105](#))

- Fix bug where [Spider variables](#) were not available if Spider was loaded upon server startup ([MDEV-33441](#))

Backup

- [mariadb-backup](#) now preserves [innodb_encrypt_tables](#) ([MDEV-33334](#))
- Fix [mariabackup](#) problem on older mariadb (opendir(NULL)) caused by [MDEV-30968](#) ([MDEV-31251](#))
- Fix [mariabackup --backup](#) FATAL ERROR: ... Can't open datafile cool_down/t3 ([MDEV-33011](#))
- [mariadb-backup --backup](#) now includes retry logic for undo tablespaces ([MDEV-33980](#))
- Fix crash recovery in [mariabackup --prepare](#) due to insufficient [innodb_log_file_size](#) ([MDEV-33540](#))
- Fix crash in [mariadb-backup --prepare --export](#) after `--prepare` ([MDEV-33023](#))
- [mariadb-backup](#) now considers O/S user when `--user` option is omitted ([MDEV-32893](#))

Character Sets, Data Types

- Fixed improper application of [ORDER BY COLLATE](#) to non-character columns ([MDEV-33318](#))
- Default charset now works with PHP MySQLi extension ([MDEV-32975](#))
- Fixed Bad SEPARATOR value in [GROUP_CONCAT](#) on character set conversion ([MDEV-33772](#))
- Fixed out of range error in [AVG\(YEAR\(datetime\)\)](#) due to a wrong data type ([MDEV-33496](#))
- Fixed [GREATEST\(\)](#) and [LEAST\(\)](#) problems with [NULLs](#) ([MDEV-21034](#))

JSON

- View created via [JSON_ARRAYAGG](#) now returns correct json object ([MDEV-30646](#))
- [JSON_TYPE](#) now detects the type of String Values and correctly returns Date/DateTime values ([MDEV-19487](#))
- [JSON_REMOVE](#) no longer returns NULL on valid arguments ([MDEV-22141](#))
- [JSON_EXTRACT](#) no longer returns multiple values for same path ([MDEV-32287](#))

Encryption, TLS, SSL

- WolfSSL's math is unnecessarily slow ([MDEV-33482](#))

Optimization & Tuning

- Server crashes in JOIN_CACHE::write_record_data upon EXPLAIN with subqueries and constant tables ([MDEV-21102](#))
- Wrong result with cross Join given join order ([MDEV-30975](#))
- Wrong warnings on 2-nd execution of PS for query with [GROUP_CONCAT](#) ([MDEV-31276](#))
- Wrong result with semi-join and splittable derived table ([MDEV-23878](#))
- Aggregation functions fail to leverage uniqueness property ([MDEV-30660](#))

Plugins

- The [audit plugin](#) now reports the user and host in all cases ([MDEV-33393](#))

Replication

- `--gtid-ignore-duplicate` can double-apply event in case of parallel replication retry ([MDEV-33475](#))
- Server crash in Rows_log_event::update_sequence upon replaying binary log ([MDEV-31779](#))
- Slave crashed:reload_acl_and_cache during shutdown ([MDEV-30260](#))
- When `binlog_annotate_row_events` on, event of binlog file is truncated ([MDEV-9179](#))

Galera

- [Galera](#) updated to 26.4.18
 - **NOTE:** Includes increasing the GCS protocol version, which prevents downgrades of individual nodes in the cluster as soon as all nodes nodes have been updated

SQL, Data Definition, and Data Manipulation

- Transportable Tablespaces no longer leave [AUTO_INCREMENT](#) in a mismatched state ([MDEV-18288](#))
- Fix wrong row targeted with "insert ... on duplicate" and "replace", leading to data corruption ([MDEV-30046](#))
- Fix incorrect DEFAULT expression evaluated in [UPDATE](#) ([MDEV-33790](#))
- Fix incorrect handling of [UPDATE](#) in PS mode when a table's column declared as NOT NULL ([MDEV-33549](#))
- Fix crash in EXECUTE IMMEDIATE 'CREATE OR REPLACE TABLE t1 (a INT DEFAULT ?)' USING DEFAULT

([MDEV-15703](#))

- Fix wrong result on 2nd execution of PS to select from view using derived ([MDEV-31277](#))
- `TIMESTAMP` value of '1970-01-01 00:00:00' can no longer be indirectly inserted in `strict mode` ([MDEV-34088](#))
- Fix zero datetime reinterpreting as '1970-01-01 00:00:00' on `field_datetime=field_timestamp` ([MDEV-34069](#))
- `unix_timestamp(coalesce(timestamp_column))` no longer returns NULL on '1970-01-01 00:00:00.000001' ([MDEV-34061](#))
- Fix crash using UDF in WHERE clause of VIEW ([MDEV-24507](#))
- Fix update for portion changes autoincrement key in period table ([MDEV-25370](#))
- Fix SIGABRT resulting from CREATE TABLE with generated column and RLIKE ([MDEV-21058](#))

General

Scripts & Clients

- It's now possible to disable system commands with the `mariadb --sandbox` option. ([MDEV-21778](#))
- `mariadb-dump` now exports the data with sandbox mode enable, so that the mariadb client will not execute potentially dangerous cli commands. ([MDEV-33727](#))
- `mariadb-dump` commands such as `mariadb-dump --dump-slave=2 --master-data=2` now record both positions ([MDEV-4827](#))
- Loading `time zones` now works with `alter_algorithm INPLACE` ([MDEV-33044](#))

Server

- Original IP not shown in network related error messages when `proxy_protocol` is in use ([MDEV-33506](#))
- Server incorrectly describes known variables as UNKNOWN if invalid values are specified at startup ([MDEV-33469](#))
- update case insensitive (large) unique key with insensitive change of value - duplicate key ([MDEV-29345](#))
- MariaDB will abort server startup if it finds an invalid parameter, but won't check for other invalid params ([MDEV-26923](#))

Security

- Fixes for the following [security vulnerabilities](#):
 - [CVE-2024-21096](#)

Changelog

For a complete list of changes made in [MariaDB 10.5.25](#), with links to detailed information on each push, see the [changelog](#).

7.0.7.2.4 MariaDB 10.5.24 Release Notes

The most recent release of MariaDB 10.5 is:
MariaDB 10.5.28 [Stable \(GA\)](#) [Download Now](#)
Alternate download from [mariadb.org](#)

Release date: 7 Feb 2024

MariaDB 10.5 is a previous *stable* series of MariaDB, [maintained until](#) June 2025. It is an evolution of [MariaDB 10.4](#) with several entirely new features not found anywhere else and with backported and reimplemented features from MySQL.

MariaDB 10.5.24 is a [Stable \(GA\)](#) release.

For an overview of [MariaDB 10.5](#) see the [What is MariaDB 10.5?](#) page.

Thanks, and enjoy MariaDB!

Notable Items

- Windows packages were delayed but have now been added to the downloads site

InnoDB

- Unique hash key on column prefix is computed incorrectly ([MDEV-29954](#))
- Query from `I_S.INNODB_SYS_INDEXES` exceeding `LIMIT ROWS EXAMINED` causes `ER_UNKNOWN_ERROR` and LeakSanitizer errors in `rec_copy_prefix_to_buf_old` ([MDEV-28613](#))
- Assertion ``0'` failed in `row_sel_convert_mysql_key_to_innobase` upon `UPDATE` using a partial-field key prefix in search ([MDEV-21245](#))
- Assertion failure on `REPLACE` on `ROW_FORMAT=COMPRESSED` table ([MDEV-31574](#))
- Crash emitting "Unsupported meta-data version number" error message ([MDEV-29972](#))
- LeakSanitizer errors in `mem_heap_create_block_func` upon query from `I_S.INNODB_SYS_TABLES` with `LIMIT ROWS EXAMINED` ([MDEV-32890](#))
- Inplace alter rebuild increases file size ([MDEV-26740](#))
- `BLOB` corruption on `UPDATE` of `PRIMARY KEY` with `FOREIGN KEY` ([MDEV-31441](#))
- GNU libc `posix_fallocate()` may be extremely slow ([MDEV-32268](#))
- InnoDB wrong error message ([MDEV-32833](#))
- Assertion failure on `ALTER TABLE...PAGE_COMPRESSED=1` ([MDEV-31000](#))
- InnoDB after `ALTER TABLE...IMPORT TABLESPACE` may not be crash safe ([MDEV-32269](#))
- InnoDB fails to restore tablespace first page from doublewrite buffer when page is empty ([MDEV-32968](#))
- `innodb_fast_shutdown=0` hang after incomplete startup ([MDEV-32798](#))
- `innodb_undo_log_truncate=ON` prevents fast shutdown ([MDEV-33062](#))
- Adaptive flush recommendation ignores dirty ratio and checkpoint age ([MDEV-31939](#))
- `gcol.gcol_purge` contaminates further execution of `innodb.gap_locks` ([MDEV-28682](#))
- `LPAD` in `vcoll` created in `ORACLE` mode makes table corrupted in non-`ORACLE` ([MDEV-27744](#))
- Adaptive flushing is still not getting invoked in 10.5.11 ([MDEV-26055](#))

Backup

- mariabackup has wrong or missing plugin-dir default? ([MDEV-29110](#))
- mariabackup fails when `innodb_max_dirty_pages_pct` contains a fraction (is not an integer) ([MDEV-20286](#))
- Missing required privilege `CONNECTION ADMIN` ([MDEV-33006](#))
- [BACKUP LOCKS](#) on table to be accessible to those with `database LOCK TABLES` privileges ([MDEV-28367](#))

JSON

- Wrong function name in `ER_JSON_PATH_NO_WILDCARD` error message for `JSON_REPLACE` ([MDEV-24541](#))
- `JSON_VALID` fail to validate integer zero in scientific notation ([MDEV-32587](#))
- `ASAN` errors in `Item_func_json_contains_path::val_int` upon `PS` execution ([MDEV-32867](#))
- `mysql_json` cannot be used on newly created table ([MDEV-32235](#))

Spider

- Thread (10.6+) and server hangs (10.4/10.5) in 'Opening tables' (on optimized builds) and `SIGABRT` in `safe_mutex_lock` (on debug) on `I_S` read when using Spider ([MDEV-29421](#))
- `SIGSEGV` in `spider_db_mbase::append_lock_tables` on `LOCK TABLES` ([MDEV-29963](#))
- `ASAN` heap-use-after-free in `spider_link_get_key` on `LOCK TABLES` ([MDEV-31357](#))
- Crash when lateral derived is guaranteed to return no rows ([MDEV-31279](#))

- Bogus error executing PS for query using CTE with renaming of columns ([MDEV-31995](#))
- Spider: Valid `LEFT JOIN` results in ERROR 1064 ([MDEV-26247](#))
- Trying to lock uninitialized mutex or hang upon shutdown after using Spider with `query_cache` ([MDEV-28739](#))
- Spider tests failing in asan/valgrind builds ([MDEV-32849](#))
- Backport fixes to spider init bugs to 10.4-10.6 once they have SQL service ([MDEV-29870](#))
- Server crash with `SIGSEGV` or `dynamic-stack-buffer-overflow` in `spider_db_mbase_util::append_table` ([MDEV-29163](#))
- `heap-use-after-free` in `ha_spider::lock_tables()`, highly sporadic `SIGSEGV` in `intern_close_table` ([MDEV-30014](#))
- Syntax error upon query with subquery from Spider table ([MDEV-30392](#))
- Spider doesn't recognize semi `JOIN` ([MDEV-31645](#))
- MariaDB, SPIDER engine, usage of `REGEXP` ([MDEV-32986](#))
- Spider: variable `spider_same_server_link` not functioning correctly ([MDEV-29718](#))
- Spider fails to autodiscover structure (did in <=10.5) and reports `ERROR 12500 (HY000): unknown` ([MDEV-33008](#))
- Spider spawns unnecessarily many system threads for stats synchronization ([MDEV-29020](#))
 - Defaults for `spider_table_crd_thread_count` and `spider_table_sts_thread_count` changed from 10 to 1
- `SIGSEGV` in `spider_db_delete_all_rows` on `TRUNCATE`, `UBSAN: member call on null pointer of type 'struct spider_db_handler'` in `spider_db_delete_all_rows` ([MDEV-33191](#))
- mariadb-upgrade fails with `'System table spider_tables is different version' => Can't create database 'performance_schema'` ([MDEV-27103](#))
- Spider: `SIGSEGV` in `spider_db_direct_delete`, `SIGSEGV` in `spider_db_connect`, `ASAN: heap-use-after-free` in `spider_db_direct_delete` ([MDEV-28683](#))
- `INSERT ... SELECT` Does not produce an optimizer trace ([MDEV-29298](#))
- No error for `DROP TABLE` and no warning for `DROP TABLE IF EXISTS` with absent table when Spider plugin is included ([MDEV-30170](#))
- `ASAN errors` in `spider_conn_queue_and_merge_loop_check` ([MDEV-29002](#))

Optimizer

- Crash caused by multi-table `UPDATE` over derived with hanging CTE ([MDEV-28615](#))
- Crash on query using CTE with the same name as a base table ([MDEV-31657](#))
- Crash with query using constant subquery as left part of `IN` subquery ([MDEV-29362](#))
- Incorrect result interceptor passed to `mysql_explain_union()` ([MDEV-33165](#))

Data Definition, Data Manipulation

- `ALTER SEQUENCE IF NOT EXISTS non_existing_seq` Errors rather than note ([MDEV-32795](#))
- Unexpected `ER_ERROR_ON_RENAME` upon `DROP non-existing FOREIGN KEY` with `ALGORITHM=COPY` ([MDEV-22230](#))
- `FOREIGN_KEY_CHECKS` does not prevent non-copy alter from creating invalid FK structure ([MDEV-29092](#))
- Assertion `!"wrong page type"` or Assertion `"wrong page type" == 0` failed in `innobase_instant_try` on `ALTER` ([MDEV-18322](#))
- Assertion `(col.vers_sys_end())` upon inplace `ALTER` with virtual columns ([MDEV-20545](#))
- `DELETE` with `ORDER BY` and semijoin optimization causing crash ([MDEV-32212](#))
- Invalid expr in `cleanup_session_expr()` upon `INSERT DELAYED` ([MDEV-29932](#))
- `SIGSEGV` in `my_decimal::operator=` and Assertion `'0'` failed in `Item_type_holder::val_decimal` on `SELECT` ([MDEV-29070](#))
- `LONG UNIQUE` does not work like unique key when using `replace` ([MDEV-32837](#))
- `LONG UNIQUE` gives error when used with `REPLACE` ([MDEV-32839](#))

Character Sets, Data Types

- InnoDB: `CHAR+nopad` does not work well ([MDEV-26743](#))
- `CAST(AS UNSIGNED)` fails with `--view-protocol` ([MDEV-32645](#))
- `JSON_ARRAYAGG` charset issue ([MDEV-24784](#))
- Server crash in `my_decimal::operator=` or unexpected `ER_DUP_ENTRY` upon comparison with `INET6` and similar types ([MDEV-32879](#))

Plugins

- Backport SQL service, introduced by [MDEV-19275](#) ([MDEV-27595](#))
- "plugin already loaded" should be a Warning, not an Error ([MDEV-32041](#))
- mariadb-upgrade should remove `mysql.plugin` entries for plugins that became bundled ([MDEV-32043](#))

Galera

- Node has been dropped from the cluster on Startup / Shutdown with async replica ([MDEV-31413](#))
- Inconsistency in Galera caused by `ALTER` being aborted before entering TOI mode ([MDEV-32938](#))
- Assertion ``total_length + thd->wsrep_sr().log_position() == saved_pos'` failed in `int wsrep_write_cache_inc(THD*, IO_CACHE*, size_t*)` ([MDEV-28971](#))
- `wsrep_provider_options` can be truncated on deep and long directory paths ([MDEV-32634](#))
- Server crashes in `rpl_sql_thread_info::cached_charset_compare / wsrep_apply_events` ([MDEV-22232](#))
- Galera crash when "create a table as select" ([MDEV-27806](#))
- Cluster is inconsistent after SAVEPOINT statement is rolled back ([MDEV-32549](#))
- `WSREP GTID MODE` is inconsistent ([MDEV-31905](#))
- IST "Donor does not know my secret" with `ssl-mode=VERIFY_CA` ([MDEV-32344](#))

Replication

- Server crashes in `Item_func_binlog_gtid_pos::val_str / Binary_string::c_ptr_safe` ([MDEV-33045](#))
- binlog corruption (/tmp no space left on device at the same moment) ([MDEV-27436](#))
- multi source replication filters breaking GTID semantic ([MDEV-26632](#))
- `SHOW SLAVE STATUS` Can Deadlock an Errored Slave ([MDEV-10653](#))
- `main.rpl_mysql_dump_slave` Fails with "Master binlog wasn't deleted" Assertion ([MDEV-32953](#))
- `rpl_seconds_behind_master_spike` Sensitive to IO Thread Stop Position ([MDEV-33327](#))
- Binlog Checksum is Zeroed by Zlib if Part of Event Data is Empty ([MDEV-33283](#))

General

- As per the [MariaDB Deprecation Policy](#), this will be the last release of [MariaDB 10.5](#) for Windows Server 2019
- Upgrade [HeidiSQL](#) to 12.6.
- Using two temporary tables in `OPTIMIZE TABLE` lead to crash ([MDEV-31523](#))
- `REGEXP_REPLACE` treats empty strings different than `REPLACE` in ORACLE mode ([MDEV-29095](#))
- `CREATE UNIQUE INDEX` fails with "ERROR 1286 (42000): Unknown storage engine 'partition'" ([MDEV-21618](#))
- Failure when executing `PS` for query using `IN` subquery ([MDEV-32569](#))
- Potential memory leak on executing of create view statement ([MDEV-32466](#))
- Assertion failures ([MDEV-32965](#))
- Two JSON related tests running in PS mode fail on server built with `-DWITH_PROTECT_STATEMENT_MEMROOT=YES` ([MDEV-32733](#))
- Alter sequence 2nd ps fails while alter sequence 2nd time (no ps) succeeds ([MDEV-33169](#))
- Set `TaskMax=inifinity` in the MariaDB systemd unit ([MDEV-30236](#))
- Unreliable autocommit flag on connection creation ([MDEV-32875](#))
- A connection can control `RAND()` in following connection ([MDEV-33148](#))
- `THD::rli_fake/rqi_fake` not cleared on new connection ([MDEV-32844](#))
- Assertion failures in `tdc_remove_table` upon interrupted `CREATE TABLE LIKE <sequence>` ([MDEV-20471](#))
- Server crash in `find_field_in_table` ([MDEV-32082](#))
- `LPAD` in vcol created in `ORACLE` mode makes table corrupted in non-ORACLE ([MDEV-27744](#))
- Failure to call SP invoking another SP with parameter requiring type conversion ([MDEV-33270](#))
- The database part is not case sensitive in SP names ([MDEV-33019](#))
- `EXCHANGE PARTITION` with non-matching vcol expression segfault ([MDEV-28127](#))
- Wrong user in `SET DEFAULT ROLE` error ([MDEV-26875](#))
- `quote(NULL)` returns incorrect result in view ('NU' instead of 'NULL') ([MDEV-28651](#))
- `mysql.slow_log` reports incorrect start time ([MDEV-11628](#))
- Update federated table and column privileges ([MDEV-32984](#))

[Overview of 10.5](#)

Release date: 13 Nov 2023

MariaDB 10.5 is a previous *stable* series of MariaDB, [maintained until](#) June 2025. It is an evolution of [MariaDB 10.4](#) with several entirely new features not found anywhere else and with backported and reimplemented features from MySQL.

MariaDB 10.5.23 is a [Stable \(GA\)](#) release.

For an overview of MariaDB 10.5 see the [What is MariaDB 10.5?](#) page.

Thanks, and enjoy MariaDB!

Notable Items

InnoDB

- [DROP INDEX](#) followed by [CREATE INDEX](#) may corrupt data ([MDEV-32132](#))
- [ROW_FORMAT=COMPRESSED](#) table: InnoDB: 2048 bytes should have been read. Only 0 bytes read. ([MDEV-31875](#))
- Server aborts during alter operation when table doesn't have foreign index ([MDEV-32527](#))
- [row_merge_fts_doc_tokenize\(\)](#) handles FTS plugin parser inconsistently ([MDEV-32578](#))
- InnoDB: tried to purge non-delete-marked record of an index on a virtual column prefix ([MDEV-30024](#))
- [lock_row_lock_current_waits](#) counter in [information_schema.innodb_metrics](#) may become negative ([MDEV-30658](#))
- [SET GLOBAL innodb_max_purge_lag_wait=...](#) hangs if [innodb_read_only=ON](#) ([MDEV-31813](#))
- Auto-increment no longer works for explicit [FTS_DOC_ID](#) ([MDEV-32017](#))
- Assertion ``pos < table->n_def` failed in [dict_table_get_nth_col](#) ([MDEV-32337](#))
- [innochecksum](#) man pages seem to be inconsistent with the binary (10.2.25) ([MDEV-20583](#))
- [innodb_compression_algorithm=0](#) (none) increments [Innodb_num_pages_page_compression_error](#) ([MDEV-30825](#))
- wrong table name in innodb's "row too big" errors ([MDEV-32128](#))
- Optimize [is_file_on_ssd\(\)](#) to speedup opening tablespaces on Windows ([MDEV-32228](#))
- Race condition between page write completion and log checkpoint ([MDEV-32511](#))
- After crash recovery, Checksum mismatch + Failing assertion: `!i || prev_id + 1 == space_id`, ([MDEV-31851](#))
- Deadlock due to [log_free_check\(\)](#), involving [trx_purge_truncate_rseg_history\(\)](#) and [trx_undo_assign_low\(\)](#) ([MDEV-32049](#))
- Write-ahead logging is broken for freed pages ([MDEV-32552](#))
- X-lock on supremum for prepared transaction for RR ([MDEV-30165](#))

Optimizer

- Crash when [HAVING](#) in a correlated subquery references columns in the outer query ([MDEV-29731](#))
- Server crashes at [TABLE::add_tmp_key](#) ([MDEV-32320](#))
- Server crashes inside [filesort](#) at [my_decimal::to_binary](#) ([MDEV-32324](#))
- Assertion ``bitmap_is_set(&m_part_info->read_partitions, m_part_spec.start_part)` failed in [ha_partition::handle_ordered_index_scan](#) ([MDEV-24283](#))
- Crash when searching for the best split of derived table ([MDEV-32064](#))
- Test case from [opt_tvc.test](#) fails with statement memory protection ([MDEV-32225](#))

- Significant slowdown for query with many outer joins ([MDEV-32351](#))
- `test_if_skip_sort_order()` should catch the join types `JT_EQ_REF`, `JT_CONST` and `JT_SYSTEM` and skip sort order for these ([MDEV-32475](#))

Replication

- `rpl.rpl_parallel_temptable` failure due to incorrect commit optimization of temptables ([MDEV-10356](#))
- Lock wait timeout with `INSERT-SELECT`, `autoinc`, and statement-based replication ([MDEV-31482](#))
- `strings/ctype-ucs2.c:2336: my_vsprintf_utf32: Assertion `(n % 4) == 0' failed in my_vsprintf_utf32 on INSERT` ([MDEV-32249](#))
- Assertion fails in `MDL_context::acquire_lock` upon parallel replication of `CREATE SEQUENCE` ([MDEV-31792](#))
- `SHOW SLAVE STATUS Last_SQL_Errno Race Condition on Errored Slave Restart` ([MDEV-31177](#))
- `seconds_behind_master` is inaccurate for Delayed replication ([MDEV-32265](#))
- detailize the semisync replication magic number error ([MDEV-32365](#))
- Parallel replication deadlock victim preference code erroneously removed ([MDEV-31655](#))

Galera

- Galera updated to 26.4.16
- Assertion ``state() == s_executing || state() == s_prepared || state() == s_committing || state() == s_must_abort || state() == s_replaying'` failed. ([MDEV-24912](#))
- Assertion ``state() == s_executing || state() == s_preparing || state() == s_prepared || state() == s_must_abort || state() == s_aborting || state() == s_cert_failed || state() == s_must_replay'` failed ([MDEV-31285](#))
- `wsrep_sst_mariabackup` not working on FreeBSD ([MDEV-31467](#))
- Galera library 26.4.16 fails with every server version ([MDEV-32024](#))
- Galera node remains paused after interleaving FTWRLs ([MDEV-32282](#))
- Failed to insert streaming client ([MDEV-32051](#))
- When set at runtime, `wsrep_sst_method` accepts any value ([MDEV-31470](#))
- galera needs packaging script changes to successfully build ([MDEV-32642](#))
- replication breaks when using optimistic replication and replica is a galera node ([MDEV-31833](#))
- McAfee database vulnerability scan caused MariaDB crash with signal 6 (system abort) ([MDEV-27004](#))

Data Definition

- MariaDB crash on calling function ([MDEV-23902](#))
- ASAN errors in `grn_obj_unlink / ha_mroonga::clear_indexes` upon index operations ([MDEV-31970](#))
- `vcoll` circular references lead to stack overflow ([MDEV-31112](#))

Scripts and Clients

- `mariadb-binlog -T/--table` (`mysqlbinlog`) option ([MDEV-25369](#))
- `mariadb-admin` (`mysqladmin`) wrong error with `simple_password_check` ([MDEV-22418](#))
- `mariadb-install-db` shows warning on missing directory `$pamtool_dir/auth_pam_tool_dir` ([MDEV-32142](#))
- `main.mysql_client_test`, `main.mysql_client_test_comp` failed on ASAN build with error: 5888, status: 23, errno: 2 ([MDEV-19369](#))
- `mariadb-install-db` (`mysql_install_db`) doesn't properly grant `proxy privileges` to all default root user accounts ([MDEV-21194](#))

Tests

- `main.events_stress` or `events.events_stress` fails with view-protocol ([MDEV-31455](#))
- `main.delete_use_source` fails (hangs) with view-protocol ([MDEV-31457](#))
- `main.sum_distinct-big` and `main.merge-big` fail with timeout with view-protocol ([MDEV-31465](#))
- `main.secure_file_priv_win` fails with 2nd execution PS protocol ([MDEV-32023](#))
- Windows : `mtr` output on is messed up with large `MTR_PARALLEL` ([MDEV-32387](#))
- `main.mysql_client_test_comp` failed in buildbot, error on exec ([MDEV-16641](#))
- `main.order_by_pack_big` fails with view-protocol ([MDEV-31460](#))

MariaBackup

- MariaBackup full backup failed with InnoDB: Failing assertion: success in storage/innobase/fil/fil0fil.cc line 657 ([MDEV-18200](#))
- `mbstream` breaks page compression on XFS ([MDEV-25734](#))

Character Sets, Data Types, Collations

- Prefix keys for CHAR work differently for MyISAM vs InnoDB ([MDEV-30048](#))
- Inconsistent results of DISTINCT with NOPAD ([MDEV-30050](#))
- Assertion `(length % 4) == 0` failed in my_lengthsp_utf32 on INSERT ([MDEV-28835](#))
- Compressed varchar values lost on joins when sorting on columns from joined table(s) ([MDEV-31724](#))
- UBSAN shift exponent X is too large for 64-bit type 'long long int' in sql/field.cc ([MDEV-32226](#))
- Wrong bit encoding using COALESCE ([MDEV-32244](#))

Spider

- Spider UBSAN runtime error: applying non-zero offset x to null pointer in st_spider_param_string_parse::restore_delims ([MDEV-31117](#))
- Segfault when setting spider_delete_all_rows to 0 and delete all rows of a spider table, ASAN heap-use-after-free in spider_db_delete_all_rows ([MDEV-31996](#))
- ASAN errors in spider_fields::free_conn_holder or spider_create_group_by_handler ([MDEV-28998](#))
- ASAN: heap-buffer-overflow & stack-buffer-overflow in spider_db_mbase_row::append_to_str | SIGSEGV's in memmove_avx_unaligned_erms from memcpy in Binary_string::q_append, in Static_binary_string::q_append and my_strntoull10rnd_8bit | Unknown error 12801 ([MDEV-29502](#))

General

- binlog_do_db option breaks importing sql dumps ([MDEV-29989](#))
- Crashes in MDL_key::mdl_key_init with lower-case-table-names=2 ([MDEV-32025](#))
- getting error 'Illegal parameter data types row and bigint for operation '+' ' when using ITERATE in a FOR..DO ([MDEV-32275](#))
- Assertion `arena_for_set_stmt== 0` failed in LEX::set_arena_for_set_stmt upon SET STATEMENT ([MDEV-17711](#))
- main.mysqlcheck fails on ARM with ASAN use-after-poison in my_mb_wc_filename ([MDEV-26494](#))
- main.delayed fails with wrong error code or timeout when executed after main.deadlock_ftwrl ([MDEV-27523](#))
- Assertion failed: !pfs->m_idle || (state == PSI_SOCKET_STATE_ACTIVE) ([MDEV-28561](#))
- MyISAM wrong server status flags ([MDEV-28820](#))
- Server crashes in check_sequence_fields upon CREATE TABLE .. SEQUENCE=1 AS SELECT .. ([MDEV-29771](#))
- slow log Rows_examined out of range ([MDEV-30820](#))
- " rpm --setugids " breaks PAM authentication ([MDEV-30904](#))
- incorrect examined rows in case of stored function usage ([MDEV-31742](#))
- Compilation failing on MacOS (unknown warning option -Wno-unused-but-set-variable) ([MDEV-31890](#))
- Server crash upon inserting into Mroonga table with compressed column ([MDEV-31966](#))
- hash unique corrupts index on virtual blobs ([MDEV-32012](#))
- insert into an empty table fails with hash unique ([MDEV-32015](#))
- Valgrind/MSAN warnings in dynamic_column_update_move_left ([MDEV-32140](#))
- Memory leak showed in [MDEV-6146](#) test suite ([MDEV-32223](#))
- Test from subselect.test fails with statement memory protection ([MDEV-32245](#))
- Memory leak when executing PS for query with IN subquery ([MDEV-32369](#))
- Allow the setting of Auto_increment on FK referenced columns ([MDEV-32018](#))
- mariadb-upgrade fails with sql_safe_updates = on ([MDEV-29914](#))
- Assertion `!(thd->server_status & (1U | 8192U))' failed in MDL_context::release_transactional_locks ([MDEV-32541](#))
- Information schema leaks table names and structure to unauthorized users ([MDEV-32500](#))
- Missing CHACHA20-POLY1305 support in WolfSSL ([MDEV-31653](#))
- incorrect error about cyclic reference about JSON type virtual column ([MDEV-32586](#))
- Disable TLS v1.0 and 1.1 for MariaDB ([MDEV-31369](#))
- Better indication of refusing to start because of ProtectHome ([MDEV-25177](#))
- Database upgrade fails: slow_log table ([MDEV-27757](#))
- myrocks_hotbackup.1 and test suite files installed when engine is disabled ([MDEV-29993](#))
- client_ed25519.dll isn't included for HeidiSQL. ([MDEV-31315](#))
- Assertion `!m_null_value' failed in int FixedBinTypeBundle<FbtImpl>::cmp_item_fbt::compare or in cmp_item_inet6::compare ([MDEV-27207](#))
- type_test.type_test_double fails with 'NUMERIC_SCALE NULL' ([MDEV-22243](#))
- LeakSanitizer errors in get_quick_select or Assertion `status_var.local_memory_used == 0 || !debug_assert_on_not_freed_memory' failed ([MDEV-32476](#))
- Update signal handler user info more compassion and correct url ([MDEV-32535](#))

Docker Official Images

- Invert single and double quotes for sql command definitions in [healthcheck.sh](#) due to failure under `sql_mode=ANSI_QUOTES` - contribution by Dominik Häckel

- [healthcheck.sh](#) --no-defaults behaviour was corrected - reported by Dominik Häckel
- Added /docker-entrypoint-init.d for tar{,compression} from [mariadb-backup - instructions](#)
- Refactor `docker_mariadb_init` in the entrypoint for extending the MariaDB image
- CIS failure due to world-writable directory /var/run/mysqld, added sticky bit - reported by @ollie1
- Add [PROXY privileges](#) for root@MARIADB_ROOT_HOST - reported by Matthieu Gusmini
- [healthcheck.sh](#) added --galera_online test, to match what the [mariadb-operator](#) does.

Security

- Fixes for the following [security vulnerabilities](#):
 - [CVE-2023-22084](#)

Changelog

For a complete list of changes made in [MariaDB 10.5.23](#), with links to detailed information on each push, see the [changelog](#).

Be notified of new MariaDB Server releases automatically by [subscribing](#) to the MariaDB Foundation community announce 'at' lists.mariadb.org announcement list (this is a low traffic, announce-only list). MariaDB plc customers will be notified for all new releases, security issues and critical bug fixes for all MariaDB plc products thanks to the Notification Services.

MariaDB may already be included in your favorite OS distribution. More information can be found on the [Distributions which Include MariaDB](#) page.

7.0.7.2.6 MariaDB 10.5.22 Release Notes

[Download](#)

[Release Notes](#)

[Changelog](#)

[Overview of 10.5](#)

[Alternate download from mariadb.org](#)

Release date: 14 Aug 2023

[MariaDB 10.5](#) is a previous *stable* series of MariaDB, [maintained until](#) June 2025. It is an evolution of [MariaDB 10.4](#) with several entirely new features not found anywhere else and with backported and reimplemented features from MySQL.

[MariaDB 10.5.22](#) is a **Stable (GA)** release.

For an overview of [MariaDB 10.5](#) see the [What is MariaDB 10.5?](#) page.

Thanks, and enjoy MariaDB!

Notable Items

General

- As per the [MariaDB Deprecation Policy](#), this will be the last release of [MariaDB 10.5](#) for Ubuntu 18.04 LTS "Bionic"
- `mariadb-dump --force` doesn't ignore error as it should ([MDEV-31092](#))
- 280 Bytes lost in `mysys/array.c`, `mysys/hash.c`, `sql/sp.cc`, `sql/sp.cc`, `sql/item_create.cc`, `sql/item_create.cc`, `sql/sql_yacc.yy:10748` when using oracle `sql_mode` ([MDEV-26186](#))
- SQL/PL package body does not appear in `I_S.ROUTINES.ROUTINE_DEFINITION` ([MDEV-30662](#))
- Unexpected result when combining `DISTINCT`, subselect and `LIMIT` ([MDEV-28285](#))
- `ROW` variables do not get assigned from subselects ([MDEV-31250](#))
- Crash after setting global `session_track_system_variables` to an invalid value ([MDEV-25237](#))
- ODKU of non-versioning column inserts history row ([MDEV-23100](#))
- UPDATE not working properly on transaction precise system versioned table ([MDEV-25644](#))

- Assertion ``const_item_cache == true'` failed in `Item_func::fix_fields` ([MDEV-31319](#))
- ANALYZE doesn't work with pushed derived tables ([MDEV-29284](#))
- `get_partition_set` is never executed in `ha_partition::multi_range_key_create_key` due to bitwise & with 0 constant ([MDEV-24712](#))
- Client can crash the server with a `mysql_list_fields("view")` call ([MDEV-30159](#))
- `I_S.parameters` not immediately changed updated after procedure change ([MDEV-31064](#))

Character Sets, Data Types

- UBSAN: null pointer passed as argument 1, which is declared to never be null in `my_strncoll_binary` on `SELECT ... COUNT or GROUP_CONCAT` ([MDEV-28384](#))
- Possibly wrong result or Assertion ``0'` failed in `Item_func_round::native_op` ([MDEV-23838](#))
- Assertion ``(length % 4) == 0'` failed in `my_lengthsp_utf32` on `SELECT` ([MDEV-29019](#))
- UBSAN: negation of -X cannot be represented in type `'long long int'`; cast to an unsigned type to negate this value to itself in `Item_func_mul::int_op` and `Item_func_round::int_op` ([MDEV-30932](#))
- Assorted assertion failures in `json_find_path` with certain collations ([MDEV-23187](#))

InnoDB

- `innochecksum` dies with Floating point exception ([MDEV-31641](#))
- Deadlock with 3 concurrent `DELETES` by `unique key` ([MDEV-10962](#))
- `innodb` protection against dual processes accessing data insufficient ([MDEV-31568](#))
- Assertion ``!strcmp(index->table->name.m_name, "SYS_FOREIGN") || !strcmp(index->table->name.m_name, "SYS_FOREIGN_COLS")'` failed in `btr_node_ptr_max_size` ([MDEV-19216](#))
- `MODIFY COLUMN` can break FK constraints, and lead to unrestoreable dumps ([MDEV-31086](#))
- Recovery or backup failure after `innodb_undo_log_truncate=ON` ([MDEV-31487](#))
- Assertion `'n & PENDING'` failed in `fil_space_t::set_needs_flush()` ([MDEV-31442](#))
- `fil_node_open_file()` releases `fil_system.mutex` allowing other thread to open its file node ([MDEV-31256](#))
- Freed data pages are not always being scrubbed ([MDEV-31253](#))
- `innodb_undo_log_truncate=ON` fails to wait for purge of enough transaction history ([MDEV-31355](#))
- `SET GLOBAL innodb_undo_log_truncate=ON` does not free space when no undo logs exist ([MDEV-31382](#))
- `innodb_read_ahead_threshold` (linear read-ahead) does not work ([MDEV-29967](#))
- `fil_ibd_create()` may hijack the file handle of an old file ([MDEV-31347](#))
- `innodb_undo_log_truncate=ON` recovery results in a corrupted undo log ([MDEV-31373](#))
- Foreign Key Constraint actions don't affect Virtual Column ([MDEV-18114](#))

Aria

- Various crashes upon `INSERT/UPDATE` after changing Aria settings ([MDEV-28054](#))
- Various crashes/asserts/corruptions when Aria encryption is enabled/used, but the encryption plugin is not loaded ([MDEV-26258](#))

Spider

- `SIGSEGV` in `spider_db_open_item_field` and `SIGSEGV` in `spider_db_print_item_type`, on `SELECT` ([MDEV-29447](#))
- `Spider variables` that double as table params overriding mechanism is buggy ([MDEV-31524](#))

Optimizer

- Assertion ``last_key_entry >= end_pos'` failed in virtual bool `JOIN_CACHE_HASHED::put_record()` ([MDEV-31348](#))
- Problem with open ranges on prefix blobs keys ([MDEV-31800](#))
- Equal on two `RANK window functions` create wrong result ([MDEV-20010](#))
- Recursive CTE execution is interrupted without errors or warnings ([MDEV-31214](#))
- Assertion ``s->table->opt_range_condition_rows <= s->found_records'` failed in `apply_selectivity_for_table` ([MDEV-31449](#))
- Inconsistency between MRR and SQL layer costs can cause poor query plan ([MDEV-31479](#))
- `MAX_SEL_ARG` memory exhaustion is not visible in the optimizer trace ([MDEV-30964](#))
- `SHOW TABLES` not working properly with `lower_case_table_names=2` ([MDEV-30765](#))
- Segfault on select query using index for group-by and filesort ([MDEV-30143](#))
- Server crash in `store_length`, assertion failure in `Type_handler_string_result::sort_length` ([MDEV-31743](#))

Replication

- Parallel Slave SQL Thread Can Update Seconds_Behind_Master with Active Workers ([MDEV-30619](#))
- ALTER SEQUENCE ends up in optimistic parallel slave binlog out-of-order ([MDEV-31503](#))
- STOP SLAVE takes very long time on a busy system ([MDEV-13915](#))
- On slave XA COMMIT/XA ROLLBACK fail to return an error in read-only mode ([MDEV-30978](#))
- rpl.rpl_manual_change_index_file occasionally fails in BB with Result length mismatch ([MDEV-30214](#))

Galera

- Node has been dropped from the cluster on Startup / Shutdown with async replica ([MDEV-31413](#))
- KILL QUERY maintains nodes data consistency but breaks GTID sequence ([MDEV-31075](#))
- MariaDB stuck on starting commit state (waiting on commit order critical section) ([MDEV-29293](#))
- Assertion state() == s_aborting || state() == s_must_replay failed in int wsrep::transaction::after_rollback() ([MDEV-30013](#))
- Assertion !wsrep_has_changes(thd) || (thd->lex->sql_command == SQLCOM_CREATE_TABLE && !thd->is_current_stmt_binlog_format_row()) || thd->wsrep_cs().transaction().state() == wsrep::transaction::s_aborted failed ([MDEV-30388](#))
- Server crashes when wsrep_sst_donor and wsrep_cluster_address set to NULL ([MDEV-28433](#))
- Create temporary sequence can cause inconsistency ([MDEV-31335](#))
- Galera 4 unable to query cluster state if not primary component ([MDEV-21479](#))

Changelog

Notable Items

InnoDB

- Server crashes in `st_join_table::choose_best_splitting` ([MDEV-31403](#))
- Crash with condition pushable into derived and containing outer reference ([MDEV-31240](#))
- InnoDB does not free UNDO after the fix of [MDEV-30671](#) ([MDEV-31234](#))
- Revert "[MDEV-30473](#) : Do not allow GET_LOCK() / RELEASE_LOCK() in cluster"

Optimizer

- Crash with condition pushable into derived and containing outer reference ([MDEV-31403](#) [MDEV-31240](#))
- Crash with `EXPLAIN EXTENDED` for multi-table update of system table ([MDEV-31224](#))

Changelog

[Overview of 10.5](#)

Release date: 10 May 2023

[MariaDB 10.5](#) is a previous *stable* series of MariaDB, [maintained until](#) June 2025. It is an evolution of [MariaDB 10.4](#) with several entirely new features not found anywhere else and with backported and reimplemented features from MySQL.

[MariaDB 10.5.20](#) is a **Stable (GA)** release.

For an overview of [MariaDB 10.5](#) see the [What is MariaDB 10.5?](#) page.

Thanks, and enjoy MariaDB!

Notable Items

InnoDB

- Crash on `ROLLBACK` in a `ROW_FORMAT=COMPRESSED` table ([MDEV-30882](#))
- `UNIQUE USING HASH` accepts duplicate entries for tricky collations ([MDEV-30034](#))

- `rec_get_offsets()` is not optimal ([MDEV-30567](#))
- Performance regression in `fil_space_t::try_to_close()` introduced in [MDEV-23855](#) ([MDEV-30775](#))
- InnoDB recovery hangs when buffer pool ran out of memory ([MDEV-30551](#))
- InnoDB undo log truncation fails to wait for purge of history ([MDEV-30671](#))
- Fix miscount of doublewrites by `InnoDB_data_written` ([MDEV-31124](#))

Backup

- `mariadb-backup` doesn't utilise `innodb-undo-log-directory` (if specified as a relative path) during copy-back operation ([MDEV-28187](#))
- `mariabackup` issues error messages during InnoDB tablespaces export on partial backup preparing ([MDEV-29050](#))
- `mariadb-backup` does not copy Aria logs if `aria_log_dir_path` is used ([MDEV-30968](#))
- Race condition between buffer pool flush and log file deletion in `mariadb-backup --prepare` ([MDEV-30860](#))

Replication

- Fixed a deadlock on parallel slave involving full image Write event on the sequence engine ([MDEV-29621](#))
- Fixed an attempted out-of-order binlogging error on slave involving ALTER on the sequence engine ([MDEV-31077](#))
- Corrected non-versioned master to versioned slave replication on no-unique attribute table ([MDEV-30430](#))
- Mended encrypted binlog master to error out to `gtid-mode` slave when master could not decrypt a binlog file ([MDEV-28798](#))
- Refined optimistic parallel slave to error-exit without any hang ([MDEV-30780](#))
- Ensured `SHOW-SLAVE-STATUS` is processed on the parallel slave having a necessary mutex always initialized ([MDEV-30620](#))
- Fixed the slave applier to report a correct error when `gtid_slave_pos` insert fails for some (engine) reasons ([MDEV-31038](#))

Optimizer

- `Split Materialized` optimization is improved to re-fill the materialized table only if necessary. The fewer number of table refills is taken into account when choosing query plan, too ([MDEV-26301](#)).
- Queries using `SELECT DISTINCT some_expression(aggregate_function())` could produce wrong query result. ([MDEV-20057](#))
- A `GROUP BY` query with `MIN(primary_key)` in select list and `primary_key<>const` in the `WHERE` could produce wrong result when executed with "Using index for group-by" strategy ([MDEV-30605](#))
- `EXPLAIN` could erroneously report that `Rowid Filter optimization` is used for partitioned tables. Partitioned tables do not support it. ([MDEV-30596](#))
- A bug in selectivity computations for `SINGLE/DOUBLE_PREC_HB` histograms could cause wrong estimates to be produced. This could cause the optimizer to pick sub-optimal query plans ([MDEV-31067](#)).

Docker Official Images

- Add replication setup to containers contributed by Md Sahil ([MDEV-29762](#))

Security

- Fixes for the following security vulnerabilities:
 - [CVE-2022-47015](#)

7.0.7.2.9 MariaDB 10.5.19 Release Notes

[Download](#)

[Release Notes](#)

[Changelog](#)

[Overview of 10.5](#)

Release date: 6 Feb 2023

MariaDB 10.5 is a previous *stable* series of MariaDB, maintained until June 2025. It is an evolution of [MariaDB 10.4](#) with several entirely new features not found anywhere else and with backported and reimplemented features from MySQL.

MariaDB 10.5.19 is a [Stable \(GA\)](#) release.

For an overview of [MariaDB 10.5](#) see the [What is MariaDB 10.5?](#) page.

Thanks, and enjoy MariaDB!

Notable Items

- As mentioned in the [10.5.18 release notes](#), our Yum/DNF/Zypper repositories for Red Hat Enterprise Linux, CentOS, Fedora, openSUSE, and SUSE are changing **with this release** to being signed with a new GPG key with SHA2 digest algorithms instead of SHA1. See [this blog post](#) and the [GPG](#) page for more details.

InnoDB

- [Full-text index](#) corruption with [system versioning](#) (MDEV-25004)
- [innodb_undo_log_truncate=ON](#) recovery and backup fixes (MDEV-29999, MDEV-30179, MDEV-30438)
- Upgrade after a crash is not supported (MDEV-24412)
- Remove [InnoDB buffer pool](#) load throttling (MDEV-25417)
- InnoDB shutdown hangs when the change buffer is corrupted (MDEV-30009)
- `innodb_fast_shutdown=0` fails to report change buffer merge progress (MDEV-29984)

Galera

- [Galera](#) updated to 26.4.14
- Fixes for cluster wide write conflict resolving (MDEV-29684)

Replication

- Parallel slave applying in binlog order is corrected for admin class of commands including ANALYZE (MDEV-30323)
- [Seconds_Behind_Master](#) is now shown now more precisely at the slave applier start, including in the delayed mode (MDEV-29639)
- `mysqlbinlog --verbose` is made to show the type of compressed columns (MDEV-25277)
- Deadlock is resolved on replica involving `BACKUP STAGE BLOCK_COMMIT` and a committing user XA (MDEV-30423)

JSON

- [JSON_PRETTY](#) added as an alias for [JSON_DETAILED](#) (MDEV-19160)

General

- Infinite sequence of recursive calls when processing embedded CTE (MDEV-30248)
- Crash with a query containing nested WINDOW clauses (MDEV-30052)
- Major performance regression with 10.6.11 (MDEV-29988)
- As per the [MariaDB Deprecation Policy](#), this will be the last release of [MariaDB 10.5](#) for Fedora 35.
- In this release repositories for Fedora 37 have been added.

Changelog

For a complete list of changes made in [MariaDB 10.5.19](#), with links to detailed information on each push, see the [changelog](#) [↗](#).

Contributors

For a full list of contributors to [MariaDB 10.5.19](#), see the [MariaDB Foundation release announcement](#) [↗](#).

Be notified of new MariaDB Server releases automatically by [subscribing](#) [↗](#) to the MariaDB Foundation community announce 'at' lists.mariadb.org announcement list (this is a low traffic, announce-only list). MariaDB plc customers will be notified for all new releases, security issues and critical bug fixes for all MariaDB plc products thanks to the Notification Services.

MariaDB may already be included in your favorite OS distribution. More information can be found on the [Distributions which Include MariaDB](#) page.

7.0.7.2.10 MariaDB 10.5.18 Release Notes

The most recent release of MariaDB 10.5 is:
MariaDB 10.5.28 [↗](#) Stable (GA) [Download Now](#) [↗](#)
Alternate download from mariadb.org [↗](#)

[Download 10.5.18](#) [↗](#)

[Release Notes](#)

[Changelog](#) [↗](#)

[Overview of 10.5](#)

Release date: 7 Nov 2022

MariaDB 10.5 is a previous *stable* series of MariaDB, maintained until June 2025. It is an evolution of [MariaDB 10.4](#) with several entirely new features not found anywhere else and with backported and reimplemented features from MySQL.

MariaDB 10.5.18 is a [Stable \(GA\)](#) [↗](#) release.

For an overview of [MariaDB 10.5](#) see the [What is MariaDB 10.5?](#) page.

Thanks, and enjoy MariaDB!

Notable Items

SSL

- The server no longer tolerates incorrectly configured SSL ([MDEV-29811](#) [↗](#)). If you have enabled SSL in `my.cnf` but have not configured it properly (for example, a certificate file is missing), MariaDB used to silently disable SSL, leaving you under impression that everything was fine and connections were secure. Since this release, MariaDB will fail to start if SSL is enabled, but cannot be switched on.

Backup

- `mariabackup --compress` hangs ([MDEV-29043](#) [↗](#))
- Assertion on `info.page_size` failed in `xb_delta_open_matching_space` ([MDEV-18589](#) [↗](#))

InnoDB

- InnoDB unnecessarily extends data files ([MDEV-13013](#) [↗](#))
- Adaptive hash index [MDEV-27700](#) [↗](#), [MDEV-29384](#) [↗](#)
- MVCC and locking [MDEV-29666](#) [↗](#), [MDEV-27927](#) [↗](#)
- Virtual columns [MDEV-29299](#) [↗](#), [MDEV-29753](#) [↗](#)
- InnoDB crash recovery fixes ([MDEV-29438](#) [↗](#), [MDEV-29475](#) [↗](#))

- InnoDB crash recovery fixes ([MDEV-29559](#))
- MVCC and locking ([MDEV-28709](#))
- Race condition between KILL and transaction commit ([MDEV-29368](#))

Galera

- Galera updated to 26.4.13
- Galera server crashes after 10.3 > 10.4 upgrade ([MDEV-29375](#))
- `wsrep_incoming_addresses` status variable prints 0 as port number if the port is not mentioned in `wsrep_node_incoming_address` system variable ([MDEV-28868](#))

JSON

- `JSON_VALUE()` does not parse NULL properties properly ([MDEV-27151](#))

Replication

- minor correction in unsafe warning message ([MDEV-28827](#))
- False replication error-stop of `REVOKE PRIVILEGES` from a non-existing user on primary ([MDEV-28530](#)) in combination with a filtering replica is corrected
- `SET DEFAULT ROLE` replication is mended on a replica that filters system tables ([MDEV-28294](#))
- XA COMMIT is not binlogged when the `XA transaction` has not updated any transaction engine ([MDEV-25616](#))
- Concurrent `CREATE TRIGGER` statements made to binlog without any mixup ([MDEV-25606](#))

Repositories

- Beginning with the next release (Q1 2023), our Yum, DNF, and Zypper repositories for Red Hat, Fedora, and SUSE will be migrated to being signed with a new [GPG key](#). The key we are migrating to is the same one we already use for our Debian and Ubuntu Repositories.
 - The short Key ID is: `0xC74CD1D8`
 - The long Key ID is: `0xF1656F24C74CD1D8`
 - The full fingerprint of the key is: `177F 4010 FE56 CA33 3630 0305 F165 6F24 C74C D1D8`
 - The key can be imported now in preparation for this change using the following command:

```
sudo rpm --import https://supplychain.mariadb.com/MariaDB-Server-GPG-KEY
```

Docker Official Image

The following changes have been made to the `docker.io/library/mariadb` container image.

- The number of gpg packages packages has been removed, leaving enough to `apt-get update`, but `dirmngr` that would fetch keys has been removed. (inspired by [issue #469](#))
- The environment variable `LANG=C.UTF-8` has been added for those that exec into containers and copy paste UTF8 characters (fixes [issue #468](#)).
- Adds OCI labels to image (fixes [issue 436](#) and [users need for version](#))
- MariaDB config: `skip-host-cache` and `skip-name-resolve` moved to `/etc/mysql/mariadb.conf.d/05-skipcache.cnf`

Changelog

MariaDB may already be included in your favorite OS distribution. More information can be found on the [Distributions which Include MariaDB](#) page.

7.0.7.2.11 MariaDB 10.5.17 Release Notes

The most recent release of MariaDB 10.5 is:
MariaDB 10.5.28 [Stable \(GA\)](#) [Download Now](#)
Alternate download from mariadb.org

[Download 10.5.17](#)

[Release Notes](#)

[Changelog](#)

[Overview of 10.5](#)

Release date: 15 Aug 2022

MariaDB 10.5 is a previous *stable* series of MariaDB. It is an evolution of MariaDB 10.4 with several entirely new features not found anywhere else and with backported and reimplemented features from MySQL.

MariaDB 10.5.17 is a [Stable \(GA\)](#) release.

For an overview of MariaDB 10.5 see the [What is MariaDB 10.5?](#) page.

Thanks, and enjoy MariaDB!

Notable Items

InnoDB

- InnoDB corruption due to lack of file locking ([MDEV-28495](#))
- FULLTEXT search with apostrophe, and mandatory words ([MDEV-20797](#))
- ALTER TABLE IMPORT TABLESPACE corrupts an encrypted table ([MDEV-28779](#))
- ALTER TABLE wrong-result fix ([MDEV-26294](#))
- Crash recovery fixes ([MDEV-28668](#), [MDEV-28731](#))

Replication

- [explicit_defaults_for_timestamp](#) is stored in binlog, so that `CREATE TABLE` on slave would always have the same effect as on master. ([MDEV-29078](#))
- `ER_SLAVE_INCIDENT` error is specified now on slave to be seen with `SHOW-SLAVE-STATUS` ([MDEV-21087](#))
- `INCIDENT_EVENT` is no longer binlogged when a being logged transaction can be safely rolledback ([MDEV-21443](#))
- sequences related row-format events are made to correspond to `binlog_row_image` ([MDEV-28487](#))
- Possible reason of `FLUSH BINARY LOGS` hang is eliminated ([MDEV-28948](#))

Galera

- Galera updated to 26.4.12
- Possible to write/update with `read_only=ON` and not a `SUPER` privilege ([MDEV-28546](#))
- Node crashes with Transport endpoint is not connected `mysqld` got signal 6 ([MDEV-25068](#))
- Galera4 not able to report proper `wsrep_incoming_addresses` ([MDEV-20627](#))
- Galera should replicate `nextval()`-related changes in sequences with `INCREMENT <> 0`, at least `NOCACHE` ones with `engine=InnoDB` ([MDEV-27862](#))

Optimizer

- Server crash in `JOIN_CACHE::free` or in `copy_fields` ([MDEV-23809](#))
 - Queries that use `DISTINCT` and an always-constant function like `COLLATION(aggregate_func(...))` could cause a server crash. Note that `COLLATION()` is a special function - its value is constant even if its argument is not constant.
- Crash when using `ANY` predicand with redundant subquery in `GROUP BY` clause ([MDEV-29139](#))
 - A query with a subquery in this form could cause a crash:

```
... ANY (SELECT ... GROUP BY (SELECT redundant_subselect_here)) ...
```

- MariaDB Server SEGV on INSERT .. SELECT ([MDEV-26427](#))
 - Certain queries in form "INSERT ... SELECT with_aggregate_or_window_func" could cause a crash.
- `restore_prev_nj_state()` doesn't update `cur_sj_inner_tables` correctly ([MDEV-28749](#))
 - Subquery semi-join optimization could miss LooseScan or FirstMatch strategies for certain queries.
- Optimizer uses all partitions after upgrade to 10.3 ([MDEV-28246](#))
 - For multi-table UPDATE or DELETE queries, the optimizer failed to apply Partition Pruning optimization for the table that is updated or deleted from.
- Range optimizer regression for key IN (const, ...) ([MDEV-25020](#))
 - The issue can be observed on [MariaDB 10.5.9](#) and later versions which have the fix for [MDEV-9750](#). That fix introduces `optimizer_max_sel_arg_weight`.
 - If one sets `optimizer_max_sel_arg_weight` to a very high value or zero (which means "unlimited") and runs queries that produce heavy-weight graphs, they can observe a performance slowdown, e.g.:

```
table.keyXpartY [NOT] IN ( ... )
```

- Wrong result with table elimination combined with `not_null_range_scan` ([MDEV-28858](#))
 - If one runs with `optimizer_switch='not_null_range_scan=on'` (which is not enabled by default), a query that does a join and has const tables could produce a wrong result.

CONNECT

- [CONNECT Engine](#) now supports `INSERT IGNORE` with [Mysql Table type](#) ([MDEV-27766](#))

mariadb Client

- New [mariadb client](#) option, `-enable-cleartext-plugin`. Option does not do anything, and is for MySQL-compatibility purposes only.

General

- `explicit_defaults_for_timestamp` now also has a session scope, not only global ([MDEV-29225](#))
- MariaDB can be built with OpenSSL 3.0
- `HELP` was updated to include the latest content
- Crash in `JSON_EXTRACT` ([MDEV-29188](#))
- `ALTER TABLE ALGORITHM=NOCOPY` does not work after upgrade ([MDEV-28727](#))
- Server crash upon `CREATE VIEW` with unknown column in `ON` condition ([MDEV-29088](#))
- As per the [MariaDB Deprecation Policy](#), this will be the last release of [MariaDB 10.5](#) for Debian 10 "Buster" for ppc64el

Security

- Fixes for the following [security vulnerabilities](#):
 - [CVE-2023-5157](#)
 - [CVE-2022-32082](#)
 - [CVE-2022-32089](#)
 - [CVE-2022-32081](#)
 - [CVE-2018-25032](#)
 - [CVE-2022-32091](#)
 - [CVE-2022-32084](#)
 - [CVE-2022-38791](#)

Changelog

For a complete list of changes made in [MariaDB 10.5.17](#), with links to detailed information on each push, see the [changelog](#).

MariaDB may already be included in your favorite OS distribution. More information can be found on the [Distributions which Include MariaDB](#) page.

7.0.7.2.12 MariaDB 10.5.16 Release Notes

The most recent release of MariaDB 10.5 is:
MariaDB 10.5.28 [Stable \(GA\)](#) [Download Now](#)

[Alternate download from mariadb.org](#)

[Download 10.5.16](#)

[Release Notes](#)

[Changelog](#)

[Overview of 10.5](#)

Release date: 20 May 2022

MariaDB 10.5 is a previous *stable* series of MariaDB. It is an evolution of [MariaDB 10.4](#) with several entirely new features not found anywhere else and with backported and reimplemented features from MySQL.

MariaDB 10.5.16 is a [Stable \(GA\)](#) release.

For an overview of MariaDB 10.5 see the [What is MariaDB 10.5?](#) page.

Thanks, and enjoy MariaDB!

Notable Items

InnoDB

- `innodb_disallow_writes` removed ([MDEV-25975](#))
- InnoDB gap locking fixes ([MDEV-20605](#), [MDEV-28422](#))
- InnoDB performance improvements ([MDEV-27557](#), [MDEV-28185](#))

Replication

- Server initialization time `gtid_slave_pos` purge related reason of crashing in binlog background thread is removed ([MDEV-26473](#))
- Shutdown of the semisync master can't produce inconsistent state anymore ([MDEV-11853](#))
- Binlogs disappear after `rsync IST` ([MDEV-28583](#))
- master crash is eliminated in compressed semisync replication protocol with packet counting amendment ([MDEV-25580](#))
- OPTIMIZE on a sequence does not cause counterfactual `ER_BINLOG_UNSAFE_STATEMENT` anymore ([MDEV-24617](#))
- Automatically generated `Gtid_log_list_event` is made to recognize within replication event group as a formal member ([MDEV-28550](#))
- `Replication unsafe INSERT .. ON DUPLICATE KEY UPDATE` using two or more unique key values at a time with `MIXED` format binlogging is corrected ([MDEV-28310](#))
- `Replication unsafe INSERT .. ON DUPLICATE KEY UPDATE` stops issuing unnecessary "Unsafe statement" with `MIXED` binlog format ([MDEV-21810](#))
- Incomplete replication event groups are detected to error out by the slave IO thread ([MDEV-27697](#))
- `mysqlbinlog --stop-never --raw` now flushes the result file to disk after each processed event so the file can be listed with the actual bytes ([MDEV-14608](#))

Backup

- Incorrect binlogs after Galera SST using `rsync` and `mariabackup` ([MDEV-27524](#))
- `mariabackup` does not detect multi-source replication slave ([MDEV-21037](#))
- Useless warning "InnoDB: Allocated tablespace ID <id> for <tablename>, old maximum was 0" during backup stage

([MDEV-27343](#))

- [mariabackup](#) prepare fails for incrementals if a new schema is created after full backup is taken ([MDEV-28446](#))

Optimizer

- A SEGV in `Item_field::used_tables/update_depend_map_for_order...` ([MDEV-26402](#))
- `ANALYZE FORMAT=JSON` fields are incorrect for UNION ALL queries ([MDEV-27699](#))
- Subquery in an UPDATE query uses full scan instead of range ([MDEV-22377](#))
- Assertion ``item1->type() == Item::FIELD_ITEM ...` ([MDEV-19398](#))
- Server crashes in `Expression_cache_tracker::fetch_current_stats` ([MDEV-28268](#))
- MariaDB server crash at `Item_subselect::init_expr_cache_tracker` ([MDEV-26164](#), [MDEV-26047](#))
- Crash with union of `my_decimal` type in ORDER BY clause ([MDEV-25994](#))
- SIGSEGV in `st_join_table::cleanup` ([MDEV-24560](#))
- Assertion ``!eliminated'` failed in `Item_subselect::exec` ([MDEV-28437](#))

General

- Server [error messages](#) are [now available in Chinese](#) ([MDEV-28227](#))
- For RHEL/CentOS 7, non x86_64 architectures are no longer supported upstream and so our support will also be dropped with this release
- As per the [MariaDB Deprecation Policy](#), this will be the last release of [MariaDB 10.5](#) for Debian 9 "Stretch", Ubuntu 21.10 "Impish", and Fedora 34

Security

- Fixes for the following [security vulnerabilities](#):
 - [CVE-2021-46669](#)
 - [CVE-2022-27376](#)
 - [CVE-2022-27377](#)
 - [CVE-2022-27378](#)
 - [CVE-2022-27379](#)
 - [CVE-2022-27380](#)
 - [CVE-2022-27381](#)
 - [CVE-2022-27382](#)
 - [CVE-2022-27383](#)
 - [CVE-2022-27384](#)
 - [CVE-2022-27386](#)

7.0.7.2.13 MariaDB 10.5.15 Release Notes

The most recent release of MariaDB 10.5 is:
MariaDB 10.5.28 [Stable \(GA\)](#) [Download Now](#)
Alternate download from mariadb.org

[Download 10.5.15](#)

[Release Notes](#)

[Changelog](#)

[Overview of 10.5](#)

Release date: 12 Feb 2022

MariaDB 10.5 is a previous *stable* series of MariaDB. It is an evolution of [MariaDB 10.4](#) with several entirely new features not found anywhere else and with backported and reimplemented features from MySQL.

MariaDB 10.5.15 is a [Stable \(GA\)](#) release.

For an overview of MariaDB 10.5 see the [What is MariaDB 10.5?](#) page.

Thanks, and enjoy MariaDB!

Notable Items

- This release fixes a blocking problem with the [MariaDB 10.5.14](#) release when manually running `mariadb-upgrade`. ([MDEV-27789](#))
- See [MariaDB 10.5.14](#) for other changes since the previous release.

InnoDB

- Set `innodb_change_buffering=none` by default ([MDEV-27734](#))

Security

- Fixes for the following [security vulnerabilities](#):
 - [CVE-2021-46665](#)
 - [CVE-2021-46664](#)
 - [CVE-2021-46661](#)
 - [CVE-2021-46668](#)

7.0.7.2.14 MariaDB 10.5.14 Release Notes

The most recent release of MariaDB 10.5 is:
MariaDB 10.5.28 [↗ Stable \(GA\)](#) [Download Now](#) [↗](#)
[Alternate download from mariadb.org](#) [↗](#)

[Download 10.5.14](#) [↗](#)

[Release Notes](#)

[Changelog](#) [↗](#)

[Overview of 10.5](#)

Release date: 9 Feb 2022

This release is no longer available for download after a problem was noticed when manually running mariadb-upgrade. See [MDEV-27789](#) [↗](#) for more details.

Please use a later release.

MariaDB 10.5 is a previous *stable* series of MariaDB. It is an evolution of [MariaDB 10.4](#) with several entirely new features not found anywhere else and with backported and reimplemented features from MySQL.

MariaDB 10.5.14 is a [Stable \(GA\)](#) [↗](#) release.

For an overview of [MariaDB 10.5](#) see the [What is MariaDB 10.5?](#) page.

Thanks, and enjoy MariaDB!

Notable Items

InnoDB

- `--skip-symbolic-links` does not disallow `.isl` file creation ([MDEV-26870](#) [↗](#))
- Indexed `CHAR` columns are broken with `NO_PAD` collations ([MDEV-25440](#) [↗](#))
- insert-intention lock conflicts with waiting ORDINARY lock ([MDEV-27025](#) [↗](#))
- Crash recovery improvements ([MDEV-26784](#) [↗](#), [MDEV-27022](#) [↗](#), [MDEV-27183](#) [↗](#), [MDEV-27610](#) [↗](#))

Galera

- [Galera](#) updated to 26.4.11
- Galera SST scripts should use `ssl_capath` (not `ssl_ca`) for CA directory ([MDEV-27181](#) [↗](#))
- Alter Sequence do not replicate to another nodes with in Galera Cluster ([MDEV-19353](#) [↗](#))
- Galera crash - Assertion. Possible parallel writeset problem ([MDEV-26803](#) [↗](#))
- CREATE TABLE with FOREIGN KEY constraint fails to apply in parallel ([MDEV-27276](#) [↗](#))
- Galera cluster node consider old `server_id` value even after modification of `server_id` [`wsrep_gtid_mode=ON`] ([MDEV-26223](#) [↗](#))

Replication

- Seconds behind master corrected from artificial spikes at relay-log rotation ([MDEV-16091](#) [↗](#))
- Statement rollback in binlog when transaction creates or drop temporary table is set right ([MDEV-26833](#) [↗](#))
- CREATE-or-REPLACE SEQUENCE is made to binlog with the DDL flag to stabilize its parallel execution on slave ([MDEV-27365](#) [↗](#))

Packaging & Misc

- prohibition running two upgrades in parallel ([MDEV-27068](#), [MDEV-27107](#), [MDEV-27279](#))
- As per the [MariaDB Deprecation Policy](#), this will be the last release of [MariaDB 10.5](#) for Ubuntu 21.04 Hirsute, CentOS 8, and Fedora 33
- [mariadb_repo_setup](#) script updated to version 2022-02-08, with the following fixes and enhancements:
 - Default location of the script has been moved to: https://r.mariadb.com/downloads/mariadb_repo_setup (old location is deprecated, but still works)
 - The GPG keyring file, used with Debian and Ubuntu repositories, has moved to: <https://supplychain.mariadb.com/mariadb-keyring-2019.gpg> and the checksum for the file can be found at: <https://supplychain.mariadb.com/mariadb-keyring-2019.gpg.sha256>
 - Support for RHEL and SLES aarch64 repositories added
 - New function added to verify that the MariaDB Server version, if specified on the command line, follows the correct naming and that a corresponding repository actually exists.
 - Fixed repository pinning for Ubuntu and Debian repositories
 - MariaDB Server 10.7 is now the default server version

Docker Library

- Faster initialization by disabling binary logging during initialization ([MDEV-27074](#))
- `mysql_upgrade` can be run if needed using the environment variable `MARIADB_AUTO_UPGRADE=1` ([MDEV-25670](#))
- A healthcheck script `/usr/local/bin/healthcheck.sh` is installed in the container with various checking options ([MDEV-25434](#))
- `mysql@localhost` user is created with the environment variable `MARIADB_MYSQL_LOCALHOST_USER=1` and additional grants (beyond `USAGE`) with `MARIADB_MYSQL_LOCALHOST_GRANTS={global grant list}` ([MDEV-27732](#))
- skip `innodb buffer pool loads/dumps` on temporary startup/shutdown for faster startup/initialization, and accurate `"healthcheck.sh --innodb_buffer_pool_loaded"`
- change group ownership on `datadir/socket dir` ([issue #401](#))
- log note about note on Securing system users, `mysql_secure_installation` not required ([reddit suggestion](#))
- speed up Docker Library initialization of timezones ([MDEV-27608](#), [MDEV-23326](#))

Security

- Fixes for the following [security vulnerabilities](#):
 - [CVE-2022-24052](#)
 - [CVE-2022-24051](#)
 - [CVE-2022-24050](#)
 - [CVE-2022-24048](#)
 - [CVE-2021-46659](#)
 - [CVE-2022-0778](#)
 - [CVE-2022-21595](#)

Changelog

7.0.7.2.15 MariaDB 10.5.13 Release Notes

The most recent release of MariaDB 10.5 is:
MariaDB 10.5.28 [↗ Stable \(GA\)](#) [Download Now](#) [↗](#)
[Alternate download from mariadb.org](#) [↗](#)

[Download 10.5.13](#) [↗](#)

[Release Notes](#)

[Changelog](#) [↗](#)

[Overview of 10.5](#)

Release date: 8 Nov 2021

MariaDB 10.5 is a previous *stable* series of MariaDB. It is an evolution of MariaDB 10.4 with several entirely new features not found anywhere else and with backported and reimplemented features from MySQL.

MariaDB 10.5.13 is a **Stable (GA)** [↗](#) release.

For an overview of MariaDB 10.5 see the [What is MariaDB 10.5?](#) page.

Thanks, and enjoy MariaDB!

Notable Items

Galera

- Fix for `WSREP: invalid state ROLLED_BACK (FATAL)` ([MDEV-25114](#) [↗](#))

InnoDB

- `ALTER TABLE...IMPORT TABLESPACE` fixes ([MDEV-18543](#) [↗](#), [MDEV-20931](#) [↗](#), [MDEV-26131](#) [↗](#), [MDEV-26621](#) [↗](#))
- `innodb_undo_log_truncate` fixes ([MDEV-26445](#) [↗](#), [MDEV-26450](#) [↗](#), [MDEV-26672](#) [↗](#), [MDEV-26864](#) [↗](#))
- Page I/O performance fixes ([MDEV-25215](#) [↗](#), [MDEV-26547](#) [↗](#), [MDEV-26626](#) [↗](#), [MDEV-26819](#) [↗](#))
- Replication timeouts with `XA PREPARE` ([MDEV-26682](#) [↗](#))

Replication

- Memory hogging on slave by ROW event applier is eliminated ([MDEV-26712](#) [↗](#))
- `mysql --binary-mode` now properly handles `\\0` in data ([MDEV-25444](#) [↗](#))
- Fixes race condition between `SHOW BINARY LOGS` and `RESET MASTER` ([MDEV-20215](#) [↗](#))
- Missed statement rollback in case transaction drops or create temporary table is corrected ([MDEV-26833](#) [↗](#))

Audit Plugin

- The `QUERY_DDL server_audit_events` setting now logs `CREATE/DROP [PROCEDURE / FUNCTION / USER]` statements. See [MariaDB Audit Plugin - Log Settings](#). ([MDEV-23457](#) [↗](#))

Packaging & Misc

- Session tracking flag in `OK_PACKET` ([MDEV-26868](#) [↗](#))
- Some views force server (and mysqldump) to generate invalid SQL for their definitions ([MDEV-26299](#) [↗](#))

Security

- Fixes for the following [security vulnerabilities](#) [↗](#):
 - [CVE-2021-35604](#) [↗](#)
 - [CVE-2021-46667](#) [↗](#)
 - [CVE-2021-46662](#) [↗](#)
 - [CVE-2022-27385](#) [↗](#)
 - [CVE-2022-27385](#) [↗](#)
 - [CVE-2022-31624](#) [↗](#)

Changelog

For a complete list of changes made in [MariaDB 10.5.13](#), with links to detailed information on each push, see the [changelog](#)

Contributors

MariaDB may already be included in your favorite OS distribution. More information can be found on the [Distributions which Include MariaDB](#) page.

7.0.7.2.16 MariaDB 10.5.12 Release Notes

The most recent release of MariaDB 10.5 is:
MariaDB 10.5.28 [Stable \(GA\)](#) [Download Now](#)
Alternate download from [mariadb.org](#)

[Download 10.5.12](#)

[Release Notes](#)

[Changelog](#)

[Overview of 10.5](#)

Release date: 6 Aug 2021

Warning: This version can cause InnoDB file corruption on FreeBSD and on AIX. If you are using AIX, please, stick to an earlier release, or upgrade to a more recent release. If you are using FreeBSD, upgrade to the bugfix release (the version ends with `_1`) of the mariadb-server from the Ports Collection. See [MDEV-26537](#).

MariaDB 10.5 is a previous *stable* series of MariaDB. It is an evolution of [MariaDB 10.4](#) with several entirely new features not found anywhere else and with backported and reimplemented features from MySQL.

MariaDB 10.5.12 is a [Stable \(GA\)](#) release.

For an overview of [MariaDB 10.5](#) see the [What is MariaDB 10.5?](#) page.

Thanks, and enjoy MariaDB!

Notable Items

InnoDB

- InnoDB no longer acquires advisory file locks by default ([MDEV-24393](#))
- Encryption: Automatically disable key rotation checks for file_key_management plugin ([MDEV-14180](#))
- Some fixes from MySQL 5.7.35 ([MDEV-26205](#))
- Fixed scrubbing on AIX ([MDEV-26110](#))
- Improved page flushing performance ([MDEV-25954](#), [MDEV-25948](#), [MDEV-25801](#), [MDEV-25113](#), [MDEV-26004](#))

Optimizer

- A query that uses ORDER BY .. LIMIT clause and "Range checked for each record optimization" could produce incorrect results under some circumstances ([MDEV-25858](#))
- Queries that have more than 32 equality conditions comparing columns of different tables ("tableX.colX=tableY.colY") could cause a stack overrun in the query optimizer ([MDEV-17783](#), [MDEV-23937](#))
- "Condition pushdown into derived table" optimization cannot be applied if the expression being pushed refers to a derived table column which is computed from expression that has a stored function call, @session variable reference, or other similar construct. The fix for [MDEV-25969](#) makes it so that only the problematic part of the condition is not

pushed. The rest of the condition is now pushed. ([MDEV-25969](#))

- A query with window function on the left side of the subquery could cause a crash. ([MDEV-25630](#))
- Fixed the issue fixed in MySQL Bug #76803: DML or locking SELECT statements that use outer joins could produce this warning in the error log: [ERROR] InnoDB: Unlock row could not find a 3 mode lock on the record. ([MDEV-26106](#))

Packaging & Misc

- As per the [MariaDB Deprecation Policy](#), this will be the last release of [MariaDB 10.5](#) for Ubuntu 20.10 Groovy
- Debian 11 Bullseye repositories added
- [Galera](#) updated to 26.4.9
- Linux on IBM Z (s390x) architecture added with releases on Ubuntu-20.04 Focal

Security

- Fixes for the following [security vulnerabilities](#):
 - [CVE-2021-2372](#)
 - [CVE-2021-2389](#)
 - [CVE-2021-46658](#)

Changelog

For a complete list of changes made in [MariaDB 10.5.12](#), with links to detailed information on each push, see the [changelog](#).

Contributors

For a full list of contributors to [MariaDB 10.5.12](#), see the [MariaDB Foundation release announcement](#).

MariaDB may already be included in your favorite OS distribution. More information can be found on the [Distributions which Include MariaDB](#) page.

7.0.7.2.17 MariaDB 10.5.11 Release Notes

The most recent release of MariaDB 10.5 is:
[MariaDB 10.5.28](#) [Stable \(GA\)](#) [Download Now](#)
[Alternate download from mariadb.org](#)

[Download 10.5.11](#)

[Release Notes](#)

[Changelog](#)

[Overview of 10.5](#)

Release date: 23 Jun 2021

[MariaDB 10.5](#) is the current *stable* series of MariaDB. It is an evolution of [MariaDB 10.4](#) with several entirely new features not found anywhere else and with backported and reimplemented features from MySQL.

[MariaDB 10.5.11](#) is a [Stable \(GA\)](#) release.

For an overview of [MariaDB 10.5](#) see the [What is MariaDB 10.5?](#) page.

Thanks, and enjoy MariaDB!

Notable Items

This version of MariaDB is being released now to fix the following two regressions:

- Table alias from previous statement interferes later commands ([MDEV-25672](#))
- Join using derived with aggregation returns incorrect results ([MDEV-25714](#))

In addition to the above, this release also contains the following fixes:

InnoDB

- InnoDB spatial indexes miss large geometry fields after [MDEV-25459](#) ([MDEV-25758](#))
- Double free of transaction during truncate operation ([MDEV-25663](#))
- Double free of table when inplace alter FTS add index fails ([MDEV-25721](#))
- Potential hang in purge for virtual columns ([MDEV-25664](#))
- Change buffer records are lost under heavy load ([MDEV-25783](#))
- Not applying INSERT_REUSE_REDUNDANT ([MDEV-25745](#))
- InnoDB recovery fails with `[ERROR] InnoDB: Not applying INSERT_REUSE_REDUNDANT due to corruption` ([MDEV-25745](#))
- `CHECK TABLE` harvests InnoDB: Index 'abdcef' contains 10001 entries, should be 10000 ([MDEV-25783](#))

Replication

- Do not replicate killed multi-table `OPTIMIZE TABLE` when the signal arrives before any table has been processed ([MDEV-22530](#))
- Fix optimistic parallel applier to not deadlock on admin commands `OPTIMIZE`, `REPAIR`, and `ANALYZE` ([MDEV-17515](#))
- Backport [MDEV-20821](#) parallel slave server shutdown hang ([MDEV-22370](#))
- Removed deprecated `--base64-output` to correct BINLOG clause in `mysqlbinlog` output ([MDEV-25222](#))

Security

- Fixes for the following [security vulnerabilities](#):
 - [CVE-2021-46666](#)
 - [CVE-2021-46657](#)

Changelog

For a complete list of changes made in [MariaDB 10.5.11](#), with links to detailed information on each push, see the [changelog](#).

Contributors

For a full list of contributors to [MariaDB 10.5.11](#), see the [MariaDB Foundation release announcement](#).

MariaDB may already be included in your favorite OS distribution. More information can be found on the [Distributions which Include MariaDB](#) page.

7.0.7.2.18 MariaDB 10.5.10 Release Notes

The most recent release of MariaDB 10.5 is:
MariaDB 10.5.28 [Stable \(GA\)](#) [Download Now](#)
Alternate download from [mariadb.org](#)

[Download 10.5.10](#)

[Release Notes](#)

[Changelog](#)

[Overview of 10.5](#)

Release date: 7 May 2021

MariaDB 10.5 is the current *stable* series of MariaDB. It is an evolution of [MariaDB 10.4](#) with several entirely new features not found anywhere else and with backported and reimplemented features from MySQL.

MariaDB 10.5.10 is a [Stable \(GA\)](#) release.

For an overview of [MariaDB 10.5](#) see the [What is MariaDB 10.5?](#) page.

Thanks, and enjoy MariaDB!

Notable Changes

- [ST_DISTANCE_SPHERE](#) for calculating the spherical distance between two geometries (point or multipoint) on a sphere ([MDEV-13467](#))
- Crash with invalid multi-table update of view in 2nd execution of SP ([MDEV-24823](#))
- Incorrect name resolution for subqueries in ON expressions ([MDEV-25362](#))
- Complex query in Store procedure corrupts results ([MDEV-25182](#))
- `DELETE HISTORY` may delete current data on system-versioned table ([MDEV-25468](#))
- Crashes with nested table value constructors ([MDEV-22786](#))
- Server crashes in `thd_clear_errors()` ([MDEV-23542](#))
- The statement `set password=password('')` executed in PS mode fails in case it is run by a user with expired password ([MDEV-25197](#))

mariabackup

- `RENAME TABLE` causes "Ignoring data file" messages ([MDEV-25568](#))

InnoDB

- Deprecated the `*innodb` and `*none` options in `innodb_checksum_algorithm` ([MDEV-25106](#))
- MVCC read from index on CHAR or VARCHAR wrongly omits rows ([MDEV-25459](#))
- Race conditions in persistent statistics ([MDEV-10682](#), [MDEV-18802](#), [MDEV-25051](#))
- Sequence created by one connection remains invisible to another ([MDEV-24545](#))
- `innodb_flush_method=O_DIRECT` fails on compressed tables ([MDEV-25121](#))
- `RESET MASTER` hangs ([MDEV-24302](#))
- InnoDB crash recovery fixes ([MDEV-25031](#), [MDEV-25110](#))

Replication

- Replication Heartbeat event was incapable to carry 4GB+ offsets ([MDEV-16146](#))
- `FLUSH LOGS` race against Binlog checkpoint event creation ([MDEV-24526](#))
- `slave_compressed_protocol` did not work correctly with semi-sync ([MDEV-24773](#))
- `DROP TABLE` should not cause "Query caused different errors on master and slave" on slave when it failed on master ([MDEV-25530](#))
- Killing server during `RESET MASTER` may lose MyRocks transaction ([MDEV-25305](#))

Galera

- [Galera](#) updated to 26.4.8
- `SET PASSWORD` command fail with wsrep api ([MDEV-25258](#))
- Long BF log wait turns on InnoDB Monitor output without telling, never turns it off ([MDEV-25319](#))
- Assertion ``state_ == s_exec'` failed in `wsrep::client_state::start_transaction` ([MDEV-22227](#))
- Frequently Crashing Mariadb Cluster 10.4.18 ([MDEV-24980](#))
- Signal 11 on `TABLE_LIST::placeholder()` ([MDEV-24878](#))
- `ALTER TABLE` not replicated with Galera in [MariaDB 10.5.9](#) ([MDEV-24956](#))
- "Flush SSL" command doesn't reload wsrep cert ([MDEV-22668](#))
- Avoid unnecessary rollbacks with SR ([MDEV-25553](#))

Packaging & Misc

- As per the [MariaDB Deprecation Policy](#), this will be the last release of [MariaDB 10.5](#) for Ubuntu 16.04 Xenial and Fedora 32
- Ubuntu 21.04 Hirsute and Fedora 34 repositories added

Security

- Fixes for the following [security vulnerabilities](#):
 - [CVE-2021-2166](#)
 - [CVE-2021-2154](#)
 - [CVE-2022-21451](#)

MongoDB protocol support files for the [CONNECT](#) engine are missing in this release. If you want to use [CONNECT](#) engine with MongoDB, you need to download [Mongo2.jar](#) or [Mongo3.jar](#) and put a path to this file into the `connect_class_path` in the `my.cnf`.

Changelog

MariaDB may already be included in your favorite OS distribution. More information can be found on the [Distributions which Include MariaDB](#) page.

7.0.7.2.19 MariaDB 10.5.9 Release Notes

The most recent release of [MariaDB 10.5](#) is:
[MariaDB 10.5.28](#) [Stable \(GA\)](#) [Download Now](#)
[Alternate download from mariadb.org](#)

- [Download 10.5.9](#)
- [Release Notes](#)
- [Changelog](#)
- [Overview of 10.5](#)

Release date: 22 Feb 2021

Last month long-time MariaDB VP of Engineering, Rasmus Johansson, passed due to complications from cancer. His loss has been felt keenly by the whole MariaDB team. Our thoughts are with his family during this difficult time and this release is dedicated to his memory.

[MariaDB 10.5](#) is the current *stable* series of MariaDB. It is an evolution of [MariaDB 10.4](#) with several entirely new features not found anywhere else and with backported and reimplemented features from MySQL.

[MariaDB 10.5.9](#) is a **[Stable \(GA\)](#)** release.

For an overview of [MariaDB 10.5](#) see the [What is MariaDB 10.5?](#) page.

Thanks, and enjoy MariaDB!

Notable Changes

InnoDB

- [MDEV-24188](#) - Hang in `buf_page_create()` after reusing a previously freed page
- [MDEV-24275](#) - InnoDB `persistent stats` analyze forces full scan forcing lock crash
- [MDEV-24449](#) - Corruption of system tablespace or last recovered page
- [MDEV-24109](#) - InnoDB hangs with `innodb_flush_sync=OFF`
- [MDEV-24537](#) - `innodb_max_dirty_pages_pct_lwm=0` lost its special meaning
- Fixed bugs in the handling of freed pages - [MDEV-24569](#), [MDEV-24695](#), [MDEV-24765](#), [MDEV-24864](#)
- [MDEV-12227](#) - Defer writes to the InnoDB temporary tablespace

Galera

- Galera updated to 26.4.7
- [MDEV-23328](#) - Server hang due to Galera lock conflict resolution
- [MDEV-23851](#) - BF-BF Conflict issue because of UK GAP locks
- [MDEV-20717](#) - Plugin system variables and activation options can break `mysqld --wsrep_recover`
- [MDEV-24469](#) - Assertion `active() == false` failed with "XA START.."
- [MDEV-23647](#) - Garbd can't initiate SST anymore in 10.5
- [MDEV-25179](#) - `wsrep_provider` and `wsrep_notify_cmd` system variables are now read-only

Replication

- [MDEV-8134](#) - relay-log is corrected to rotate past 999999
- [MDEV-23033](#) - fixed slave applier for row-based events with FK constraints on virtual columns
- [MDEV-4633](#) - Relay_Log_Space of Show-Slave-Status is made thread-safe
- [MDEV-10272](#) - add master host/port info to slave thread exit messages
- [MDEV-23846](#) - improves `mysqlbinlog` error message issuing
- [MDEV-24087](#) - replication of `S3 ALTER PARTITION` corrected
- [MDEV-23610](#) - New privilege `REPLICA MONITOR` (also accessible as `SLAVE MONITOR`)

ColumnStore

- MariaDB ColumnStore updated to 5.5.1
- MariaDB ColumnStore deb and rpm packages now have a version of `10.5.9-5.5.1` so one can see both the server version (10.5.9) and the plugin version (5.5.1) without needing to check the [Available Versions](#) table in the ColumnStore docs
- The MariaDB ColumnStore plugin is no longer provided for 32-bit x86 (i386) builds

Misc

- MariaDB is fixed to build on the Apple M1 CPU
- MariaDB is fixed to build on AIX
- [MDEV-24122](#) - anomalies in `mysql.user` tables on previously 5.7 MySQL versions corrected
- [MDEV-24093](#) - Detect during `mysql_upgrade` if `type_mysql_json.so` is needed and load it
- Binary tarballs now use WolfSSL v4.6.0 and pcre2-10.36
- [MDEV-23630](#) - `mysqldump --system` option
- Fixes for the following [security vulnerabilities](#):
 - [CVE-2021-27928](#)

Changelog

For a complete list of changes made in [MariaDB 10.5.9](#), with links to detailed information on each push, see the [changelog](#).

MariaDB may already be included in your favorite OS distribution. More information can be found on the [Distributions which Include MariaDB](#) page.

7.0.7.2.20 MariaDB 10.5.8 Release Notes

The most recent release of MariaDB 10.5 is:
MariaDB 10.5.28 [Stable \(GA\)](#) [Download Now](#)

[Alternate download from mariadb.org](#)

[Download 10.5.8](#)

[Release Notes](#)

[Changelog](#)

[Overview of 10.5](#)

Release date: 11 Nov 2020

MariaDB 10.5 is the current *stable* series of MariaDB. It is an evolution of [MariaDB 10.4](#) with several entirely new features not found anywhere else and with backported and reimplemented features from MySQL.

For an overview of MariaDB 10.5 see the [What is MariaDB 10.5?](#) page.

Thanks, and enjoy MariaDB!

Notable Changes

- Out-of-cycle release to fix regressions in [MariaDB 10.5.7](#)
- Follow up to [MDEV-19838](#) to alter protocol checks to support the following implementations (which add garbage to the end of some packets):
 - PHP PDO (all versions) ([MDEV-24121](#))
 - mysqlnd (from PHP < 7.3) ([MDEV-24121](#))
 - mysql-connector-python (all versions) ([MDEV-24134](#))
 - and mysql-connector-java (all versions)
- Arbitrary InnoDB buffer pool and data file corruption ([MDEV-24096](#))
- The query optimizer consumed a lot of memory when handling construct in form of `key_column [NOT] IN (large-list-of constants)` ([MDEV-24117](#))

Changelog

7.0.7.2.21 MariaDB 10.5.7 Release Notes

The most recent release of MariaDB 10.5 is:
MariaDB 10.5.28 [Stable \(GA\)](#) [Download Now](#)

[Alternate download from mariadb.org](#)

Release date: 3 Nov 2020

MariaDB 10.5 is the current *stable* series of MariaDB. It is an evolution of [MariaDB 10.4](#) with several entirely new features not found anywhere else and with backported and reimplemented features from MySQL.

For an overview of [MariaDB 10.5](#) see the [What is MariaDB 10.5?](#) page.

Thanks, and enjoy MariaDB!

Notable Changes

This release introduced an InnoDB data corruption bug ([MDEV-24096](#)). If any InnoDB tables contain indexed virtual columns or unique indexes on BLOB or TEXT columns, any InnoDB tables or tablespaces may become irreparably corrupted.

- Improved write performance ([MDEV-23399](#), [MDEV-23855](#), [MDEV-24037](#))
- [MDEV-18323](#) It is now possible to upgrade from MySQL 5.7 Tables containing JSON, by loading the MYSQL_JSON datatype plugin first. See [Making MariaDB understand MySQL JSON](#).
- Update [S3 engine](#) to maturity Gamma
- `mysqld --temp-pool` option deprecated and defaulted to zero ([MDEV-22278](#))
- [BLACKHOLE Storage Engine](#) maximum index size increased from 1000 to 3500 bytes ([MDEV-24017](#))
- [Calculating \(auto rounding\)](#) issue ([MDEV-23702](#))
- Temporary tables can no longer overwrite existing files. Instead an error is returned should a conflict occur ([MDEV-23569](#))
- Binlog checksum verification at recovery time ([MDEV-23832](#))
- Verbose print-out of [Geometry types](#) by `mysqlbinlog` ([MDEV-22330](#))
- `SHOW BINLOG EVENTS` from `<pos>` validates `<pos>` when binlog checksummed ([MDEV-21839](#))
- Freeing memory of `replicate_do_table` ([MDEV-23534](#))
- Corrected verbose `mysqlbinlog` output for multi-record Rows-log-event ([MDEV-16372](#))
- `SET GLOBAL replicate_do_db = DEFAULT` no longer causes crash ([MDEV-20744](#))
- `User killed queries` that were running an index condition pushdown in InnoDB will now return an error ([MDEV-23938](#))
- Wrong `direxec` param data caused crash; Numerous fixes about Mac builds (by Dmitri Shulga) ([MDEV-19838](#))
- `server_audit plugin` now logs proxy users ([MDEV-19443](#))
- Crash on `SELECT` on a table with indexed virtual columns ([MDEV-18366](#))
- InnoDB updated to 5.7.32 ([MDEV-23989](#))
- Bug fixes related to adaptive hash index ([MDEV-23452](#), [MDEV-23370](#))
- Fixed a bug in the recovery of encrypted tables ([MDEV-23456](#))
- Fixed a race condition in MVCC reads ([MDEV-22924](#))
- `ALTER TABLE` fixes ([MDEV-22277](#), [MDEV-22939](#), [MDEV-23199](#), [MDEV-23356](#), [MDEV-23499](#), [MDEV-23672](#), [MDEV-23685](#), [MDEV-23722](#))
- Disk space not reused for BLOB in data file ([MDEV-23072](#))
- InnoDB: Failing assertion: `!space->referenced()` ([MDEV-23651](#))
- `SIGSEGV` in `maria_create()` because of double free ([MDEV-23222](#))
- `CREATE TEMPORARY TABLE .. LIKE` (system versioned table) returns error if unique index is defined in the table ([MDEV-23968](#))
- Error upon querying the view, that selecting from versioned table with partitions ([MDEV-23779](#))
- `CREATE .. SELECT` wrong result on join versioned table ([MDEV-23799](#))
- `SIGSEGV` in `check_fields` on `UPDATE` ([MDEV-22805](#))
- Parser fix ([MDEV-23094](#))
- Add CRC-32 code to `mysys`, giving notable speedup in checksum calculation on x64 ([MDEV-19935](#))
- Faster CRC-32C checksum calculations ([MDEV-23495](#), [MDEV-22749](#))
- Fixes to potential corruption bugs ([MDEV-23973](#), [MDEV-24054](#))
- Fixed delayed replication with S3 storage engine slave ([MDEV-23691](#))
- Deadlock between `BACKUP STAGE BLOCK_COMMIT` and parallel replication ([MDEV-23586](#))
- `CREATE` fails after `DROP without .frm` ([MDEV-23549](#))

S3 Storage Engine

- Update [S3 engine](#) to maturity Gamma
- Add the [s3_use_http](#) and [s3_port](#) system variables

Galera

- [Galera wsrep library](#) updated to 26.4.6
- Fixed assertion failure on before_commit ([MDEV-22681](#))
- Fixed assertion after ROLLBACK AND CHAIN ([MDEV-22055](#))
- Fixed replication of DROP TRIGGER ([MDEV-23638](#))
- IPv6 SST handling improved ([MDEV-21770](#), [MDEV-23576](#), [MDEV-23580](#), [MDEV-23581](#), [MDEV-23574](#))
- Fixed SIGSEGV in lock_rec_unlock ([MDEV-23101](#))
- Fixed replication of timezone if only 1 timezone is loaded ([MDEV-22626](#))
- Fixed replication of CREATE OR REPLACE TRIGGER ([MDEV-21578](#))
- Fixed SST FLUSH TABLES WITH READ LOCK timeout ([MDEV-22543](#))

Notes

- As per the [MariaDB Deprecation Policy](#), this will be the last release of [MariaDB 10.5](#) for CentOS/RHEL 6 and Fedora 31
- Packages for [Ubuntu 20.10 "Groovy Gorilla"](#) added
- Packages for [Debian 10 "buster"](#) arm64 and ppc64el added
- Packages for [Debian 9 "stretch"](#) arm64 added
- Fixes for the following [security vulnerabilities](#):
 - [CVE-2020-14812](#)
 - [CVE-2020-14765](#)
 - [CVE-2020-14776](#)
 - [CVE-2020-14789](#)
 - [CVE-2020-28912](#) ([MDEV-24040](#))
 - [CVE-2021-2194](#) ([MDEV-18366](#))
 - [CVE-2022-21427](#)

7.0.7.2.23 MariaDB 10.5.5 Release Notes

The most recent release of MariaDB 10.5 is:
[MariaDB 10.5.28](#) [Stable \(GA\)](#) [Download Now](#)
[Alternate download from mariadb.org](#)

[Download](#)

[Release Notes](#)

[Changelog](#)

[Overview of 10.5](#)

Release date: 10 Aug 2020

[MariaDB 10.5](#) is the current *stable* series of MariaDB. It is an evolution of [MariaDB 10.4](#) with several entirely new features not found anywhere else and with backported and reimplemented features from MySQL.

For an overview of [MariaDB 10.5](#) see the [What is MariaDB 10.5?](#) page.

Thanks, and enjoy MariaDB!

Notable Changes

Deprecated variables

- [innodb_thread_concurrency](#)
- [innodb_commit_concurrency](#)
- [innodb_replication_delay](#)
- [innodb_concurrency_tickets](#)
- [innodb_thread_sleep_delay](#)
- [innodb_adaptive_max_sleep_delay](#) (MDEV-23379)

InnoDB

- Fixed corruption in delete buffering (MDEV-22497)
- Fixed a deadlock in `FLUSH TABLES...FOR EXPORT` (MDEV-22890)

- InnoDB data file extension is not crash-safe ([MDEV-23190](#))
- Minor fixes related to encryption and FULLTEXT INDEX
- Dropping the adaptive hash index may cause DDL to lock up InnoDB ([MDEV-22456](#))
- `innodb_log_optimize_ddl=OFF` is not crash safe ([MDEV-21347](#))
- Mariadb service won't shutdown when it's running and the OS datetime updated backwards ([MDEV-17481](#))
- Doublewrite recovery can corrupt data pages ([MDEV-11799](#))
- Fixed race conditions related to buffer pool resizing
- ALTER TABLE fixes ([MDEV-22637](#), [MDEV-23244](#), [MDEV-22988](#), [MDEV-23295](#), [MDEV-22771](#), [MDEV-22811](#), [MDEV-22899](#))
- Slow InnoDB shutdown on large instance ([MDEV-22778](#))
- Fixes to performance regressions introduced in MariaDB 10.5.4 ([MDEV-23017](#), [MDEV-23369](#), [MDEV-23410](#))
- Performance improvements ([MDEV-22110](#), [MDEV-22930](#), [MDEV-23379](#), [MDEV-22778](#))
- Correctly implemented the scrubbing of freed pages ([MDEV-8139](#))
- Crash recovery fixes ([MDEV-21347](#), [MDEV-23190](#), [MDEV-11799](#))

Replication

- Make the binlog dump thread to log into errorlog a requested GTID position ([MDEV-20428](#))
- Fix stop of the optimistic parallel slave at requested START-SLAVE-UNTIL position ([MDEV-15152](#))
- Properly handle `RESET MASTER TO` value, when the value exceeds the max allowed 2147483647 ([MDEV-22451](#))
- Correct 'relay-log.info' updating by concurrent parallel workers ([MDEV-22806](#))
- Eliminate deadlock involving parallel workers, `STOP SLAVE` and `FLUSH TABLES WITH READ LOCK` ([MDEV-23089](#))
- Correct master-slave automatic reconnection by slave to always pass through all steps of the initial connect. Specifically, do not skip master notification about slave binlog checksum awareness ([MDEV-14203](#))
- Refine mysqlbinlog output to print out `START TRANSACTION` at `Gtid_log_event` processing which satisfies clients that submit the output with `sql_mode=oracle` ([MDEV-23108](#))
- Replication aborts with `ER_SLAVE_CONVERSION_FAILED` upon `CREATE ... SELECT` in ORACLE mode ([MDEV-19632](#))

Optimizer

- Improve Protocol performance for numeric data by avoiding unnecessary character string conversions ([MDEV-23162](#))
- ALTER TABLE ... ANALYZE PARTITION ... with EITS reads and locks all rows ... ([MDEV-21472](#))
- Print ranges in the optimizer trace created for non-indexed columns when `optimizer_use_condition_selectivity > 2`
Now the optimizer trace shows the ranges constructed while getting estimates from EITS ([MDEV-22665](#))
- `LATERAL DERIVED` is not clearly visible in `EXPLAIN FORMAT=JSON`, make `LATERAL DERIVED` tables visible in `EXPLAIN FORMAT=JSON` output ([MDEV-17568](#))
- Crash on `WITH RECURSIVE` large query ([MDEV-22748](#))
- Crash with Prepared Statement with a '?' parameter inside a re-used CTE ([MDEV-22779](#))

Other

- `div_precision_increment` is now taken into account for all intermediate calculations. Previously results could be unpredictable. Note that this means results will have a lower precision in some cases - see `div_precision_increment` ([MDEV-19232](#))
- `mariadb_schema` data type qualifier allowing MariaDB native date types in an SQL_MODE that has conflicting data type translations.
- MariaDB could crash after changing the query_cache size ([MDEV-5924](#))
- Errors and SIGSEGV on CREATE TABLE w/ various charsets ([MDEV-22111](#))
- Crash in `CREATE TABLE AS SELECT` when the precision of returning type = 0 ([MDEV-22502](#))
- XA: Reject DDL operations between PREPARE and COMMIT ([MDEV-22420](#))
- Stop `mariabackup --prepare` on errors during innodb redo log applying ([MDEV-22354](#))
- Server crashes in `mysql_alter_table` upon adding a non-null date column under `NO_ZERO_DATE` with `ALGORITHM=INPLACE` ([MDEV-18042](#))
- Can't uninstall plugin if the library file doesn't exist ([MDEV-21258](#))
- Mariabackup parameter cleanup ([MDEV-18215](#), [MDEV-21298](#), [MDEV-21301](#), [MDEV-22894](#))
- Rounding functions return wrong datatype ([MDEV-23366](#), [MDEV-23367](#), [MDEV-23368](#), [MDEV-23350](#), [MDEV-23351](#), [MDEV-23337](#), [MDEV-23323](#))
- Create `mariadb.sys` user on each update even if the user is not needed ([MDEV-23102](#))
- `INFORMATION_SCHEMA.INNODB_TABLESPACES_ENCRYPTION` required SUPER instead PROCESS privilege ([MDEV-23003](#))
- Reinforce DDL operation rejection after XA PREPARE ([MDEV-22420](#))
- As per the [MariaDB Deprecation Policy](#), this will be the last release of [MariaDB 10.5](#) for Ubuntu 19.10 Eoan and

- Fixes for the following [security vulnerabilities](#):
 - [CVE-2021-2022](#)

Changelog

7.0.7.2.24 MariaDB 10.5.4 Release Notes

The most recent release of MariaDB 10.5 is:
MariaDB 10.5.28 [Stable \(GA\)](#) [Download Now](#)
[Alternate download from mariadb.org](#)

[Download](#)

[Release Notes](#)

[Changelog](#)

[Overview of 10.5](#)

Release date: 24 Jun 2020

[MariaDB 10.5](#) is the current *stable* series of MariaDB. It is an evolution of [MariaDB 10.4](#) with several entirely new features not found anywhere else and with backported and reimplemented features from MySQL.

[MariaDB 10.5.4](#) is a **Stable (GA)** release.

For an overview of [MariaDB 10.5](#) see the [What is MariaDB 10.5?](#) page.

Thanks, and enjoy MariaDB!

Notable Changes

This is the first Stable (GA) release in the [MariaDB 10.5](#) series.

- This release of MariaDB Server includes the [S3 storage engine](#). *Note, that plugins have [independent maturity levels](#) and S3 storage engine in 10.5.4 has **Alpha** maturity.*
- This release of MariaDB Server includes the [MariaDB ColumnStore](#) storage engine. *Note, that plugins have [independent maturity levels](#) and MariaDB ColumnStore in 10.5.4 has **Beta** maturity.*
- New [Gamma](#) version of the [Spider Storage Engine](#), 3.3.15.
- [DROP TABLE](#) now reliably deletes table remnants inside a storage engine even if the .frm file is missing ([MDEV-11412](#)).
- Accelerated `crc32()` function for AMD64, ARMv8, POWER 8 ([MDEV-22669](#)).
- Lots of bug fixes, see the [changelog](#).
- [Galera wsrep library](#) updated to 26.4.5

Variables

- Limit `innodb_encryption_threads` to 255 ([MDEV-22258](#)).

- Minimum value of `max_sort_length` raised to 8 (previously 4) so fixed size `data types` like `DOUBLE` and `BIGINT` are not truncated for lower values of `max_sort_length` ([MDEV-22715](#)).

InnoDB

- `DROP TABLE` improvements: [MDEV-8069](#), [MDEV-11412](#), [MDEV-22456](#)
- InnoDB Performance improvements: [MDEV-15053](#), [MDEV-22593](#), [MDEV-22697](#), [MDEV-22871](#), [MDEV-22841](#)

Changelog

For a complete list of changes made in [MariaDB 10.5.4](#), with links to detailed information on each push, see the [changelog](#).

Contributors

For a full list of contributors to [MariaDB 10.5.4](#), see the [MariaDB Foundation release announcement](#).

Be notified of new MariaDB Server releases automatically by [subscribing](#) to the MariaDB Foundation community announce 'at' lists.mariadb.org announcement list (this is a low traffic, announce-only list). MariaDB plc customers will be notified for all new releases, security issues and critical bug fixes for all MariaDB plc products thanks to the Notification Services.

MariaDB may already be included in your favorite OS distribution. More information can be found on the [Distributions which Include MariaDB](#) page.

7.0.7.2.25 MariaDB 10.5.3 Release Notes

The most recent release of MariaDB 10.5 is:
MariaDB 10.5.28 [Stable \(GA\)](#) [Download Now](#)
[Alternate download from mariadb.org](#)

[Download](#)[Release Notes](#)[Changelog](#)[Overview of 10.5](#)

Release date: 12 May 2020

[MariaDB 10.5](#) is the current *development* series of MariaDB. It is an evolution of [MariaDB 10.4](#) with several entirely new features not found anywhere else and with backported and reimplemented features from MySQL.

[MariaDB 10.5.3](#) is a [Release Candidate](#) (RC) release.

Do not use non-stable (non-GA) releases in production!

For an overview of [MariaDB 10.5](#) see the [What is MariaDB 10.5?](#) page.

Thanks, and enjoy MariaDB!

Notable Changes

Notable changes of this release include:

Syntax

- Application period tables: [WITHOUT OVERLAPS](#) ([MDEV-16978](#))
- Introduce a file format constraint to ALTER TABLE. See [innodb_instant_alter_column_allowed](#) ([MDEV-20590](#))

Large Pages

- Modernise Linux Large Page support (multiplesizes) ([MDEV-18851](#))

Storage Engines

- Partitioned [S3 tables](#) are discoverable. This means that if you create a partitioned S3 table, both the partitioned table and its partitions can be directly used by another server that has access to the S3 storage. ([MDEV-22088](#))

Performance

- Optimizer flag `rowid_filter` leads to long query ([MDEV-21794](#))
- `WSREP_ON` is unnecessarily expensive to evaluate ([MDEV-22203](#))
- Misc `wsrep` performance optimization ([MDEV-7962](#))

Security

- Added system user for user view which allows to remove root ([MDEV-19650](#))
- WolfSSL updated
- `ALTER USER` doesn't remove excess authentication plugins from `mysql.global_priv` ([MDEV-21928](#))
- `mysql_upgrade` creating empty `global_priv` table ([MDEV-21244](#))

Aria

- Updated [aria_pack](#) to support transactional tables and added the `--datadir`, `--ignore-control-file` and `--require-control-file` options. More details [here](#)

ALTER TABLE

- Error on online ADD PRIMARY KEY after instant DROP/reorder ([MDEV-21658](#))
- Assertion failure in file `data0type.cc` ([MDEV-20726](#))
- Server aborts upon attempt to create foreign key on spatial field ([MDEV-21792](#))
- DROP COLUMN, DROP INDEX is wrongly claimed to be ALGORITHM=INSTANT ([MDEV-22465](#))
- Introduce a file format constraint ([MDEV-20590](#))
- FORCE all partition to rebuild if any one of the partition does rebuild ([MDEV-21832](#))
- InnoDB aborts while adding instant column for discarded tablespace ([MDEV-22446](#))
- Misc ALTER TABLE assertion failure ([MDEV-22358](#))

Optimizer

- Optimizer, Wrong query results with `optimizer_switch="split_materialized=on"` ([MDEV-21614](#))
- SHOW GRANTS does not quote role names properly ([MDEV-20076](#))
- Partitioning INSERT chooses wrong partition for RANGE partitioning by DECIMAL column ([MDEV-21195](#))

Mariabackup

- [Mariabackup](#) does not honor `ignore_db_dirs` from server config ([MDEV-19347](#))
- `Mariabackup --ftwrl-wait-timeout` never times out on explicit lock ([MDEV-20230](#))

Crash Recovery

- Loop of Read redo log up to LSN ([MDEV-21826](#))
- `buf_page_get_gen()` should apply buffered page initialized redo log during recovery ([MDEV-21572](#))
- Running out of file descriptors and eventual crash ([MDEV-18027](#))
- Efficient InnoDB redo log record format ([MDEV-12353](#))
- Punch holes when pages are freed ([MDEV-15528](#))

Other

- Use MariaDB in error messages instead of MySQL ([MDEV-17812](#))
- FULLTEXT INDEX, Assertion `!table->fts->in_queue` failed in `fts_optimize_remove_table` ([MDEV-21550](#))
- Wrong estimate of affected BLOB columns in update of PRIMARY KEY ([MDEV-22384](#))

- Duplicate key value is silently truncated to 64 characters in `print_keydup_error` (MDEV-20604 [↗](#))
- Session tracking returns incorrectly long tracking data (MDEV-22504 [↗](#))
- Add `pam_user_map.so` file to binary tarball package (MDEV-21913 [↗](#))
- Misc fixes for Mac build (MENT-606)
- `mysql_upgrade` is made aware of the upstream slave tables to issue warnings when that takes place (MDEV-10047 [↗](#))
- InnoDB `ALTER TABLE` fixes (MDEV-21564 [↗](#), MDEV-19092 [↗](#), MDEV-21549 [↗](#))
- InnoDB FULLTEXT INDEX fixes (MDEV-21563 [↗](#))
- Corruption for `SET GLOBAL innodb_` string variables (MDEV-22393 [↗](#))
- Test suite, Add JUnit support to MTR to generate XML test result (MDEV-22176 [↗](#))
- `mysqldump` parameter, `--ignore-table-data`, added (MDEV-22037 [↗](#))
- Refactored `MYSQL_BIN_LOG::xid_count_per_binlog` to satisfy UBSAN enabled build (MDEV-20923 [↗](#))
- Unregister of slave threads disconnected before `COM_BINLOG_DUMP` (Bug#29915479)
- Server can fail while replicating conditional comments (Bug#28388217)
- Added the `xml-report` option to `mysql-test-run` (MDEV-22176 [↗](#))
- Packages and [repositories](#) [↗](#) for Ubuntu 20.04 "focal" added

Changelog

For a complete list of changes made in [MariaDB 10.5.3](#), with links to detailed information on each push, see the [changelog](#) [↗](#).

Contributors

For a full list of contributors to [MariaDB 10.5.3](#), see the [MariaDB Foundation release announcement](#) [↗](#).

Do not use non-stable (non-GA) releases in production!

Be notified of new MariaDB Server releases automatically by [subscribing](#) [↗](#) to the MariaDB Foundation community announce 'at' lists.mariadb.org announcement list (this is a low traffic, announce-only list). MariaDB plc customers will be notified for all new releases, security issues and critical bug fixes for all MariaDB plc products thanks to the Notification Services.

MariaDB may already be included in your favorite OS distribution. More information can be found on the [Distributions which Include MariaDB](#) page.

7.0.7.2.26 MariaDB 10.5.2 Release Notes

The most recent release of [MariaDB 10.5](#) is:
MariaDB 10.5.28 [↗](#) Stable (GA) [Download Now](#) [↗](#)
Alternate download from [mariadb.org](#) [↗](#)

[Download](#) [↗](#)

[Release Notes](#)

[Changelog](#) [↗](#)

[Overview of 10.5](#)

Release date: 26 Mar 2020

[MariaDB 10.5](#) is the current *development* series of MariaDB. It is an evolution of [MariaDB 10.4](#) with several entirely new features not found anywhere else and with backported and reimplemented features from MySQL.

[MariaDB 10.5.2](#) is a [Beta](#) [↗](#) release.

Do not use beta releases in production!

For an overview of [MariaDB 10.5](#) see the [What is MariaDB 10.5?](#) page.

Thanks, and enjoy MariaDB!

Notable Changes

Notable changes of this release include:

Syntax

- [RELEASE_ALL_LOCKS](#) (MDEV-10569 [↗](#))
- [ALTER TABLE ... RENAME INDEX / KEY](#) (MDEV-7318 [↗](#))
- [ALTER TABLE ... RENAME COLUMN](#) (MDEV-16290 [↗](#))
- Recursive [CTE](#) cycle detection using [CYCLE](#) clause (MDEV-20632 [↗](#))
- [ALTER TABLE](#) and [RENAME TABLE](#) now support `IF EXISTS`.

Privileges

- Split [SUPER](#) privilege to smaller privileges (MDEV-21743 [↗](#)). New privileges were added so that more fine grained tuning of what each user can do can be applied:
 - [BINLOG ADMIN](#)
 - [BINLOG REPLAY](#)
 - [CONNECTION ADMIN](#)
 - [FEDERATED ADMIN](#)
 - [READ_ONLY ADMIN](#)
 - [REPLICATION MASTER ADMIN](#)
 - [REPLICATION SLAVE ADMIN](#)
 - [SET USER](#)
- The [REPLICATION CLIENT](#) privilege was renamed to [BINLOG MONITOR](#). The old syntax is understood for compatibility (MDEV-21743 [↗](#)).
- The [SHOW MASTER STATUS](#) statement was renamed to [SHOW BINLOG STATUS](#) (MDEV-21743 [↗](#)). The old syntax is understood for compatibility.
- A number of statements changed the privileges that they require. The old privileges were historically inappropriately chosen in the upstream. 10.5.2 fixes this problem. Note, these changes are incompatible to previous versions. A number of [GRANT](#) commands might be needed after upgrade.
 - [SHOW BINLOG EVENTS](#) now requires the [BINLOG MONITOR](#) privilege (required [REPLICATION SLAVE](#) prior to 10.5.2).
 - [SHOW SLAVE HOSTS](#) now requires the [REPLICATION MASTER ADMIN](#) privilege (required [REPLICATION SLAVE](#) prior to 10.5.2).
 - [SHOW SLAVE STATUS](#) now requires the [REPLICATION SLAVE ADMIN](#) or the [SUPER](#) privilege (required [REPLICATION CLIENT](#) or [SUPER](#) prior to 10.5.2).
 - [SHOW RELAYLOG EVENTS](#) now requires the [REPLICATION SLAVE ADMIN](#) privilege (required [REPLICATION SLAVE](#) prior to 10.5.2).
- In order to help the server understand which version a privilege record was written by, the `mysql.global_priv.priv` field contains a new JSON field, `version_id` (MDEV-21704 [↗](#))
- [SHOW PRIVILEGES](#) now correctly lists the `Delete history` privilege, rather than displaying it as `Delete versioning rows`. (MDEV-20382 [↗](#))

InnoDB

- An upgrade will only be possible after a clean shutdown. `mariabackup --prepare` will not work with backups taken before version 10.5.2.
- Efficient InnoDB redo log record format (MDEV-12353 [↗](#))
- Deprecate and ignore `innodb_scrub_log` and `innodb_scrub_log_speed` (MDEV-21870 [↗](#))
- Remove `INFORMATION_SCHEMA.INNODB_TABLESPACES_SCRUBBING` table and deprecate and ignore `innodb-background-scrub-data-uncompressed`, `innodb-background-scrub-data-compressed`, `innodb-background-scrub-data-interval` and `innodb-background-scrub-data-check-interval` (MDEV-15528 [↗](#))
- Deprecate and ignore `innodb_log_files_in_group` (MDEV-14425 [↗](#))
- Do not acquire InnoDB record locks when covering table locks exist (MDEV-14479 [↗](#))
- Issue a message on changing deprecated `innodb_log_files_in_group` (MDEV-21990 [↗](#))
- Optimize append only files for NVDIMM (MDEV-17084 [↗](#))
- Improve innodb redo log group commit performance (MDEV-21534 [↗](#))
- Punch holes when pages are freed (MDEV-15528 [↗](#))

Optimizer

- Allow packed sort keys in sort buffer (MDEV-21580 [↗](#))

Performance Schema

- Merge 5.7 P_S transaction instrumentation and tables ([MDEV-16435](#))
- Merge 5.7 P_S memory instrumentation and tables ([MDEV-16431](#))
- Merge 5.7 P_S mdl instrumentation and tables ([MDEV-16432](#))
- Merge 5.7 P_S sxlocks instrumentation and tables ([MDEV-16436](#))
- Merge 5.7 P_S user variables instrumentation and tables ([MDEV-16439](#))
- Merge 5.7 P_S [show] status instrumentation and tables ([MDEV-16438](#))
- Merge 5.7 P_S ps instrumentation and tables ([MDEV-16433](#))
- Merge 5.7 P_S sp instrumentation and tables ([MDEV-16434](#))

Replication

- `ENFORCE` option for `slave_run_triggers_for_rbr` ([MDEV-21833](#))

ANALYZE FORMAT=JSON

- Add information about packed addon fields in `ANALYZE FORMAT=JSON` ([MDEV-21838](#))

Binaries

- All binaries previously beginning with `mysql` now begin with `mariadb`, with symlinks for the corresponding `mysql` command. ([MDEV-21303](#))

Galera

- `Galera wsrep library` updated to 26.4.4
- Galera Cluster Node During IST gets stuck going from "Synced" to "Joining:..." ([MDEV-21002](#))

Other

- `HeidiSQL` updated to 11.0 ([MDEV-22032](#))
- `require_secure_transport` system variable, for rejecting connections attempted using insecure transport ([MDEV-13362](#))
- `sql_if_exists` session system variable, which adds an implicit IF EXISTS to ALTER, RENAME and DROP of TABLES, VIEWS, FUNCTIONS and PACKAGES. ([MDEV-19964](#))
- `XA PREPARE` transactions must survive client disconnection ([MDEV-742](#))
- Binary tarball size has been reduced ([MDEV-21943](#))

7.0.7.2.27 MariaDB 10.5.1 Release Notes

The most recent release of MariaDB 10.5 is:
MariaDB 10.5.28 [↗ Stable \(GA\)](#) [Download Now](#) [↗](#)
Alternate download from mariadb.org [↗](#)

[Download](#) [↗](#)

[Release Notes](#)

[Changelog](#) [↗](#)

[Overview of 10.5](#)

Release date: 14 Feb 2020

MariaDB 10.5 is the current *development* series of MariaDB. It is an evolution of MariaDB 10.4 with several entirely new features not found anywhere else and with backported and reimplemented features from MySQL.

MariaDB 10.5.1 is a **Beta** [↗](#) release.

Do not use beta releases in production!

For an overview of MariaDB 10.5 see the [What is MariaDB 10.5?](#) page.

Thanks, and enjoy MariaDB!

Notable Changes

Notable changes of this release include:

InnoDB

- Remove dummy tablespace for the redo log ([MDEV-18115](#) [↗](#))
- Optimize access to InnoDB page header fields ([MDEV-21133](#) [↗](#))
- Remove multiple InnoDB buffer pool instances ([MDEV-15058](#) [↗](#))
 - Deprecate and ignore `innodb_buffer_pool_instances` and `innodb_page_cleaners`
 - Columns that indicated the buffer pool instance from the Information Schema `innodb_buffer_page`, `innodb_buffer_page_lru`, `innodb_buffer_pool_stats`, `innodb_cmpmem` and `innodb_cmpmem_reset` tables now return a dummy value of 0 .
- Deprecate and ignore `innodb_log_optimize_ddl` ([MDEV-19747](#) [↗](#))
- Prefer MDL to `dict_sys.latch` for innodb background tasks ([MDEV-16678](#) [↗](#))
- Use `fdatasync()` for redo log where appropriate ([MDEV-21382](#) [↗](#))
- Replace `recv_sys.heap` with list of `buf_block_t` ([MDEV-21351](#) [↗](#))
- Several fixes to server hangs ([MDEV-16264](#) [↗](#))

Optimizer

- Allow packed values of non-sorted fields in the sort buffer ([MDEV-21263](#) [↗](#))

Replication and Galera

- `slave_parallel_mode` now defaults to `optimistic` ([MDEV-18648](#) [↗](#)).
- Make REPLICHA a synonym for SLAVE in SQL statements ([MDEV-20601](#) [↗](#))
- Galera GTID support ([commit](#) [↗](#))
- Add new mode to `wsrep_OSU_method` in which Galera checks storage engine of the effected table ([MDEV-20051](#) [↗](#))
- Galera: Replicate MariaDB GTID to other nodes in the cluster ([MDEV-20720](#) [↗](#))

PCRE

- Migrate to PCRE2 ([MDEV-14024](#) [↗](#))

Compatibility

- Show internal type for TIMESTAMP, DATETIME, and TIME columns ([MDEV-19906](#) [↗](#))

Variables

- Numerous deprecated variables removed ([MDEV-18650](#))
 - [multi_range_count](#)
 - [thread_concurrency](#)
 - [timed_mutexes](#)

Changelog

7.0.7.2.28 MariaDB 10.5.0 Release Notes

The most recent release of MariaDB 10.5 is:
MariaDB 10.5.28 [Stable \(GA\)](#) [Download Now](#)
Alternate download from [mariadb.org](#)

[Download](#)

[Release Notes](#)

[Changelog](#)

[Overview of 10.5](#)

Release date: 3 Dec 2019

[MariaDB 10.5](#) is the current development series of MariaDB. It is an evolution of [MariaDB 10.4](#) with several entirely new features not found anywhere else and with backported and reimplemented features from MySQL.

[MariaDB 10.5.0](#) is an [Alpha](#) release.

Do not use *alpha* releases in production!

For an overview of [MariaDB 10.5](#) see the [What is MariaDB 10.5?](#) page.

Thanks, and enjoy MariaDB!

Notable Changes

This is the first alpha release in the [MariaDB 10.5](#) series.

Notable changes of this release include:

INET 6 Data Type

- New [INET6](#) data type for storing IPv6 addresses ([MDEV-274](#)).

Syntax

- [INSERT ... RETURNING](#) (MDEV-10014 [↗](#))
- [REPLACE ... RETURNING](#) (MDEV-10014 [↗](#))
- [EXCEPT ALL](#) and [INTERSECT ALL](#) (MDEV-18844 [↗](#))
- Database comments in [CREATE DATABASE](#) and [ALTER DATABASE](#) statements (MDEV-307 [↗](#))
- Setup [default partitions for system versioning](#) (MDEV-19903 [↗](#))
- Fix [REFERENCES constraint](#) in column definition (MDEV-20729 [↗](#))

JSON

- [JSON_ARRAYAGG](#)
- [JSON_OBJECTAGG](#)
- Add information about packed addon fields in [ANALYZE FORMAT=JSON](#) (MDEV-21838 [↗](#))

S3 Storage Engine

- [S3 Storage Engine](#), a read-only storage engine that stores its data in Amazon S3 (MDEV-17841 [↗](#))

Thread Pool

- Information Schema tables ([THREADPOOL_GROUPS](#), [THREADPOOL_QUEUES](#) and [THREADPOOL_STATS](#)) for internals of generic threadpool (MDEV-19313 [↗](#))

InnoDB

- [innodb_adaptive_hash_index](#) now defaults to `OFF` (MDEV-20487 [↗](#))
- [innodb_checksum_algorithm](#) now defaults to `full_crc32` (MDEV-19534 [↗](#))
- [innodb_checksums](#) has been removed (MDEV-19534 [↗](#))
- [innodb_log_checksums](#) has been deprecated (MDEV-19543 [↗](#))
- [innodb_locks_unsafe_for_binlog](#) has been removed (MDEV-19544 [↗](#))
- [innodb_stats_sample_pages](#) has been removed (MDEV-19551 [↗](#))
- [innodb_undo_logs](#) has been deprecated (MDEV-19570 [↗](#))
- [innodb_rollback_segments](#) has been removed (MDEV-19570 [↗](#))
- Set [innodb_log_files_in_group=1](#) by default (MDEV-20907 [↗](#))
- Extend [SHOW STATUS LIKE 'InnoDB_%'](#) (MDEV-18582 [↗](#))
- Clean up [INFORMATION_SCHEMA.INNODB_](#) tables (MDEV-19940 [↗](#))
- Doublewrite buffer is unnecessarily used for newly (re)initialized pages (MDEV-19738 [↗](#))
- Defer change buffer merge until pages are requested (MDEV-19514 [↗](#))

InnoDB Refactoring

- Remove `buf_page_t::newest_modification` (MDEV-21132 [↗](#))
- Replace `recv_sys_t::addr_hash` with a `std::map` (MDEV-19586 [↗](#))
- Obsolete internal parser for FK in InnoDB (MDEV-20480 [↗](#))
- InnoDB thread pool for background tasks (MDEV-16264 [↗](#))

Binary Log

- Extended [binlog](#) metadata (MDEV-20477 [↗](#))

Query Optimizer

- [ANALYZE for statements](#) is improved, now it also shows the time spent checking the WHERE clause and doing other auxiliary operations (MDEV-20854 [↗](#))
- [Inferred IS NOT NULL predicates can be used by the range optimizer](#) (MDEV-15777 [↗](#))

Galera

- Galera 4 Inconsistency voting (MDEV-17048 [↗](#))

General

- The [Information Schema SYSTEM_VARIABLES Table](#) has a new column showing from which config file a variable derives its value ([MDEV-12684](#))
- Switch Perl DBI scripts from DBD::mysql to DBD::MariaDB driver ([MDEV-19755](#))
- The [Aria](#) max key length is now 2000 bytes, compared to 1000 bytes in [MyISAM](#).

Do not use *alpha* releases in production!

Changelog

For a complete list of changes made in [MariaDB 10.5.0](#), with links to detailed information on each push, see the [changelog](#).

7.0.8 MariaDB Server 10.4

Changes and Improvements in MariaDB 10.4

Current Version: 10.4.34 | Status: Stable (GA) | Release Date: 16 May 2024

Release Notes - MariaDB 10.4 Series

[MariaDB 10.4 Series Release Notes](#)

Changelogs - MariaDB 10.4 Series

[MariaDB 10.4 changelogs](#).

There are [3 related questions](#).

7.0.8.1 Changes and Improvements in MariaDB 10.4

MariaDB 10.4 is no longer maintained. Please use a [more recent release](#).

The most recent release of MariaDB 10.4 is:
MariaDB 10.4.34 Stable (GA) [Download Now](#)

Contents

1. Implemented Features
 1. Authentication
 2. InnoDB
 3. Optimizer
 4. Syntax
 5. Variables
 6. Replication
 7. Backup
 8. Galera 4
 1. Galera 4 Versions
 2. New Features in Galera 4
 3. Limitations in Galera 4
 1. Rolling Upgrades from Galera 3 to Galera 4
 9. General
2. Security Vulnerabilities Fixed in MariaDB 10.4
3. List of All MariaDB 10.4 Releases

MariaDB 10.4 is a previous major stable version. The first stable release of 10.4 was in June 2019, and it was [maintained until](#) [June 2024](#).

Implemented Features

See the [Differences in MariaDB Enterprise Server 10.4](#) page for items that are different between MariaDB Community Server 10.4 and MariaDB Enterprise Server 10.4.

Authentication

- See [Authentication from MariaDB 10.4](#) for an overview of the changes.
- The [unix_socket authentication plugin](#) is now default on Unix-like systems, which is a major change to authentication in MariaDB ([MDEV-12484](#))
- [User password expiry](#) ([MDEV-7597](#))
- [Account Locking](#) ([MDEV-13095](#))
- The obsolete [mysql.host table](#) is no longer created ([MDEV-15851](#))
- Much faster privilege checks for MariaDB setups with many user accounts or many database grants ([MDEV-15649](#))
- [mysql.user table](#) is retired. User accounts and global privileges are now stored in the [mysql.global_priv table](#) ([MDEV-17658](#))
- [SET PASSWORD](#) support for [ed25519](#) and other [authentication plugins](#) ([MDEV-12321](#))

InnoDB

- Added instant [DROP COLUMN](#) and changing of the order of columns ([MDEV-15562](#))
- More Instant VARCHAR extension or ROW_FORMAT=DYNAMIC and ROW_FORMAT=COMPACT ([MDEV-15563](#))
 - change CHAR(0) to any VARCHAR
 - change a CHAR that is longer than 255 bytes to VARCHAR or wider CHAR
 - change a VARCHAR that is shorter than 128 bytes into any longer VARCHAR
- Instant collation or charset changes for non-indexed columns ([MDEV-15564](#))
- Reduced redo log volume for undo tablespace initialization ([MDEV-17138](#))
- Removed crash-upgrade support for pre-10.2.19 TRUNCATE TABLE ([MDEV-13564](#))
- Added key rotation for [innodb_encrypt_log](#) ([MDEV-12041](#))
- Implement [innodb_checksum_algorithm=full_crc32](#) ([MDEV-12026](#))

Optimizer

- Implementation of the [optimizer trace](#), one can enable the optimizer trace by enabling the system variable [optimizer_trace](#) ([MDEV-6111](#))
- [Engine Independent Table Statistics](#) is now enabled by default; new default values are [use_stat_tables=PREFERABLY_FOR_QUERIES](#) and [optimizer_use_condition_selectivity=4](#) ([MDEV-15253](#))
 - Two new values for the variable [use_stat_tables](#): `COMPLEMENTARY_FOR_QUERIES` and `PREFERABLY_FOR_QUERIES` ([MDEV-17255](#))
 - [Histograms](#) are now used (but not collected) by default ([MDEV-18608](#)).
 - [analyze_sample_percentage](#) variable added. The default value is 100 (`ANALYZE` will use the whole table), but one can also set `analyze` to only use a sample of table data to collect the statistics.
- Condition pushdown optimization now has bigger scope:

- [Conditions can be pushed into materialized IN-subqueries \(MDEV-12387\)](#)
- Conditions in `HAVING` clause can be pushed to `WHERE`. This behavior is controlled through [optimizer switch flag](#) `condition_pushdown_from_having`.
- The [optimizer switch flag](#) `optimize_join_buffer_size` now defaults to `on` ([MDEV-17903](#))
- [Rowid Filtering optimization](#) added ([MDEV-16188](#)). It is controlled through [optimizer switch flag](#) `rowid_filter`.

Syntax

- [Temporal tables](#) extended with support for [application-time periods \(MDEV-16973, MDEV-16974, MDEV-16975, MDEV-17082\)](#)
- Support of brackets (parentheses) for specifying precedence in [UNION/EXCEPT/INTERSECT](#) operations ([MDEV-11953](#))
- New `FLUSH SSL` command to reload SSL certificates without server restart ([MDEV-16266](#))
- New `CAST` target — `CAST(x AS INTERVAL DAY_SECOND(N))` ([MDEV-17776](#))
- `IF NOT EXISTS` clause added to [INSTALL PLUGIN](#) and `IF EXISTS` clause added to [UNINSTALL PLUGIN](#) and [UNINSTALL SONAME](#) ([MDEV-16294](#))
- Unique indexes can be created on [BLOB](#) or [TEXT](#) fields ([MDEV-371](#))

Variables

For a list of all new variables, see [System Variables Added in MariaDB 10.4](#) and [Status Variables Added in MariaDB 10.4](#).

- Added to the `tcp_nodelay` system variable ([MDEV-16277](#))
- Removed the `InnoDB_pages0_read` status variable ([MDEV-15705](#)).
- New `sql-mode` setting, `TIME_ROUND_FRACTIONAL` ([MDEV-16991](#))
- New variable `gtid_cleanup_batch_size` for determining how many old rows must accumulate in the `mysql.gtid_slave_pos` table before a background job will be run to delete them.
- The default for `eq_range_index_dive_limit` is now `200` (previously `0`) ([MDEV-18551](#))
- `core_file` on Windows now defaults to `ON` ([MDEV-18439](#))

Replication

- Speed up rotation of binary logs, `SHOW BINARY LOGS` etc with optimizing binary log index file locking ([MDEV-19116](#), [MDEV-19117](#)).
- A new server command, `SHUTDOWN WAIT FOR ALL SLAVES`, and a new `mysqladmin shutdown --wait-for-all-slaves` option, are added to instruct the server to wait for the last binlog event to be sent to all connected slaves before shutting down. ([MDEV-18450](#)).

Backup

- [BACKUP STAGE](#) allows one to implement very efficient backups with minimal locking. [MDEV-5336](#).

Galera 4

In [MariaDB 10.4.2](#) and later, [Galera](#) has been upgraded from [Galera 3](#) to [Galera 4](#).

Galera 4 Versions

The following table lists each version of the [Galera 4](#) wsrep provider, and it lists which version of MariaDB each one was first released in. If you would like to install [Galera 4](#) using `yum`, `apt`, or `zypper`, then the package is called `galera-4`.

Galera Version	Released in MariaDB Version
26.4.21	11.8.1 , 11.7.2 , 11.4.5 , 10.11.11 , 10.6.21 , 10.5.28
26.4.20	11.7.1 , 11.6.2 , 11.4.4 , 11.2.6 , 10.11.10 , 10.6.20 , 10.5.27
26.4.19	11.4.3 , 11.2.5 , 11.1.6 , 10.11.9 , 10.6.19 , 10.5.26
26.4.18	11.2.4 , 11.1.5 , 11.0.6 , 10.11.8 , 10.6.18 , 10.5.25 , 10.4.34
26.4.16	11.2.2 , 11.1.3 , 11.0.4 , 10.11.6 , 10.10.7 , 10.6.16 , 10.5.23 , 10.4.32
26.4.14	10.10.3 , 10.9.5 , 10.8.7 , 10.7.8 , 10.6.12 , 10.5.19 , 10.4.28
26.4.13	10.10.2 , 10.9.4 , 10.8.6 , 10.7.7 , 10.6.11 , 10.5.18 , 10.4.27

26.4.12	10.10.1 , 10.9.2 , 10.8.4 , 10.7.5 , 10.6.9 , 10.5.17 , 10.4.26
26.4.11	10.8.1 , 10.7.2 , 10.6.6 , 10.5.14 , 10.4.22
26.4.9	10.6.4 , 10.5.12 , 10.4.21
26.4.8	10.6.1 , 10.5.10 , 10.4.19
26.4.7	10.5.9 , 10.4.18
26.4.6	10.5.7 , 10.4.16
26.4.5	10.5.4 , 10.4.14
26.4.4	10.5.1 , 10.4.13
26.4.3	10.5.0 , 10.4.9
26.4.2	10.4.4
26.4.1	10.4.3
26.4.0	10.4.2

New Features in Galera 4

The `mysql` database contains new tables related to Galera replication:

- `wsrep_cluster`
- `wsrep_cluster_members`
- `wsrep_streaming_log`

End users may read but not modify these tables.

The new streaming replication feature allows replicating transactions of unlimited size. With streaming replication, a cluster is replicating a transaction in small fragments during transaction execution. This transaction fragmenting is controlled by two new configuration variables:

- `wsrep_trx_fragment_unit` (bytes, rows, statements) defines the metrics for how to measure transaction size limit for fragmenting. Possible values are:
 - `bytes` : transaction's binlog events buffer size in bytes
 - `rows` : number of rows affected by the transaction
 - `statements` : number of SQL statements executed in the multi-statement transaction
- `wsrep_trx_fragment_size` defines the limit for fragmenting. When a transaction's size, in terms of the configured fragment unit, has grown over this limit, a new fragment will be replicated.

Transactions replicated through galera replication will now process the commit phase using MariaDB's group commit logic. This will affect transaction throughput, especially when binary logging is enabled in the cluster.

Limitations in Galera 4

Rolling Upgrades from Galera 3 to Galera 4

Rolling upgrades from [MariaDB 10.3](#) (or earlier) to [MariaDB 10.4](#) also require an upgrade from [Galera 3](#) to [Galera 4](#). Galera 4 has a lot of changes and improvements that were not present in Galera 3.

Prior to the General Availability (GA) releases of [MariaDB 10.4](#) and Galera 4, earlier versions of [MariaDB 10.4](#) and Galera 4 had bugs that could lead to problems if Galera 4 nodes were in a cluster with Galera 3 nodes during a rolling upgrade. In these versions, rolling upgrades were not supported. This meant that, in order to upgrade a cluster, the cluster had to be completely stopped, and the nodes could only be restarted after the entire cluster had been upgraded to [MariaDB 10.4](#) and Galera 4.

These bugs have been fixed in more recent versions, and rolling upgrades from Galera 3 to Galera 4 are supported. In order to perform a rolling upgrade, it is recommended to upgrade to [MariaDB 10.4.6](#) or later and Galera 26.4.2 or later. However, as a general rule, users should try to ensure that they are upgrading to the latest versions of [MariaDB 10.4](#) and Galera 4.

For more detailed information on how to upgrade, see [Upgrading from MariaDB 10.3 to MariaDB 10.4 with Galera Cluster](#).

General

- Crash safe [Aria](#)-based [system tables](#) ([MDEV-16421](#))
- Added Linux abstract socket support ([MDEV-15655](#))
- Enabled C++11 ([MDEV-16410](#))

- Performance improvements in [Unicode collations](#) ([MDEV-17534](#), [MDEV-17511](#), [MDEV-17502](#), [MDEV-17474](#))
- User data type plugins ([MDEV-4912](#), in progress)
- Improvements with SQL standard INTERVAL support to help functions [TIMESTAMP\(\)](#) and [ADDTIME\(\)](#) return more predictable results.
 - Historically, MariaDB uses the TIME data type for both "time of the day" values and "duration" values. In the first meaning the natural value range is from '00:00:00' to '23:59:59.999999', in the second meaning the range is from '-838:59:59.999999' to '+838:59:59.999999'.
 - To remove this ambiguity and for the SQL standard conformance we plan to introduce a dedicated data type INTERVAL that will be able to store values in the range at least from '-87649415:59:59.999999' to '+87649415:59:59.999999', which will be enough to represent the time difference between [TIMESTAMP](#)'0001-01-01 00:00:00' and [TIMESTAMP](#)'9999-12-31 23:59:59.999999'.
 - As a first step we support this range of values for intermediate calculations when TIME-alike string and numeric values are used in INTERVAL (i.e. duration) context, e.g. as the second argument of SQL functions [TIMESTAMP\(ts,interval\)](#) and [ADDTIME\(ts,interval\)](#), so the following can now be calculated:

```

SELECT ADDTIME(TIMESTAMP'0001-01-01 00:00:00', '87649415:59:59.999999');
-> '9999-12-31 23:59:59.999999'

SELECT TIMESTAMP(DATE'0001-01-01', '87649415:59:59.999999')
-> '9999-12-31 23:59:59.999999'

SELECT ADDTIME(TIME'-838:59:59.999999', '1677:59:59.999998');
-> '838:59:59.999999'

```

- Support for window [UDF functions](#) via the new method [x_remove](#) ([MDEV-15073](#))
- Json service for plugins ([MDEV-5313](#))
- Change in behavior for [FLUSH TABLES](#) ([MDEV-5336](#)).
- The [JSON_VALID](#) function is automatically used as a [CHECK constraint](#) for the [JSON data type alias](#) in order to ensure that a valid json document is inserted ([MDEV-13916](#))
- MariaDB Named Commands ([MDEV-17591](#))
- MariaDB systemd multi-instance service have changed. See [systemd page](#) for details.

Security Vulnerabilities Fixed in [MariaDB 10.4](#)

For a complete list of security vulnerabilities (CVEs) fixed across all versions of MariaDB, see the [Security Vulnerabilities Fixed in MariaDB](#) page.

7.0.8.2 Release Notes - MariaDB 10.4 Series

MariaDB 10.4 was a long-term maintenance series of MariaDB [maintained until](#) [June 2024](#).

MariaDB 10.4.34 Release Notes

Status: [Stable \(GA\)](#) | Release Date: [16 May 2024](#)

MariaDB 10.4.33 Release Notes

Status: [Stable \(GA\)](#) | Release Date: [7 Feb 2024](#)

MariaDB 10.4.32 Release Notes

Status: [Stable \(GA\)](#) | Release Date: [13 Nov 2023](#)

MariaDB 10.4.31 Release Notes

Status: [Stable \(GA\)](#) | Release Date: [14 Aug 2023](#)

MariaDB 10.4.30 Release Notes

Status: [Stable \(GA\)](#) | Release Date: [7 Jun 2023](#)

MariaDB 10.4.29 Release Notes

Status: [Stable \(GA\)](#) | Release Date: [10 May 2023](#)

MariaDB 10.4.28 Release Notes

Status: [Stable \(GA\)](#) | Release Date: [6 Feb 2023](#)

MariaDB 10.4.27 Release Notes

Status: [Stable \(GA\)](#) | Release Date: [7 Nov 2022](#)

MariaDB 10.4.26 Release Notes

Status: [Stable \(GA\)](#) | Release Date: [15 Aug 2022](#)

MariaDB 10.4.25 Release Notes

Status: [Stable \(GA\)](#) | Release Date: [20 May 2022](#)

MariaDB 10.4.24 Release Notes

Status: [Stable \(GA\)](#) | Release Date: [12 Feb 2022](#)

MariaDB 10.4.23 Release Notes

Status: [Stable \(GA\)](#) | Release Date: [9 Feb 2022](#)

MariaDB 10.4.22 Release Notes

Status: [Stable \(GA\)](#) | Release Date: [8 Nov 2021](#)

MariaDB 10.4.21 Release Notes

Status: [Stable \(GA\)](#) | Release Date: [6 Aug 2021](#)

MariaDB 10.4.20 Release Notes

Status: [Stable \(GA\)](#) | Release Date: [23 Jun 2021](#)

MariaDB 10.4.19 Release Notes

Status: [Stable \(GA\)](#) | Release Date: [7 May 2021](#)

MariaDB 10.4.18 Release Notes

Status: [Stable \(GA\)](#) | Release Date: [22 Feb 2021](#)

MariaDB 10.4.17 Release Notes

Status: [Stable \(GA\)](#) | Release Date: [11 Nov 2020](#)

MariaDB 10.4.16 Release Notes

Status: [Stable \(GA\)](#) | Release Date: [3 Nov 2020](#)

MariaDB 10.4.15 Release Notes

Status: [Stable \(GA\)](#) | Release Date: [7 Oct 2020](#)

MariaDB 10.4.14 Release Notes

Status: [Stable \(GA\)](#) | Release Date: [10 Aug 2020](#)

MariaDB 10.4.13 Release Notes

Status: [Stable \(GA\)](#) | Release Date: [12 May 2020](#)

MariaDB 10.4.12 Release Notes

Status: [Stable \(GA\)](#) | Release Date: [28 Jan 2020](#)

MariaDB 10.4.11 Release Notes

Status: [Stable \(GA\)](#) | Release Date: [11 Dec 2019](#)

MariaDB 10.4.10 Release Notes

Status: [Stable \(GA\)](#) | Release Date: [8 Nov 2019](#)

MariaDB 10.4.9 Release Notes

Status: [Stable \(GA\)](#) | Release Date: [5 Nov 2019](#)

MariaDB 10.4.8 Release Notes

Status: [Stable \(GA\)](#) | Release Date: [11 Sep 2019](#)

MariaDB 10.4.7 Release Notes

Status: [Stable \(GA\)](#) | Release Date: [31 Jul 2019](#)

MariaDB 10.4.6 Release Notes

Status: [Stable \(GA\)](#) | Release Date: [18 Jun 2019](#)

MariaDB 10.4.5 Release Notes

Status: [Release Candidate \(RC\)](#) | Release Date: [21 May 2019](#)

MariaDB 10.4.4 Release Notes

Status: [Release Candidate](#) | Release Date: [7 Apr 2019](#)

MariaDB 10.4.3 Release Notes

Status: [Release Candidate](#) | Release Date: [25 Feb 2019](#)

MariaDB 10.4.2 Release Notes

Status: [Beta](#) | Release Date: [29 Jan 2019](#)

MariaDB 10.4.1 Release Notes

Status: [Beta](#) | Release Date: [20 Dec 2018](#)

MariaDB 10.4.0 Release Notes

Status: [Alpha](#) | Release Date: [9 Nov 2018](#)

7.0.9 MariaDB Server 10.3

Changes & Improvements in MariaDB 10.3

Current Version: [10.3.39](#) | Status: [Stable \(GA\)](#) | Release Date: [10 May 2023](#)

4. List of All MariaDB 10.3 Releases

MariaDB 10.3 is a previous major stable version. The first stable release was in May 2018, and it was [maintained until](#) May 2023.

For details on upgrading from [MariaDB 10.2](#), see [Upgrading from MariaDB 10.2 to 10.3](#).

MariaDB Server 10.3 is included in MariaDB TX 3.0. [Watch the webinar recording](#) to learn more about the new features included in this release.

The following lists the major new features in [MariaDB 10.3](#):

Implemented Features

Sequences

- [Sequences Overview \(MDEV-10139\)](#)
- `CREATE SEQUENCE`
- `SHOW CREATE SEQUENCE`
- `ALTER SEQUENCE`
- `DROP SEQUENCE`
- `NEXT VALUE FOR`
- `PREVIOUS VALUE FOR`
- `SETVAL()`

Syntax / General Features

- [System-versioned tables](#) (also known as AS OF) ([MDEV-12894](#))
- [Table Value Constructors](#) ([MDEV-12172](#)) — GSoC 2017 project by Galina Shalygina
- [Transform \[NOT\] IN predicate with long list of values INTO \[NOT\] IN subquery](#) ([MDEV-12176](#)) — GSoC 2017 project by Galina Shalygina
- `ROW TYPE OF` now supports local SP variables ([MDEV-14139](#))
- [Aggregate stored functions](#) ([MDEV-7773](#)) — GSoC 2016 project by Varun Gupta
- Support for `LIMIT` clause in `GROUP_CONCAT()` ([MDEV-11297](#))
- `PERCENTILE_CONT`, `PERCENTILE_DISC`, and `MEDIAN` window functions ([MDEV-12985](#))
- `FOR ... END FOR` statement ([MDEV-14415](#))
- `XA RECOVER FORMAT='SQL'` ([MDEV-14593](#))
- Oracle compatible `SUBSTR()` function ([MDEV-14012](#)) — contribution by Jérôme Brauge
- [INVISIBLE columns](#) ([MDEV-10177](#)) — GSoC 2016 project by Sachin Setiya

- Various scalability improvements ([MDEV-14529](#), [MDEV-14505](#))
- **Semi-sync plugin** merged into the server ([MDEV-13073](#)) — contribution by Alibaba
- **INTERSECT** and **EXCEPT**. These are both now **reserved words** and can no longer be used as an **identifier** without being quoted ([MDEV-10141](#))
- **ROW** data type for **stored routine** variables ([MDEV-10914](#), [MDEV-12007](#), [MDEV-12291](#))
- **TYPE OF** and **ROW TYPE OF** anchored data types for **stored routine** variables ([MDEV-12461](#))
- **Cursors** with parameters ([MDEV-12457](#))
- **DDL Fast Fail - WAIT/NOWAIT** ([MDEV-11379](#), [MDEV-11388](#))
- **CHR()** function ([MDEV-12685](#))
- **DELETE** statement can delete from the table that is used in a subquery in the **WHERE** clause ([MDEV-12137](#))
- Stored routine parameters can use **ROW TYPE OF** ([MDEV-13581](#))
- The server now **supports the PROXY protocol** - see also the new **proxy_protocol_networks** system variable ([MDEV-11159](#))
- **Instant ADD COLUMN** ([MDEV-11369](#)) — *Tencent Game DBA Team, developed by vinchen.*
- **UPDATE statements with the same source and target** ([MDEV-12874](#)) — *from Jerome Brauge.*
- **ORDER BY** and **LIMIT** in multi-table update ([MDEV-13911](#))
- **DATE_FORMAT(date, format, locale)** - 3 argument form of **DATE_FORMAT** ([MDEV-11553](#))
- The MariaDB SQL/PL stored procedure dialect (enabled with **sql_mode=ORACLE**) now supports Oracle style packages. Support for the following statements has been added ([MDEV-10591](#)):
 - **CREATE PACKAGE**
 - **CREATE PACKAGE BODY**
 - **DROP PACKAGE**
 - **DROP PACKAGE BODY**
 - **SHOW CREATE PACKAGE**
 - **SHOW CREATE PACKAGE BODY**
- New **sql_mode** **SIMULTANEOUS_ASSIGNMENT** to make the **SET** part of the **UPDATE** statement evaluate all assignments simultaneously, not left-to-right.
- Correctness improvement - **TRUNCATE** honors transactional locks ([MDEV-15061](#))
- Windows binaries now use high-precision timer when available ([MDEV-15694](#)). This makes much less probable for two queries to have the same **CURRENT_TIMESTAMP(6)** value, for example.
- Two new **ALTER TABLE ... ALGORITHM** options, **INSTANT** and **NOCOPY**, which allow operations that would require any data files to be modified, or that would require rebuilding the clustered index respectively, to be refused rather than potentially perform slowly ([MDEV-13134](#))
- **mysqldump** **--ignore-database** option ([MDEV-13336](#))

Compatibility

- As a result of implementing Table Value Constructors, the **VALUES function** has been renamed to **VALUE()** ([MDEV-12172](#))
- When running with **sql_mode=ORACLE**, the server now understands a subset of Oracle's PL/SQL language instead of the traditional MariaDB syntax for stored routines. See [MDEV-10142](#), [MDEV-10764](#) and [SQL_MODE=ORACLE From MariaDB 10.3](#) to know the current status.
- New **sql_mode**, **EMPTY_STRING_IS_NULL**.
- **INTERSECT** and **EXCEPT** are both now **reserved words** and can no longer be used as an **identifier** without being quoted ([MDEV-10141](#))
- Functions that used to only return 64-bit now can return 32-bit results ([MDEV-12619](#)).

Compression

- **Storage-engine Independent Column Compression** ([MDEV-11371](#)) — *Tencent Game DBA Team, developed by willhan, also thanks to AliSQL.*
- On Linux, shrink the core dumps by omitting the InnoDB buffer pool ([MDEV-10814](#))

Encryption

- Temporary files created by merge sort and row log are encrypted if **innodb_encrypt_log** is set to **1**, regardless of whether the table encrypted or not ([MDEV-12634](#)).

Optimizer/Performance

- Condition pushdown through **PARTITION BY** clause of **window functions** ([MDEV-10855](#))
- New **Lateral Derived optimization** was introduced.
- Numerous performance improvements for high-concurrency load
- Numerous scalability and performance improvements to global data structures, including [MDEV-14756](#), [MDEV-15019](#), [MDEV-14482](#), [MDEV-15059](#), [MDEV-15104](#)

- Performance improvements to persistent data structures: [MDEV-15090](#), [MDEV-15132](#)

Storage Engines

InnoDB

- [innodb_fast_shutdown](#) now has a new mode, `3`, which skips the rollback of connected transactions ([MDEV-15832](#))

Spider

The [Spider storage engine](#) has been updated to 3.3.13. The partitioning storage engine has been updated to support all the new Spider features including:

- Direct join support. This allows Spider to do JOINS and GROUP BYs internally.
- Direct update and delete.
- Direct aggregates.
- [slave_transaction_retry_errors](#) and [slave-transaction-retry-interval](#) allow more control over handling delays or conflicts when applying binary logs.

Most of the features were done as part of [MDEV-7698](#).

OQGRAPH

- [OQGraph](#) now supports the "leaves" algorithm ([MDEV-11271](#)) — contribution by Heinz Wiesinger

Partition Engine

- Numerous improvements for the partition engine ([MDEV-7698](#)) — contribution by Kentoku Shiba
 - Full text support.
 - Multi-range-read (Gives better performance when handling multiple ranges).
 - Support for condition pushdown.
 - HANDLER support
- Aggregate pushdown
- Bulk update/delete

Information Schema

- The Information Schema is optimized to use much less memory when selecting from [INFORMATION_SCHEMA.TABLES](#) or any other table with many [VARCHAR](#) or [TEXT](#) columns ([MDEV-14275](#))
- The [Information Schema Columns table](#) now displays [system versioning](#) info in the EXTRA column - [MDEV-15062](#)

Logging

- Disable logging of certain statements to the [general log](#) or the [slow query log](#) with the [log_disabled_statements](#) and [log_slow_disabled_statements](#) system variables.
- A new option to [log_slow_filter](#), `filsort_priority_queue`.

Replication

- Per-engine `mysql.gtid_slave_pos` tables ([MDEV-12179](#)) — *Implemented by Kristian Nielsen funded by Booking.com.*

Data Type API

10.3 continues refactoring for the data type API started in 10.2, which will make it possible to have user data type plugins. This work is still in progress (see [MDEV-4912](#) for the current status and subtasks). Most of the task in this category do not change the server behavior. Some tasks do have a [visible effect](#).

Idle Transactions

Connections with idle transactions can be automatically killed after a specified time period by means of the [idle_transaction_timeout](#), [idle_readonly_transaction_timeout](#) and [idle_write_transaction_timeout](#) system variables.

System Variables

For a list of all new variables, see [System Variables Added in MariaDB 10.3](#) and [Status Variables Added in MariaDB 10.3](#).

- New system variable [gtid_pos_auto_engines](#).
- New system variable [secure_timestamp](#) for restricting the direct setting of a session timestamp ([MDEV-15923](#)).
- [session variables tracking](#) is enabled by default ([MDEV-11825](#)).
- Remove deprecated variables [innodb_file_format](#), [innodb_file_format_check](#), [innodb_file_format_max](#) and [innodb_large_prefix](#).
- [version_source_revision](#) - permits seeing which version of the source was used for the build ([MDEV-12583](#)).
- Added [bind_address](#) as a system variable ([MDEV-12542](#)).
- The max value of the [max_prepared_stmt_count](#) system variable has been increased from 1048576 to 4294967295.
- The [proxy_protocol_networks](#) variable can now be modified without restarting the server ([MDEV-15501](#)).

Security Vulnerabilities Fixed in MariaDB 10.3

For a complete list of security vulnerabilities (CVEs) fixed across all versions of MariaDB, see the [Security Vulnerabilities Fixed in MariaDB](#) page.

2. [Comparison with MySQL](#)
3. [List of All MariaDB 10.2 Releases](#)

MariaDB 10.2 is a previous major stable version. The first stable release was in May 2017.

For details on upgrading from [MariaDB 10.1](#), see [Upgrading from MariaDB 10.1 to 10.2](#).

The following lists the major new features in [MariaDB 10.2](#):

Implemented Features

InnoDB as Default

- [InnoDB](#) is now the default storage engine. Until [MariaDB 10.1](#), MariaDB used the XtraDB storage engine as default. XtraDB in 10.2 is not up to date with the latest features of InnoDB and cannot be used. As the InnoDB on disk format is identical to XtraDB's this will not cause any problems when upgrading to [MariaDB 10.2](#). See [Why does MariaDB 10.2 use InnoDB instead of XtraDB?](#)

Syntax / General Features

- [MyRocks](#) storage engine added. (It has its own [maturity level](#) [🔗](#). In [MariaDB 10.2.14](#) [🔗](#), it is considered Gamma) ([MDEV-9658](#) [🔗](#))
- [Window functions](#) have been introduced.
- The [SHOW CREATE USER](#) statement was introduced
- New [CREATE USER](#) options for limiting resource usage and tls/ssl
- New [ALTER USER](#) statement
- [Non-recursive Common Table Expressions](#)
- [Recursive Common Table Expressions](#) ([MDEV-9864](#) [🔗](#))
- New [WITH](#) statement. `WITH` is a common table expression that allows you to refer to a subquery expression many times in a query ([MDEV-8308](#) [🔗](#) & [MDEV-9864](#) [🔗](#)) — *Original code from Galina Shalygina*
- Support for [CHECK CONSTRAINT](#) ([MDEV-7563](#) [🔗](#))
- Support for [DEFAULT with expressions](#) ([MDEV-10134](#) [🔗](#))
- [BLOB and TEXT](#) fields can now have a [DEFAULT](#) value
- Lots of restrictions lifted for [Virtual computed columns](#)
- Number of supported decimals in [DECIMAL](#) has increased from 30 to 38 ([MDEV-10138](#) [🔗](#))
- Added catchall for [list partitions](#) ([MDEV-8348](#) [🔗](#))
- Oracle-style [EXECUTE IMMEDIATE](#) statement ([MDEV-10585](#) [🔗](#))
- [PREPARE Statement](#)/Dynamic SQL now understand most expressions ([MDEV-10866](#) [🔗](#), [MDEV-10709](#) [🔗](#)).
- InnoDB tables now support [spatial indexes](#)
- [ed25519 authentication plugin](#) ([MDEV-12160](#) [🔗](#))
- Better InnoDB crash recovery progress reporting ([MDEV-11027](#) [🔗](#))
- Improvements to InnoDB startup/shutdown to make it more robust
- [AWS Key Management plugin](#) added for Windows, CentOS, RHEL, and Fedora packages
- [Atomic writes support made more general](#). [Shannon system SSD cards](#) [🔗](#) are now supported.

Incompatible Changes

- [TokuDB](#) [🔗](#) has been split into a separate package, mariadb-plugin-tokudb.
- [SQL_MODE](#) has been changed; in particular, NOT NULL fields with no default will no longer fall back to a dummy value for inserts which do not specify a value for that field.
- Replication from legacy MySQL servers may require setting [binlog_checksum](#) to NONE.
- New [reserved words](#): OVER, RECURSIVE, and ROWS.

Triggers

- Multiple [triggers](#) for the same event ([MDEV-6112](#) [🔗](#))
- The FOLLOWS/PRECEDES clauses have been added to the [CREATE TRIGGER](#) statement
- Multiple triggers are now counted in the Executed_triggers status variable ([MDEV-10915](#) [🔗](#))
- [SHOW TRIGGERS](#) and [SHOW CREATE TRIGGER](#) now include the date and time the trigger was created

Replication / Binary Log

- [DML_only flashback](#) can rollback instances/databases/tables to an old snapshot ([MDEV-10570](#) [🔗](#))
- New variable [read_binlog_speed_limit](#) permits restricting the speed at which the slave reads the binlog from the master ([MDEV-11064](#) [🔗](#)) — *Original code from Tencent Game DBA Team, developed by chouryzhou.*
- [Delayed replication](#) is supported ([MDEV-7145](#) [🔗](#)) — *Backported from MySQL 5.6 by Kristian Nielsen funded by Booking.com.*
- [Compression of events in the binary log](#) is supported ([MDEV-11065](#) [🔗](#)) — *Original code from Tencent Game DBA Team, developed by vichen.*
- Default [binary log format](#) changed to mixed ([MDEV-7635](#) [🔗](#))
- Default value of [replicate_annotate_row_events](#) changed to ON ([MDEV-7635](#) [🔗](#))
- Default value of [slave_net_timeout](#) reduced to 60 seconds ([MDEV-7635](#) [🔗](#))
- Default [server_id](#) changed from 0 to 1

GeoJSON / JSON

- The [JSON data type](#) (an alias for LONGTEXT) was introduced.
- [JSON functions](#) added ([MDEV-9143](#) [🔗](#))
- Implement [ST_AsGeoJSON](#) and [ST_GeomFromGeoJSON](#) functions so the spatial features can be imported/exported using GeoJSON format ([MDEV-11042](#) [🔗](#))

Information Schema

- An information schema plugin to report all user variables, which creates the [Information Schema USER_VARIABLES Table](#) ([MDEV-7331](#) [🔗](#))
- Changes to the [Information Schema COLUMNS](#) table. Literals are now quoted in the `COLUMN_DEFAULT` column to

distinguish them from expressions ([MDEV-13132](#)), and two new columns added providing information about generated (virtual, or computed) columns ([MDEV-9255](#)).

EXPLAIN

- [EXPLAIN FORMAT=JSON](#) now shows `outer_ref_condition` field which contains the condition that the(?) SELECT checks on each re-execution ([MDEV-9652](#))
- [EXPLAIN FORMAT=JSON](#) now shows `sort_key` field which shows the sort criteria used by `filesort` operation. ([commit 2078392](#))
- EXPLAIN used to show incorrect information about how the optimizer resolved `ORDER BY` clause or `Distinct`. This was a long-standing problem with roots back in MySQL. Now, after [MDEV-8646](#) and related fixes, the problem doesn't exist anymore. (For test cases, see [MDEV-7982](#), [MDEV-8857](#), [MDEV-7885](#), [MDEV-326](#))

Optimizations

- Connection setup was made faster by moving creation of THD to new thread ([MDEV-6150](#))
- Pushdown conditions into non-mergeable views/derived tables ([MDEV-9197](#), [condition-pushdown-into-derived-table-optimization](#)) — *Original code from Galina Shalygina*
- [ANALYZE TABLE](#) has been re-implemented so as not to lock the entire table when collecting engine independent statistics ([MDEV-7901](#))
- Internal CRC32 routines use the optimized implementation on Power8 — [MDEV-9872](#)
- Table cache can automatically partition itself as needed to reduce the contention ([MDEV-10296](#))

Compatibility

- 88 new [NO PAD collations](#) added. In `NO PAD` collations, end spaces are significant in comparisons ([MDEV-9711](#))
— *Original code from Daniil Medvedev*
- MariaDB now works when started with a MySQL 5.7.6+ data directory ([MDEV-11170](#))

CONNECT

- [Zipped File Tables](#) for the CONNECT storage engine ([MDEV-11295](#))
- The CONNECT engine now supports the [JDBC Table type](#) ([MDEV-9765](#))

System Variables

For a list of all new system variables, see [System Variables Added in MariaDB 10.2](#). Variable changes include:

- New variable to disable deadlock detection `innodb_deadlock_detect`
- `aria_recover` has been renamed to `aria_recover_options` ([MDEV-8542](#))
- Default values of the `aria_recover` and `myisam_recover_options` system variables changed to `BACKUP, QUICK`
- The server version can now be faked to work around dated applications that require a particular [version string](#) ([MDEV-7780](#))
- `slave_parallel_workers` is now an alias for `slave_parallel_threads`
- New status variables `com_alter_user`, `com_multi` and `com_show_create_user`
- New variable for setting a directory for storing temporary non-tablespace InnoDB files, `innodb_tmpdir`
- New variable `read_binlog_speed_limit` permits restricting the speed at which the slave reads the binlog from the master ([MDEV-11064](#))
- `innodb_log_files_in_group` can now be set to `1` ([MDEV-12061](#))
- The thread pool now gives higher priority to connections that have an active transaction. This can be controlled with the new `thread_pool_prio_kickup_timer` and `thread_pool_priority` system variables. ([MDEV-10297](#))
- Default value of `group_concat_max_len` changed to 1M ([MDEV-7635](#))
- Default value of `sql_mode` changed to `STRICT_TRANS_TABLES,ERROR_FOR_DIVISION_BY_ZERO,NO_AUTO_CREATE_USER,NO_ENGINE_SUBSTITU` ([MDEV-7635](#)) ([MariaDB 10.2.4](#) and later)
- Default value of `innodb_compression_algorithm` changed to `zlib` - this does not mean pages are now compressed by default, see [compression](#) ([MDEV-11838](#))
- Default value of `innodb_log_compressed_pages` changed to `ON` from [MariaDB 10.1.2](#) to [MariaDB 10.1.25](#) ([MDEV-7635](#) and [MDEV-13247](#))
- Default value of `innodb_use_atomic_writes` and `innodb_use_trim` changed to `ON`
- The unused `innodb_api_*` variables have been removed ([MDEV-12050](#))
- `tmp_disk_table_size` was added to allow one to limit the size of temporary disk tables stored in `tmpdir`. At the same time `tmp_memory_table_size` was added an alias for `tmp_table_size`. At some point we plan to deprecate `tmp_table_size`. ([MariaDB 10.2.7](#) and later).

Status Variables

For a list of all new status variables, see [Status Variables Added in MariaDB 10.2](#).

Scripts

- Continuous binary log backup has been added to [mysqlbinlog](#) (MDEV-8713)
- [mysql_zap](#) and [mysqlbug](#) have been removed (MDEV-7376, MDEV-8654)

Other Changes

- Added support for OpenSSL 1.1 and LibreSSL (MDEV-10332)
- Persistent `AUTO_INCREMENT` for InnoDB (MDEV-6076)
- Support `COM_RESET_CONNECTION` (MDEV-10340)
- "fast mutexes" have been removed. These aren't faster than normal mutexes, and have been disabled by default for years (MDEV-8111)
- Old GPL client library is gone; now MariaDB Server comes with the LGPL Connector/C client library (MDEV-9055)
- MariaDB is no longer compiled with jemalloc
- TokuDB is now a separate package, not part of the server RPM (because TokuDB still needs jemalloc).
- Upgrading to a new major release no longer requires setting `innodb_fast_shutdown` to 0. Omitting it can make the upgrade process a lot faster. (MDEV-12289)

Security Vulnerabilities Fixed in MariaDB 10.2

For a complete list of security vulnerabilities (CVEs) fixed across all versions of MariaDB, see the [Security Vulnerabilities Fixed in MariaDB](#) page.

- CVE-2022-32088: MariaDB 10.2.44
- CVE-2022-32083: MariaDB 10.2.44

2. [Comparison with MySQL](#)
3. [List of all MariaDB 10.1 releases](#)

MariaDB 10.1 is a previous stable version of MariaDB. The first stable release was in October 2014.

For details on upgrading from [MariaDB 10.0](#), see [Upgrading from MariaDB 10.0 to 10.1](#).

The following lists the major new features in [MariaDB 10.1](#):

Implemented Features

Galera

- [Galera](#), a true multi-master solution, is a standard part of [MariaDB 10.1](#).
- Two new Information Schema tables for examining wsrep information, [WSREP_MEMBERSHIP](#) and [WSREP_STATUS](#) ([MDEV-7053](#)).

Encryption

- [Table, Tablespace and log Encryption](#).

Page Compression

- [InnoDB/XtraDB Page Compression](#)
- Page compression for [FusionIO](#).

Replication

- [Optimistic mode of in-order parallel replication](#) ([MDEV-6676](#)).
- domain_id based replication filters - see [CHANGE MASTER TO](#) ([MDEV-6593](#)).
- Enhanced semisync replication; Wait for at least one slave to acknowledge transaction before committing ([MDEV-162](#)).
- [Triggers can now be run on the slave](#) for row-based events.
- Dump Thread Enhancements from Google. Makes multiple slave setups faster by allowing concurrent reading of binary log. ([MDEV-7257](#)).
- Commits in certain instances in parallel replication complete immediately, avoiding losing throughput when many transactions need conflicting locks. See [binlog_commit_wait_count](#).
- [RESET_MASTER](#) is extended with `TO #` which allows one to specify the number of the first binary log. ([MDEV-8469](#))

- Due to the implementation of SQL standards-compliant behavior when dealing with [Primary Keys with Nullable Columns](#), in certain edge cases, there may be replication issues when replicating from a [MariaDB 10.0](#) master to a [MariaDB 10.1](#) slave using [statement-based replication](#). See [MDEV-12248](#).

Roles

- [SET DEFAULT ROLE](#) ([MDEV-5210](#)).
- New columns for the [INFORMATION_SCHEMA.APPLICABLE_ROLES](#) table.

Optimization

- [ORDER BY optimization is improved](#) by several fixes for real-world cases.
- Don't create frm files for temporary tables ([MDEV-4260](#)).
- [MAX_STATEMENT_TIME](#) can be used to automatically abort long running queries. ([MDEV-4427](#)).
- [UNION ALL](#) works without usage of a temporary table ([MDEV-334](#)). The feature was backported from MySQL 5.7.
- Scalability fixes ([MDEV-7004](#)). Up to 60% higher throughput in sysbench benchmarks on Power8.
- Make simple queries faster as we call malloc() fewer times.
- Automatic discovery of [performance schema](#) tables (simpler mysql_install_db code). ([MDEV-4262](#)), [Performance Schema](#) tables no longer use .frm files.
- Other Webscale patches ([MDEV-6039](#))
- [MDEV-7728](#) xid cache scalability was significantly improved (by using lock-free hash)

GIS

- Support for Spatial Reference systems for the GIS data ([MDEV-60](#)), new `REF_SYSTEM_ID` column attribute can be used to specify Spatial Reference System ID for columns of spatial data types:
- More functions from the [OGC](#) standard added ([MDEV-4045](#)):
 - [ST_Boundary](#)
 - [ST_ConvexHull](#)
 - [ST_IsRing](#)
 - [ST_PointOnSurface](#)
 - [ST_Relate](#)
- [INFORMATION_SCHEMA.GEOMETRY_COLUMNS](#) table.
- [INFORMATION_SCHEMA.SPATIAL_REF_SYS](#) table.

Syntax

- Consistent support for `IF EXISTS`, `IF NOT EXISTS`, and `OR REPLACE` clauses:
 - [CREATE DATABASE](#) ([MDEV-7280](#))
 - [CREATE FUNCTION UDF](#) ([MDEV-7283](#))
 - [CREATE ROLE](#) ([MDEV-7288](#))
 - [CREATE SERVER](#) ([MDEV-7285](#))
 - [CREATE USER](#) ([MDEV-7288](#))
 - [CREATE VIEW](#) ([MDEV-7283](#))
 - [DROP ROLE](#) ([MDEV-7288](#))
 - [DROP USER](#) ([MDEV-7288](#))
 - [CREATE EVENT](#) and [DROP EVENT](#) ([MDEV-7281](#))
 - [CREATE INDEX](#) and [DROP INDEX](#) ([MDEV-7284](#))
 - [CREATE TRIGGER](#) and [DROP TRIGGER](#) ([MDEV-7286](#))
- Information Schema plugins can now support `SHOW` and `FLUSH` statements. New statements include:
 - [SHOW QUERY_RESPONSE_TIME](#)
 - [FLUSH QUERY_RESPONSE_TIME](#)
 - [SHOW LOCALES](#)
- New columns for the [INFORMATION_SCHEMA.APPLICABLE_ROLES](#) and [INFORMATION_SCHEMA.VIEWS](#) tables.
- [ANALYZE statement](#) provides output that looks like `EXPLAIN` output, but also includes data from the query execution (how many rows were actually read, etc).
- [EXPLAIN FORMAT=JSON](#) is a re-implementation of similar feature in MySQL 5.6
- [ANALYZE FORMAT=JSON](#) produces detailed information about the statement execution
- [GET_LOCK\(\)](#) now supports microseconds in the timeout, no longer rounding fractions to the nearest integer ([MDEV-4018](#))
- [Compound statements can be used outside of stored programs](#).
- The number of rows affected by a slow `UPDATE` or `DELETE` is now recorded in the [slow query log](#) - see also [mysql.slow_log Table](#). ([MDEV-4412](#))

- SQL standards-compliant behavior when dealing with [Primary Keys with Nullable Columns](#). Note that this could cause replication issues in certain edge cases when replicating from a [MariaDB 10.0](#) master to a [MariaDB 10.1](#) slave. using [statement-based replication](#). See [MDEV-12248](#).
- Explicit or implicit casts from MAX(string) to INT, DOUBLE or DECIMAL now produce warnings ([MDEV-8852](#)).

XtraDB / InnoDB

- Allow up to 64K pages in InnoDB (old limit was 16K) ([MDEV-6075](#)).
- The Facebook/Kakao defragmentation patch (see [Defragmenting InnoDB Tablespaces](#)) which uses [OPTIMIZE TABLE](#) to defragment InnoDB tablespaces).

Collations

- Added the `utf8_thai_520_w2`, `utf8mb4_thai_520_w2`, `ucs2_thai_520_w2`, `utf16_thai_520_w2` and `utf32_thai_520_w2` collations.

Variables

For a list of all new variables, see [System Variables Added in MariaDB 10.1](#) and [Status Variables Added in MariaDB 10.1](#). Some of these, and other variable-related changes, include:

- `INFORMATION_SCHEMA.SYSTEM_VARIABLES` gives information, like description and value origin, for system variables ([MDEV-6138](#)).
- [MDEV-6858](#) New server variable `enforce_storage_engine`
- New status variables to show the number of grants on different objects (see [Status Variables Added in MariaDB 10.1](#))
- Default size of `query_alloc_block_size` changed from 8192 to 16384 and `query_prealloc_size` from 8192 to 24576 to avoid the need for simple queries with one join to call `my_malloc`.
- Added variable `default-tmp-storage-engine` (From MySQL 5.6) ([MDEV-6107](#)).
- `SET STATEMENT` - set variables for the duration of the query ([MDEV-5231](#)). This is a backport of [Per-query Variable Statement](#) feature of Percona Server 5.6 (which, in turn, is based in MySQL GSoC 2009 project by Joseph Lukas), with many bugs fixed.
- `--mysql56-temporal-format` option to use the MySQL-5.6 low level formats to store `TIME`, `DATETIME` and `TIMESTAMP` types. ([MDEV-5528](#))
- Backport `innodb_default_row_format` ([MDEV-14904](#))
- `mysqld --help --verbose` now shows valid variables for ENUM variables. ([MDEV-6137](#))
- [MDEV-6981](#) New status variables to track `MASTER_GTID_WAIT` time.
- [MDEV-7198](#) New status variable `Slave_skipped_errors`.
- `--silent-startup` `mysqld` option. If specified, `mysqld` does not print Notes to the error log during startup.

Plugins

- [Password validation plugin API](#) ([MDEV-6431](#)).
- `simple_password_check` password validation plugin. It can enforce a minimum password length and guarantee that a password contains at least a specified number of uppercase and lowercase letters, digits, and punctuation characters.
- `cracklib_password_check` password validation plugin. It only allows passwords that are strong enough to pass [CrackLib](#) test. This is the same test that `pam_cracklib.so` does, installed by default on many Linux distributions.
- [ed25519 authentication plugin](#) for traditional password-based authentication. A new, secure alternative to the old `mysql_native_password` plugin.

Security

- Enhance security using special compilation options - MariaDB is now compiled with security hardening options by default. It is an additional protection layer that makes new, yet unknown, security vulnerabilities more difficult to exploit. ([MDEV-5730](#))

Security Vulnerabilities Fixed in [MariaDB 10.1](#)

For a complete list of security vulnerabilities (CVEs) fixed across all versions of MariaDB, see the [Security Vulnerabilities Fixed in MariaDB](#) page.

7.0.12 MariaDB Server 10.0

Changes & Improvements in MariaDB 10.0

Current Version: 10.0.38 | Status: Stable (GA) | Release Date: 31 Jan 2019

Release Notes - MariaDB 10.0 Series

MariaDB 10.0 Series Release Notes

Changelogs - MariaDB 10.0 Series

MariaDB 10.0 changelogs.

7.0.12.1 Changes & Improvements in MariaDB 10.0

MariaDB 10.0 is no longer maintained. Please use a [more recent release](#).

The most recent release in the [MariaDB 10.0 series](#) is:

MariaDB 10.0.38 [Download Now](#)

MariaDB 10.0 is a previous stable series of MariaDB. It is built on the [MariaDB 5.5 series](#) with backported features from

MySQL 5.6 and entirely new features not found anywhere else. The first stable release was in March 2014, and the final release was in January 2019.

For details on upgrading from [MariaDB 5.5](#), see [Upgrading from MariaDB 5.5 to MariaDB 10.0](#).

Blog posts with details of the reasoning behind calling this version MariaDB 10:

- <http://blog.mariadb.org/mariadb-10-0-and-mysql-5-6/>
- <http://blog.mariadb.org/what-comes-in-between-mariadb-now-and-mysql-5-6/>
- <http://blog.mariadb.org/explanation-on-mariadb-10-0/>

Contents

1. Implemented Features
 1. New Features
 2. New Features Re-implemented From a Similar MySQL Feature
 3. New Features Backported from MySQL 5.6
2. Incompatible Changes
3. Security Vulnerabilities Fixed in MariaDB 10.0
4. Comparison with MySQL
5. List of All MariaDB 10.0 Releases

Implemented Features

Features that are in a release.

New Features

- For a list of all new variables, see [System Variables Added in MariaDB 10.0](#)
- [Parallel Replication](#)
- [Global Transaction ID \(MDEV-26\)](#)
- [Multi source replication \(MDEV-253\)](#) — *Original code from Taobao, developed by Peng Lixun*
- Slave started with `--binlog-format=STATEMENT` can replicate from master with any type of `--binlog-format` Starting from [MariaDB 10.0.22](#)
- [Cassandra storage engine \(MDEV-4695\)](#)
- [CONNECT storage engine \(MDEV-4146\)](#)
- Better [table discovery](#). [Sequence](#) storage engine. Assisted discovery in [FederatedX \(MDEV-3808\)](#)
- [Spider storage engine \(MDEV-4438\)](#)
- [TokuDB storage engine \(MDEV-4507\)](#)
- [Mroonga full-text search storage engine](#)
- [QUERY_RESPONSE_TIME plugin](#)
- [Engine independent table statistics \(MDEV-3806\)](#)
- Subquery optimizations: [EXISTS-to-IN optimization \(MDEV-38\)](#) - NOT EXISTS to IN), [MDEV-537](#), [MDEV-3862](#)
- [Histogram-based statistics for non-indexed columns \(MDEV-4145\)](#)
- [SHOW EXPLAIN command \(MDEV-165\)](#)
- [EXPLAIN in the slow query log \(MDEV-407\)](#)
- Per thread memory usage ([MDEV-4011](#)). — *Original code from Taobao, developed by Peng Lixun*
 - `information_schema.processlist` has two new columns: `MEMORY_USAGE` and `EXAMINED_ROWS`.
 - `SHOW STATUS` has a new variable: `Memory_used`.
- [SHOW PLUGINS SONAME 'XXX' \(MDEV-3807\)](#)
- [SHUTDOWN statement \(MDEV-4660\)](#)
- [Killing a query by query id, not thread id \(MDEV-4911\)](#)
- Faster UNIQUE key generation with [ALTER TABLE \(MDEV-539\)](#)
- Implement async commit checkpoint in InnoDB and XtraDB ([MDEV-532](#))
- Support for [atomic writes on FusionIO DirectFS \(MDEV-4338\)](#)
- [DELETE ... RETURNING \(MDEV-3814\)](#)
- IF (NOT) EXISTS clauses for [ALTER TABLE \(MDEV-318\)](#)
- [CREATE OR REPLACE TABLE \(MDEV-5491\)](#)
 - `slave-ddl-exec-mode` variable to specify how `CREATE TABLE` and `DROP TABLE` is replicated.
- [Dynamic columns now support names \(MDEV-377\)](#), [summary of changes](#)
- multiple use locks ([GET_LOCK](#)) in one connection ([MDEV-3917](#))
- Better error messages (all error numbers now include descriptive text explaining what the number means)
- [table attributes](#) with sysvar as a default value ([MDEV-4022](#))
- regular expression enhancements

- new regular expression library with modern features ([PCRE](#))
- new functions [REGEXP_REPLACE](#), [REGEXP_INSTR](#), [REGEXP_SUBSTR](#).
- [Roles](#) ([MDEV-4397](#))
- [metadata_lock_info](#) information schema. Shows you which meta data locks are active.
- [Adjustable hash size](#) for MyISAM and Aria. This can greatly improve shutdown time (from hours to minutes) if you are using a lot of MyISAM/Aria tables with delayed keys.
- [FLUSH TABLES ... FOR EXPORT](#)
- The [Extended Keys](#) optimization is enabled by default
- [MariaDB audit plugin](#)
- [filesort-with-small-limit-optimization](#) is now visible through the [slow query log](#) and a new status variable, [sort_priority_queue_sorts](#)
- [Error log](#) flood protection

New Features Re-implemented From a Similar MySQL Feature

- [CURRENT_TIMESTAMP](#) as DEFAULT for [DATETIME](#) columns ([MDEV-452](#))
- [EXPLAIN](#) for INSERT/UPDATE/DELETE ([MDEV-3798](#) , [MWL#51](#))

New Features Backported from MySQL 5.6

- New InnoDB — *from MySQL 5.6.14 in MariaDB 10.0.8* [onwards](#)
- New [Performance schema](#) — *from MySQL 5.6.10 in MariaDB 10.0.4* [onwards](#)
- New [Information Schema](#) tables, updates and defaults.
- Optimized read only transaction (for InnoDB). This includes support for [TRANSACTION READ ONLY](#).
- Filesort optimization for queries using the `ORDER BY ... LIMIT` optimization - A useful optimization for showing only a few rows of a bigger result set. ([MDEV-4026](#))
- backport `--plugin-load-add` ([MDEV-3860](#))
- Online [ALTER TABLE](#) ([MDEV-3933](#)) (ALGORITHM=INPLACE, etc)
- [InnoDB persistent statistics](#).
- privileges on temporary tables
- character set related extensions
- [GET DIAGNOSTICS](#) [onwards](#)
- [EXCHANGE PARTITION](#)
- Partition selection
- Temporal literals (such as `TIME'12:34:56'`)
- [WEIGHT_STRING\(\)](#) function
- Collation customization improvements (see [Supported Characters Sets and Collations](#))
- [TO_BASE64\(\)](#) and [FROM_BASE64\(\)](#) functions

Incompatible Changes

- New [reserved word](#): RETURNING. This can no longer be used as an [identifier](#) without being quoted.

Security Vulnerabilities Fixed in MariaDB 10.0

For a complete list of security vulnerabilities (CVEs) fixed across all versions of MariaDB, see the [Security Vulnerabilities Fixed in MariaDB](#) [onwards](#) page.

There are [2 related questions](#).

7.0.13.1 Changes & Improvements in MariaDB 5.5

MariaDB 5.5 is no longer maintained. Please use a [more recent release](#).

The most recent release in the MariaDB 5.5 series is:

[MariaDB 5.5.68](#) [Download Now](#)

Contents

- [1. Feature Comparison Matrix](#)
- [2. New Features](#)
 - [1. Information Schema](#)
- [3. Minor Extensions](#)
- [4. Deprecated / Disabled Features](#)
- [5. Switching Between InnoDB and XtraDB](#)
- [6. Security Vulnerabilities Fixed in MariaDB 5.5](#)
- [7. List of All MariaDB 5.5 Releases](#)

MariaDB 5.5 is MariaDB 5.3 + MySQL 5.5, with added features. The first stable release was in April 2012, and the final release in May 2020.

For upgrading to [MariaDB 10.0](#), the more recent stable release, see [Upgrading from MariaDB 5.5 to MariaDB 10.0](#).

Feature Comparison Matrix

We have created an [Optimizer Feature Comparison Matrix](#) showing the new optimizer features in [MariaDB 5.5](#) and 5.3 compared to MySQL 5.5 and 5.6.

See also a detailed breakdown of [System variable differences between MariaDB 5.5 and MySQL 5.5](#).

New Features

- Significantly more efficient [thread pool](#), comparable in functionality to the closed source feature in MySQL Enterprise.
- [Non-blocking client API Library](#) ([MWL#192](#))
- [@@skip_replication option](#) ([MWL#234](#))
- [SphinxSE](#) updated to version 2.0.4.
- [Extended Keys](#) support for XtraDB and InnoDB
- New [INSTALL SONAME](#) statement ([MWL#77](#))
- New [LIMIT ROWS EXAMINED](#) optimization ([MDEV-28](#))
- `mysql_real_connect()` Changes
 - In MySQL, and in MariaDB versions before 5.5.21, `mysql_real_connect()` removes from the MYSQL object any options set with `mysql_option()` when it fails. Beginning with [MariaDB 5.5.21](#), options are preserved by a failing `mysql_real_connect()`; use `mysql_close()`, as normal, to clear them.
 - This only has effect if the MYSQL object is reused after a `mysql_real_connect()` failure (which is unusual). No real-life incompatibilities are expected from this change (it is unlikely that an application would rely on options being automatically removed between connection attempts).
- The variables `replicate_do_*`, `replicate_ignore_*`, and `replicate_wild_*` have been made dynamic, so they can be changed without requiring a server restart. See [Dynamic Replication Variables](#) for more information.
- New [status variables](#) for checking if features are used. These are very useful in [user feedback](#) to tell developers how much a feature is used:
 - [Feature_dynamic_columns](#)
 - [Feature_fulltext](#)
 - [Feature_gis](#)
 - [Feature_locale](#)
 - [Feature_subquery](#)
 - [Feature_timezone](#)
 - [Feature_trigger](#)
 - [Feature_xml](#)
- New [status variables](#) to see what's going on:
 - [Opened_views](#)
 - [Executed_triggers](#)

- [Executed_events](#)
- New plugin to log SQL level errors. [SQL_ERROR_LOG](#)
- New variable [OLD_MODE](#) to set compatibility behavior with older MySQL or MariaDB versions.

Information Schema

There are a number of new [INFORMATION SCHEMA](#) tables:

- [INNODB_SYS_COLUMNS](#)
- [INNODB_SYS_FIELDS](#)
- [INNODB_SYS_FOREIGN](#)
- [INNODB_SYS_FOREIGN_COLS](#)
- [PARAMETERS](#)
- [TABLESPACES](#)

Minor Extensions

- Updates to performance schema tables are not stored in the [binary log](#) and thus not replicated to slaves. This is to ensure that monitoring of the master will not cause a slower performance on all slaves. This also fixes a crash on the slaves.

New features are added to [MariaDB 10.0](#).

Deprecated / Disabled Features

- [PBXT](#) is no longer in the binary builds/distributions. It's however still in the source distributions and in the source tree. The reason is that PBXT is no longer actively maintained, has a few bugs that are not fixed and is not in widespread use.

Switching Between InnoDB and XtraDB

[MariaDB 5.5](#) comes with both [XtraDB](#) (compiled in) and InnoDB (as a plugin). By default [MariaDB 5.5](#) uses XtraDB. If you want to switch to use InnoDB you can do:

```
mysqld --ignore-builtin-innodb --plugin-load=innodb=ha_innodb.so \  
--plugin_dir=/usr/local/mysql/lib/mysql/plugin
```

([plugin_dir](#) should point to where `ha_innodb.so` is installed)

The above options can of course also be added to your [my.cnf](#) file:

```
[mysqld]  
ignore-builtin-innodb  
plugin-load=innodb=ha_innodb.so  
plugin_dir=/usr/local/mysql/lib/mysql/plugin
```

If you want you can also compile MariaDB with [InnoDB as default](#).

Security Vulnerabilities Fixed in MariaDB 5.5

For a complete list of security vulnerabilities (CVEs) fixed across all versions of MariaDB, see the [Security Vulnerabilities Fixed in MariaDB](#) page.

8. [Security Vulnerabilities Fixed in MariaDB 5.3](#)

The focus for [MariaDB 5.3](#) is to radically improve performance for subqueries, as well as for joins and single-table queries over large data sets.

[MariaDB 5.3](#) is based on [MariaDB 5.2](#) and thus on [MariaDB 5.1](#) and MySQL 5.1. It is no longer being supported.

Some of the code was backported from MySQL 6.0 (a MySQL version that was never released as GA by Oracle), some was re-engineered and enriched by new features, and some code was written from scratch.

Any new feature or combination of features can be switched on/off dynamically via the [optimizer_switch](#) system variable.

The first stable (GA) release of [MariaDB 5.3](#) was [MariaDB 5.3.5](#), which was released on 29 Feb 2012.

You can download [the latest binaries of MariaDB 5.3 here](#), or get the latest [source code from launchpad](#).

Feature Comparison Matrix

We have created an [Optimizer Feature Comparison Matrix](#) showing the new optimizer features in [MariaDB 5.5](#) and 5.3 compared to MySQL 5.5 and 5.6.

Query optimizer

Subquery optimizations

Subqueries are finally usable in practice. It is no longer necessary to rewrite subqueries manually into joins or into separate queries. [MariaDB 5.3](#) aims to provide reasonably efficient handling for all kinds of subqueries. All problems with `EXPLAIN` taking a long time have also been resolved.

- [Semi-join subquery optimizations](#)

These transform subqueries into 'semi-joins', entities similar to inner joins, and then use join optimizer to pick the best semi-join execution strategy. Overall the process is similar to how joins are processed in MySQL, MariaDB and other database systems.

 - [Table pullout optimization](#)
 - [FirstMatch execution strategy](#)
 - [Semi-join Materialization execution strategy](#)
 - [LooseScan execution strategy](#)
 - [DuplicateWeedout execution strategy](#)
- [Non-semi-join optimizations](#)

If a subquery is not a semi-join, [MariaDB 5.3](#) will make a cost-based choice between these two strategies:

- Materialization for non-correlated subqueries, with [efficient NULL-aware execution](#)
- IN-to-EXISTS transformation (the only optimization inherited from [MariaDB 5.2](#) and MySQL 5.1/5.5)
- [Subquery Cache](#)
The subquery cache makes sure that subqueries are re-executed as few times as possible, improving performance of already optimized subqueries.
- Subqueries are never executed during `EXPLAIN`, thus resulting in almost instant `EXPLAIN`.
- `DISTINCT` and `GROUP BY` without `HAVING` are [optimized away](#) from subqueries.

The [Subquery Optimizations Map](#) shows new subqueries optimizations graphically.

Optimizations for derived tables and views

- No early materialization of derived tables (e.g. subqueries in a `FROM` clause) and materialized views (`EXPLAIN` is always instantaneous)
- Thanks to [Derived Table Merge optimization](#), mergeable derived tables are now processed like mergeable VIEWS.
- [Derived Table with Keys](#) optimization gives the optimizer an option to create indexes over materialized derived tables
- Fields of merge-able views and derived tables are involved now in all optimizations employing equalities

Disk access optimization

- [Index Condition Pushdown](#)
- [Multi-Range-Read optimization \(MRR\)](#)
 - Key-ordered retrieval

Join optimizations

- [Block-based Join Algorithms](#)
- Block Nested Loop algorithm can be used for outer joins
- Block Hash Join (classic algorithm) is implemented and can be used for any equi-joins
- Block Index Join (Batch Key Access Join) is supported and can exploit the benefits of ordered retrievals for primary and secondary keys provided by the new implementation of [MRR](#)
- All block based algorithms for joins can use the benefits of new incremental join buffers
- All block based algorithms fully support outer joins including nested outer joins
- All block based algorithms can use the benefits of the first match optimization for semi-joins and the non-exist optimization for outer joins
- All block based algorithms for joins can exploit the benefits of index condition push-down.
- The total memory space used by the query for join buffers can be limited now, and block based algorithms can allocate join buffers up to their needs (not exceeding the set limits).
- Condition over outer tables extracted from `ON` expressions of outer joins are evaluated before inner tables are accessed (supported for both regular index join and block index join)
- Early checks for nulls for the fields from any null-rejecting conditions are performed

Index Merge improvements

- Correct optimization of `index_merge` vs range access: [Fair choice between range and index_merge optimizations](#)
- [index_merge/sort_intersection](#) strategy

Optimizer control

- [@@optimizer_switch](#) variable can be used to turn on/off all new optimizations.

NoSQL-style interfaces

- [HandlerSocket](#) plugin included.
- Faster `HANDLER` commands; `HANDLER READ` now also work with prepared statements.
- [Dynamic Columns](#) support.

Replication and binary logging

- [Group commit for the binary log](#) — [MariaDB 5.3](#) implements group commit which works when using XtraDB with the binary log enabled. (In previous MariaDB releases, and all MySQL releases at the time of writing, group commit works in InnoDB/XtraDB when the binary log is disabled, but stops working when the binary log is enabled).

- [Annotation of row-based replication events with the original SQL statement](#) — When using row-based replication, the binary log does not contain SQL statements, only discrete single-row insert/update/delete *events*. This can make it harder to read mysqlbinlog output and understand where in an application a given event may have originated, complicating analysis and debugging. This feature adds an option to include the original SQL statement as a comment in the binary log (and shown in mysqlbinlog output) for row-based replication events.
- [Checksums for binlog events](#). This is a backport of the same feature in MySQL 5.6. It was implemented in [MWL#180](#) [↗](#).
- [Enhancements for START TRANSACTION WITH CONSISTENT SNAPSHOT](#) [↗](#) — In [MariaDB 5.3](#), `START TRANSACTION WITH CONSISTENT SNAPSHOT` now also works with the binary log. This means it is possible to obtain the binlog position corresponding to a transactional snapshot of the database without blocking any other queries. This is used by the command `mysqldump --single-transaction --master-data` to do a fully non-blocking backup which can be used to provision a new slave. `START TRANSACTION WITH CONSISTENT SNAPSHOT` now also works consistently between transactions involving more than one storage engine (currently XTraDB and PBXT support this).
- [Row-based replication for tables with no primary key](#) — This feature can improve the performance of row-based replication on tables that do not have a primary key (or other unique key), but which do have another index that can help locate rows to update or delete. With this feature, index cardinality information from `ANALYZE TABLE` is considered when selecting the index to use (before this feature is implemented, the first index was selected unconditionally).
- `mysqlbinlog` will now omit redundant `use` statements around `BEGIN`, `SAVEPOINT`, `COMMIT`, and `ROLLBACK` events when reading MySQL 5.0 binlogs.

Datatypes

- [Microsecond](#) support for `NOW()` and `timestamp`, `time`, and `datetime` columns.
- `CAST()` now supports `AS DECIMAL[(M,D)]` and `AS INT`.
- `CAST()` and all other `datetime/time` functions now supports microsecond fully.

Windows performance improvements

- Backported [Windows performance patches](#) [↗](#) from MySQL 5.5.
- Asynchronous IO in XtraDB is [redesigned](#) [↗](#) and is now faster, due to the use of IO completion ports.
- Additional durability option for XtraDB: `innodb_flush_method` can now be `O_DSYNC`, like on Unixes. The effect of using this option is that the log file is opened with `FILE_FLAG_WRITETHROUGH`, and `FlushFileBuffers()` is not done. This may improve speed in write-heavy scenarios.
- A new Windows [MSI installer](#).
- Includes a GUI-tool, [HeidiSQL](#) [↗](#).

Miscellaneous

- [GIS precise operations](#)
- New status variables: `Rows_tmp_read`, `Handler_tmp_write`, and `Handler_tmp_update` which count what happens with internal temporary tables. `Rows_read`, `Handler_write` and `Handler_update` no longer count operations on internal temporary tables.
- New status variable `Handler_read_rnd_deleted`, which is number of deleted rows found and skipped while scanning a table. Before this was part of `Handler_read_rnd_next`.
- New variable 'in_transaction' that is 1 if you are in a transaction, 0 otherwise.
- [Progress reports](#) for `ALTER TABLE` and `LOAD DATA INFILE`. In addition Aria tables gives progress reports for `REPAIR TABLE` and `CHECK TABLE`. The progress can be seen in `SHOW PROCESSLIST`, `INFORMATION_SCHEMA.PROCESSLIST` and is sent to MariaDB clients that calls `mysql_real_connect()` with the new `CLIENT_PROGRESS` flag. `mysql` command line client supports the new progress indications.
- [PBXT consistent commit ordering](#) [↗](#) — This feature implements the new commit ordering storage engine API in PBXT. With this feature, it is possible to use `START TRANSACTION WITH CONSISTENT SNAPSHOT` and get consistency among transactions which involve both XtraDB and InnoDB. (Without this feature, there is no such consistency guarantee. For example, even after running `START TRANSACTION WITH CONSISTENT SNAPSHOT` it was still possible for the InnoDB/XtraDB part of some transaction *T* to be visible and the PBXT part of the same transaction *T* to not be visible.)
- MariaDB unique error numbers now start from `1900` to not clash with MySQL error numbers.
- `/*M!##### */` new [executed comment syntax](#) that can be used when you want use new MariaDB syntax but still want your program to be compatible with MySQL.
- A MariaDB optimized version of [mytop](#) [↗](#) is included in the MariaDB distribution.
- Enhanced [KILL syntax](#):

```
KILL [HARD | SOFT] [CONNECTION | QUERY] [thread_id | USER user_name]
```

- `max_user_connections` (both the global variable and the `GRANT` option) can be set to `-1` to stop users from connecting to the server. The global `max_user_connections` variable does not affect users with the `SUPER` privilege.
- The `IGNORE` directive does not ignore all errors (like fatal errors), only things that are safe to ignore.

You can access the [MariaDB 5.3 tree](#) from [launchpad](#).

Security Vulnerabilities Fixed in MariaDB 5.3

For a complete list of security vulnerabilities (CVEs) fixed across all versions of MariaDB, see the [Security Vulnerabilities Fixed in MariaDB](#) page.

Contents

1. [New storage engines](#)
2. [New features](#)
3. [Other things](#)
4. [Security Vulnerabilities Fixed in MariaDB 5.2](#)

MariaDB 5.2 contains features that didn't have time to go into [MariaDB 5.1](#). For all practical purposes it's a drop in replacement for [MariaDB 5.1](#) (and thus MySQL 5.1).

MariaDB 5.2 is based on [MariaDB 5.1](#) and thus MySQL 5.1.

The new features in 5.2 are quite isolated and as most have been in use by members in the MySQL community for a long time. Current versions of [MariaDB 5.2](#) are [stable](#) and can be downloaded from <http://downloads.askmonty.org>.

New storage engines

- [OQGRAPH](#)
 - Allows you to handle hierarchies (tree structures) and complex graphs (nodes having many connections in several directions)
- [SphinxSE](#): Text search within MariaDB.
 - A built-in Sphinx client which allows MariaDB to talk to searchd, run search queries, and obtain search results.

New features

- [Virtual columns](#)
 - Columns that are an expression and are calculated on retrieval.
- [Extended User Statistics](#)
 - Client, User, Index and Table statistics.
- [Segmented MyISAM key cache](#)
 - The key cache's global mutex is split into several mutex which gives a notable speed improvement under multi user load. We have registered up to [250% more performance](#) thanks to this.
- [Pluggable Authentication](#)
 - Authentication is done via an extensible plugin, which makes it easy to add any kind of authentication to MariaDB.
- [Storage-engine-specific CREATE TABLE](#)
 - Allows one to specify additional attributes per field, index or table to the storage engine.
- [Enhancements to INFORMATION_SCHEMA.PLUGINS table](#)
 - We expose more information about the plugins, like maturity levels.
- [Group commit](#) for the [Aria](#) engine.
 - Speeds up multi user inserts.

Other things

We have also done several smaller speed improvements, bug fixes and code cleanups.

Security Vulnerabilities Fixed in [MariaDB 5.2](#)

For a complete list of security vulnerabilities (CVEs) fixed across all versions of MariaDB, see the [Security Vulnerabilities Fixed in MariaDB](#) page.

Contents

1. [New storage engines:](#)
2. [Speed improvements](#)
3. [Extensions & new features](#)
4. [Easier to upgrade](#)
5. [Better Testing](#)
6. [Fewer warnings and bugs](#)
7. [Security Vulnerabilities Fixed in MariaDB 5.1](#)

In short, [MariaDB 5.1](#) is a binary drop in replacement of MySQL 5.1, but with performance like MySQL 5.5 (thanks to XtraDB), fewer bugs, and more features. Thanks to the extended and improved `mysql_upgrade` program it's also easier to upgrade from MySQL 5.0 to [MariaDB 5.1](#) than to MySQL 5.1.

[MariaDB 5.1](#) is based on MySQL 5.1. We do a merge once a month with MySQL 5.1 to ensure all MySQL bug fixes get into MariaDB.

See also:

- [MariaDB versus MySQL - Compatibility](#)

New storage engines:

- [Aria](#): A crash-safe storage engine based on MyISAM.
- [XtraDB](#): Drop-in replacement for InnoDB based on the InnoDB plugin.
- [PBXT](#): A transactional storage engine with a lot of nice features.
- [FederatedX](#): Drop-in replacement for Federated.

Speed improvements

- [CHECKSUM TABLE](#) is faster.
- We have eliminated/improved some not needed character set conversions. Overall speed improvements is 1-5 % (according to sql-bench) but can be higher for big result sets with all characters between 0x00-0x7f.
- Our use of the Aria storage engine enables faster complex queries (queries which normally use disk-based temporary tables). The [Aria](#) storage engine is used for internal temporary tables, which should give you a speedup when doing complex selects. Aria is usually faster for temporary tables when compared to MyISAM because Aria caches row data in memory and normally doesn't have to write the temporary rows to disk.
- There are some improvements to DEBUG code to make its execution faster when debug is compiled in but not used.

Extensions & new features

- [Table Elimination](#) (New optimization) ([MWL#17](#))
- [Pool of Threads](#) (Allows you to have 200,000+ connections to MariaDB)
- MariaDB can handle up to 32 key segments per key (up from 16)
- Added `--abort-source-on-error` to the mysql client.
- [Microsecond Precision in Processlist](#)
- [mysqltest extensions](#)

Easier to upgrade

We have made it [easy to upgrade from MySQL 5.0](#) to [MariaDB 5.1](#)

- InnoDB and Archive tables are now upgraded properly.
- More options to `mysql_upgrade` and `mysqlcheck` to find out what's going on.
- Cleaned up wrong warnings from `mysqlcheck`.

(Upgrading from MySQL 5.1 to [MariaDB 5.1](#) is a trivial 1 min exercise as MariaDB is a binary drop in replacement of MySQL. Just remove MySQL and install MariaDB and things will ***just work***)

Better Testing

- More tests in the test suite.
- All tests runs now clean without having to restart test. (Oracle re-runs tests 3 times and assumes things are ok if one tests works)

- Test builds with different configure options to get better feature testing.
- Remove invalid tests. (e.g. Don't test feature "X" if that feature is not in the build you are testing.)

Fewer warnings and bugs

- A build is not regarded ok if there are any errors or compiler warnings.
- We have fixed a lot of bugs in the MySQL code which we have found while merging the MySQL code into MariaDB and by running the extended test suite.

Security Vulnerabilities Fixed in [MariaDB 5.1](#)

For a complete list of security vulnerabilities (CVEs) fixed across all versions of MariaDB, see the [Security Vulnerabilities Fixed in MariaDB](#) page.

- [CVE-2013-1548](#): MariaDB 5.1.66
- [CVE-2013-1531](#): MariaDB 5.1.67
- [CVE-2013-0389](#): MariaDB 5.1.67
- [CVE-2013-0385](#): MariaDB 5.1.67
- [CVE-2013-0384](#): MariaDB 5.1.67
- [CVE-2013-0383](#): MariaDB 5.1.67
- [CVE-2013-0375](#): MariaDB 5.1.67
- [CVE-2012-5612](#): MariaDB 5.1.67
- [CVE-2012-5611](#): MariaDB 5.1.67, MariaDB 5.1.66
- [CVE-2012-5060](#): MariaDB 5.1.66
- [CVE-2012-4414](#): MariaDB 5.1.66 [2]
- [CVE-2012-3197](#): MariaDB 5.1.66
- [CVE-2012-3180](#): MariaDB 5.1.66
- [CVE-2012-3177](#): MariaDB 5.1.66
- [CVE-2012-3173](#): MariaDB 5.1.66
- [CVE-2012-3167](#): MariaDB 5.1.66
- [CVE-2012-3166](#): MariaDB 5.1.66
- [CVE-2012-3163](#): MariaDB 5.1.66
- [CVE-2012-3160](#): MariaDB 5.1.66
- [CVE-2012-3158](#): MariaDB 5.1.66
- [CVE-2012-3150](#): MariaDB 5.1.66
- [CVE-2012-1734](#): MariaDB 5.1.66
- [CVE-2012-1705](#): MariaDB 5.1.67
- [CVE-2012-1703](#): MariaDB 5.1.62
- [CVE-2012-1702](#): MariaDB 5.1.67
- [CVE-2012-1690](#): MariaDB 5.1.62
- [CVE-2012-1689](#): MariaDB 5.1.66
- [CVE-2012-1688](#): MariaDB 5.1.62
- [CVE-2012-0574](#): MariaDB 5.1.67
- [CVE-2012-0572](#): MariaDB 5.1.67
- [CVE-2012-0540](#): MariaDB 5.1.66
- [CVE-2009-4484](#): MariaDB 5.1.42

The following CVEs are also fixed in [MariaDB 5.1](#) but the fix is not tied to a specific version number:

- [CVE-2012-0113](#)
- [CVE-2011-2262](#)
- [CVE-2012-0116](#)
- [CVE-2012-0118](#)
- [CVE-2012-0087](#)
- [CVE-2012-0101](#)
- [CVE-2012-0102](#)
- [CVE-2012-0115](#)
- [CVE-2012-0119](#)
- [CVE-2012-0120](#)
- [CVE-2012-0484](#)
- [CVE-2012-0485](#)
- [CVE-2012-0490](#)
- [CVE-2012-0112](#)
- [CVE-2012-0114](#)
- [CVE-2012-0492](#)
- [CVE-2012-0075](#)

8 The Community

MariaDB is a project developed by the open source community. The [MariaDB Foundation](#) is the main steward for the project. However, anyone can participate in the development.

The following links provides information to help you participate in making MariaDB a success

For reporting documentation bugs specifically, see [Reporting Documentation Bugs](#).

MariaDB's bug and feature tracker is found at <https://jira.mariadb.org>.

This page contains general guidelines for the community for reporting bugs and feature requests in MariaDB products. If you want to discuss a problem or a new feature with other MariaDB developers, you can find the email lists and forums [here](#).

Known Issues

First, check that the bug or feature request isn't already filed in the [MariaDB bugs database](#).

For the MariaDB issue database, use JIRA search to check if a report you are going to submit already exists. You are not expected to be a JIRA search guru, but please at least make some effort.

- Choose `Issues => Search for issues` ;
- If the form opens for you with a long blank line at top, press `Basic` on the right to switch to a simpler mode;
- In the `Project` field, choose the related project, (`MDEV` for generic MariaDB server and clients);
- In the `Contains text` text field, enter the most significant key words from your future report;
- Press `Enter` or the magnifying glass icon to search.

If you see issue reports which are already closed, pay attention to the 'Fix version/s' field -- it is possible that they were addressed in the *upcoming* release. If they are said to be addressed in the release that you are currently using or earlier, you can ignore them and file a new one (although please mention in your report that you found them, it might be useful).

If you find an open issue report, please vote/add a comment that the issue also interests you along with any additional information you have that may help us to find and address the issue.

If the issue is not in the MariaDB issue database yet, then it's time to file a report. If you're filing a report about an issue that's already in the [MySQL issue database](#), please indicate so at the start of the report. Filing issue reports from MySQL in the MariaDB issue database makes sense, because:

- It shows the MariaDB team that there is interest in having this issue addressed in MariaDB.
- It allows work to start on addressing the issue in MariaDB - assigning versions, assigning MariaDB developers to the issue, etc.

Reporting an Issue

Bugs and feature requests are reported to the [MariaDB issue tracker](#).

JIRA Privacy

Please note that our JIRA entries are public, and JIRA is very good at keeping a record of everything that has been done. What this means is that if you ever include confidential information in the description there will be a log containing it, even after you've deleted it. The only way to get rid of it will be removing the JIRA entry completely.

Attachments in JIRA are also public.

Access to a comment can be restricted to a certain group (e.g. Developers only), but the existing groups are rather wide, so you should not rely on it either.

If you have private information -- SQL fragments, logs, database dumps, etc. -- that you are willing to share with MariaDB team, but not with the entire world, put it into a file, compress if necessary, upload to the [mariadb-ftp-server](#), and just mention it in the JIRA description. This way only the MariaDB team will have access to it.

Reporting Security Vulnerabilities

As explained above, all JIRA issues are public. If you believe you have found a security vulnerability, send an email to [\[email protected\]](#), please, do not use JIRA for that. We will enter it in JIRA ourselves, following the [responsible disclosure](#) practices.

Contents of a Good Bug Report

Below is the information we need to be able to fix bugs. The more information we get and the easier we can repeat the bug, the faster it will be fixed.

A good bug report consists of:

- a. The environment (Operating system, hardware and MariaDB version) where the bug happened.
- b. Any related errors or warnings from the server error log file. Normally it is `hostname.err` file in your database directory, but it can be different depending on the distribution and version; if you cannot find it, run `SELECT @@log_error` on the running server. If either the variable or the file it points at is empty, the error log most likely goes to your system log. If this is systemd you can get the last 50 lines of the MariaDB log with `journalctl -n 50 -u mariadb.service`. If possible, attach the full unabridged error log at least from the last server restart and till the end of the log.,
- c. If the problem is related to MariaDB updates, or otherwise changing the version of the server, recovery from a previous crash, and such, then include the previous versions used, and the error log from previous server sessions.
- d. The content of your `my.cnf` file or alternatively the output from `mariabdd --print-defaults` or `SHOW VARIABLES`.
- e. Any background information you can provide ([stack trace](#), tables, table definitions (`show-create-table SHOW CREATE TABLE {tablename}`), data dumps, query logs).
- f. If the bug is about server producing wrong query results: the actual result (what you are getting), the expected result (what you think should be produced instead), and, unless it is obvious, the reason why you think the current result is wrong.
- g. If the bug about a performance problem, e.g. a certain query is slower on one version than on another, output of `EXPLAIN EXTENDED <query>` on both servers. If its a `SELECT` query use [analyze-format-json ANALYZE FORMAT=JSON](#).
- h. A test case or some other way to repeat the bug. This should preferably be in plain SQL or in `mysqltest` format. See [mysqltest/README](#) for information about this.
- i. If it's impossible to do a test case, then providing us with a [backtrace information](#) would be of great help.

JIRA Fields

The section below describes which JIRA fields need to be populated while filing reports, and what should be put there. Apart from what's mentioned below, you don't have to fill or change any fields while creating a new bug report.

Project

If you are filing a report for MariaDB server, client programs, or MariaDB Galera cluster, the target project is `MDEV`. Connectors and MaxScale have separate projects with corresponding names. If you choose a wrong project, bug processing can be delayed, but there is no reason to panic -- we'll correct it. If you inform us about the mistake, we'll change it faster.

Some project names include:

- CONC - MariaDB Connector/C
- CONCPP - MariaDB Connector/C++
- CONJ - MariaDB Connector/J

- CONJS - MariaDB Connector/node.js
- CONPY - MariaDB Connector/Python
- MCOL - ColumnStore
- MDBF - MariaDB Foundation Development (anything related to the [mariadb.org domain](https://mariadb.org) [↗](#))
- MDEV - MariaDB server, client programs, or MariaDB Galera Cluster
- MXS - MaxScale
- ODBC - MariaDB Connector/ODBC
- R2DBC - MariaDB Connector/R2DBC

Type

Feature requests are not the same as bug reports. Specify a `New feature` type for feature requests in [Jira](#) [↗](#), and a `Bug` type for bug reports. Like with the project field, choosing a wrong type will put the request to the wrong queue and can delay its processing, but eventually it will be noticed and amended.

See also [plans for next release](#) [↗](#) for things that we are considering to have in the next MariaDB release.

Summary

Please make sure the summary line is informative and distinctive. It should always be easy to recognize your report among other similar ones, otherwise a reasonable question arises -- why are they not duplicates?

Examples:

- good summary: *Server crash with insert statement containing DEFAULT into view*
- not a good summary: *mariabd crash*

Generally, we try not to change the original summary without a good reason to do it, so that you can always recognize your own reports easily.

Priority

We do not have separate Severity/Priority fields in JIRA, so this Priority field serves a double purpose. For original reports, it indicates the importance of the problem from the reporter's point of view. The default is 'Major'; there are two lower and two higher values. Please set the value accurately. While we do take it into account during initial processing, increasing the value above reasonable won't do any good, the only effect will be the waste of time while somebody will be trying to understand why a trivial problem got such a high priority. After that, the value will be changed, and the report will be processed in its due time anyway.

Affected Versions

Put everything you know about which versions are affected. There are both major versions (10.6, 10.5 etc.) and minor versions (10.5.9, 10.4.12, etc.) available for choosing. Please always specify there the exact version(s) (X.Y.Z) which you are working with, and where you experience the problem.

Additionally, if you know the exact version where the problem appeared, please put it as well. If the problem has been present, as far as you know, in all previous releases, you can also put there the major version, e.g. 10.0. Alternatively, you can mention all of it in the description or comments.

Please also note in the description or comments which versions you know as *not* affected. This information will help to shorten further processing.

Environment

Put here environment-related information that might be important for reproducing or analyzing the problem: operating system, hardware, related 3rd-party applications, compilers, etc.

Description

The most important part of the description are steps to reproduce the problem. See more details about bug report contents above in the section [Contents of a good bug report](#).

If in the process of reproducing, you executed some SQL, don't describe it in words such as "I created a table with text columns and date columns and populated it with some rows" -- instead, whenever possible, put the exact SQL queries that you ran. The same goes for problems that you encountered: instead of saying "it did not work, the query failed, I got an error", always paste the exact output that you received.

Use `{noformat}...{noformat}` and `{code}...{code}` blocks for code and console output in the description.

Attachments

If you have SQL code, a database dump, a log etc. of a reasonable size, attach them to the report (archive them first if necessary). If they are too big, you can upload them to <ftp.askmonty.org/private>. It is always a good idea to attach your `cnf` file(s), unless it is absolutely clear from the nature of the report that configuration is irrelevant.

Links

If you found or filed a bug report either in MariaDB or MySQL or Percona bug base which you think is related to yours, you can put them in the `Links` section; same for any external links to 3rd-party resources which you find important to mention. Alternatively, you can just mention them in the description or comments.

Tags

You don't have to set any tags, but if you want to use any for your convenience, feel free to do so. However, please don't put too generic values -- for example, the tag `mariadb` is meaningless, because everything there is `mariadb`. Don't be surprised if some tags are removed later during report processing.

Bugs that also Affect MySQL or Percona

Our normal practice is to report a bug upstream if it's applicable to their version. While we can do it on your behalf, it is always better if you do it yourself -- it will be easier for you to track it further.

If the bug affects MySQL, it should also be reported at [MySQL bugs database](#). If the bug affects Percona server and not MySQL, it should go to [Percona Launchpad](#).

Collecting Additional Information for a Bug Report

Getting a Stack Trace with Details

See the article [How to produce a stack trace from a core file](#).

Extracting a Portion of a Binary Log

See the article [here](#).

Getting Help with your Servers

If you require personalized assistance, want to ensure that the bug is fixed with high priority, or want someone to login to your server to find out what's wrong, you can always purchase a [Support](#) contract from MariaDB plc or use their consulting services.

 10. [Tags](#)

Documentation bugs and feature requests should be reported at <https://jira.mariadb.org>.

This page contains general guidelines for the community for reporting documentation bugs.

Known Bugs

First, check that the bug isn't already filed in the [MariaDB bugs database](#).

For the MariaDB bugs database, use JIRA search to check if a report you are going to submit already exists. You are not expected to be a JIRA search guru, but please at least make some effort.

- Choose `Issues => Search for issues` ;
- If the form opens for you with a long blank line at top, press `Basic` on the right to switch to a simpler mode;
- In the `Project` field, choose the related project, (`MDEV` for generic MariaDB server and clients);
- In the `Contains text` text field, enter the most significant key words from your future report;
- Press `Enter` or the magnifying glass icon to search.

If you see bug reports which are already closed, but you still see the error, please confirm that the issue still exists in the Knowledge Base.

If you find an open bug report, please vote/add a comment that the bug also affects you along with any additional information you have that may help us to find and fix the bug.

If the bug is not in the MariaDB bugs database yet, then it's time to file a bug report.

Reporting a Bug

Bugs and feature requests are reported to the [MariaDB bugs database](#).

JIRA Privacy

Please note that our JIRA entries are public, and JIRA is very good at keeping a record of everything that has been done. What this means is that if you ever include confidential information in the description there will be a log containing it, even after you've deleted it. The only way to get rid of it will be removing the JIRA entry completely.

Attachments in JIRA are also public.

Access to a comment can be restricted to a certain group (e.g. Developers only), but the existing groups are rather wide, so you should not rely on it either.

JIRA Fields

The section below describes which JIRA fields need to be populated while filing reports, and what should be put there. Apart from what's mentioned below, you don't have to fill or change any fields while creating a new bug report.

Project

If you are filing a report for documentation about MariaDB server, client programs, or MariaDB Galera Cluster, the target project is `MDEV`. Connectors and MaxScale have separate projects with corresponding names. If you choose a wrong project, bug processing can be delayed, but there is no reason to panic -- we'll correct it. If you inform us about the mistake, we'll change it faster.

Some project names include:

- `CONC` - MariaDB Connector/C
- `CONJ` - MariaDB Connector/J
- `CONJS` - MariaDB Connector/node.js
- `CONPY` - MariaDB Connector/Python
- `MCOL` - ColumnStore
- `MDBF` - MariaDB Foundation Development (anything related to the [mariadb.org domain](#))
- `MDEV` - MariaDB server, client programs, or MariaDB Galera Cluster
- `MXS` - MaxScale
- `ODBC` - MariaDB Connector/ODBC

Type

Feature requests are not the same as bug reports. Specify a `Task` type for feature requests in [Jira](#), and a `Bug` type for bug reports. Like with the project field, choosing a wrong type will put the request to the wrong queue and can delay its processing, but eventually it will be noticed and amended.

Summary

Please make sure the summary line is informative and distinctive. It should always be easy to recognize your report among other similar ones, otherwise a reasonable question arises -- why are they not duplicates?

Examples:

- good summary: *SELECT max_statement_time clause example gives incorrect results*
- not a good summary: *code example doesn't work*

Generally, we try not to change the original summary without a good reason to do it, so that you can always recognize your own reports easily.

Priority

We do not have separate Severity/Priority fields in JIRA, so this Priority field serves a double purpose. For original reports, it indicates the importance of the problem from the reporter's point of view. The default is 'Major'; there are two lower and two higher values. Please set the value accurately. While we do take it into account during initial processing, increasing the value above reasonable won't do any good, the only effect will be the waste of time while somebody will be trying to understand why a trivial problem got such a high priority. After that, the value will be changed, and the report will be processed in its due time anyway.

Component/s

Documentation bugs should have "Documentation" added as a component in order to be correctly assigned.

Affected Version/s

Since the documentation is not version-dependent, you can put N/A in this field.

Environment

Usually this can be left empty, but if applicable, put any environment-related information that might be important for reproducing or analyzing the problem.

Description

The most important part of the description are the steps to reproduce the problem. Link to the page on the Knowledge Base with the error/s. Where applicable, provide a sample structure and results clearly demonstrating the problem.

Use `{noformat}...{noformat}` and `{code}...{code}` blocks for code and console output in the description.

Links

If the documentation error relates to an existing bug/feature request in JIRA (for example an undocumented new feature), you should link it here. Alternatively, you can just mention them in the description or comments.

Tags

You don't have to set any tags, but if you want to use any for your convenience, feel free to do so. However, please don't put too generic values -- for example, the tag `mariadb` is meaningless, because everything there is `mariadb`. Don't be surprised if some tags are removed later during report processing.

 2. [Cannot Reproduce](#)

This page describes how community bug reports are processed among our products and explains what you need to notice while tracking bugs.

Commitments

MariaDB does not have any SLA or guaranteed reaction times on bugs in Jira. While we are taking bugs reported by the community very seriously, and aim to provide response and to handle issues as fast as possible, MariaDB does not have a dedicated bug verification team, this activity is performed on the best-effort basis.

To make sure your bug report will be confirmed and moved forward faster, please follow [the guidelines](#) about creating bug reports.

Bug Verification Routine

As of today, initial bug processing routine in MariaDB is not strictly formalized. This section describes the de-facto status rather than any policy.

The process is different for bug reports (*Bug* type in JIRA) vs feature requests (*Task* type). The process described below is related to bug reports.

Incoming Queue

All new bug reports go to the waiting list, to be reproduced and confirmed by a member of the team. The bug stays in the queue until one or more of the conditions below are met:

- Bug report is assigned to a developer;
- Bug report gets status 'Confirmed';
- Bug report gets the label 'upstream';
- Bug report is closed (on whatever reason).

With other things equal, bug reports in the queue are initially handled in the FIFO manner; however, there are various factors that make things not equal.

Bug Processing Order

First thing that is taken into account is [Priority](#). It does not mean that everything needs to be filed as Critical; on the contrary, it means that Priority should be chosen wisely. Although a report with higher Priority will be looked at sooner, as soon as it becomes clear that the Priority is set to a higher value than the problem deserves, it will be amended and put back to the queue. However, if the high priority is justified, we will try to process the report as fast as possible.

Another important factor is [the quality of the report](#) itself.

- If the report is written well and [has all information](#), including a reproducible test case, it can be verified and moved forward quickly.
- If the report is written clearly enough, but does not have enough information, it will get fast enough first response where we will request the missing details; but the further exchange can take a lot of time until we get everything we need to work on the issue.
- Finally, reports which are written in a tangled and incomprehensible manner get the slowest response time, because even if eventually it turns out that they do have all required information, it is difficult and time-consuming to extract and process, so they can be put aside for some time.

First Response

Complete processing of a reported bug can be complicated and time-consuming, especially the reproducing part. We do not want our users to wait for long not knowing if their bug report has even been noticed, we try to provide first response quicker than that.

First response to the bug, which we are trying to provide as quickly as possible, is one of these:

- If we can reproduce the problem based on the information that was provided in the initial description, the report gets the status Confirmed.
- If it is obvious from the initial description that the bug report is a [duplicate](#) of an existing one, or the problem has already been fixed in later releases or in the upcoming release, or the described behavior is not a bug, or, in very rare cases, it is admitted to be a bug, but it is not going to be fixed, the report gets closed with the corresponding Resolution value and a comment with the explanation.
- If the bug report at least appears to describe a real bug, but we do not have enough information to proceed, we will request the information from the reporter, and the report will go to the [Need feedback](#) list.
- If on some reason it is clear from the bug report that it will be very difficult to reproduce based on the information from the user, but there is a reason to believe that the problem can be analyzed by code inspection, the bug report can be assigned to a developer who is an expert in the corresponding area for the analysis.

We realize that "as quickly as possible" is a relative term. The dream scenario is that all reports are responded to in a matter of hours; however, more realistically, it can take a few days, and in some cases, when the team is overly busy with a big upcoming release or some other extraordinary events, it can even be weeks.

Need Feedback

When a report does not have all the information to reproduce the problem right away (which is quite often the case), we will ask the reporter to provide the missing information. Usually it takes more than one iteration to get everything right, so it is important that you respond to the questions as precisely as you can. Please make sure that you answered **all** questions (or, if you cannot answer some of them, please say so, otherwise we will have to ask again, and more time will be wasted on it).

There is no status "Need Feedback" in our JIRA; instead, we are using the label `need_feedback`. As long as the report has this label, it remains on the "Waiting for feedback" list. The label is set and removed manually by whoever asks for the feedback and receives it; so it can happen that the reporter has provided the response, but it remained unnoticed and the bug keeps waiting. It will be our fault, but human errors happen; it would help a lot if the reporter removed the label along with providing the feedback.

E-mail Notifications

This question arises fairly often, so it deserves mentioning.

As already said before, the `need_feedback` label is set and *removed* manually. JIRA e-mail updates about it can be confusing when you look at them quickly. For example, when someone *removes* the label, the email looks like this:

```
Elena Stepanova updated MDEV-9791:
-----
Labels:      (was: need_feedback)
```

What it says that the `Labels` field has become empty, while before it had been `need_feedback`. People often misread it and ask "What else do you need from me? I've answered your questions". This update means that at the moment we don't need anything, your report is back to the incoming queue, and your feedback will be analyzed as soon as possible. Then, we will possibly ask more questions and set the label again, and the notification will look like this:

```
Elena Stepanova updated MDEV-9801:
-----
Labels: need_feedback (was: )
```

Successful Outcome

If the feedback exchange was fruitful and we received enough information to proceed, the bug report will go through the normal [verification steps](#).

Incomplete Reports

Reports do not stay open on the "Need Feedback" list forever. After a month of waiting, if we do not get a response from the reporter, and still cannot proceed without it, we close the report as **Incomplete** with the corresponding comment. This state is not irreversible: you can still add comments and provide the information even when the report is closed as Incomplete, and it will be re-opened.

Worst Case Scenario

Sometimes it happens that after iterations of feedback requests we run out of ideas what else to ask from the reporter, and still could not verify the bug, or that the reporter is willing to collaborate with us, but cannot provide the necessary information on objective reasons (usually when the problem happens on a production instance). In some cases we might close the report as "Cannot reproduce", which we consider our loss; but more often we want to keep it open, in hope that more information arrives, maybe from a different source, and together with this report they will help us get to the bottom of the problem; if it happens so, the report gets assigned to somebody without being confirmed, just so it remains at least on somebody's radar, and it will stay open for a long time. It does not mean it is forgotten, it means that for the time being we hit the wall. You are very welcome to comment on such reports, whenever you think you might have something to add, because this is exactly what we are waiting for.

Bug Verification

Normally the bug report has to go through the following steps before it is moved forward to fixing:

- the described problem needs to be reproduced;
- it needs to be checked against all active post-Beta versions of MariaDB where it is theoretically applicable (as of the moment of writing this article, it is 5.5, 10.0, 10.1);
- in case it is a relatively recent regression, the guilty change needs to be found;
- the component or functional area should be determined, so that the bug gets assigned to the right person.

After that the bug is ready for fixing.

Bug Fixing Routine

Sometimes it seems hard to understand from the outside how MariaDB development team chooses which bugs to fix in a particular release, or why some bugs are fixed faster than others, or why critical bugs stay untouched for a long time.

Sprint Model for Bug Fixing

MariaDB currently uses 1- or 2-week sprint model for server development and bugfixing. It needs a separate article to describe it in more detail, but for bugfixing, in a nutshell it means the following.

- one or two weeks before a scheduled release the team creates a new sprint and evaluates existing bugs which affect this release;
- the selected bugs are added to the new sprint;
- during the active sprint, the developer is supposed to work on the tasks which are part of the sprint, unless a true emergency arises.

There are two important consequences of this model which sometimes cause a confusion:

1) If the current sprint is for one version, e.g. 10.0, and you file a bug for another version, e.g. 10.1, then, even if the bug is really critical, it won't be jumped on right away: it makes no sense, because the 10.1 is not going to be released next week anyway, while 10.0 will be. When the 10.0 sprint finishes, and 10.1 sprint starts, your bug will be picked up for that sprint and fixed then.

2) If the current sprint for 10.1 is already in progress, newly created 10.1 reports normally won't be included into it, unless they are considered so extremely important that the developer is allowed to ignore the sprint plan.

Bugs Chosen for a Sprint

When a new sprint is created, bugs which affect the scheduled release are evaluated.

- from all such bugs assigned to a developer, each developer chooses bugs he is able to work on during the given time interval;
- bug priority plays the most significant role in this process, but this is not the only factor.
 - **Blocker** bugs must be either fixed or degraded before the release goes out;

- `Critical` bugs should be chosen above other bugs, except for `Blocker`s;
- among `Major` bugs,
 - bugs with patches, either external, or upstream, or internal, are usually prioritized above ordinary bug reports;
 - external reports (community reports) are ranked higher than bugs reported by the development team;
 - bugs which can realistically be fixed in the given time interval are chosen more frequently than those that are likely to take several cycles;
 - bugs which affect the reporter in a worse matter get more attention than those that have viable workarounds;
- `Minor` bugs are usually fixed when there are no more urgent tasks.

Tracking Progress

If a bug report has passed through verification stage, either being confirmed, or pushed forward to the development-level analysis as is, there can be various updates on it. It is important to understand what they mean.

JIRA Fields to Watch

All JIRA fields are public, but some of them are mainly used for internal development process, while others are more user-facing. [This article](#) describes which fields should be populated during the initial report submission. There is a different set of fields important for tracking purposes.

Resolution vs. Status

It might come as counter-intuitive, but in the existing JIRA structure, the `Status` field does not mean much for the user, it is mainly used for development and management purposes. On the contrary, the `Resolution` field is entirely user-facing: it does not participate in planning or development. It remains the same 'Unresolved' for the whole life of the report, and is only changed when the bug gets closed, demonstrating the reason why it was closed.

Resolution

- `Unresolved` - the bug report remains open, the work has not been finished.
- `Fixed` - the bug has been fixed, see [Fix version/s](#) and possibly comments to the report for more information. This is almost always a terminal state, we do not re-open fixed bugs even if they later re-appear; please create a new one instead. The only case when it can be re-opened is when the 'Fix version/s' have not been released yet.
- `Duplicate` - the bug report is identical to an already existing open (or recently fixed) report, which will be quoted in the comments and/or links. It is usually a terminal state, unless it is proven later that the report was not a duplicate after all.
- `Not a bug` - the described behavior is not a bug, there will be a comment explaining why. It is usually a terminal state, unless you object and show why it is a bug. If the report is in fact a feature request, then rather than closing it as 'Not a bug', we will switch the type to 'Task'.
- `Incomplete` - we had requested feedback from the user and waited for 1 month, but did not receive it. It is a pseudo-terminal state, the report can be re-opened any time when the requested information is provided.
- `Cannot reproduce` - rather rarely used "resolution", which means we could not find the way to confirm the problem described by the reporter, and ran out of ideas what other information to request from the reporter in order to reproduce it.
- `Won't fix` - another rarely used "resolution", which means that the bug is admitted, but we have no intention to fix it. Usually it happens when the bug only affects old versions, and is not important enough to fix in the old versions; or, when it is related to systems or architectures we don't officially support.

Status

- `Open`, `Confirmed` - this distinction is used in our internal queues, but from the user's perspective the difference is slim: setting the bug report to 'Confirmed' does mean that we are satisfied with the information provided in the report, but the user will also know about it from our comments and other updates. Otherwise, bugs in both statuses can be considered for fixing.
- `In Progress`, `Stalled` - different intermediate states of bugs which help developers to filter their lists and management to gather a picture of the current activity. For the user, there is no important difference -- despite the negative semantics, 'Stalled' does not mean that something is wrong with the bug report, only that the developer is not working on it actively at the moment.
- `In review` - means, literally, that a peer review has been requested.
- `Closed` - means that the bug report is closed, on whatever reason. The real reason is in the 'Resolution' field.

Fix Versions

This is an important field for progress tracking. After the bug is confirmed or otherwise acknowledged, this field is populated with a set of major versions where we intend to fix it. E.g. if the field is set to `10.0 10.1`, it means that at the moment we consider it for fixing in some future 10.0 release (not necessarily the next one), and the bugfix will be merged into the next 10.1 release after that; but we do not consider it for fixing in 5.5, even if it is affected to.

To some extent, you can influence the initial plans: if you see that the fix is not targeted for versions where you think it should be, you can comment on the report, and if you provide convincing arguments and make your case, it can be reconsidered.

The value of the field is not a promise to fix the bug in the mentioned releases. It can be changed both ways: during further analysis, the developer can find out that it can be safely fixed in an earlier release, or, on the contrary, that it cannot be safely fixed in the GA release, and the fix can only go to the next versions which are currently under development.

After the bug is fixed, the value of the field is changed to the exact versions, e.g. `10.0.25 10.1.14`. It means that the patch has been pushed into the 10.0 branch, and will be released with 10.0.25 release; it also means that the patch *will be* merged to 10.1 tree and released with 10.1.14 release, but it does not mean that it is already in the 10.1 branch.

Priority

As the other article says, the **Priority** field serves two purposes. During the initial bug creation, it indicates the importance of the bug report from the user's perspective (in other bug tracking systems it is called 'Severity' or alike). After the bug has been confirmed, the same field is used for development purposes, to prioritize bug fixing (real 'Priority'). While we take into account the reporter's view on the matter, we can change the initial priority both ways, depending on the information we revealed during the problem analysis, versions affected, etc.

The value of the field normally means the following:

- `Blocker` - we currently think that the bug must be fixed before the next release(s) set in the 'Fix version/s' field;
- `Critical` - the bug should be picked up for fixing earlier than any other bugs apart from blockers;
- `Major` - the bug will be present in the main queue for fixing in the upcoming 'Fix version/s', although only a part of such bugs will be fixed in every release;
- `Minor`, `Trivial` - the bugs will be picked up when the assignee does not have more pressing issues for the upcoming release.

Please note that the Priority field only demonstrates our intentions at the moment, it does not guarantee that things will happen according to these intentions.

Labels

Labels are mostly used for more convenient filtering and don't carry much importance otherwise. However, there are a few that affect the processing of a bug report:

- `need_feedback` - its role during the initial bug processing was already described [above](#). However, after a bug is confirmed and queued for fixing, it should not appear anymore; and even if it's left by mistake, it won't affect the progress.
- `upstream` - the label means that the bug also exists in the upstream version of the corresponding component - normally, in MySQL server or a client program, but can also be in Percona's XtraDB or TokuDB. Normally there should also be a link to the upstream bug report. Setting this label means that we might want to take for a while and see whether the bug is fixed in the upstream version before we fix it in MariaDB directly. It was usual for 5.5, less usual for 10.x where bugfixes, apart from InnoDB, are not merged automatically. The label is still set, but it is more for informational purposes than to affect the priority.
- `upstream-fixed` - the label means that the bug used to exist in the upstream version, but not anymore. It means that there is nothing more to wait; moreover, it might be worth picking up the bug soon and at least evaluating the upstream bugfix.

Bug Reports with Patches

MariaDB encourages contributors to provide bug fixes; so, bug reports which come with the fixes in general have a quicker turnaround. The bug fix can come in a form of Git pull request, or, in simple cases, as a diff pasted in or attached to the bug report itself.

Principles for External Bug Reports

There are some basic rules for bugs, particularly for setting the **Resolution** value, which we want to stick to and which might be different from procedures you came across in other projects. It mainly concerns *external* bugs (those that come from the community), for internal ones we can cut corners more freely.

This all is easier to understand if one remembers that the **Resolution** or its analogues in other bug-tracking systems is a *user-facing* field, as already mentioned above, and that it relates more to the report, than to the bug itself.

Duplicate

An older bug report cannot be a duplicate of a newer one, it is nonsensical. The only possible exception is when an older bug has no useful information whatsoever *and* the reporter does not provide any helpful feedback, while a newer report was not closed as a duplicate right away and got some useful updates. The common example of such exception is when the first report is just an optimized stack trace, no query, no data, nothing to work with, while the second report has a test case. But if the first reporter at least makes an effort to collaborate, the report deserves to be treated with respect.

Bug reports which have essentially different descriptions and/or test cases should not be duplicates. The common example is this: a developer creates a bug saying something like "this and that pieces of code are wrong, it should be so and so"; and then a user files a bug saying "this SQL produces a wrong result on this data set". Even if they are about *the same error in the code* at the end, they are not duplicate *bug reports*.

Obviously, a report can never be a duplicate of anything private (luckily it does not concern MariaDB server so far, as the bug reports are public).

In general, a bug report is a duplicate of another one if, and only if, the new reporter could find the existing report just by a reasonable [JIRA search](#).

Cannot Reproduce

A bug report should not be closed as "cannot reproduce" if it was once verified/confirmed, but disappeared in later versions. It's unfair to the reporter, and also dangerous to the product. We should know why a bug stopped being reproducible -- either we find when and how it was fixed (and close the report as "Fixed in version X by a patch for Y"), or we discover that it wasn't in fact fixed, but just masked. The simplest example is a change of execution plan in optimizer: server would crash on a particular query, then due to a change in optimizer it started using a different plan for the same query, so it wouldn't go through the crashing path anymore. The crash is still there, though.

In general, the "cannot reproduce" resolution is a last resort. Usually if we can't reproduce something, it means that either the reporter did not provide required information (and then the resolution should be "Incomplete"), or we don't know what to request from the reporter, and then we should keep thinking, rather than close it. Of course, it happens that the bug is genuinely not reproducible, but it shouldn't be decided lightly.

8.1.4 MariaDB Security Bug Fixing Policy

See [MariaDB Security Policy](#).

8.1.5 Building MariaDB Server for Debugging

Contents

1. [What to Do When You Get a Crash After Installing a Debug Binary](#)

Instructions on how to build a mysqld that contains all the information we need to fix the problem: (A more detailed explanation can be found [here](#).)

Note: *this text has been extracted into a separate article from [Reporting bugs](#), see its full history there.*

- Add the `--core-file` option to your `./my.cnf` or `/etc/my.cnf` file under the `[mysqld]` tag.
- Get the latest [MariaDB code from GitHub](#).
- Compile MariaDB with the `-g` compiler flag (Unix).
- Optionally: with more checking [Compile MariaDB for debugging](#) - will cause slowdown.
- Shut down your old mysqld server.
- Install the new compiled `mysqld` binary. Note that if you are compiling same version of MariaDB that you have already installed it's enough to just copy this one binary!
- Restart mysqld.

Compiling with `-g` should not cause any notable slowdown of the server.

You can of course also do `make install`, but the above way allows you to go back to your old binary if needed.

If you get any errors about a wrong number of error messages, you can fix that by copying the corresponding language file from `sql/share` over your old ones (this should be reasonably safe to do).

```
cp sql/share/english/* mariadb-install-dir/share/mysql/english
```

What to Do When You Get a Crash After Installing a Debug Binary

Now when you get a crash do the following:

- Create a README file that describes the problem. You can use the mysqlbug script to generate a template for this.
- Create a tar file containing the core, the mysqld binary and README. If possible, also add any database files that could help us repeat the problem!

```
sh> tar cvfz /tmp/mariadb-bug-'short-description'.tgz mariadb-data-dir/core* mariadb-
install-dir/libexec/mysqld README
```

- Send it to our secure ftp server:

```
sh> ftp -a ftp.askmonty.org
ftp> cd private
ftp> binary
ftp> put /tmp/mariadb-bug-'short-description'.tgz
ftp> quit
```

- To be able to follow the progress, create a bug report in [JIRA](#) about this. This should be easy to do based on the information you have in your README file.

8.1.6 Extracting Entries from the Binary Log

This article is relevant if the problem is on a replication slave.

Note: this text has been extracted into a separate article from [Reporting bugs](#), see its full history there.

Sometimes a [binary log](#) event causes an error of some sort. A whole binary log file is sometimes impractical due to size or sensitivity reasons.

Step 1: Copy the binary log locally

This is just in case you don't quite extract the right information first. If the binlog expired off and you haven't got the right information, your bug report may not easily be reproducible.

```
sudo cp /var/lib/mysql/mysql-bin.000687 ~/
sudo chown $USER: ~/mysql-bin.000687
```

Step 2: Create an extract header

Binary logs have a header portion. Without the header [mariadb-binlog](#) won't be able to read it. The header also contains valuable session information

We look at the binary log to see how big the header and session information is:

```
mariadb-binlog --base64-output=decode-rows --verbose mysql-bin.000687 | more
/*!50530 SET @@SESSION.PSEUDO_SLAVE_MODE=1*/;

BEGIN
/*!*/;
# at 328
```

We see that the session information ends at 328 because of the last line, so we extract to that point.

```
dd if=mysql-bin.000687 of=mysql-bin.000687-extract-offset-129619 bs=1 count=328
```

We need to find out at what offset the entry at 129619 ends and it might be useful to extract some previous entries as well.

```
mariadb-binlog --base64-output=decode-rows --verbose mysql-bin.000687 | grep '^# at ' | grep -C
```

```
# at 127602  
# at 127690  
# at 128201  
# at 128290  
# at 128378  
# at 128829  
# at 128918  
# at 129006  
# at 129459  
# at 129548  
# at 129619  
# at 129647  
# at 130070  
# at 130097  
# at 130168  
# at 130196  
# at 130738  
# at 130942  
# at 130969  
# at 131040  
# at 131244
```

Take a look at those entries with:

```
mariadb-binlog --base64-output=decode-rows --verbose --start-position 129006 --stop-position 130
```

Now let's assume we want to start at our original 129619 and finish before 130168

```
dd if=mysql-bin.000687 bs=1 skip=129619 count=$(( 130168 - 129619 )) >> mysql-bin.000687-extract
```

Check the extract:

```
mariadb-binlog mysql-bin.000687-extract-offset-129619
```

Upload this to the [private uploads](#) or attach to the public bug report if nothing sensitive there.

8.1.7 Profiling Memory Usage

Profiling the memory usage can be useful for finding out why a program appears to use more memory than it should. It is especially helpful for analyzing OOM situations or other cases where the memory grows linearly and causes problems.

To profile the memory usage of a program, there are multiple options. The following sections describe the methods that are available.

If a problem in memory usage is identified and it appears to be due to a bug, please open a new bug report on the [MariaDB Jira](#) under the correct project and include the relevant memory profiling output in it. Refer to [How to Write a Good Bug Report](#) for more details.

Known issues that can cause extended memory usage

Transparent huge pages (THP)

Transparent huge pages (THP), which is enabled by default in many newer Linux distributions, can cause out-of-memory-issues for MariaDB as THP is not suitable for databases. This is described at [MDEV-33279](#).

MariaDB Community Server 10.6.17, MariaDB Enterprise Server 10.6.16-11 and all other MariaDB server releases after these have THP disabled.

System malloc is not good if there are a lot of allocations of different size.

If [Memory_used](#) and [information_schema.processlist](#) do not show an increase in memory, but the process still increases in size, then a likely problem is the system memory allocation library (malloc). Replacing malloc with [tcmalloc](#) or [jemalloc](#) should fix the issue in this case.

Profiling with the MariaDB server

Recent MariaDB versions have a global variable [Memory_used](#) that shows how much memory the MariaDB server has allocated. By monitoring this variable one can find out if the MariaDB allocated memory grows.

One can also check memory usage per user with the [information_schema.processlist](#):

```
select id, MEMORY_USED, MAX_MEMORY_USED from information_schema.processlist;
```

This shows the current memory used per connection and the maximum memory they have used since the user connected.

The [Performance Schema](#) can also be used to find out who is allocated memory and for what.

Note that one can also set the [max_session_mem_used](#) variable to restrict a user's memory usage.

BPF Compiler Collection (bcc)

The [BPF Compiler Collection \(bcc\)](#) toolkit comes with the `memleak` program that traces outstanding memory allocations. This is a very convenient way of debugging high memory usage as it'll immediately show where the memory is allocated at.

By default the tool will print output once every five seconds with the stacktraces that have the most open allocations.

`Ctrl+C` can be used to interrupt the collection of the traces.

The profiling interval and the profiling duration can be passed as arguments to `memleak`. The first argument is how often a sample is taken and the second argument is how long to sample for. To help analyze excessive memory usage, collect the output of the `memleak` program for at least 60 seconds. The longer the profiling can be left on, the more accurate the information will be.

The overhead of the profiling can be large enough that it affects production workloads negatively. To reduce the overhead, the sampling frequency of memory allocations can be lowered using the `--sample-rate` option:

```
-s SAMPLE_RATE, --sample-rate SAMPLE_RATE
    sample every N-th allocation to decrease the overhead
```

For example, `-s 10` will sample only 10% of memory allocations which may miss out memory leaks from individual allocations but the longer the system is left running, the more likely it is that a leaking memory allocation is sampled. This means that even with a lower sampling rate, the source of the memory leak will eventually be found.

RHEL, CentOS, Rocky Linux and Fedora

On RHEL based systems, the package is named `bcc-tools`. After installing it, use the following command to profile the memory usage 5 times per second over a window of 60 seconds:

```
sudo /usr/share/bcc/tools/memleak -p $(pidof mariadb) 5 60 | tee memleak.log
```

Ubuntu and Debian

On Ubuntu/Debian the package is named `bpffcc-tools`. After installing it, use the following command to profile the memory usage 5 times per second over a window of 60 seconds:

```
sudo memleak-bpffcc -p $(pidof mariadb) 5 60 | tee memleak.log
```

Jemalloc Heap Profiling

Jemalloc is an alternative to the default glibc memory allocator. It is capable of analyzing the heap memory usage of a process which allows it to be used to detect all sorts of memory usage problems with a lower overhead compared to tools like Valgrind. Unlike the ASAN and LSAN sanitizers, it is capable of detecting cases where memory doesn't actually leak but keeps growing with no upper limit (e.g. items get appended to a list but are never removed).

Ubuntu and Debian

To enable jemalloc, the packages for it must be first installed from the system repositories. Ubuntu 20.04 requires the following packages to be installed for jemalloc profiling:

```
apt-get -y install libjemalloc2 libjemalloc-dev binutils
```

RHEL, CentOS, Rocky Linux and Fedora

The version of jemalloc that is available in most Red Hat repositories is not compiled with memory profiling support enabled. For RHEL based distributions, the only option is to [build jemalloc from source](#).

Configuring Jemalloc for Heap Profiling

Once installed, edit the systemd service file with `systemctl edit mariadb.service` and add the following lines into it. The path to the `libjemalloc.so` file is OS-specific so make sure it points to the correct file. The example here is for Ubuntu and Debian environments.

```
[Service]
Environment=MALLOC_CONF=prof:true,prof_leak:true,prof_gdump:true,lg_prof_sample:18,prof_prefix:/v
Environment=LD_PRELOAD=/usr/lib/x86_64-linux-gnu/libjemalloc.so.2
```

Then create the directory for the profile files:

```
mkdir /var/lib/mysql/jeprof/
chown mysql:mysql /var/lib/mysql/jeprof/
```

And finally restart MariaDB with `systemctl restart mariadb.service`.

The directory in `/var/lib/mysql/jeprof/` will start to be filled by versioned files with a `.heap` suffix. Every time the virtual memory usage reaches a new high, a file will be created. Initially, the files will be created very often but eventually the pace will slow down. Once the problematic memory usage has been identified, the latest `.heap` file can be analyzed with the `jeprof` program.

The simplest method is to generate a text report with the following command.

```
jeprof --txt /usr/sbin/mariadb $(ls -1 /var/lib/mysql/jeprof/*.heap|sort -V|tail -n 1) > heap-re
```

A better way to look at the generated heap profile is with the PDF output. However, this requires the installation of extra packages (`apt -y install graphviz ghostscript gv`). To generate the PDF report of the latest heap dump, run the following command:

```
jeprof --pdf /usr/sbin/mariadb $(ls -1 /var/lib/mysql/jeprof/*.heap|sort -V|tail -n 1) > heap-re
```

The generated `heap-report.pdf` will contain a breakdown of the memory usage.

Note that the report generation with the `jeprof` program must be done on the same system where the profiling was done. If done elsewhere, the binaries do not necessarily match and can cause the report generation to fail.

Tcmalloc Heap Profiling

Similarly to the jemalloc memory allocator, the [tcmalloc](#) memory allocator comes with a leak checker and heap profiler.

Installation

RHEL, CentOS and Rocky Linux

On RHEL based systems, the `gperftools` package is in the EPEL repositories. These must be first enabled by installing the `epel-release` package.

```
sudo dnf -y install epel-release
```

After this, the `gperftools` package can be installed.

```
sudo dnf -y install gperftools
```

Ubuntu 20.04

```
sudo apt -y install google-perftools
```

Service file configuration

Once `tcmalloc` is installed, edit the `systemd` service file with `systemctl edit mariadb.service` and add the following lines into it.

Note: Make sure to use the correct **path** and **library name** to the `tcmalloc` library in `LD_PRELOAD`. The following example uses the Debian location of the library. The file is usually located in `/usr/lib64/libtcmalloc_and_profiler.so.4` on RHEL systems. The version number of the library can also change which might require other adjustments to the library path.

```
[Service]
Environment=LD_PRELOAD=/usr/lib/x86_64-linux-gnu/libtcmalloc_and_profiler.so.4
Environment=HEAPPROFILE=/var/lib/mysql/pprof/mariadb.prof
Environment=HEAPCHECK=normal
Environment=HEAP_CHECK_AFTER_DESTRUCTORS=true
```

Then create the directory for the profile files:

```
mkdir /var/lib/mysql/pprof/
chown mysql:mysql /var/lib/mysql/pprof/
```

And finally restart MariaDB with `systemctl restart mariadb.service`.

Configuring Heap Dump Frequency

The heap profiling is configured using environment variables. The details can be found in the *Modifying Runtime Behavior* section of the `gperftools` documentation: <https://gperftools.github.io/gperftools/heapprofile.html>

By default, `tcmalloc` dumps the heap profile every time 1GiB of memory has been allocated (`HEAP_PROFILE_ALLOCATION_INTERVAL`) or whenever the high-water memory usage mark increases by 100MiB (`HEAP_PROFILE_INUSE_INTERVAL`). If there's no activity, no memory dumps will be generated.

To trigger a memory dump based on a time interval, set the `HEAP_PROFILE_TIME_INTERVAL` environment variable to the number of seconds between each dump. For example, with `Environment=HEAP_PROFILE_TIME_INTERVAL=3600` there will be one heap dump per hour.

Report generation

Depending on which OS you are using, the report generation program is named either `pprof` (RHEL) or `google-pprof` (Debian/Ubuntu).

It is important to pick the latest `.heap` file to analyze. The following command generates the `heap-report.pdf` from the latest heap dump. The file will show the breakdown of the memory usage.

```
pprof --pdf /usr/sbin/mariabdb $(ls /var/lib/mysql/pprof/*.heap|sort -V|tail -n 1) > heap-report.pdf
```

8.2 Contributing & Participating

There are many ways to contribute to MariaDB.

Getting Help With MariaDB

8.2.1 Getting Help With MariaDB

If you can't find help in the [MariaDB documentation](#), you can also subscribe to the [mailing lists](#) or [Zulip](#) to communicate with MariaDB users and developers.

There's an active help community on [StackOverflow](#) for programming with SQL and indexing questions, and [DBA StackExchange](#) for non-programming questions for example tuning/backups/architecture/migration/replication etc. Use the `mariadb` tag so questions are searchable by those that can help you.

If you have a question about a feature that is not properly documented or something that is not working as expected, go to the corresponding [Knowledge Base page](#) and ask your question there.

You can report and check on bugs which apply to MariaDB in [JIRA](#).

[MariaDB plc](#) offers [commercial support](#).

8.2.2 Contributing to the MariaDB Project

Contents

1. [Getting Started](#)
 1. [MariaDB Email Lists](#)
 2. [Getting Started for Developers](#)

The success of [MariaDB](#) depends on the participation of the [community](#). MariaDB would not be as good as it is today without the participation of the entire [MariaDB community](#).

Getting Started

There are several ways to contribute besides [Contributing Code](#), and not all of them require strong C/C++ skills. Areas for non-developers include:

- [Reporting Bugs](#)
 - To report a bug you'll need to sign up for an account by clicking on the Create an account link below the login fields
- [Suggesting Features](#)
- [Answering questions](#) in the Knowledge Base
- Helping other people answering problems or even fixing their bugs on [IRC](#) in the [#maria](#) channel on [Libera.Chat](#) or on MariaDB's Zulip instance at <https://mariadb.zulipchat.com>
- Testing and Benchmarking
 - Bug tests can be uploaded to the 'private' directory of our [FTP](#) server.
- Creating [documentation and KB articles](#) for MariaDB, or [translating existing documentation](#)
- Advocating MariaDB in your area.
- Participate in [open source events](#) and talk about MariaDB.
- Running a [BuildBot](#) on a platform which is not currently <https://buildbot.mariadb.org/#/builders>
- [Donate](#) time or money to the MariaDB project.
- Ask your company to [sponsor a feature](#).
- [MariaDB Foundation page on getting involved](#)

[Contributing to the Knowledge Base](#) is a great way to help improve MariaDB.

MariaDB Email Lists

A great way to get started in MariaDB is to participate in e-mail discussions via our mailing lists (whichever list best matches your interests):

- [developers](#)
- [discuss](#)
- [docs](#)

Sensitive security issues can be sent directly to the persons responsible for MariaDB security: `security [AT] mariadb (dot) org`.

You can find additional email address, email archives and ways to connect with MariaDB people [here](#).

All MariaDB contributors are expected to follow the [Ubuntu Code Of Conduct](#).

Getting Started for Developers

- [Contributing Code](#)

See also the pages for new developers on the MariaDB Foundation website:

- [Getting Started For Developers](#)
- [Get the Code, Build It, Test It](#)
- [Writing Good Test Cases for MariaDB Server](#)
- [Submitting a Pull Request](#)

8.2.3 Contributing Code

 7. [Working on a Bug Fix](#)
 8. [Making Things Easier for Reviewers](#)
 9. [When Reviewing Code](#)

on the [maria-developers](#) mailing list, on our Zulip instance at <https://mariadb.zulipchat.com>, or on the #maria IRC channel on <https://libera.chat/>. Other email lists and places to find MariaDB can be found [here](#).

General information about contributing to MariaDB (for developers and non-developers) is found on the [Contributing to the MariaDB Project](#) page.

Finding Development Projects to Work on

There are many open development projects for MariaDB which you can contribute to (in addition to any ideas you may have yourself).

- We are using [JIRA](#) to manage the MariaDB project. Go to <https://jira.mariadb.org> and click on "Projects" to get to the MariaDB project. Browse around the [unresolved and unassigned](#) issues to see if there is something that interests you. Some issues have sponsors and you can be paid for doing them!
- A list of [beginner friendly](#) tasks is also available.
- Check the [development plans](#) for the next MariaDB version.
- Join [maria-developers](#) and ask for suggestions of tasks you could do. Please include your programming experience and your knowledge of the MariaDB source and how much you know about using MySQL/MariaDB with the email so that we know which tasks we can suggest to you.
- If this is your first project, check out the [Suggested Development](#) page. It lists projects that will make a good start.
- Join MariaDB's Zulip instance at <https://mariadb.zulipchat.com> and ask for suggestions.
- Join #/maria on <https://libera.chat/> IRC and ask for suggestions.

If you have your own ideas, please submit them to [JIRA](#) so other MariaDB developers can comment on them and suggest how to implement them. You can of course also use the [maria-developers](#) list for this.

What to Expect From a MariaDB Server Developer

This section is mainly directed to developers with commit rights to the MariaDB git repository. However, we hope it's also useful for anyone wanting to contribute code to MariaDB to know what a reviewer will expect from them.

This is not about coding style or if one should prefer C instead of C++. That would be a separate topic that should be created sooner or later.

The Basics

When coding, try to create code that 'never has to be changed again'. Try to make the code as performant as possible. In general it is acceptable to spend 50% more time to make the code 15% faster than what you originally intended. Take that into account when you plan your time estimates! That said, don't try to add classes or functionality that is not yet used.

The code should be easy to read and follow the coding standards of the project. Patches that are smaller and simpler are often better than complex solutions. Don't make the server depend on new external libraries without first checking with Sergei or Monty!

Add code comments for anything that is not obvious. When possible, use assertions within the code to document expectations of arguments etc. In general, if the code requires complex comments, think if there is a better way to structure the logic. Simpler is often better and with fewer bugs.

What to Have in a Commit Comment

- Jira issue number and summary ex: [MDEV-23839](#) innodb_fast_shutdown=0 hang on change buffer merge
- An empty line
- A short description of the problem
- A description of the solution
- Any extra information needed to understand the patch
- The commit message should be self contained and the reviewer shouldn't preferably have to look at the Jira at all to understand the commit. This doesn't mean that the commit message should include all background and different design options considered, as the Jira should contain.
- Name of all reviewers and authors should be clear from the commit message. The preferred way would be (one line per person)
 - Reviewed-by: email
 - Co-authored-by: email
 - See <https://docs.github.com/en/free-pro-team@latest/github/committing-changes-to-your-project/creating-a-commit-with-multiple-authors> for details
- The default is that all code should be reviewed. Only in really extraordinary cases, like merge (where the original code

was already reviewed) then it can be self-reviewed, which should clear from the commit. In this case the code should of course be tested extra carefully both locally and in buildbot before pushing.

Testing

- All code should have a test case that shows that the new code works or, in case of a bug fix, that the problem is fixed! It should fail with an unpatched server and work with the new version. In the extreme case that a test case is practically impossible to do, there needs to be documentation (in the commit message, optionally also in Jira) how the code was tested.
- The test case should have a reference to the Jira issue, if such one exists.
- Patches related to performance should be tested either by the developer (for simple commits) or by performance testers. The result should be put in Jira with a summary in the commit.
- Complex patches and should be tested by QA in a bb- branch before pushing. The Jira entry should include information that this has been done and what kind of test has been run.
- For anything not trivial, one should run either Valgrind or ASAN/MSAN on the new code. (Buildbot will do this for you if you can't get valgrind or ASAN to work). At least the test case added should be tested by either. If the developer cannot do that for some reason, he should check the buildbot builders that do this and ensure that at least his test case doesn't give any warnings about using not initialized memory or other failures.
- For complex code the developer should preferably use gcov or some similar tool to ensure that at least not all not-error branches are executed. "mtr --gcov" or "dgcov.pl" can help you with this.

Getting Your Code into the Main MariaDB Tree

All code in MariaDB comes from one of the following sources:

- MySQL
- Code developed by people employed by the [MariaDB Foundation](#).
- Code developed by people employed by [MariaDB Corporation](#).
- Code shared with the MariaDB Foundation under the [MCA](#).
- Code with a known origin that is under a permissive license (BSD or public domain).

If you want the code to be part of the main [MariaDB](#) tree, you also have to give the MariaDB Foundation a shared copyright to your code. This is needed so that the foundation can offer the code to other projects (like MySQL).

You do this by either:

1. Signing the MariaDB Contributor Agreement ([MCA](#)) and then scanning and sending it to the foundation.
2. Sending an email to [maria-developers](#) where you say that your patch and all fixes to it are provided to the MariaDB Foundation under the [MCA](#).
3. Licensing your code using the [BSD license](#).

We need shared copyright for the following reasons:

1. to defend the copyright or GPL if someone breaks it (this is the same reason why the Free Software Foundation also [requires copyright assignment](#) for its code)
2. to be able to donate code to MySQL (for example to fix security bugs or new features)
3. to allow people who have a non-free license to the MySQL code to also use MariaDB (the MCA/BSD allows us to give those companies the rights to all changes between MySQL and MariaDB so they can use MariaDB instead of MySQL)

More information about the MCA can be found on the [MCA FAQ](#) page.

Before Pushing Code to a Stable Branch

- Ensure that you have compiled everything for your new code, in a debug server (configured with cmake -DCMAKE_BUILD_TYPE=Debug) including embedded and all plugins that may be affected by your code change..
- Run the mysql-test-run (mtr) test suite locally with your debug server.
- For anything complex the full test suite should be run.
- For something absolutely trivial, at least the main suite must be run.
- Always push first to a bb- branch to test the code. When the bb- branch is green in buildbot you can push to the main branch. Take care of checking that Windows builds compiles (take extra care of checking this as this often fails) and that valgrind and msan builds doesn't show any problems with your new test cases.
- If you have to do a rebase before pushing, you have to start from the beginning again.
- When porting code from third parties (such as MySQL), make sure to attribute copyright to the right owner, in the header of each modified file.
- For example: Copyright © 2000, 2018, Oracle and/or its affiliates. Copyright © 2009, 2020, MariaDB
- The only exception is that if the changes are trivial and the rebase was trivial and the local mysql-test-run worked, then you can push directly to the main branch. Only do this if you are 99% sure there are no issues! * Please don't make us regret that we have made this one exception! When we have protected git branches, then the above rule will

be enforced automatically as the protection will take care of this.

Working on a New Project

- First create a Jira entry that explains the problems and the different solutions that can be used to solve the problem. If there is a new syntax include examples of queries and results.
- After getting an agreement of the to-be-used solution, update the Jira entry with the detailed architecture of the suggested solution.
- When the architecture is reviewed, the assigned developer can start coding.
- When the code is ready, the Jira entry should be updated with the reviewer.
- The reviewer checks the code and either approves it to be pushed or gives comments to the developers that should be fixed. In the later case the developer updates the code and gives it back to the reviewer. This continues until the code is approved.
- If the design changes during the project, the design in Jira needs to be updated.

Working on a Bug Fix

- Ensure that the Jira issue is up to date.
- For complex bugs that require redesign, follow the process in "Working on a new project"
- For simpler bugs, one can skip the listing of different solutions and architecture. However one should still document the reason for the bug and how it's fixed or to-be-fixed, in a JIRA comment.

Making Things Easier for Reviewers

- Ensure that code compiles, all MTR test works before asking for a review
- Try to split a bigger project into smaller, self-contained change sets.
- Automatic things, like renames of classes, variables, functions etc is better to be done in a separate commit.

When Reviewing Code

Remember that the stability and security of any project hangs a lot on the reviewers. If there is something wrong with an accepted patch, it's usually the reviewer who is to be blamed for it, as the reviewer was the one who allowed it to go in!

- Ensure that the code is licensed under New BSD or another approved license for MariaDB (basically any open source license not conflicting with GPL) or that the contributor has signed the MCA.
- GPL is only allowed for code from MySQL (as MariaDB is already depending on MySQL code).
- Ensure that commits are not too large. If the code is very large, give suggestions how to split it into smaller pieces. Merge commits, when rebasing is possible, are not allowed, to keep history linear.
- Check that the commits message describes the commit properly. For code that improves performance, ensure that Jira and the commit message contains information about the improvements.
- Check that there are no unexplained changes in old tests.
- Check the quality of the code (no obvious bugs, right algorithms used)
- Check if any code can be simplified or optimized. Using already existing functions, are loops optimal, are mutexes used correctly etc.
- Check that there is an appropriate test case for the code. See 'testing' for what is required!
- Ensuring the code follows the coding standard for MariaDB. This document should be created shortly, but in the meantime ask an old MySQL/MariaDB developer if you are unsure.
- Ensuring that the code follows the architecture agreed for in Jira (if it's in Jira).
- Code should be easy to understand (good code comments, good function and variable names etc).
- Ensure you understand every single line of code that is reviewed. If not, ask the developer to add more comments to get things clear or ask help from another reviewer.
- No performance degradations for all common cases.
- Any code that touches any sensitive area (files, communication, login, encryption or security) needs to have another reviewer that is an expert in this area.

8.2.4 Donate to the Foundation

To donate, please visit the [MariaDB Foundation donations page](#).

8.2.5 Sponsoring the MariaDB Project

Sponsorships are crucial for ongoing and future development of the MariaDB project! There are a number of easy ways you for you to help the project:

- Fund the development of a specific feature. You can find a list of suggested features to sponsor [here](#) or in [JIRA](#).

Feel free to sign in and add more projects to either place!

- Contribute with [developer](#) time. If your organization has talented developers familiar with MariaDB or MySQL codebase they can become part of the MariaDB team and contribute to the development of the MariaDB project.
- Hire a developer that you dedicate to work on the MariaDB project.
- A pure [donation](#) with no strings attached

To get going with the sponsorship please visit the [MariaDB Foundation sponsorships page](#).

8.2.6 Using Git with MariaDB

Tricks and tips on how to use Git, the source control system MariaDB uses.

Just Getting the Source

If you just want to get the latest source and you don't require the ability to push changes to the MariaDB repository, you can use the following command to check out the latest 10.5 branch:

```
git clone -b 10.5 https://github.com/MariaDB/server.git
```

Setup up git for MariaDB

- Set your name with git

```
git config --global user.name "Ivan Ivanov"
git config --global user.email "[email protected]"
```

- Go to <https://github.com/settings/ssh> and add your public SSH key ([GitHub Help](#)).

- Clone the repository

```
git clone [email protected]:MariaDB/server.git
cd server
git checkout 10.5
```

- Config repository pull and alias for fast forward:

```
git config pull.ff only
git config --global alias.ff "merge --ff-only"
```

Commit comments

In git commit messages are normally formatted as

```
subject

body
more body
...
```

That is, the first line is considered a *subject*, much like email subject. Many git commands and pages on github only show the commit subject, not the complete comment. After the subject goes an empty line, then the detailed description of the comment. Please, structure your commit comments this way, don't forget the empty line.

Branches

This is an important concept, and git branches do not have equivalents in bzt.

In Bazaar, we all used to have one shared repository, within which there were many branches. This seems to be impossible with git?

In Git, each repository has only one branch that is currently checked out.

```
git branch
```

List Existing Branches

To see which branches exists locally and remotely:

```
git branch --all
```

To Move to Work on a Specific Branch

```
git checkout branch-name
```

Note that if the output from `git branch --all` is `remotes/origin/XXX` you should just use `XXX` as branch name.

Making a Local Copy of a Branch (Like bzt clone)

```
branch clone old_directory new_directory
cd new_directory
git remote set-url origin [email protected]:MariaDB/server.git
git pull
```

Remove Last Commit From a Branch

```
git reset --hard HEAD^
```

Fetch a Branch Someone Has Done a Rebase on

If you get the following error on pull:

```
shell> git pull
X11 forwarding request failed on channel 0
fatal: Not possible to fast-forward, aborting.
```

Instead of removing your copy and then clone, you can do:

```
git reset --hard origin/##branch-name##
```

Other Things About Branches

- Note: branches whose names start with `bb-` are automatically put into the buildbot.

Equivalents For Some bzd Commands

CAVEAT UTILITOR. Check the manual before running!

- `bzd status` **is** `git status`
- `bzd diff` **is** `git diff`
- `bzd log` **is** `git log`
- `bzd revert` **is** `git reset --hard`
- `bzd revert filename` **is** `git checkout filename`
- `bzd parent` **is** `git remote -v` (but there are more detailed commands)
- `bzd parent to-default-mariadb-repo` `git remote set-url origin :MariaDB/server.git`
- `bzd push` **is** `git push REMOTENAME BRANCHNAME`. `REMTENAME` is typically "origin", for example: `git push origin HEAD:10.3-new-feature`. The `HEAD:` stands for "from current branch".
- `bzd clean-tree --ignored` **is** `git clean -Xdf` (note the capital X!)
- `bzd root` **is** `git rev-parse --show-toplevel`
- `bzd missing --mine-only` **is** `git cherry -v origin` (kind-of).

GUIs

- `bzd gcommit` **is** `git citool`
- `bzd viz` **is** `gitk`
- `bzd gannotate` **is** `git gui blame`

Commit Emails

In the MariaDB project, it is a good idea (and a long tradition since MySQL Ab) to have all your commits sent to a [\[email protected\]](#) mailing list. It allows others to follow the progress, comment, etc.

A script and instructions on how to setup commit triggers in Git are here: http://bazaar.launchpad.net/~maria-captains/mariadb-tools/trunk/files/head:/git_template/ . Jira task for commit trigger was [MDEV-6278](#) .

Attributing Code to Someone Else

If you add code on behalf of someone else, please attribute the code to the original author:

- Run `git citool` and move changed files to staged.
- Don't commit, abort instead
- run `git commit --author="Original author name <email_address>"`

The above is needed as `git citool` can't handle the `--author` option.

Applying a Pull Request

At the end of the pull request page there is a button "Merge pull request" and next to it a link "command line instructions". Click the link, you'll see something like

Step 1: From your project repository, check out a new branch and test the changes.

```
git checkout -b mariadb-server-joeuser-cool-feature 10.3
git pull https://github.com/joeuser/mariadb-server cool-feature
```

Step 2: Merge the changes and update on GitHub.

```
git checkout 10.3
git merge --no-ff mariadb-server-joeuser-cool-feature
git push origin 10.3
```

Note where to pull from — <https://github.com/joeuser/mariadb-server-cool-feature>.

Now, checkout the branch you want to merge it to, say, bb-10.3-stage, and do the following

```
git fetch https://github.com/joeuser/mariadb-server-cool-feature
git checkout FETCH_HEAD
git rebase @{-1}
```

Now's the time to compile the code, test it, fix, if necessary. Then

```
git checkout @{-1}
git ff @{-1}
```

If you want to do small changes to the pull request, do it in a separate commit, after `git rebase @{-1}` above. If you want to do *big* changes to the pull request, perhaps you shouldn't merge it in the first place, but ask the contributor to fix it?

Examples

Diff For Last Commit

```
git show
```

Applying New Code From Main Tree to a Branch

You are working on a branch (`NEW_FEATURE`) and would like to have into that branch all changes from the main branch (`10.1`).

```
git checkout 10.1
git pull
git checkout NEW_FEATURE
git rebase 10.1
```

Applying a Bugfix in the Main Branch

You've just fixed and committed a bug in the main `10.1` branch and want to merge it with the latest `10.1`. Often a rebase is better in this case. Assuming your current checked out branch is `10.1`:

```
git fetch origin
git rebase origin/10.1
```

This will work even if you have done multiple commits in your local `10.1` tree.

Dealing With Conflicts When One Tries to Push

What to do when you have fixed a bug in the main tree but notices that someone has changed the tree since you pulled last time. This approach ensures that your patch is done in one block and not spread out over several change sets.

```

git clone 10.1
cd 10.1
< fix a bug here>
git citool
git push
# ^ and the above fails, because someone has pushed to 10.1 in between
git branch tmp
# ^ copy our work to branch named 'tmp'
get checkout 10.1
git reset --hard HEAD^
# ^ remove our work from '10.1' local branch'
git pull
# ^ get changes from remote
git checkout tmp
git rebase 10.1
# ^ switch to 'tmp' and try to rebase 'tmp' branch on top of 10.1 branch.
# here you will be asked to merge if necessary
git checkout 10.1
git pull --ff . tmp
# ^ switch back to the '10.1' branch, and pull from 'tmp' branch.
git branch -D tmp
#^ this removes the tmp. branch
git push

```

Finding in Which MariaDB Version a Commit Exists

```

sh> git tag --contain e65f667bb60244610512efd7491fc77eccceb9db
mariadb-10.0.30
mariadb-10.1.22
mariadb-10.1.23
mariadb-10.2.5
mariadb-10.3.0
mariadb-galera-10.0.30

```

8.2.6.3 Configuring Git to Send Commit Notices

Commit emails for MariaDB are sent to [\[email protected\]](#). You can find the archive [here](#).

To allow others to see what you are working on in your MariaDB tree, you should:

1. [subscribe](#) to the email list
2. configure git to send your commits to [\[email protected\]](#).

Download the [post-commit git trigger](#) script. Configure as

```

git config --global hooks.postcommitrecipients "[email protected]"
git config --global hooks.postcommitbranches "*"

```

Also you might want to check the [README](#) for the post-commit trigger.

The post-commit git trigger uses *sendmail* for sending emails. Some platforms don't have *sendmail* and then you'll need to modify to make use of something that is supported.

Also, the post-commit trigger is just one approach. You can also use git-email on at least Debian and Fedora to send commit emails to the MariaDB commits email list.

8.3 Legal Matters

GNU General Public License, Version 2

[Full text of the GNU General Public License, Version 2](#)

Legal Notices for the Knowledge Base

[List of licenses and trademarks associated with the content in the MariaDB Knowledge Base.](#)

8.3.1 GNU General Public License, Version 2

GNU GENERAL PUBLIC LICENSE

Version 2, June 1991

Copyright (C) 1989, 1991 Free Software Foundation, Inc.,
51 Franklin Street, Fifth Floor, Boston, MA 02110-1301 USA
Everyone is permitted to copy and distribute verbatim copies
of this license document, but changing it is not allowed.

Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General Public License is intended to guarantee your freedom to share and change free software--to make sure the software is free for all its users. This General Public License applies to most of the Free Software Foundation's software and to any other program whose authors commit to using it. (Some other Free Software Foundation software is covered by the GNU Lesser General Public License instead.) You can apply it to your programs, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs; and that you know you can do these things.

To protect your rights, we need to make restrictions that forbid anyone to deny you these rights or to ask you to surrender the rights. These restrictions translate to certain responsibilities for you if you distribute copies of the software, or if you modify it.

For example, if you distribute copies of such a program, whether gratis or for a fee, you must give the recipients all the rights that you have. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

We protect your rights with two steps: (1) copyright the software, and (2) offer you this license which gives you legal permission to copy, distribute and/or modify the software.

Also, for each author's protection and ours, we want to make certain that everyone understands that there is no warranty for this free software. If the software is modified by someone else and passed on, we want its recipients to know that what they have is not the original, so that any problems introduced by others will not reflect on the original authors' reputations.

Finally, any free program is threatened constantly by software patents. We wish to avoid the danger that redistributors of a free program will individually obtain patent licenses, in effect making the program proprietary. To prevent this, we have made it clear that any patent must be licensed for everyone's free use or not licensed at all.

The precise terms and conditions for copying, distribution and modification follow.

GNU GENERAL PUBLIC LICENSE

TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License applies to any program or other work which contains a notice placed by the copyright holder saying it may be distributed under the terms of this General Public License. The "Program", below, refers to any such program or work, and a "work based on the Program" means either the Program or any derivative work under copyright law: that is to say, a work containing the Program or a portion of it, either verbatim or with modifications and/or translated into another language. (Hereinafter, translation is included without limitation in the term "modification".) Each licensee is addressed as "you".

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running the Program is not restricted, and the output from the Program

is covered only if its contents constitute a work based on the Program (independent of having been made by running the Program). Whether that is true depends on what the Program does.

1. You may copy and distribute verbatim copies of the Program's source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and give any other recipients of the Program a copy of this License along with the Program.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Program or any portion of it, thus forming a work based on the Program, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

- a) You must cause the modified files to carry prominent notices stating that you changed the files and the date of any change.
- b) You must cause any work that you distribute or publish, that in whole or in part contains or is derived from the Program or any part thereof, to be licensed as a whole at no charge to all third parties under the terms of this License.
- c) If the modified program normally reads commands interactively when run, you must cause it, when started running for such interactive use in the most ordinary way, to print or display an announcement including an appropriate copyright notice and a notice that there is no warranty (or else, saying that you provide a warranty) and that users may redistribute the program under these conditions, and telling the user how to view a copy of this License. (Exception: if the Program itself is interactive but does not normally print such an announcement, your work based on the Program is not required to print an announcement.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Program, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Program, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Program.

In addition, mere aggregation of another work not based on the Program with the Program (or with a work based on the Program) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may copy and distribute the Program (or a work based on it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you also do one of the following:

- a) Accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,
- b) Accompany it with a written offer, valid for at least three years, to give any third party, for a charge no more than your cost of physically performing source distribution, a complete machine-readable copy of the corresponding source code, to be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,
- c) Accompany it with the information you received as to the offer

to distribute corresponding source code. (This alternative is allowed only for noncommercial distribution and only if you received the program in object code or executable form with such an offer, in accord with Subsection b above.)

The source code for a work means the preferred form of the work for making modifications to it. For an executable work, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the executable. However, as a special exception, the source code distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

If distribution of executable or object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place counts as distribution of the source code, even though third parties are not compelled to copy the source along with the object code.

4. You may not copy, modify, sublicense, or distribute the Program except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense or distribute the Program is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

5. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Program or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Program (or any work based on the Program), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Program or works based on it.

6. Each time you redistribute the Program (or any work based on the Program), the recipient automatically receives a license from the original licensor to copy, distribute or modify the Program subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties to this License.

7. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Program at all. For example, if a patent license would not permit royalty-free redistribution of the Program by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Program.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system, which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

8. If the distribution and/or use of the Program is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Program under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

9. The Free Software Foundation may publish revised and/or new versions of the General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Program specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of this License, you may choose any version ever published by the Free Software Foundation.

10. If you wish to incorporate parts of the Program into other free programs whose distribution conditions are different, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

11. BECAUSE THE PROGRAM IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

12. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER PROGRAMS), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

END OF TERMS AND CONDITIONS

How to Apply These Terms to Your New Programs

If you develop a new program, and you want it to be of the greatest possible use to the public, the best way to achieve this is to make it free software which everyone can redistribute and change under these terms.

To do so, attach the following notices to the program. It is safest to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

```
<one line to give the program's name and a brief idea of what it does.>  
Copyright (C) <year> <name of author>
```

```
This program is free software; you can redistribute it and/or modify  
it under the terms of the GNU General Public License as published by  
the Free Software Foundation; either version 2 of the License, or  
(at your option) any later version.
```

This program is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU General Public License for more details.

You should have received a copy of the GNU General Public License along with this program; if not, write to the Free Software Foundation, Inc., 51 Franklin Street, Fifth Floor, Boston, MA 02110-1301 USA.

Also add information on how to contact you by electronic and paper mail.

If the program is interactive, make it output a short notice like this when it starts in an interactive mode:

```
Gnomovision version 69, Copyright (C) year name of author
Gnomovision comes with ABSOLUTELY NO WARRANTY; for details type `show w'.
This is free software, and you are welcome to redistribute it
under certain conditions; type `show c' for details.
```

The hypothetical commands `show w' and `show c' should show the appropriate parts of the General Public License. Of course, the commands you use may be called something other than `show w' and `show c'; they could even be mouse-clicks or menu items--whatever suits your program.

You should also get your employer (if you work as a programmer) or your school, if any, to sign a "copyright disclaimer" for the program, if necessary. Here is a sample; alter the names:

```
Yoyodyne, Inc., hereby disclaims all copyright interest in the program
`Gnomovision' (which makes passes at compilers) written by James Hacker.
```

```
<signature of Ty Coon>, 1 April 1989
Ty Coon, President of Vice
```

This General Public License does not permit incorporating your program into proprietary programs. If your program is a subroutine library, you may consider it more useful to permit linking proprietary applications with the library. If this is what you want to do, use the GNU Lesser General Public License instead of this License.
